

Oracle® Universal Content Management: Folders and WebDAV

Folders and WebDAV Release Notes

10g Release 3 (10.1.3.3.3)

July 2008

These release notes outline new and enhanced features for this release of the Universal Content Management (UCM) Folders and WebDAV components, now called Folders_g and CoreWebDav. These notes also address installation issues and special considerations.

1 What's New

The Folders and WebDav components have the following new features and enhancements.

Folders_g and CoreWebDav Components

Starting with Content Server release 10gR3 version 10.1.3.3.3, the Folders and WebDAV components have been replaced by two components that perform essentially the same functions but are packaged differently: Folders_g and CoreWebDav.

- **Folders_g:** This component provides a hierarchical folder interface to content in Content Server in the form of "virtual folders" (also called "hierarchical folders"), similar to the folders tree in Windows Explorer. Virtual folders enable you to create multi-level folder structures. The Folders_g component is an optional selection during the Content Server release 10gR3 version 10.1.3.3.3 installation process. It can be manually installed at a later time.
- **CoreWebDav:** This component enhances Content Server to allow it to respond to DAV (Distributed Authoring and Versioning) requests, so contributors can use Windows Explorer or Microsoft Office products to check in, check out, and modify content in the repository instead of using Content Server's own web browser interface. The CoreWebDav component is automatically installed with Content Server release 10gR3 version 10.1.3.3.3.

FolderToTrashDeleteAccessIsStrict Feature

This new feature can prevent users from being able to delete Folders when any internal content of the folder (document items or other folders) cannot be deleted by that user. By default, when a folder is deleted, it is moved to the Trash folder if the user has DELETE security rights on the Folder, even if the user does not have security rights to all the internal content.

To enable the FolderToTrashDeleteAccessIsStrict feature, set the configuration variable `FolderToTrashDeleteAccessIsStrict=true` in the following file, and then restart Content Server:

- `<Installation_Dir>/<Instance_Dir>/custom/Folders_g/folders_environment.cfg`

ForceFolderSecurity Feature Enabled By Default

The ForceFolderSecurity feature enables a Folder to be configured so that any new, copied, or moved content or folder placed into the Folder will automatically be set to the containing Folder's security attributes (security group and document account). This feature is now enabled by default in the Folders_g component. If you do not need this feature, you can disable it as follows:

- During a manual installation of the Folders_g component, deselect the option.
- If the Folders_g component has been automatically installed during Content Server installation, change the configuration setting to `CollectionForceSecurityEnabled=false` in all of the following files, and then restart Content Server.
 - `<Installation_Dir>/<Instance_Dir>/custom/Folders_g/folders_environment.cfg`
 - `<Installation_Dir>/<Instance_Dir>/data/components/folders_g/config.cfg`
 - `<Installation_Dir>/<Instance_Dir>/data/components/folders_g/install.cfg`

Compared to Version 7.x

The Folders component for release 7.x is only compatible with Content Server releases 7.1.1, 7.5.1, and 7.5.2. Folders_g is only compatible with Content Server 10gR3 and later releases.

If you are upgrading Content Server release 7.x, you must upgrade the Folders component to Folders_g (which will disable all Folders 7.x components). You can choose to install the Folders_g component during Content Server installation or manually install the component at a later time.

If you are upgrading Content Server release 7.x and have the WebDAV component enabled, the WebDAV component is automatically disabled to allow the CoreWebDav component to function.

Compared to Earlier 10gR3 Versions

The Folders_g component will work with earlier versions of Content Server 10gR3 (version 10.1.3.3.1 or 10.1.3.3.2), but only if you install the 10gR3CoreUpdate component. The 10gR3CoreUpdate component is included in the 10gR3 UpdateBundle, and you can manually install the component.

2 Installation Considerations

The following considerations should be taken into account when installing the Folders_g component.

Note: Due to the technical nature of browsers, databases, web servers, and operating systems, Oracle cannot warrant compatibility with all versions and features of third-party products.

Folders_g Component

The Folders_g component is an optional choice offered during Content Server installation. You can choose to manually install the component at a later time, using the Folders_g.zip file located in the `<Installation_Dir>/<Instance_Dir>/packages/allplatform` directory.

CoreWebDav Component

The CoreWebDav component is installed automatically during Content Server installation. If you are upgrading an earlier Content Server release that has the WebDAV component enabled, the WebDAV component is automatically disabled to allow the CoreWebDav component to function.

3 Implementation and Usage Considerations

The following special considerations should be taken into account when implementing and using Folders and WebDAV.

Folders/WebDAV Actions Menu

In the *Folders and WebDAV User Guide* (10gR3), chapter 3, the following description is provided for the Folders Actions list:

- **Customize:** Opens a configuration page where you can modify the personalized My View display. (See the *Content Server User Guide* for details).

This option does not exist in the Folders Actions list.

Uninstalling Folders_g

The Folders_g component can be uninstalled by using Component Wizard or Component Manager.

4 User Documentation

Content Server comes with a comprehensive online Help system and a full set of PDF documentation. When the Folders_g and CoreWebDav components are installed, online Help and PDFs for component administration and user guides are made available.

The Help system can be accessed from the application or the file system:

- To view the Help system from the Content Server application, click on any help link in the user interface. To see the full help system, you need to be logged into the content server as an administrator. Otherwise you will just see the user help, which contains only a fraction of the information included in the administrator help system. The Welcome link in the administrator online Help provides useful information on using the Help system.
- To view the help system from the file system, go to the `[ServerInstance_Dir]/weblayout/help/` directory and start the file `wh_start.htm`. This starts the full administrator help. The Welcome link in the online Help provides useful information on using the Help system.

The documentation is also available as a set of PDF files, which is installed on the hard drive along with the Content Server software. A navigation menu is available to provide easy access to the documents. To open this navigation menu, start the file `[ServerInstance_Dir]/weblayout/help/documentation/start.pdf`. The

full PDF documentation set is also available in the documentation distribution package for the software.

Note: The "Tips for Usage" link opens a PDF document that provides useful information on using the PDF documentation set.
