Sun Java System Directory Server Enterprise Edition 6.3 Man Page Reference

Sun Microsystems, Inc. 4150 Network Circle Santa Clara, CA 95054 U.S.A.

Part No: 820–2767 March 13, 2008 Copyright 2008 Sun Microsystems, Inc. 4150 Network Circle, Santa Clara, CA 95054 U.S.A. All rights reserved.

Sun Microsystems, Inc. has intellectual property rights relating to technology embodied in the product that is described in this document. In particular, and without limitation, these intellectual property rights may include one or more U.S. patents or pending patent applications in the U.S. and in other countries.

U.S. Government Rights - Commercial software. Government users are subject to the Sun Microsystems, Inc. standard license agreement and applicable provisions of the FAR and its supplements.

This distribution may include materials developed by third parties.

Parts of the product may be derived from Berkeley BSD systems, licensed from the University of California. UNIX is a registered trademark in the U.S. and other countries, exclusively licensed through X/Open Company, Ltd.

Sun, Sun Microsystems, the Sun logo, the Solaris logo, the Java Coffee Cup logo, docs.sun.com, Java, and Solaris are trademarks or registered trademarks of Sun Microsystems, Inc. in the U.S. and other countries. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. in the U.S. and other countries. Products bearing SPARC trademarks are based upon an architecture developed by Sun Microsystems, Inc.

The OPEN LOOK and SunTM Graphical User Interface was developed by Sun Microsystems, Inc. for its users and licensees. Sun acknowledges the pioneering efforts of Xerox in researching and developing the concept of visual or graphical user interfaces for the computer industry. Sun holds a non-exclusive license from Xerox to the Xerox Graphical User Interface, which license also covers Sun's licensees who implement OPEN LOOK GUIs and otherwise comply with Sun's written license agreements.

Products covered by and information contained in this publication are controlled by U.S. Export Control laws and may be subject to the export or import laws in other countries. Nuclear, missile, chemical or biological weapons or nuclear maritime end uses or end users, whether direct or indirect, are strictly prohibited. Export or reexport to countries subject to U.S. embargo or to entities identified on U.S. export exclusion lists, including, but not limited to, the denied persons and specially designated nationals lists is strictly prohibited.

DOCUMENTATION IS PROVIDED "AS IS" AND ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT, ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT SUCH DISCLAIMERS ARE HELD TO BE LEGALLY INVALID.

Copyright 2008 Sun Microsystems, Inc. 4150 Network Circle, Santa Clara, CA 95054 U.S.A. Tous droits réservés.

Sun Microsystems, Inc. détient les droits de propriété intellectuelle relatifs à la technologie incorporée dans le produit qui est décrit dans ce document. En particulier, et ce sans limitation, ces droits de propriété intellectuelle peuvent inclure un ou plusieurs brevets américains ou des applications de brevet en attente aux Etats-Unis et dans d'autres pays.

Cette distribution peut comprendre des composants développés par des tierces personnes.

Certaines composants de ce produit peuvent être dérivées du logiciel Berkeley BSD, licenciés par l'Université de Californie. UNIX est une marque déposée aux Etats-Unis et dans d'autres pays; elle est licenciée exclusivement par X/Open Company, Ltd.

Sun, Sun Microsystems, le logo Sun, le logo Solaris, le logo Java Coffee Cup, docs.sun.com, Java et Solaris sont des marques de fabrique ou des marques déposées de Sun Microsystems, Inc. aux Etats-Unis et dans d'autres pays. Toutes les marques SPARC sont utilisées sous licence et sont des marques de fabrique ou des marques déposées de SPARC International, Inc. aux Etats-Unis et dans d'autres pays. Les produits portant les marques SPARC sont basés sur une architecture développée par Sun Microsystems, Inc.

L'interface d'utilisation graphique OPEN LOOK et Sun a été développée par Sun Microsystems, Inc. pour ses utilisateurs et licenciés. Sun reconnaît les efforts de pionniers de Xerox pour la recherche et le développement du concept des interfaces d'utilisation visuelle ou graphique pour l'industrie de l'informatique. Sun détient une licence non exclusive de Xerox sur l'interface d'utilisation graphique Xerox, cette licence couvrant également les licenciés de Sun qui mettent en place l'interface d'utilisation graphique OPEN LOOK et qui, en outre, se conforment aux licences écrites de Sun.

Les produits qui font l'objet de cette publication et les informations qu'il contient sont régis par la legislation américaine en matière de contrôle des exportations et peuvent être soumis au droit d'autres pays dans le domaine des exportations et importations. Les utilisations finales, ou utilisateurs finaux, pour des armes nucléaires, des missiles, des armes chimiques ou biologiques ou pour le nucléaire maritime, directement ou indirectement, sont strictement interdites. Les exportations ou réexportations vers des pays sous embargo des Etats-Unis, ou vers des entités figurant sur les listes d'exclusion d'exportation américaines, y compris, mais de manière non exclusive, la liste de personnes qui font objet d'un ordre de ne pas participer, d'une façon directe ou indirecte, aux exportations des produits ou des services qui sont régis par la legislation américaine en matière de contrôle des exportations et la liste de ressortissants spécifiquement designés, sont rigoureusement interdites.

LA DOCUMENTATION EST FOURNIE "EN L'ETAT" ET TOUTES AUTRES CONDITIONS, DECLARATIONS ET GARANTIES EXPRESSES OU TACITES SONT FORMELLEMENT EXCLUES, DANS LA MESURE AUTORISEE PAR LA LOI APPLICABLE, Y COMPRIS NOTAMMENT TOUTE GARANTIE IMPLICITE RELATIVE A LA QUALITE MARCHANDE, A L'APTITUDE A UNE UTILISATION PARTICULIERE OU A L'ABSENCE DE CONTREFACON.

Preface

A man page is intended to answer concisely the question "What does it do?" The man pages in general comprise a reference manual. Man pages are not intended to be a tutorial.

Overview

The following contains a brief description of each man page section and the information the section references.

- Section 1 describes, in alphabetical order, commands available for Directory Server Enterprise Edition.
- Section 1M describes, in alphabetical order, commands that are used chiefly for Directory Server Enterprise Edition maintenance and administration purposes.
- Section 4 outlines the formats of files delivered with Directory Server Enterprise Edition.
- Section 5dsconf describes Directory Server configuration properties. You modify these
 properties using the dsconf command.

Section 5dsconf also describes legacy Directory Server configuration attributes. You modify these attributes using the ldapmodify command on the entries under cn=config.

- Section 5dpconf describes Directory Proxy Server configuration properties. You modify these properties using the dpconf command.
- Section 5dssd describes collections of LDAP schema objects that Directory Server provides. See Intro(5dssd) for an introduction to the LDAP schema reference documentation.
- Section 5dsat describes attribute types defined in the LDAP schema that Directory Server provides.
- Section 5dsoc describes object classes defined in the LDAP schema that Directory Server provides.

Below is a generic format for man pages. The man pages of each manual section generally follow this order, but include only needed headings. See man(1) for more information about man pages in general.

NAME

This section gives the names of the commands or functions documented, followed by a brief description of what they do.

SYNOPSIS	When a command or file path, its full path name is are alphabetized, with sir	entax of commands or functions. e does not exist in the standard s shown. Options and arguments ngle letter arguments first, and next, unless a different argument
	The following special cha	aracters are used in this section:
	these bracket	e option or argument enclosed in ts is optional. If the brackets are argument must be specified.
	previous arg	eral values can be provided for the ument, or the previous argument ied multiple times, for example, .".
		nly one of the arguments this character can be specified at a
	enclosed with	options and/or arguments hin braces are interdependent, rything enclosed must be treated
DESCRIPTION	service. Thus it describes does. It does not discuss	unctionality and behavior of the concisely what the command OPTIONS or cite EXAMPLES. ubcommands, requests, macros, bed under USAGE.
OPTIONS	summary of what each op literally and in the order section. Possible argume	mand options with a concise ption does. The options are listed they appear in the SYNOPSIS nts to options are discussed under propriate, default values are
OPERANDS	This section lists the com how they affect the action	nmand operands and describes ns of the command.
OUTPUT	This section describes the standard error, or output command.	e output – standard output, t files – generated by the

RETURN VALUES	If the man page documents functions that return values, this section lists these values and describes the conditions under which they are returned. If a function can return only constant values, such as 0 or -1 , these values are listed in tagged paragraphs. Otherwise, a single paragraph describes the return values of each function. Functions declared void do not return values, so they are not discussed in RETURN VALUES.
ERRORS	On failure, most functions place an error code in the global variable errno indicating why they failed. This section lists alphabetically all error codes a function can generate and describes the conditions that cause each error. When more than one condition can cause the same error, each condition is described in a separate paragraph under the error code.
EXAMPLES	This section provides examples of usage or of how to use a command or function. Wherever possible a complete example including command-line entry and machine response is shown. Whenever an example is given, the prompt is shown as \$, or if the user must be superuser, #. Examples are followed by explanations, variable substitution rules, or returned values. Most examples illustrate concepts from the SYNOPSIS, DESCRIPTION, OPTIONS, and USAGE sections.
ENVIRONMENT VARIABLES	This section lists any environment variables that the command or function affects, followed by a brief description of the effect.
EXIT STATUS	This section lists the values the command returns to the calling program or shell and the conditions that cause these values to be returned. Usually, zero is returned for successful completion, and values other than zero for various error conditions.
FILES	This section lists all file names referred to by the man page, files of interest, and files created or required by commands. Each is followed by a descriptive summary or explanation.
ATTRIBUTES	This section lists characteristics of commands, utilities, and device drivers by defining the attribute type and its corresponding value. See attributes(5) for more information.

SEE ALSO	This section lists references to other man pages, in-house documentation, and outside publications.
DIAGNOSTICS	This section lists diagnostic messages with a brief explanation of the condition causing the error.
WARNINGS	This section lists warnings about special conditions which could seriously affect your working conditions. This is not a list of diagnostics.
NOTES	This section lists additional information that does not belong anywhere else on the page. It takes the form of an aside to the user, covering points of special interest. Critical information is never covered here.
BUGS	This section describes known bugs and, wherever possible, suggests workarounds.

Directory Server Enterprise Edition Documentation Set

This Directory Server Enterprise Edition documentation set explains how to use Sun Java System Directory Server Enterprise Edition to evaluate, design, deploy, and administer directory services. In addition, it shows how to develop client applications for Directory Server Enterprise Edition. The Directory Server Enterprise Edition documentation set is available at http://docs.sun.com/coll/1224.4.

For an introduction to Directory Server Enterprise Edition, review the following documents in the order in which they are listed.

Document Title	Contents
Sun Java System Directory Server Enterprise Edition 6.3 Release Notes	Contains the latest information about Directory Server Enterprise Edition, including known problems.
Sun Java System Directory Server Enterprise Edition 6.3 Evaluation Guide	Introduces the key features of this release. Demonstrates how these features work and what they offer in the context of a fictional deployment that you can implement on a single system.
Sun Java System Directory Server Enterprise Edition 6.3 Deployment Planning Guide	Explains how to plan and design highly available, highly scalable directory services based on Directory Server Enterprise Edition. Presents the basic concepts and principles of deployment planning and design. Discusses the solution life cycle, and provides high-level examples and strategies to use when planning solutions based on Directory Server Enterprise Edition.

TABLE P-1 Directory Server Enterprise Edition Documentation

Document Title	Contents	
Sun Java System Directory Server Enterprise Edition 6.3 Installation Guide	Explains how to install the Directory Server Enterprise Edition software. Shows how to select which components to install, configure those components after installation, and verify that the configured components function properly.	
	For instructions on installing Directory Editor, go to http://docs.sun.com/coll/DirEdit_05q1.	
Sun Java System Directory Server Enterprise Edition 6.3 Migration Guide	Provides instructions for upgrading components from earlier versions of Directory Server Enterprise Edition.	
Sun Java System Directory Server Enterprise Edition 6.3 Administration Guide	Provides command-line instructions for administering Directory Server Enterprise Edition.	
	For hints and instructions on using the DSCC to administer Directory Server Enterprise Edition, see the online help provided in the DSCC.	
	For instructions on administering Directory Editor, go to <pre>http://docs.sun.com/coll/DirEdit_05q1.</pre>	
	For instructions on administering Identity Synchronization for Windows, go to http://docs.sun.com/coll/isw_04Q3.	
Sun Java System Directory Server Enterprise Edition 6.3 Developer's Guide	Shows how to develop directory client applications with the tools and APIs that are provided as part of Directory Server Enterprise Edition.	
Sun Java System Directory Server Enterprise Edition 6.3 Reference	Introduces the technical and conceptual foundations of Directory Server Enterprise Edition. Describes its components, architecture, processes, and features. Also provides a referenceto the developer APIs.	
Sun Java System Directory Server Enterprise Edition 6.3 Man Page Reference	Describes the command-line tools, schema objects, and other public interfaces that are available through Directory Server Enterprise Edition. Individual sections of this document can be installed as online manual pages.	
Sun Java System Identity Synchronization for Windows 6.0 Deployment Planning Guide	Provides general guidelines and best practices for planning and deploying Identity Synchronization for Windows	
Sun Java System Directory Server Enterprise Edition 6.3 Troubleshooting Guide	Provides information to define the scope of the problem, gather data, and troubleshoot the problem areas using various tools.

Related Reading

The SLAMD Distributed Load Generation Engine (SLAMD) is a Java[™] application that is designed to stress test and analyze the performance of network-based applications. It was originally developed by Sun Microsystems, Inc. to benchmark and analyze the performance of LDAP directory servers. SLAMD is available as an open source application under the Sun Public License, an OSI-approved open source license. To obtain information about SLAMD, go to http://www.slamd.com/.SLAMD is also available as a java.net project. See https://slamd.dev.java.net/.

Java Naming and Directory Interface (JNDI) technology supports accessing the Directory Server using LDAP and DSML v2 from Java applications. For information about JNDI, see http://java.sun.com/products/jndi/. The *JNDI Tutorial* contains detailed descriptions and examples of how to use JNDI. this tutorial is at http://java.sun.com/products/jndi/tutorial/.

Directory Server Enterprise Edition can be purchased as a standalone product or as a component of Sun Java Enterprise System. Java Enterprise System is a software infrastructure that supports enterprise applications distributed across a network or Internet environment. If Directory Server Enterprise Edition was purchased as a component of Java Enterprise System, you should be familiar with the system documentation at http://docs.sun.com/coll/1286.3.

Redistributable Files

Directory Server Enterprise Edition does not provide any files that you can redistribute.

Default Paths and Command Locations

This section explains the default paths used in the documentation, and gives the locations of commands on different operating systems and deployment types.

Default Paths

The following table describes the default paths that are used in this book.

TABLE P-2 Default Paths

Placeholder	Description	Default Value
install-path	Represents the base installation directory for Directory Server Enterprise Edition software.	When you install from a zip distribution using dsee_deploy(1M), the default <i>install-path</i> is the current directory. You can set the <i>install-path</i> using the -i option of the dsee_deploy command.
		 When you install from a native package distribution, such as you would using the Java Enterprise System installer or when installing Directory Service Control Center, the default installation path is one of the following locations. (Solaris systems) /opt/SUNWdsee/. (HP-UX systems) /opt/SUN/dsee/. (HP-UX systems) /opt/sun/. (Red Hat systems) /opt/sun/. (Windows systems) C:\Program Files\Sun\JavaES5\.
instance-path	Represents the full path to an instance of Directory Proxy Server or Directory Server.	No default path exists. Instance paths must nevertheless always be found on the <i>local</i> file system.
		The documentation uses /local/dps/ for Directory Proxy Server, and /local/ds/ for Directory Server.
serverroot	Represents the parent directory of the Identity Synchronization for Windows installation location	Depends on installation
isw-hostname	Represents the Identity Synchronization for Windows instance directory	Depends on installation
/path/to/cert8.db	Represents the default path and file name of the client's certificate database for Identity Synchronization for Windows	<i>current-working-dir/</i> cert8.db
serverroot/isw-hostname/logs/	Represents the default path to the Identity Synchronization for Windows local logs for the System Manager, each connector, and the Central Logger	Depends on installation
<pre>serverroot/isw-hostname/logs/</pre>	c&æpra&ønts the default path to the Identity Synchronization for Windows central logs	Depends on installation

Command Locations

To know more about each of the commands, see the relevant man pages. For full descriptions of the files installed, see also the following documentation.

- covers files installed with Directory Server, and files created for server instances.
- covers files installed with Directory Proxy Server, and files created for server instances.
- covers files installed with Directory Server Resource Kit.

User Commands

Name	authrate – measure rate of authentication to an LDAP directory		
Synopsis	<pre>install-path/dsrk6/bin/authrate [options]</pre>		
Description	iption The authrate command measures the rate at which a given bind DN can LDAP directory. As with all measures of performance, results depend on r including what options you pass to the authrate command, and also how service itself is tuned.		
	The command supporting LD	uses LDAP v3, and cannot be used to authenticate to an LDAP v2 directory not AP v3.	
Options	The authrate	command supports the following options:	
	- C messages	Display the specified number of results messages before exiting. Results messages appear by default as output on standard out, similar to the following:	
		Avg r=2584.00/thr (516.80/sec), total= 7752	
		This shows output for three threads authenticating for five seconds. The average bind rate per thread is 516.80 per thread per second for the interval measured. The total shown for all threads is 7752.	
		Default is to continue iterating until the command is interrupted.	
	-D bindDN	Use the specified bind DN to authenticate to the directory.	
		If the bind DN is not specified, the authrate command attempts anonymous authentication.	
	- h <i>hostname</i>	Connect to the directory on the specified host.	
		Enclose IPv6 addresses in brackets ([]) as described in RFC 2732.	
		Default is to connect to the local host on the loopback address, 127.0.0.1.	
	- i filename	Use the file specified to read bind DNs and passwords at random.	
		Refer to Random Bind DN Syntax and Random Bind DN Substitution for details.	
	-j seconds	Display results each specified number of seconds.	
		Default is to display results every 5 seconds.	
	- k	Keep connections open, measuring only the time required to perform the bind operation.	

	Default is to measure both the bind and unbind time as part of the authentication sequence.
-m <i>maxAuth</i>	Perform no more than the specified number of binds per thread.
	Default is for each thread to continue iterating until the command is interrupted.
-p <i>port</i>	Connect to the directory on the specified port.
	Default is to connect to the default simple authentication port for LDAP, 389.
- q	Run in quiet mode, not displaying results.
	Default is to display results every 5 seconds, which you can adjust using the - j option.
- r maxRand	Use the specified maximum to determine the range for random numbers replacing %d formatting specifications when authenticating with random bind DNs and passwords.
	When you use this option twice, the first occurrence generates random numbers in the range [0, <i>maxRand1</i> –1] for the first %d, the second [1, <i>maxRand2</i>] for the second %d.
- S randSeed	Use the specified seed, an unsigned int, for random number generation.
	Default seed is 0.
-t threads	Use the specified number of the threads to connect to the server.
	Default is to use one thread.
- u	Do not unbind as part of the authentication sequence.
	Default is to unbind as part of the authentication sequence.
- V	Display verbose output.
-W filename	Read the bind password from the specified file.
-w password	Use the specified bind password to authenticate to the directory.
- W —	Prompt for the bind password so it does not appear on the command line or in a file.

Extended The authrate command repeatedly initializes a connection and binds to a directory server, without performing any other operation. Threads may be configured to keep open connections and perform LDAP binds repeatedly. The command-line options let you specify the bind credentials.

	suppo	ommand uses LDAP v3, and cannot be used to authenticate to an LDAP v2 directory not orting LDAP v3. Furthermore, the authrate command uses simple authentication, not e binding.
		fault, the authrate command attempts to bind indefinitely, displaying results dically, and displaying any errors encountered as well without interrupting operation.
	tests, t	nulate real use conditions and reduce any artifacts due to the repetitive nature of the the authrate command provides a mechanism for generating a random bind DN for ntication.
Random Bind DN Syntax		de randomly generated numbers by specifying %d and %s placeholders in the bind DN ne bind password. These placeholders are then replaced according to the following rules:
	%d	Replace this placeholder with random integer values depending on the <i>maxRand</i> parameter to the -r option.
		The - r option may be used at most two times to generate random bind DNs. When used in the bind DN, replacement values for the %d placeholder range over [0, <i>maxRand1</i> -1] for the first use of the - r option, and over [1, <i>maxRand2</i>] for the second.
		The %d may be used up to eight times to generate a random password. When used in the bind password, replacement values for the %d placeholder range over [0, <i>maxRand1</i> -1] for each use of the -r option.
		When the the number of %d placeholders exceeds the number of -r options, only one value for each use of the -r option is generated. Each %d placeholder is replaced with a generated value.
	%S	Replace this placeholder with random strings from the file specified using the -i option.
		Replacement values for this placeholder are randomly selected lines of the file specified.
Random Bind DN Substitution		uthrate command requires that you apply the following rules for substitutions, ying an error message when the used incorrectly:
		se only one type of placeholder, either %d or %s, per invocation of the authrate mmand.
	• Us	se %%d and %%s to specify literal strings %d and %s, respectively.
		ler to use this random authentication mechanism, you must populate your directory dingly. For example, you can measure the authentication rate using the following nand:

\$ authrate -D "uid=test%d,ou=test,dc=example,dc=com" -w "auth%d%d" -r 100

In order for the authrate command to bind effectively, your directory must contain entries corresponding to the following LDIF excerpt:

```
dn: uid=test0,ou=test,dc=example,dc=com
userPassword: auth00
dn: uid=test1,ou=test,dc=example,dc=com
userPassword: auth11
dn: uid=test2,ou=test,dc=example,dc=com
userPassword: auth22
...
dn: uid=test10,ou=test,dc=example,dc=com
userPassword: auth1010
...
dn: uid=test99,ou=test,dc=example,dc=com
userPassword: auth9999
```

Examples Examples in this section use the following conventions:

- The authrate command is found in a directory present in the PATH used for the examples.
- The directory server is located on a system named host.
- The directory has been configured to support anonymous access for search and read. Therefore, you do not have to specify bind information.
- The directory server listens on port 389, the default for non-SSL connections.

EXAMPLE 1 authrate: Sample Output

The following command performs anonymous binds until it has displayed five results messages. Notice that each line concerns only the elapsed interval.

```
$ authrate -C 5
Avg r=1952.00/thr (390.40/sec), total= 1952
Avg r=1937.00/thr (387.40/sec), total= 1937
Avg r=1938.00/thr (387.60/sec), total= 1938
Avg r=1921.00/thr (384.20/sec), total= 1921
Avg r=1921.00/thr (384.20/sec), total= 1921
All threads exited
```

Notice also that a result message provides the following items of information:

- The average rate of authentication per thread of execution
- The average rate of authentication per second
- The total number of authentication operations performed during the interval the results message concerns

EXAMPLE 2 authrate: Two Threads

The following command performs anonymous binds until it has displayed five results messages, using three threads to bind. Notice that each line concerns only the elapsed interval.

```
$ authrate -C 5 -t 3
Avg r= 300.00/thr (180.00/sec), total= 900
Avg r= 300.00/thr (180.00/sec), total= 900
Avg r= 299.67/thr (179.80/sec), total= 899
Avg r= 298.00/thr (178.80/sec), total= 894
Avg r= 299.33/thr (179.60/sec), total= 898
All threads exited
```

Here the average per thread, approximate 300 binds, is shown for each interval of three seconds. The averages given in parentheses, approximately 180 per second, represent the average bind rate over the interval. The totals shown represent the total number of binds over the interval.

EXAMPLE 3 authrate: Full Authentication Rate

The following command applies the mechanism described in Random Bind DN Substitution, performing full authentication (open, bind, unbind, close) with randomly generated bind DNs and passwords.

```
$ authrate -D "uid=test%d,ou=test,dc=example,dc=com" -w "auth%d%d" -r 100 -C 5
Avg r=1301.00/thr (260.20/sec), total= 1301
Avg r=1307.00/thr (261.40/sec), total= 1307
Avg r=1281.00/thr (256.20/sec), total= 1281
Avg r=1316.00/thr (263.20/sec), total= 1316
Avg r=1313.00/thr (262.60/sec), total= 1313
All threads exited
```

EXAMPLE 4 authrate: Bind Rate Alone

The following command applies the mechanism described in Random Bind DN Substitution, keeping the connection open and binding repeatedly with randomly generated bind DNs and passwords.

```
$ authrate -D "uid=test%d,ou=test,dc=example,dc=com" -w "auth%d%d" -r 100 -k -C 5
Avg r=2584.00/thr (516.80/sec), total= 2584
Avg r=2603.00/thr (520.60/sec), total= 2603
Avg r=2592.00/thr (518.40/sec), total= 2592
Avg r=2613.00/thr (522.60/sec), total= 2613
Avg r=2560.00/thr (512.00/sec), total= 2560
All threads exited
```

Exit Status The authrate command returns the following exit status codes.

0 Successful completion.

non-zero An error occurred.

Name dsmlmodify - add, modify, rename, move, or delete directory entries

- Synopsis install-path/dsrk6/bin/dsmlmodify -h hostURL [options] -f filename
- **Description** The dsmlmodify command requests the addition, modification, rename, move, or deletion of entries stored in a directory accessible through Directory Services Markup Language (DSML) v2.

You must specify additions and modifications in the proper order, because the directory performs the updates in the order you request them. For example, to add entries to a subtree that does not yet exist, you must first update the base entry at the root of the subtree before adding entries under the base entry.

Options The dsmlmodify command supports the following options:

-D user-identifier	Use the specified user identifier to authenticate.
	The user identifier is the HTTP-layer identifier. The HTTP-layer identifier is typically mapped to an account in the directory. For example, if the uid value is used for HTTP-layer authentication, which maps in the directory to bind DN dn:uid=user-identifier, ou=people, dc=example, dc=com, then the dsmlmodify -D bjensen command would end up using permissions for directory operations based on the permissions for the account with entry DN uid=bjensen, ou=people, dc=example, dc=com. The user-identifier thus depends closely on the identity mapping between the HTTP layer and the LDAP layer.
	If the user identifier and its password are omitted, the dsmlmodify command binds anonymously. The user identifier determines what entries and attributes the user can modify, according to the permissions for the user.
-f filename	Read the modifications from a file using DSML syntax.
	The following content for example allows modification of Barbara Jensen's password:
	<modifyrequest dn="uid=bjensen,ou=people,dc=example,dc=com"> <modification name="userpassword" operation="replace"> <value>newpassword</value> </modification> </modifyrequest>
-h <i>hostURL</i>	Use the specified URL to access the directory.

	The host URL takes the form http://host:port where host represents the host on which the directory runs, and port is the port on which the directory listens for DSML requests.
- j filename	Read the bind password for simple HTTP authentication from the specified file.
- W —	Prompt for the bind password for simple HTTP authentication.
-w password	Use the specified bind password for simple HTTP authentication.

Examples Examples in this section use the following conventions:

- The dsmlmodify command is found in a directory present in the PATH used for the examples.
- The directory server is located on a system named host.
- The directory server listens for DSML requests over HTTP on port 8080.

```
EXAMPLE 1 dsmlmodify: Adding an Entry
```

The following commands demonstrate adding an entry:

```
$ cat add.dsml
```

```
<addRequest dn="uid=ajohnson,ou=people,dc=example,dc=com">
    <attr name="objectclass"><value>top</value></attr>
    <attr name="objectclass"><value>person</value></attr>
    <attr name="objectclass"><value>person</value></attr>
    <attr name="objectclass"><value>organizationalPerson</value></attr>
    <attr name="objectclass"><value>inetOrgPerson</value></attr>
    <attr name="uid"><value>ajohnson</value></attr>
    <attr name="sn"><value>ajohnson</value></attr>
    <attr name="sn"><value>ajohnson</value></attr>
    <attr name="sn"><value>ajohnson</value></attr>
    <attr name="sn"><value>ajohnson</value></attr>
    <attr name="sn"><value>alice</attr>
    <attr name="sn"><value>alice</attr>
    <attr name="mail"><value>alice.johnson@example.com</value></attr>
    <attr name="userPassword"><value>weakness</value></attr>
    <attr name="userPassword"><value>weakness</value></attr>
    <attr name="userPassword"><value>weakness</value></attr>
    <attr name="userPassword">attr><attr name="userPassword"></ttr>
```

If you read Example.ldif, you see that hmiller's password is hillock.

EXAMPLE 2 dsmlmodify: Modifying an Entry

The following commands demonstrate modifying an entry:

```
$ cat mod.dsml
```

```
<modifyRequest dn="uid=bjensen,ou=people,dc=example,dc=com">
<modification name="userpassword" operation="replace">
<value>newpassword</value>
```

```
EXAMPLE 2 dsmlmodify: Modifying an Entry (Continued)
</modification>
</modifyRequest>
$ dsmlmodify -h http://host:8080 -D bjensen -w - -f mod.dsml
Enter bind password:
...
```

If you read Example.ldif, you see that the bjensen's password is hifalutin.

```
EXAMPLE 3 dsmlmodify: Deleting an Entry
```

The following commands demonstrate deleting an entry:

```
$ cat del.dsml
<delRequest dn="uid=ajohnson,ou=people,dc=example,dc=com" />
$ dsmlmodify -h http://host:8080 -D hmiller -w - -f del.dsml
Enter bind password:
...
```

If you read Example.ldif, you see that hmiller's password is hillock.

```
EXAMPLE 4 dsmlmodify: Renaming an Entry
```

The following commands demonstrate renaming an entry:

```
$ cat rdn.dsml
<modDNRequest
    dn="uid=ajohnson,ou=people,dc=example,dc=com"
    newrdn="uid=aweiss"
    deleteoldrdn="true"
    newSuperior="ou=people,dc=example,dc=com"/>
$ dsmlmodify -h http://host:8080 -D hmiller -w - -f rdn.dsml
Enter bind password:
....
```

If you read Example.ldif, you see that hmiller's password is hillock.

- **Exit Status** Exit status values are returned as part of the response, including both the code and the description as described in the DSML v2 standard. Common exit status codes follow:
 - Successful completion; success.
 - 1 Server encountered errors while processing the request; operationsError.
 - 2 Server encountered errors while processing the request; protocolError.

- 10 Base DN belongs to an entry handled by neither server, and the referral URL identifies another server that handles the entry; referral.
- 16 Attribute to be modified does not exist; noSuchAttribute.
- 19 Attribute modification requested is not a proper modification. For example, a requested change to userpassword would result in a user password shorter than the minimum length allowed; constraintViolation.
- 20 Attribute to add already exists with specified value; attributeOrValueExists.
- 21 In response to a request to modify directory schema, the requested modification includes no object class or attribute type specification; invalidAttributeSyntax.
- 32 Base DN belongs to an entry handled by neither server, and no referral URL is available for the entry; noSuchObject.
- 50 Bind DN user does not have permission to read the entry from the directory; insufficientAccessRights.
- 53 Directory is read-only; unwillingToPerform.
- 65 Requested modification would cause the entry not to comply with the schema; objectClassViolation.
- 67 Requested modification would cause the entry to be missing attributes that are components of the entry DN; notAllowedOnRDN.
- 68 An entry already exists with the same DN as the entry to add; entryAlreadyExists.

Attributes See attributes(5) for descriptions of the following attributes:

See Also dsmlsearch(1), ldap_error(3LDAP)

Name	dsmlsearch – find directory entries			
Synopsis	install-path/dsrk6/bin/dsmlsearch -h hostURL -b baseDN [options] [attribute]			
Description	The dsmlsearch command searches for entries stored in a directory accessible through Directory Services Markup Language (DSML) v2, and displays the results in DSML format, including the specified attributes or all attributes returned if none are specified.			
	Filter files contain fil LDAP-style filters.	ters in DSML format. The c	dsmlsearch command does not support	
Options	The dsmlsearch cor	nmand supports the follow	ing options:	
	-a deref	Dereference aliases as spec <i>deref</i> argument include:	cified during a search. Possible values for the	
		derefAlways	Dereference aliases both when finding the base DN, and when searching below it.	
		derefFindingBaseObj	Dereference aliases when finding the base DN.	
		neverDerefAliases	Never dereference aliases (default).	
		This option has no effect wallias dereferencing.	when used with directories that do not support	
	-b baseDN	Use the entry with the specified distinguished name (DN) as the base entry for the search scope.		
	-D user-identifier	Use the specified user ider	ntifier to authenticate.	
		The user identifier is the HTTP-layer identifier. The HTTP-layer identifier is typically mapped to an account in the directory. For example, if the uid value is used for HTTP-layer authentication, which maps in the directory to bind DN dn:uid=user-identifier, ou=people, dc=example, dc=com, then the dsmlsearch -D bjensen command would end up using permissions for directory operations based on the permissions for the account with entry DN uid=bjensen, ou=people, dc=example, dc=com. The user-identifier thus depends closely on the identity mapping between the HTTP layer and the LDAP layer.		
		If the user identifier and its password are omitted, the dsmlsearch command binds anonymously. The user identifier determines what entries and attributes the user can read, according to the permissions for the user.		
	- f filename	Read the search filter or filters from the specified file.		

- h <i>hostURL</i>	Use the specified URL to access the directory.		
	The host URL takes the form http://host:port where host represents the host on which the directory runs, and port is the port on which the directory listens for DSML requests.		
- j filename	Read the bind password for simple HTTP authentication from the specified file.		
- l timelimit	Interrupt the search if the time limit specified in seconds is exceeded.		
- s scope	Use the specified search scope.		
	The following values are supported for <i>scope</i> :		
	baseObject Examine only the entry specified by the argument to the -b option.		
	singleLevel Examine only to the entry specified by th to the - b option and its immediate childr		
	wholeSubtree	(Default) Examine the subtree whose root is the entry specified by the argument to the -b option.	
- w —	Prompt for the bind password for simple HTTP authentication.		
-w password	Use the specified bind password for simple HTTP authentication.		
- z maxEntries	Return no more than the specified number of entries.		

Examples Examples in this section use the following conventions:

- The dsml search command is found in a directory present in the PATH used for the examples.
- The directory server is located on a system named host.
- The directory has been configured to support anonymous access for search and read. Therefore, you do not have to specify bind information.
- The directory server listens for DSML requests over HTTP on port 8080.

EXAMPLE 1 dsmlsearch: Returning All Entries

The following command returns all entries in the suffix under the base DN. Use this only when you need to retrieve all entries and attributes:

```
$ cat filter
<filter>
<present name="objectclass"/>
</filter>
$ dsmlsearch -h http://host:8080 -b dc=example,dc=com -f filter
```

EXAMPLE 2 dsmlsearch: Narrowing a Search

The following command employs a more specific filter to narrow the search:

```
$ cat filter
<filter>
<equalityMatch name="uid">
<value>bjensen</value>
</equalityMatch>
</filter>
$ dsmlsearch -h http://host:8080 -b dc=example,dc=com -f filter
```

```
EXAMPLE 3 dsmlsearch: Searching the Root DSE
```

The following command searches the root DSE entry, which contains the list of suffixes supported by the directory and potentially other information. Notice you specify the scope as only the base entry:

```
$ cat filter
<filter>
<present name="objectclass"/>
</filter>
$ dsmlsearch -h http://host:8080 -b "" -s baseObject -f filter
```

EXAMPLE 4 dsmlsearch: Searching the Schema Entry

The following command searches the schema entry, which contains the directory schema. Notice you specify the scope as only the base entry:

```
$ cat filter
<filter>
<present name="objectclass"/>
</filter>
$ dsmlsearch -h http://host:8080 -b cn=schema -s baseObject -f filter
```

```
EXAMPLE 5 dsmlsearch: Filter Examples
```

The following list shows LDAP search filters with corresponding DSML search filters.

LDAP filter: (cn=Barbara Francis)

DSML filter:

<filter> <equalityMatch name="cn"> <value>Barbara Francis</value> </equalityMatch> </filter>

EXAMPLE 5 dsmlsearch: Filter Examples (Continued)	
LDAP filter: (cn=*Barb*)	DSML filter:
	<filter> <substrings name="cn"> <any>Barb</any> </substrings> </filter>
LDAP filter: (cn~=Barbare)	DSML filter:
	<filter> <approxmatch name="cn"> <value>Barbare</value> </approxmatch> </filter>
LDAP filter: (!(cn=*Barbara*))	DSML filter:
	<filter> <not> <substrings name="cn"> <auy>Barbara</auy> </substrings> </not> </filter>
LDAP filter: (&(cn=*Barbara*)(cn=*Francis*))	DSML filter:
	<filter> <and> <substrings name="cn"> <any>Barbara</any> </substrings> <substrings name="cn"> <any>Francis</any> </substrings> <any>Francis</any> </and> </filter>
LDAP filter: ((cn=*Barbara*)(cn=*Jensen*))	DSML filter:
	<filter> <or> <substrings name="cn"> <any>Barbara</any> </substrings> <substrings name="cn"> <any>Jensen</any> </substrings></or></filter>

EXAMPLE 5 dsmlsearch: Filter Examples (Continued)

</or> </filter>

- **Exit Status** Exit status values are returned as part of the response, including both the code and the description as described in the DSML v2 standard. Common exit status codes follow:
 - Successful completion; success.
 - 1 Server encountered errors while processing the request; operationsError.
 - 2 Server encountered errors while processing the request; protocolError.
 - 3 Search exceeded the time limit for operations on the server; timeLimitExceeded.
 - 4 Search returned more results than the maximum number allowed by the server; sizeLimitExceeded.
 - 10 Base DN belongs to an entry handled by neither server, and the referral URL identifies another server that handles the entry; referral.
 - 11 Search returned more results than the maximum number a client application is allowed by the server to retrieve; adminLimitExceeded.
 - 32 Base DN belongs to an entry handled by neither server, and no referral URL is available for the entry; noSuchObject.
 - 50 Bind DN user does not have permission to read the entry from the directory; insufficientAccessRights.
 - 53 Directory is read-only; unwillingToPerform.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	Zip distribution only
Stability Level	Evolving

See Also dsmlmodify(1), ldap_error(3LDAP)

Name	entrycmp – compare the same entry on two or more different servers			
Synopsis	install-path/ds6/bin/entrycmp [-D bindDN] [-w password] [-n] [-p port] [-j file] [-T timeout] [-J file] [-W keypassword] [-K keydbpath] [-N certname] [-P certdbpath] [-e SSL port] ServerSpec entryDN			
Description	is retrieved fro from a specifie	o command compares the same entry on two or more different servers. An entry om the master and the nsuniqueid of the entry is used to retrieve the same entry ed consumer. All the attributes and values of the two entries are compared. If ical, the entries are considered to be the same.		
Options	The following	options are supported:		
	- D	The distinguished name with which to bind to the server. This parameter is optional if the server is configured to support anonymous access. If a DN is specified in the <i>ServerSpec</i> , this overrides the -D option.		
	- j	If specifying the default password at the command-line poses a security risk, the password can be stored in a file. The -j option specifies this file.		
	- n	Specifies that entrycmp should not run in interactive mode. Running in interactive mode allows you to re-enter the bindDN, password, host and port, if a bind error occurs.		
	- p	The TCP port used by Directory Server. The default port is 389. If a port is specified in the <i>ServerSpec</i> , this overrides the -p option.		
	- T	Specifies the number of seconds after which entrycmp will time out if the server connection goes down.		
	- W	The password associated with the distinguished name specified by the -D option. If a password is specified in the <i>ServerSpec</i> , this overrides the -w option.		
	entryDN	The DN of the entry that you wish to compare.		
	ServerSpec	The server specification. The server specification is of one of the following forms.		
		-s -S HostSpec [-c -C HostSpec]		
	-c -C HostSpec [-s -S HostSpec]			
		Here, - s refers to the supplier replica c refers to the consumer replica. Lower case specifies non-SSL options. Upper case specifies SSL options.		
	Host Spec	The host specification, which takes the form [bindDN: [password]]@] <i>host</i> [:port]. The following is an example:		
		<pre>cn=admin,cn=Administrators,cn=config:mypword@myserver:1389</pre>		

If you are using SSL, use - S and - C in the server specification. In this case, *HostSpec* specifies the certificate name and key password, rather than the bindDN and password. Specifying both more than one - s, and also more than one - c generates an error. If no - c option is specified, the - s *HostSpec* may refer to any server, either a consumer or a supplier.

- **Ssl Options** You can use the following options to specify that entrycmp uses LDAPS when communicating with the Directory Server. You can also use these options if you want to use certificate-based authentication. These options are valid only when LDAPS has been turned on and configured.
 - -e Default SSL port, 636.
 - -J This option has the same function as the -j option, for the key password.
 - -К Specifies the name of the certificate key used for certificate-based client authentication. For example, -К *Server-Key*.
 - -N Specifies the certificate name to use for certificate-based client authentication. For example, N *Server-Cert*. If this option is specified, the -W option is required.
 - P Specifies the location of the certificate database.
 - -W Specifies the password for the certificate database identified by the -P option. For example, -W *serverpassword*.

Examples EXAMPLE 1 Specifying an entry DN

\$ entrycmp -D cn=admin,cn=Administrators,cn=config -w mypword \
 -s myserver:1389 "uid=csmith,ou=people,dc=example,dc=com"

- Exit Status The following exit values are returned:
 - 0 Successful completion, that is a match was found.
 - 1 An error occurred, and no match was found.
- Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Stable

See Also insync(1), repldisc(1)

Notes The node on which you are running the entrycmp, insync, and repldisc tools must be able to reach all the specified hosts. If these hosts are unavailable due to a firewall, VPN, or other network setup reasons, you will encounter difficulties using these tools. For the same reason ensure that all servers are up and running before using these tools.

When identifying hosts, you must use either symbolic names or IP addresses for all hosts since the replication monitoring commands do not address resolution between symbolic names and IP addresses. Using a combination of the two can cause problems. Moreover, on multi-homed hosts, referring to the same Directory Server instance using different names may cause unexpected results.

When SSL is enabled, the directory server on which you are running the tools must have a copy of all the certificates used by the other servers in the topology.

The replication monitoring tools rely on access to cn=config to obtain the replication status. This should be taken into account particularly when replication is configured over SSL.

Name fildif - creates a filtered version of an LDIF input file **Synopsis** *install-path*/ds6/bin/fildif -i input-file [-o output-file] [-f] -b repl-agmt-dn -p instance-path **Description** The fildif command creates a filtered version of an LDIF input file. fildif takes a configuration file as an input parameter. This configuration file must conform to the configuration rules of the filtering service included as part of Directory Server, and must contain the specific set and element entries that define these rules. The configuration rules can be defined by using Directory Service Control Center or at the command-line. fildif does not require the Directory Server instance to be running. A filtering service configuration is accessed through a replication agreement. The replication agreement entry DN is provided to fildif with the -b option. **Options** The following options are supported: -b repl-agmt-dn The DN of the replication agreement used as the filtering service configuration entry point. The entry specified must exist in the configuration of the Directory Server instance. - f Force fildif to overwrite the contents of the specified output file, if it exists. -i input-file The input LDIF file whose contents are filtered. -o output-file The output LDIF file in which the filtered results are stored. If no output file is specified, the default output file is . /output.ldif. The full path to the Directory Server instance whose configuration - p contains the replication agreement specified as a parameter of the -b option.

Examples EXAMPLE 1 Using All Options

The following example shows the fildif command to generate an output file filt_data.ldif that overwrites the file if it exists already.

```
$ fildif -i data.ldif -o filt data.ldif -f \
-b "cn=ds.example.com:389,cn=replica,cn=dc=example\,dc=com,\
cn=mapping tree,cn=config"
-p /local/ds
```

- **Exit Status** The following exit values are returned:
 - 0 Successful completion.
 - 1 An error occurred.

On error, verbose error messages are output to standard output.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Stable

See Also insync(1), entrycmp(1)

Name	insync – indic consumer rep	ate the synchronization state between a supplier replica and one or more licas
Synopsis	[-T timeout]	[-w password] [-t] [-n] [-d] [-j file] [-p port] [-J file] [-W keypassword] [-K keydbpath]] [-P certdbpath] [-e SSL port] [-b ReplicaRoot]
Description	or more consu	ommand indicates the synchronization state between a supplier replica and one umer replicas. insync compares the RUVs of replicas and displays the time delay (in seconds) between the servers.
Options	The following options are supported:	
	- b	The suffix (replica root) that has been specified for replication. If -b is not specified, the delay for all suffixes is displayed.
	- d	Displays the date of the last change recorded on the master. Using the -d option twice (-d -d) displays the time difference (in days, minutes and seconds) between the time of the last change and the current time.
	- D	The distinguished name with which to bind to the server. This parameter is optional if the server is configured to support anonymous access. If a DN is specified in the <i>ServerSpec</i> , this overrides the -D option.
	-j	If specifying the default password at the command-line poses a security risk, the password can be stored in a file. The - j option specifies this file.
	- N	Specifies that insync should not run in interactive mode. Running in interactive mode allows you to re-enter the bindDN, password, host and port, if a bind error occurs.
	- p	The TCP port used by Directory Server. The default port is 389. If a port is specified in the <i>ServerSpec</i> , this overrides the -p option.
	-t	Displays the mode of transport (SSL or CLEAR)
	- T	Specifies the number of seconds after which insync will time out if the server connection goes down.
	- W	The password associated with the distinguished name specified by the -D option. If a password is specified in the <i>ServerSpec</i> , this overrides the -w option.
	ServerSpec	The server specification. The server specification is of one of the following forms.
		-s -S HostSpec [-c -C HostSpec]
		-c -C HostSpec [-s -S HostSpec]

Here, -s refers to the supplier replica. - c refers to the consumer replica. Lower case specifies non-SSL options. Upper case specifies SSL options.

Host Spec The host specification, which takes the form
[bindDN:[password]]@]host[:port]. The following is an example:

cn=admin,cn=Administrators,cn=config:mypword@myserver:1389

If you are using SSL, use - S and - C in the server specification. In this case, *HostSpec* specifies the certificate name and key password, rather than the bindDN and password. Specifying both more than one - s, and also more than one - c generates an error. If no - c option is specified, the - s *HostSpec* may refer to any server, either a consumer or a supplier.

- interval The amount of time (in seconds) after which the synchronization query will start again (in an infinite loop). If no interval is specified, the synchronization query will run only once.
- **Ssl Options** You can use the following options to specify that insync uses LDAPS when communicating with the Directory Server. You can also use these options if you want to use certificate-based authentication. These options are valid only when LDAPS has been turned on and configured.
 - -e Default SSL port, 636.
 - J This option has the same function as the j option, for the key password.
 - -К Specifies the name of the certificate key used for certificate-based client authentication. For example, -К *Server-Key*.
 - -N Specifies the certificate name to use for certificate-based client authentication. For example, N *Server-Cert*. If this option is specified, the -W option is required.
 - P Specifies the location of the certificate database.
 - -W Specifies the password for the certificate database identified by the -P option. For example, -W *serverpassword*.

Examples EXAMPLE 1 Single Server, Repeat Each 30 Seconds

Note that the delay changes to 5, indicating that the consumer is 5 seconds behind the supplier.

```
$ insync -D cn=admin,cn=Administrators,cn=config -w mypword \
    -s portugal:1389 30
```

ReplicaDn	Consumer	Supplier	Delay
dc=example,dc=com	<pre>france.example.com:2389</pre>	portugal:1389	0
dc=example,dc=com	<pre>france.example.com:2389</pre>	portugal:1389	5

	EXAMPLE 1 Single Server, Repeat Each 30 Seconds (Continued)
	<pre>dc=example,dc=com france.example.com:2389 portugal:1389 0</pre>
	EXAMPLE 2 Getting Date of Last Change
	<pre>\$ insync -D cn=admin,cn=Administrators,cn=config -w mypword \ -s portugal:1389 -b o=rtest -d</pre>
Exit Status	The following exit values are returned:

- 0 Successful completion.
- 1 An error occurred.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Stable

See Also entrycmp(1), repldisc(1)

Notes The node on which you are running the entrycmp, insync, and repldisc tools must be able to reach all the specified hosts. If these hosts are unavailable due to a firewall, VPN, or other network setup reasons, you will encounter difficulties using these tools. For the same reason ensure that all servers are up and running before using these tools.

When identifying hosts, you must use either symbolic names or IP addresses for all hosts since the replication monitoring commands do not address resolution between symbolic names and IP addresses. Using a combination of the two can cause problems. Moreover, on multi-homed hosts, referring to the same Directory Server instance using different names may cause unexpected results.

When SSL is enabled, the directory server on which you are running the tools must have a copy of all the certificates used by the other servers in the topology.

If a delay of -1 is returned, insync was unable to obtain any replication information. This may indicate that a Total Update has just been run, or that no changes have been sent to the supplier server.

The replication monitoring tools rely on access to cn=config to obtain the replication status. This should be taken into account particularly when replication is configured over SSL.

Name ldapcmp - compare LDAP entries from two directories

Synopsis install-path/dsrk6/bin/ldapcmp [-h host1 -p port1 [-h host2 -p port2]] [options] -b basedn

Description The ldapcmp command compares a Lightweight Directory Access Protocol (LDAP) entry or subtree of entries from one directory with the an entry or subtree of entries from another directory. It detects entries that do not appear in both directories and detects attribute differences in entries that do appear in both directories.

The ldapcmp command reports comparison results using the following output syntax:

- 10nly: DN Entry appears only in the first directory specified.
- 20nly: *DN* Entry appears only in the second directory specified.
- *DN* Entry appears in both directories, attributes differ. The ldapcmp command then explains the differences found:

different: attrname	Entries differed by attribute value.
different: attrname(*)	Specified attribute found only in one directory.
1: attrvalue	Specified value found in first directory.
2: attrvalue	Specified value found in second directory.

Options Although the -h (host) and -p (port) options are not required, you generally use these options to specify how to access the two directories. If you do not specify any -h or -p options, the ldapcmp command compares the content of the directory listening on the default port of the localhost system with itself.

Unless the LDAP_BASEDN environment variable is set, you must at minimum provide a *basedn* argument to the -b option. The *basedn* argument specifies the distinguished name (DN) of the LDAP entry at the base of the search scope.

The following additional options are supported:

- 0

Ignore LDAP library version mismatches.

When this option is omitted, the default behavior is to assert that the revision number of the LDAP API be greater than or equal to that used to compile the tool. Also, if the library and the tool have the same vendor name, the tool will assert that the vendor version number of the API be greater than or equal to that used to compile the tool. Revision and version numbers are based on the contents of the LDAPAPIInfo structure defined in <ld><ldap.h> or header files included by<ldap.h>.

- 3

Check host names in SSL certificates.

- B

Allow binary values to be printed, even if the -o option is used.

-D binddn

Use the specified bind DN for accessing both directories, usually enclosed in double quotes ("") for the shell.

If the bind DN and its password are omitted, the Ldapcmp command binds anonymously. The bind DN determines what entries and attributes appear in the comparison results, according to the search permissions for the bind DN.

- E

Request that the directories expose (report) bind identities.

- H

-help

--help

-?

Display usage information.

- I filename

Read SSL key password for the client key database specified using the -P option from *filename*.

The default is key3.db.

```
- J controloid[:criticality[:value|::base64value|:<fileurl]]
Use the specified control OID.
```

The criticality is false by default.

An LDAP control can be associated with a value. Proxy authorization takes a proxy authorization ID, for example, passed with the control OID, and criticality. If a value is necessary you specify it using *value*, *base64value*, or *<fileurl*.

-K pathname

Use the SSL key database located in *pathname*, the full path to the key database file.

The default is to search for the key database file, key3.db, in the directory specified by the -P option.

- M

Manage referrals, returning the entry containing the referral instead of the entry obtained by following the referral.

-N certificate

Use the specified *certificate* for certificate-based client authentication, for example: -N "Directory-Cert".

Both directories must recognize the specified certificate to perform the comparison.

-0 limit

Follow at maximum *limit* referral hops. Default is 5.

- P filename

Use the certificate database located in *filename*, the full path to the certificate database file.

The default is to search for the certificate database file, cert8.db, in the current directory.

-Q [token][:certificate-name] Use PKCS 11.

- R

Do not follow referrals automatically.

- V n

Use LDAP protocol version *n*, where *n* is 2 or 3. Default is 3.

- W -

Prompt for the password for the client key database specified using the -P option.

The -W option is required for certificate-based client authentication.

-W password

Specify the password for the client key database specified using the -P option.

The -W option is required for certificate-based client authentication.

-Y proxydn

Use the specified proxy DN for accessing both directories, usually enclosed in double quotes ("") for the shell.

- Z

Use SSL to provide certificate-based client authentication.

The -Z option requires the -N and -W options and any other SSL options needed to identify the certificate and the key database.

- d level

Set LDAP debug level to the specified value.

The following debug levels are supported:

- 1 Display verbose debugging messages; LDAP_DEBUG_TRACE.
- 2 Display messages about the content of network packets; LDAP_DEBUG_PACKETS.
- 320 Display messages about LDIF parsing; LDAP_DEBUG_PARSE.
- 16384 Display informational messages; LDAP_DEBUG_ANY.

Use the sum of the levels to specify more than one debug level. For example, to set the debug level to display both verbose debugging messages, and messages about the content of network packets, specify -d 3.

-h host

Contact the LDAP server on the specified host, which may be a host name or an IP address.

The default is localhost.

Specify the host twice to specify hosts for each of the two directories. When you specify the host twice, the first host specified corresponds to the first directory, and the second host corresponds to the second, regardless of the order of other options.

-i charset

Use the specified character set to override the value of the LANG environment variable. This option is useful, as the command converts certain arguments you specify to UTF-8 before sending the request to the server. The following arguments are converted: base DN, bind DN, LDAP filter, and password.

You can prevent the command from converting passwords by using the -k option.

Examples of *charset* values include IS08859-1, IS08859-15, ibm-1275, and windows-1251.

- j filename

Read the bind password for simple authentication from the specified file.

- k

Do not convert the passwords to UTF-8.

-l timelimit

Interrupt the comparison if the specified time limit is exceeded.

-m pathname

Use the security module database located in the specified directory.

Use the -m option if the security module database is in a different directory from the certificate database itself.

- n

Show what would be done, but do not actually do it.

-o attrname=attrvalue

Use the specified attribute values when performing SASL authentication.

The following attrname arguments are supported:

- authid Use the specified authentication identity.
- authzid Use the specified authorization identity.
- mech Request the specified SASL mechanism for the bind.
- realm Use the specified realm to complete the bind.
- secProp Use the specified security level.

The *attrvalue* is a valid value corresponding to the *attrname* you specify.

-pport

Contact the LDAP server on the specified port.

The default is 389 (636 if SSL is used).

Specify the port twice to specify ports for each of the two directories. When you specify the port twice, the first port specified corresponds to the first directory, and the second port corresponds to the second, regardless of the order of other options.

- s scope

Use the specified search scope.

The following values are supported for scope:

- base Examine only the entry specified by the argument to the -b option.
- one Examine only to the entry specified by the argument to the -b option and its immediate children.
- sub (Default) Examine the subtree whose root is the entry specified by the argument to the -b option.
- V

Run in verbose mode, displaying diagnostics on standard output.

- W -

Prompt for the bind password for simple authentication.

-w password

Use the specified bind password for simple authentication.

- z sizelimit

Interrupt the comparison if the specified maximum number of entries returned is exceeded.

Examples All examples in this section use the following conventions:

- All entries to compare are stored under dc=example, dc=com.
- The directories have been configured to support anonymous access for search and read. Therefore, you do not have to specify any bind information.
- The directory servers are located on systems named host1 and host2.
- The servers both listen on port number 389, the default.

EXAMPLE 1 Comparing Two Suffixes

When you specify the root DN of the suffix as the base DN, ldapcmp compares all entries of the entire suffix in both directories.

\$ ldapcmp -h host1 -h host2 -b "dc=example,dc=com"

EXAMPLE 1 Comparing Two Suffixes (Continued)

You should have some idea of the size and differences between your directories before comparing them. Comparing two directories is useful for finding small difference between directories. When comparing completely different subtrees, the output can be very large. Narrow your comparison by specifying the base DN of a similar subtree in both directories.

EXAMPLE 2 Comparing Two Entries

The following command compares a single user entry in both directories:

```
$ ldapcmp -h host1 -h host2 -s base \
-b "uid=bjensen,ou=People,dc=example,dc=com"
```

```
EXAMPLE 3 Setting the Base DN
```

The following commands set the LDAP_BASEDN environment variable, and then compare all entries of the entire base suffix in both directories, running in verbose mode. The syntax of the first command may not work for your shell. Refer to the documentation about your shell for instructions on setting environment variables.

```
$ LDAP_BASEDN="dc=example,dc=com"; export LDAP_BASEDN
$ ldapcmp -v -h host1 -h host2
```

EXAMPLE 4 Comparing Directory Configurations

The following command compares root DSE entries for both directories:

```
$ ldapcmp -h host1 -h host2 -s base -b ""
```

EXAMPLE 5 Comparing Directory Schema

The following command compares schema entries for both directories:

\$ ldapcmp -h host1 -h host2 -b "cn=schema"

- **Exit Status** The exit status returned reflects the return values of the underlying functions used, which may depend on return values sent by the server. The return values are defined through <ldap.h> files both on the client side and on the server side. Common exit status codes follow:
 - 0 Successful completion; LDAP_SUCCESS; 0x00.
 - Server encountered errors while processing the request; LDAP_OPERATIONS_ERROR; 0x01.
 - 2 Server encountered errors, such as a BER-decoding error, while processing the request; LDAP_PROTOCOL_ERROR; 0x02.

- 3 Search exceeded the time limit for operations on the server; LDAP TIMELIMIT EXCEEDED; 0×03.
- 4 Search returned more results than the maximum number allowed by the server; LDAP_SIZELIMIT_EXCEEDED; 0x04.
- 10 Base DN belongs to an entry handled by neither server, and the referral URL identifies another server that handles the entry; LDAP_REFERRAL; 0x0a.
- 11 Search returned more results than the maximum number a client application is allowed by the server to retrieve; LDAP_ADMINLIMIT_EXCEEDED; 0x0b.
- 32 Base DN belongs to an entry handled by neither server, and no referral URL is available for the entry; LDAP_NO_SUCH_OBJECT; 0x20.
- 50 Bind DN user does not have permission to read the entry from the directory; LDAP_INSUFFICIENT_ACCESS; 0x32.
- 81 One of the directories did not respond to the request, or the connection was lost; LDAP_SERVER_DOWN; 0x51.
- 82 An error occurred while receiving results; LDAP_LOCAL_ERROR; 0x52.
- 83 The request could not be BER-encoded; LDAP_ENCODING_ERROR; 0x53.
- A result could not be decoded; LDAP_DECODING_ERROR; 0x54.
- The search exceeded the time limit specified using the -l option; LDAP_TIMEOUT; 0x55.
- 89 An option or argument is not valid; LDAP_PARAM_ERROR; 0x59.
- 90 Needed memory could not be allocated; LDAP_NO_MEMORY; 0x5a.
- 91 A specified host name or port is not valid; LDAP_CONNECT_ERROR; 0x5b.
- 92 At least one server supports only LDAPv2, and the -V 2 option was not used; LDAP_NOT_SUPPORTED; 0x5c.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldapcsdk-tools
Stability Level	Evolving

See Also ldapcompare(1), ldapdelete(1), ldapmodify(1), ldappasswd(1), ldapsearch(1)

Name ldapcompare – compare a value with an LDAP entry attribute value

Synopsis *install-path/*dsrk6/bin/ldapcompare [options] attrtype:attrvalue [dn]...

install-path/dsrk6/bin/ldapcompare
[options] attrtype::base64value [dn]...

install-path/dsrk6/bin/ldapcompare
[options] attrtype:<fileurl [dn]...</pre>

Description The ldapcompare command asserts that a value you specify is the same as an entry attribute value stored by the directory server.

Specify the attribute type, followed by the attribute value, either as a string, a base64–encoded value, or a URL to a file containing the attribute value, such as a photo or certificate. You typically enclose the attribute type/value pair in single quotes ('') for the shell.

Also specify one or more entry DNs, separated by space, and typically enclosed in double quotes ("") for the shell. The Ldapcompare command then compares the specified attribute value to that of attributes on each of the entries indicated by the DNs you provide.

- **Options** The following options are supported:
 - 0

Ignore LDAP library version mismatches.

When this option is omitted, the default behavior is to assert that the revision number of the LDAP API be greater than or equal to that used to compile the tool. Also, if the library and the tool have the same vendor name, the tool will assert that the vendor version number of the API be greater than or equal to that used to compile the tool. Revision and version numbers are based on the contents of the LDAPAPIInfo structure defined in <ld><ldap.h> or header files included by <ldap.h>.

- 3

Check host names in SSL certificates.

-D bindDN

Use the specified bind DN to authenticate to the directory server.

If the bind DN and its password are omitted, the Ldapcompare command binds anonymously. The bind DN determines what entries and attributes appear in the comparison results, according to the search permissions for the bind DN.

- E

Request that the directories expose (report) bind identities.

-H -help --help -?

Display usage information.

- I filename

Read SSL key password for the client key database specified using the -P option from *filename*.

The default is key3.db.

- J controloid[:criticality[:value|::base64value|:<fileurl]] Use the specified control OID.

The criticality, a boolean, is false by default.

An LDAP control can be associated with a value. Proxy authorization takes a proxy authorization ID, for example, passed with the control OID, and criticality. If a value is necessary you specify it using *value*, *base64value*, or *<fileurl*.

-K pathname

Use the SSL key database located in *pathname*, the full path to the key database file.

The default is to search for the key database file, key3.db, in the directory specified by the -P option.

- M

Manage referrals, comparing the entry containing the referral instead of the entry obtained by following the referral.

-N certificate

Use the specified *certificate* for certificate-based client authentication, for example: -N "Client-Cert", where Client-Cert is the subject name of the user certificate.

-0 limit

Follow at maximum *limit* referral hops. Default is 5.

- P pathname

Use the certificate database located in *pathname*, the full path to the certificate database file.

The default is to search for the certificate database file, cert8.db, in the current directory.

-Q [token][:certificate-name]

Use PKCS 11.

- R

Do not follow referrals automatically.

-V n

Use LDAP protocol version *n*, where *n* is 2 or 3. Default is 3.

- W -

Prompt for the password for the client key database specified using the -P option.

The -W option is required for certificate-based client authentication.

-W password

Specify the password for the client key database specified using the - P option.

The -W option is required for certificate-based client authentication.

-Y proxydn

Use the rights of the entry having the specified DN for performing LDAP operations. When using this option, you must also specify how to bind before you assume the rights of the proxy. Thus, when using simple authentication, you would also use the -D and -w options with this option.

Before proxy authentication can work in Directory Server, you must set up the appropriate access control instructions.

- Z

Use SSL to provide certificate-based client authentication.

The -Z option requires the -N and -W options and any other SSL options needed to identify the certificate and the key database.

- ZZ

Use Start TLS to provide certificate-based client authentication.

The -ZZ option requires the -N and -W options and any other SSL options needed to identify the certificate and the key database.

- C

Run in continuous mode, not stopping on errors.

In continuous mode, errors are reported but the ldapcompare command continues performing comparisons. When not running in continuous mode, the ldapcompare command quits after the first error.

-d level

Set LDAP debug level to the specified value.

The following debug levels are supported:

- Display verbose debugging messages; LDAP_DEBUG_TRACE.
- 2 Display messages about the content of network packets; LDAP_DEBUG_PACKETS.
- 320 Display messages about LDIF parsing; LDAP_DEBUG_PARSE.
- 16384 Display informational messages; LDAP_DEBUG_ANY.

Use the sum of the levels to specify more than one debug level. For example, to set the debug level to display both verbose debugging messages, and messages about the content of network packets, specify -d 3.

-f filename

Read DNs from the specified file.

The file format is one DN per line without quotes around DNs. The ldapcompare command reads each line as one literal DN, performing the comparison for each entry whose DN is specified.

- h *host*

Contact the LDAP server on the specified host, which may be a host name or an IP address. Enclose IPv6 addresses in brackets ([]) as described in RFC 2732.

For example, when mapping the IPv4 address 192.168.0.99 to IPv6, pass the -h option with its argument as -h [::ffff:192.168.0.99]. Notice the brackets.

When using GSSAPI with Directory Server, specify the *host* as a fully-qualified host name which matches the value of the nsslapd-localhost attribute on the cn=config entry. The GSSAPI authentication process requires that the host name provided by the client match the one provided by the server.

The default is localhost.

-i charset

Use the specified character set to override the value of the LANG environment variable. This option is useful, as the command converts certain arguments you specify to UTF-8 before sending the request to the server. The following arguments are converted: base DN, bind DN, LDAP filter, and password.

You can prevent the command from converting passwords by using the -k option.

Examples of *charset* values include IS08859-1, IS08859-15, ibm-1275, and windows-1251.

- j filename

Read the bind password for simple authentication from the specified file.

- k

Do not convert the passwords to UTF-8.

-mpathname

Use the security module database located in the specified directory.

Use the -m option if the security module database is in a different directory from the certificate database itself.

- n

Show what would be done, but do not actually do it.

- o attrname=attrvalue

Use the specified attribute values when performing SASL authentication.

The following *attrname* arguments are supported:

authid	Use the specified authentication identity.
authzid	Use the specified authorization identity.
mech	Request the specified SASL mechanism for the bind.
realm	Use the specified realm to complete the bind.
secProp	Use the specified security level.

The *attrvalue* is a valid value corresponding to the *attrname* you specify.

-pport

Contact the LDAP server on the specified port.

The default is 389 (636 if SSL is used).

- q

Run in quiet mode, displaying no information about results of comparisons, but only about LDAP errors.

- V

Run in verbose mode, displaying diagnostics on standard output.

-w -

Prompt for the bind password for simple authentication.

-w *password* Use the specified bind password for simple authentication.

Examples Examples in this section use the following conventions:

- The directory server is located on a system named host.
- The directory server has been configured to support anonymous access for search and read. Therefore, you do not have to specify bind information.
- The directory server listens on port number 389, the default.

EXAMPLE 1 Comparing String Values

The following command compares a specified string with an attribute value:

```
$ ./ldapcompare -h host 'givenname:Barbara' \
"uid=bjensen,ou=People,dc=example,dc=com"
comparing type: "givenname" value: "Barbara"
in entry "uid=bjensen,ou=People,dc=example,dc=com"
compare TRUE
```

EXAMPLE 2 Comparing Base 64 Encoded Values

The following command compares a base64–encoded value with an attribute value:

EXAMPLE 2 Comparing Base 64 Encoded Values (Continued)

```
$ ./ldapcompare -h host 'cn::QmFicyBKZW5zZW4=' \
"uid=bjensen,ou=People,dc=example,dc=com"
comparing type: "cn" value: "Babs Jensen"
in entry "uid=bjensen,ou=People,dc=example,dc=com"
compare TRUE
```

EXAMPLE 3 Comparing Binary Values in Files

The following command compares an image with an attribute value:

```
$ ./ldapcompare -h host 'jpegphoto:<file:///home/bjensen/bjensen.jpg' \
"uid=bjensen,ou=People,dc=example,dc=com"
comparing type: "jpegphoto" value: "NOT ASCII (3674 bytes)"
in entry "uid=bjensen,ou=People,dc=example,dc=com"
compare TRUE</pre>
```

- **Exit Status** The exit status returned either corresponds to 5 (LDAP_COMPARE_FALSE) or 6 (LDAP_COMPARE_TRUE), or reflects the return values of the underlying functions used, which may depend on return values sent by the server. Common exit status codes follow:
 - Server encountered errors while processing the request; LDAP_OPERATIONS_ERROR; 0x01.
 - 2 Server encountered errors, such as a BER-decoding error, while processing the request; LDAP_PROTOCOL_ERROR; 0x02.
 - 3 Search exceeded the time limit for operations on the server; LDAP_TIMELIMIT_EXCEEDED; 0×03.
 - 5 Operation was successful but the values did not match; LDAP_COMPARE_FALSE; 0x05.
 - 6 Operation was successful and the values match; LDAP_COMPARE_TRUE; 0x06.
 - 10 DN of the entry to compare belongs to an entry handled by neither server, and the referral URL identifies another server that handles the entry; LDAP_REFERRAL; 0x0a.
 - 32 DN of the entry to compare belongs to an entry handled by neither server, and no referral URL is available for the entry; LDAP_N0_SUCH_OBJECT; 0x20.
 - 34 DN of the entry to compare is not a valid DN; LDAP_INVALID_DN_SYNTAX; 0x22.
 - 50 Bind DN user does not have permission to read the entry from the directory; LDAP_INSUFFICIENT_ACCESS; 0x32.
 - 81 One of the directories did not respond to the request, or the connection was lost; LDAP_SERVER_DOWN; 0x51.
 - 82 An error occurred while receiving results; LDAP_LOCAL_ERROR; 0x52.

- 83 The request could not be BER-encoded; LDAP ENCODING ERROR; 0x53.
- 84 A result could not be decoded; LDAP DECODING ERROR; 0x54.
- An option or argument is not valid; LDAP_PARAM_ERROR; 0x59.
- 90 Needed memory could not be allocated; LDAP_NO_MEMORY; 0x5a.
- 91 A specified host name or port is not valid; LDAP_CONNECT_ERROR; 0x5b.
- 92 At least one server supports only LDAPv2, and the -V 2 option was not used, or the -V 2 option was used, but the server no longer supports LDAP v2; LDAP_NOT_SUPPORTED; 0x5c.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE	
Availability	SUNWldapcsdk-tools	
Stability Level	Evolving	

See Also ldapcmp(1), ldapdelete(1), ldapmodify(1), ldapsearch(1), ldappasswd(1)

Name ldapdelete – delete LDAP entries

Synopsis install-path/dsrk6/bin/ldapdelete [options] [dn]...

install-path/dsrk6/bin/ldapdelete
[options] < filename</pre>

Description The ldapdelete command requests deletion of entries stored by a directory server. You must bind as a user having access to delete the entries specified.

Specify one or more entry DNs, separated by space, and typically enclosed in double quotes ("") for the shell. Alternatively, include DNs in a file, one per line without quotes around DNs. The ldapdelete command reads each line as one literal DN.

When deleting a subtree, you must delete child entries before you delete their parent entries.

Options The following options are supported:

- 0

Ignore LDAP library version mismatches.

When this option is omitted, the default behavior is to assert that the revision number of the LDAP API be greater than or equal to that used to compile the tool. Also, if the library and the tool have the same vendor name, the tool will assert that the vendor version number of the API be greater than or equal to that used to compile the tool. Revision and version numbers are based on the contents of the LDAPAPIInfo structure defined in <ld><ldap.h> or header files included by <ldap.h>.

- 3

Check host names in SSL certificates.

-D bindDN

Use the specified bind DN to authenticate to the directory server.

If the bind DN and its password are omitted, the ldapdelete command binds anonymously. The bind DN determines whether the delete operation can complete, according to the user permissions.

- E

Request that the directories expose (report) bind identities.

- H

- -help
- --help

-?

Display usage information.

- I filename

Read SSL key password for the client key database specified using the -P option from *filename*.

The default is key3.db.

- J controloid[:criticality[:value|::base64value|:<fileurl]] Use the specified control OID.

The *criticality*, a boolean, is false by default.

An LDAP control can be associated with a value. Proxy authorization takes a proxy authorization ID, for example, passed with the control OID, and criticality. If a value is necessary you specify it using *value*, *base64value*, or *<fileurl*.

-K pathname

Use the SSL key database located in *pathname*, the full path to the key database file.

The default is to search for the key database file, key3.db, in the directory specified by the -P option.

- M

Manage referrals, deleting the entry containing the referral instead of the entry obtained by following the referral.

-N certificate

Use the specified *certificate* for certificate-based client authentication, for example: -N "Client-Cert", where Client-Cert is the subject name of the user certificate.

-0 limit

Follow at maximum *limit* referral hops. Default is 5.

- P pathname

Use the certificate database located in *pathname*, the full path to the certificate database file.

The default is to search for the certificate database file, cert8.db, in the current directory.

-Q [token][:certificate-name] Use PKCS 11.

- R

Do not follow referrals automatically.

-V n

Use LDAP protocol version *n*, where *n* is 2 or 3. Default is 3.

-W -

Prompt for the password for the client key database specified using the -P option.

The -W option is required for certificate-based client authentication.

-W password

Specify the password for the client key database specified using the - P option.

The -W option is required for certificate-based client authentication.

-Y proxydn

Use the rights of the entry having the specified DN for performing LDAP operations. When using this option, you must also specify how to bind before you assume the rights of the proxy. Thus, when using simple authentication, you would also use the -D and -w options with this option.

Before proxy authentication can work in Directory Server, you must set up the appropriate access control instructions.

- Z

Use SSL to provide certificate-based client authentication.

The -Z option requires the -N and -W options and any other SSL options needed to identify the certificate and the key database.

- ZZ

Use Start TLS to provide certificate-based client authentication.

The -ZZ option requires the -N and -W options and any other SSL options needed to identify the certificate and the key database.

- C

Run in continuous mode, not stopping on errors.

In continuous mode, errors are reported but the ldapdelete command continues. When not running in continuous mode, the ldapdelete command quits after the first error.

-d level

Set LDAP debug level to the specified value.

The following debug levels are supported:

- 1 Display verbose debugging messages; LDAP_DEBUG_TRACE.
- 2 Display messages about the content of network packets; LDAP_DEBUG_PACKETS.
- 320 Display messages about LDIF parsing; LDAP_DEBUG_PARSE.

16384 Display informational messages; LDAP_DEBUG_ANY.

Use the sum of the levels to specify more than one debug level. For example, to set the debug level to display both verbose debugging messages, and messages about the content of network packets, specify -d 3.

- f filename

Read DNs from the specified file.

The file format is one DN per line without quotes around DNs. The ldapdelete command reads each line as one literal DN.

This option has no effect when you also specify DNs on standard input.

-h host

Contact the LDAP server on the specified host, which may be a host name or an IP address. Enclose IPv6 addresses in brackets ([]) as described in RFC 2732.

For example, when mapping the IPv4 address 192.168.0.99 to IPv6, pass the -h option with its argument as -h [::ffff:192.168.0.99]. Notice the brackets.

When using GSSAPI with Directory Server, specify the *host* as a fully-qualified host name which matches the value of the nsslapd-localhost attribute on the cn=config entry. The GSSAPI authentication process requires that the host name provided by the client match the one provided by the server.

The default is localhost.

-i charset

Use the specified character set to override the value of the LANG environment variable. This option is useful, as the command converts certain arguments you specify to UTF-8 before sending the request to the server. The following arguments are converted: base DN, bind DN, LDAP filter, and password.

You can prevent the command from converting passwords by using the -k option.

Examples of *charset* values include IS08859-1, IS08859-15, ibm-1275, and windows-1251.

- j filename

Read the bind password for simple authentication from the specified file.

- k

Do not convert the passwords to UTF-8.

-mpathname

Use the security module database located in the specified directory.

Use the -m option if the security module database is in a different directory from the certificate database itself.

- n

Show what would be done, but do not actually do it.

- o attrname=attrvalue

Use the specified attribute values when performing SASL authentication.

The following attrname arguments are supported:

- authid Use the specified authentication identity.
- authzid Use the specified authorization identity.
- mech Request the specified SASL mechanism for the bind.
- realm Use the specified realm to complete the bind.

secProp Use the specified security level.

The attrvalue is a valid value corresponding to the attrname you specify.

-pport

Contact the LDAP server on the specified port.

The default is 389 (636 if SSL is used).

- V

Run in verbose mode, displaying diagnostics on standard output.

- W —

Prompt for the bind password for simple authentication.

-w password

Use the specified bind password for simple authentication.

Examples Examples in this section use the following conventions:

- The bind DN given corresponds to a user with permission to delete entries.
- The directory server is located on a system named host.
- The directory server listens on port number 389, the default for non-SSL traffic.
- The directory server listens on port number 636, the default for SSL traffic. SSL is enabled.

EXAMPLE 1 Deleting an Entry

The following command deletes a single entry from the directory:

```
$ ./ldapdelete -h host -D uid=kvaughan,ou=people,dc=example,dc=com \
-w - uid=scarter,ou=People,dc=example,dc=com
Enter bind password:
$
```

EXAMPLE 2 Deleting an Entry Interactively

The following commands demonstrate deleting an entry whose DN is specified on standard input:

```
$ ./ldapdelete -h host -D uid=kvaughan,ou=People,dc=example,dc=com \
-w - -c -v
Enter bind password:
ldapdelete: started Tues Oct 18 08:31:14 2005
ldap_init( host, 389 )
uid=scarter, ou=People, dc=example,dc=com
```

```
deleting entry uid=scarter, ou=People, dc=example,dc=com
entry removed
```

```
EXAMPLE 2 Deleting an Entry Interactively (Continued)

^D

$

EXAMPLE 3 Deleting Multiple Entries Specified in a File
```

The following commands demonstrate reading DNs of entries to delete from a file. Notice that the -c option is used to continue if an error occurs.

```
$ cat DNfile
uid=scarter, ou=People, dc=example,dc=com
uid=bjensen, ou=People, dc=example,dc=com
$ ./ldapdelete -h host -D uid=kvaughan,ou=People,dc=example,dc=com \
-c -f DNfile -w -
Enter bind password:
$
```

The following command uses server authentication during the bind, where the server only accepts binds by clients with trusted certificates. Notice only the -P option is used without other SSL-related options.

```
$ ./ldapdelete -h host -p 636 -c -f DNfile -P /home/kvaughan/security \
-D uid=kvaughan,ou=People,dc=example,dc=com -w -
Enter bind password:
```

The following command uses client authentication during the bind, where the server only accepts binds by clients with trusted certificates, and the client must sign the certificate with a password-protected private key. Notice the options used in this example.

```
$ ./ldapdelete -h host -p 636 -c -f DNfile -Z -P /home/kvaughan/security \
-N "kvscert" -K /home/kvaughan/security -W keypassword
```

- **Exit Status** The exit status returned reflects the return values of the underlying functions used, which may depend on return values sent by the server. Common exit status codes follow:
 - 0 Successful completion; LDAP_SUCCESS; 0x00.
 - Server encountered errors while processing the request; LDAP_OPERATIONS_ERROR; 0x01.
 - 2 Server encountered errors, such as a BER-decoding error, while processing the request; LDAP_PROTOCOL_ERROR; 0x02.

- 10 DN of the entry to delete belongs to an entry handled by neither server, and the referral URL identifies another server that handles the entry; LDAP_REFERRAL; 0x0a.
- 32 DN of the entry to delete belongs to an entry handled by neither server, and no referral URL is available for the entry; LDAP_NO_SUCH_OBJECT; 0x20.
- 34 DN of the entry to delete is not a valid DN; LDAP_INVALID_DN_SYNTAX; 0x22.
- 50 Bind DN user does not have permission to read the entry from the directory; LDAP_INSUFFICIENT_ACCESS; 0x32.
- 53 Directory is read-only; LDAP UNWILLING TO PERFORM; 0x35.
- 66 Entry specified has child-entries that must be deleted first; LDAP_NOT_ALLOWED_ON_NONLEAF; 0x42.
- 81 One of the directories did not respond to the request, or the connection was lost; LDAP_SERVER_DOWN; 0x51.
- 82 An error occurred while receiving results; LDAP_LOCAL_ERROR; 0x52.
- 83 The request could not be BER-encoded; LDAP_ENCODING_ERROR; 0x53.
- A result could not be decoded; LDAP_DECODING_ERROR; 0x54.
- An option or argument is not valid; LDAP_PARAM_ERROR; 0x59.
- 90 Needed memory could not be allocated; LDAP_NO_MEMORY; 0x5a.
- 91 A specified host name or port is not valid; LDAP CONNECT ERROR; 0x5b.
- 92 At least one server supports only LDAPv2, and the -V 2 option was not used, or the -V 2 option was used, but the server no longer supports LDAP v2; LDAP_NOT_SUPPORTED; 0x5c.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE	
Availability	SUNWldapcsdk-tools	
Stability Level	Evolving	

See Also ldapcmp(1), ldapcompare(1), ldapmodify(1), ldappasswd(1), ldapsearch(1)

Name ldapmodify - add, modify, rename, move, or delete LDAP entries

- Synopsis install-path/dsrk6/bin/ldapmodify [options]
- **Description** The ldapmodify command requests the addition, modification, rename, move, or deletion of entries stored by a directory server.

You must bind as a user having access to perform the requested operation.

The directory server may check all modifications against its schema, and reject updates that cause entries not to conform to the schema.

You must specify additions and modifications in the proper order, because the directory server performs the updates in the order you request them. For example, to add entries to a subtree that does not yet exist, you must first update the base entry at the root of the subtree before adding entries under the base entry. When a requested operation fails, the ldapmodify command stops processing further input unless you use the -c option. The ldapmodify command does not save rejected entries unless you use the -e option.

Options The following options are supported:

-0

Ignore LDAP library version mismatches.

When this option is omitted, the default behavior is to assert that the revision number of the LDAP API be greater than or equal to that used to compile the tool. Also, if the library and the tool have the same vendor name, the tool will assert that the vendor version number of the API be greater than or equal to that used to compile the tool. Revision and version numbers are based on the contents of the LDAPAPIInfo structure defined in <ld><ldap.h> or header files included by <ldap.h>.

- 3

Check host names in SSL certificates.

- A

Display non-ASCII values when the -v option is used.

- B baseDN

Bulk import entries into the suffix under the specified DN.

Bulk import using the ldapmodify command does not erase entries that already exist.

-D bindDN

Use the specified bind DN to authenticate to the directory server.

If the bind DN and its password are omitted, the Ldapmodify command binds anonymously. The bind DN determines what entries and attributes appear in the comparison results, according to the search permissions for the bind DN. - E

Request that the directories expose (report) bind identities.

- F

Force application of all modifications, even if some lines are duplicates.

-H

-help

--help -?

Display usage information.

- I filename

Read SSL key password for the client key database specified using the -P option from *filename*.

The default is key3.db.

- J controloid[:criticality[:value|::base64value|:<fileurl]] Use the specified control OID.

The criticality, a boolean, is false by default.

An LDAP control can be associated with a value. Proxy authorization takes a proxy authorization ID, for example, passed with the control OID, and criticality. If a value is necessary you specify it using *value*, *base64value*, or *<fileurl*.

-K pathname

Use the SSL key database located in *pathname*, the full path to the key database file.

The default is to search for the key database file, key3.db, in the directory specified by the -P option.

- M

Manage referrals, modifying the entry containing the referral instead of the entry obtained by following the referral.

- N certificate

Use the specified *certificate* for certificate-based client authentication, for example: -N "Client-Cert", where Client-Cert is the subject name of the user certificate.

-0 limit

Follow at maximum *limit* referral hops. Default is 5.

- P filename

Use the certificate database located in *filename*, the full path to the certificate database file.

The default is to search for the certificate database file, cert8.db, in the current directory.

-Q [token][:certificate-name] Use PKCS 11.

- R

Do not follow referrals automatically.

- V n

Use LDAP protocol version *n*, where *n* is 2 or 3. Default is 3.

-W -

Prompt for the password for the client key database specified using the -P option.

The -W option is required for certificate-based client authentication.

-W password

Specify the password for the client key database specified using the - P option.

The -W option is required for certificate-based client authentication.

-Y proxydn

Use the rights of the entry having the specified DN for performing LDAP operations. When using this option, you must also specify how to bind before you assume the rights of the proxy. Thus, when using simple authentication, you would also use the -D and -w options with this option.

Before proxy authentication can work in Directory Server, you must set up the appropriate access control instructions.

- Z

Use Start TLS to provide certificate-based client authentication.

The -ZZ option requires the -N and -W options and any other SSL options needed to identify the certificate and the key database.

- ZZ

Use a start TLS request.

The -Z option requires the -N and -W options and any other SSL options needed to identify the certificate and the key database.

-a

Add LDAP entries, rather than modifying existing entries.

- b

Handle binary files.

Note – This option is deprecated. Use standard LDIF notation as described in RFC 2849 instead.

When you use the -b option, the ldapmodify command scans every attribute value to determine whether it specifies a valid file reference, such as /home/bjensen/bjensen.jpg. If so, the ldapmodify command uses the content of the specified file as the attribute value.

- C

Run in continuous mode, not stopping on errors.

In continuous mode, errors are reported but the ldapmodify command continues performing comparisons. When not running in continuous mode, the ldapmodify command quits after the first error.

-d level

Set LDAP debug level to the specified value.

The following debug levels are supported:

- 1 Display verbose debugging messages; LDAP_DEBUG_TRACE.
- 2 Display messages about the content of network packets; LDAP_DEBUG_PACKETS.
- 320 Display messages about LDIF parsing; LDAP DEBUG PARSE.
- 16384 Display informational messages; LDAP_DEBUG_ANY.

Use the sum of the levels to specify more than one debug level. For example, to set the debug level to display both verbose debugging messages, and messages about the content of network packets, specify -d 3.

-e filename

Save rejected entries in the specified file.

- f filename

Read modifications from the specified file.

The file format is standard LDIF notation as described in RFC 2849.

- h *host*

Contact the LDAP server on the specified host, which may be a host name or an IP address. Enclose IPv6 addresses in brackets ([]) as described in RFC 2732.

For example, when mapping the IPv4 address 192.168.0.99 to IPv6, pass the -h option with its argument as -h [::ffff:192.168.0.99]. Notice the brackets.

When using GSSAPI with Directory Server, specify the *host* as a fully-qualified host name which matches the value of the nsslapd-localhost attribute on the cn=config entry. The GSSAPI authentication process requires that the host name provided by the client match the one provided by the server.

The default is localhost.

-i charset

Use the specified character set to override the value of the LANG environment variable. This option is useful, as the command converts certain arguments you specify to UTF-8 before sending the request to the server. The following arguments are converted: base DN, bind DN, LDAP filter, and password.

You can prevent the command from converting passwords by using the - k option.

Examples of *charset* values include IS08859-1, IS08859-15, ibm-1275, and windows-1251.

- j filename

Read the bind password for simple authentication from the specified file.

- k

Do not convert the passwords to UTF-8.

-m pathname

Use the security module database located in the specified directory.

Use the -m option if the security module database is in a different directory from the certificate database itself.

- n

Show what would be done, but do not actually do it.

-o *attrname=attrvalue*

Use the specified attribute values when performing SASL authentication.

The following attrname arguments are supported:

authid Use the specified authentication identity.

authzid Use the specified authorization identity.

mech Request the specified SASL mechanism for the bind.

realm Use the specified realm to complete the bind.

secProp Use the specified security level.

The *attrvalue* is a valid value corresponding to the *attrname* you specify.

-pport

Contact the LDAP server on the specified port.

The default is 389 (636 if SSL is used).

-q

Run in quiet mode, not displaying information about the operations performed.

- V

Run in verbose mode, displaying diagnostics on standard output.

-w –

Prompt for the bind password for simple authentication.

-w password Use the specified bind password for simple authentication.

Examples Examples in this section use the following conventions:

- The bind DN given corresponds to a user with permission to update entries.
- The directory server is located on a system named host.
- The directory server listens on port number 389, the default for non-SSL traffic.
- The directory server listens on port number 636, the default for SSL traffic. SSL is enabled.

EXAMPLE 1 Adding an Entry

The following commands demonstrate adding a single entry to the directory:

```
$ cat add.ldif
dn: uid=bcubbins,ou=People,dc=example,dc=com
objectclass: top
objectclass: person
objectclass: organizationalPerson
objectclass: inetOrgPerson
uid: bcubbins
givenName: Bartholomew
sn: Cubbins
cn: Bartholomew Cubbins
mail: bcubbins@example.com
userPassword: bcubbins
facsimiletelephonenumber: +1 234 567 8910
```

```
$ ldapmodify -a -h host -D uid=bjensen,ou=people,dc=example,dc=com \
-w - -f add.ldif
Enter bind password:
adding new entry uid=bcubbins,ou=People,dc=example,dc=com
```

\$

EXAMPLE 2 Modifying an Entry

The following commands demonstrate modifying an entry. Notice a line with a single dash (-) separates multiple modifications to a single entry.

```
$ cat modify.ldif
dn: uid=bcubbins,ou=People,dc=example,dc=com
changetype: modify
add: description
description: Added with ldapmodify
-
replace: mail
mail: bart@example.com
$ ./ldapmodify -h host -c -v \
-D uid=bjensen,ou=People,dc=example,dc=com -w - -f modify.ldif
Enter bind password:
```

```
EXAMPLE 2 Modifying an Entry (Continued)
modifying entry uid=bcubbins,ou=People,dc=example,dc=com
$
EXAMPLE 3 Deleting an Entry Interactively
```

The following commands delete the entry added and modified in previous examples.

```
$ ./ldapmodify -h host -D uid=bjensen,ou=People,dc=example,dc=com -w -
Enter bind password:
dn: uid=bcubbins,ou=People,dc=example,dc=com
changetype: delete
deleting entry uid=bcubbins,ou=People,dc=example,dc=com
^D
```

The following command uses server authentication during the bind, where the server only accepts binds by clients with trusted certificates. Notice only the -P option is used without other SSL-related options.

```
$ ./ldapmodify -h host -p 636 -c -f modify.ldif -P /home/bjensen/security \
-D "uid=bjensen,ou=People,dc=example,dc=com" -w -
Enter bind password:
```

The following command uses client authentication during the bind, where the server only accepts binds by clients with trusted certificates, and the client must sign the certificate with a password-protected private key. Notice the options used in this example.

```
$ ldapmodify -h host -p 636 -c -Z -P /home/bjensen/security \
    -N "bjscert" -K /home/bjensen/security -W keypassword -f modify.ldif
```

EXAMPLE 6 Moving an Entry

The following command moves an entry from one branch of a suffix to another:

```
$./ldapmodify -h host -D uid=hmiller,ou=people,dc=example,dc=com -w -
Enter bind password:
dn: uid=jwallace,ou=people,dc=example,dc=com
changetype: modrdn
newrdn: uid=jwallace
```

EXAMPLE 6 Moving an Entry (Continued) deleteoldrdn: 0 newsuperior: ou=special users,dc=example,dc=com ^D

- **Exit Status** The exit status returned reflects the return values of the underlying functions used, which may depend on return values sent by the server. Common exit status codes follow:
 - 0 Successful completion; LDAP_SUCCESS; 0x00.
 - Server encountered errors while processing the request; LDAP_OPERATIONS_ERROR; 0x01.
 - 2 Server encountered errors, such as a BER-decoding error, while processing the request; LDAP_PROTOCOL_ERROR; 0x02.
 - 10 DN of the entry to modify belongs to an entry handled by neither server, and the referral URL identifies another server that handles the entry; LDAP_REFERRAL; 0x0a.
 - 16 Attribute to be modified does not exist; LDAP_NO_SUCH_ATTRIBUTE; 0x10.
 - 19 Attribute modification requested is not a proper modification. For example, a requested change to userpassword would result in a user password shorter than the minimum length allowed; LDAP_CONSTRAINT_VIOLATION; 0x13.
 - Attribute to add already exists with the specified value; LDAP_TYPE_OR_VALUE_EXISTS; 0x14.
 - 21 The value modified does not respect the syntax for the attribute type; LDAP_INVALID_SYNTAX; 0x15.
 - 32 DN of the entry to modify belongs to an entry handled by neither server, and no referral URL is available for the entry; LDAP_NO_SUCH_OBJECT; 0x20.
 - DN of the entry to modify is not a valid DN; LDAP_INVALID_DN_SYNTAX; 0x22.
 - 50 Bind DN user does not have permission to read the entry from the directory; LDAP_INSUFFICIENT_ACCESS; 0x32.
 - 53 Directory is read-only; LDAP_UNWILLING_TO_PERFORM; 0x35.
 - 65 Requested modification would cause the entry not to comply with the directory schema; LDAP_OBJECT_CLASS_VIOLATION; 0x41.
 - 66 Entry specified has child-entries that must be deleted first; LDAP NOT ALLOWED ON NONLEAF; 0x42.
 - 67 Requested modification would cause the entry to be missing attributes that are components of the entry DN; LDAP_NOT_ALLOWED_ON_RDN; 0x43.

- 68 An entry already exists with the same DN as the entry to add; LDAP_ALREADY_EXISTS; 0x44.
- 81 One of the directories did not respond to the request, or the connection was lost; LDAP_SERVER_DOWN; 0x51.
- 82 An error occurred while receiving results; LDAP_LOCAL_ERROR; 0x52.
- 83 The request could not be BER-encoded; LDAP_ENCODING_ERROR; 0x53.
- 84 A result could not be decoded; LDAP_DECODING_ERROR; 0x54.
- 89 An option or argument is not valid; LDAP_PARAM_ERROR; 0x59.
- 90 Needed memory could not be allocated; LDAP_NO_MEMORY; 0x5a.
- 91 A specified host name or port is not valid; LDAP_CONNECT_ERROR; 0x5b.
- 92 At least one server supports only LDAPv2, and the -V 2 option was not used, or the -V 2 option was used, but the server no longer supports LDAP v2; LDAP_NOT_SUPPORTED; 0x5c.
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE	
Availability	SUNWldapcsdk-tools	
Stability Level	Evolving	

See Also ldapcmp(1), ldapcompare(1), ldapdelete(1), ldappasswd(1), ldapsearch(1)

Name ldappasswd – change the password of an LDAP entry

- Synopsis install-path/dsrk6/bin/ldappasswd [options] [auth-id]
- **Description** The ldappasswd command changes the password of an LDAP entry, identified by an *auth-id* such as uid=bjensen, ou=people, dc=example, dc=com, stored by a directory server.

The ldappasswd command relies on the Password Modify Extended Operation (OID 1.3.6.1.4.1.4203.1.11.1).

Options The following options are supported:

- 0

Ignore LDAP library version mismatches.

When this option is omitted, the default behavior is to assert that the revision number of the LDAP API be greater than or equal to that used to compile the tool. Also, if the library and the tool have the same vendor name, the tool will assert that the vendor version number of the API be greater than or equal to that used to compile the tool. Revision and version numbers are based on the contents of the LDAPAPIInfo structure defined in <ld><ldap.h> or header files included by <ldap.h>.

- 3

Check host names in SSL certificates.

- A

Prompt for old password.

- D bindDN

Use the specified bind DN to authenticate to the directory server.

If the bind DN and its password are omitted, the ldappasswd command binds anonymously.

- E

Request that the directory expose (report) the bind identity.

- H

-help

--help

- ?

Display usage information.

- I filename

Read SSL key password for the client key database specified using the -P option from *filename*.

The default is key3.db.

- J controloid[:criticality[:value|::base64value|:<fileurl]] Use the specified control OID.

The *criticality*, a boolean, is false by default.

An LDAP control can be associated with a value. Proxy authorization takes a proxy authorization ID, for example, passed with the control OID, and criticality. If a value is necessary you specify it using *value*, *base64value*, or *<fileurl*.

-K pathname

Use the SSL key database located in *pathname*, the full path to the key database file.

The default is to search for the key database file, key3.db, in the directory specified by the -P option.

- M

Manage referrals, modifying the entry containing the referral instead of the entry obtained by following the referral.

-N certificate

Use the specified *certificate* for certificate-based SSL client authentication, for example: -N "Client-Cert", where Client-Cert is the subject name of the user certificate.

-0 limit

Follow at maximum *limit* referral hops.

Default is 5.

- P pathname

Use the SSL certificate database located in the specified file system directory.

The default is to search for the certificate database file, cert8.db, in the current directory.

- R

Do not follow referrals automatically.

- S

Prompt for the new password.

- T filename

Read the new password from the specified file.

-V n

Use LDAP protocol version *n*, where *n* is 2 or 3. Default is 3.

-W -

Prompt for the password for the client key database specified using the -P option.

The -W option is required for certificate-based client authentication.

-W password

Specify the password for the client key database specified using the -P option.

The -W option is required for certificate-based client authentication.

-Y proxydn

Use the rights of the entry having the specified DN for performing LDAP operations. When using this option, you must also specify how to bind before you assume the rights of the proxy. Thus, when using simple authentication, you would also use the -D and -w options with this option.

Before proxy authentication can work in Directory Server, you must set up the appropriate access control instructions.

- Z

Use SSL to provide certificate-based client authentication.

The -Z option requires the -N and -W options and any other SSL options needed to identify the certificate and the key database.

- ZZ

Use start TLS when possible to connect to the directory.

-a password

Use the specified old password.

- h *host*

Contact the LDAP server on the specified host, which may be a host name or an IP address. Enclose IPv6 addresses in brackets ([]) as described in RFC 2732.

For example, when mapping the IPv4 address 192.168.0.99 to IPv6, pass the -h option with its argument as -h [::ffff:192.168.0.99]. Notice the brackets.

When using GSSAPI with Directory Server, specify the *host* as a fully-qualified host name which matches the value of the nsslapd-localhost attribute on the cn=config entry. The GSSAPI authentication process requires that the host name provided by the client match the one provided by the server.

The default is localhost.

-i charset

Use the specified character set to override the value of the LANG environment variable. This option is useful, as the command converts certain arguments you specify to UTF-8 before sending the request to the server. The following arguments are converted: base DN, bind DN, LDAP filter, and password.

You can prevent the command from converting passwords by using the -k option.

Examples of *charset* values include IS08859-1, IS08859-15, ibm-1275, and windows-1251.

- j *filename* Read the bind password for simple authentication from the specified file.

- k

Do not convert the passwords to UTF-8.

-m pathname

Use the security module database located in the specified file system directory.

Use the -m option if the security module database is in a different directory from the certificate database itself.

- n

Show what would be done, but do not actually do it.

-o attrname=attrvalue

Use the specified attribute values when performing SASL authentication.

The following *attrname* arguments are supported:

authid	Use the sp	pecified	authenti	cation	identity	7.

authzid Use the specified authorization identity.

mech Request the specified SASL mechanism for the bind.

realm Use the specified realm to complete the bind.

secProp Use the specified security level.

The *attrvalue* is a valid value corresponding to the *attrname* you specify.

-pport

Contact the LDAP server on the specified port.

The default is 389 (636 if SSL is used).

-s password

Use the specified new password.

-t filename

Read the old password from the specified file.

- V

Run in verbose mode, displaying diagnostics on standard output.

-w -

Prompt for the bind password for simple authentication.

-w *password* Use the specified bind password for simple authentication.

Examples Examples in this section use the following conventions:

- The directory server is located on a system named host.
- The directory server supports the Password Modify Extended Operation (OID 1.3.6.1.4.1.4203.1.11.1)
- The directory server listens on port number 389, the default for non-SSL traffic.
- The directory server listens on port number 636, the default for SSL traffic. SSL is enabled.

```
EXAMPLE 1 Changing Your User Password
```

The following command lets Barbara Jensen change her own user password, connecting over simple authentication:

```
$ ./ldappasswd -h host -D uid=bjensen,ou=people,dc=example,dc=com \
-j old.pwd -T new.pwd -t old.pwd uid=bjensen,ou=people,dc=example,dc=com
ldappasswd: password successfully changed
$
```

EXAMPLE 2 Changing The Password For Another User

The following command lets Kirsten Vaughan change Barbara Jensen's password, connecting over simple authentication:

```
$ ./ldappasswd -h host -D uid=kvaughan,ou=people,dc=example,dc=com \
-w - -A -S uid=bjensen,ou=people,dc=example,dc=com
Old Password:
New Password:
Re-enter new Password:
Enter bind password:
ldappasswd: password successfully changed
$
```

EXAMPLE 3 Using Server Authentication

The following command uses server authentication during the bind, where the server only accepts binds by clients with trusted certificates. Notice only the -P option is used without other SSL-related options.

```
$ ./ldappasswd -h host -p 636 -P /home/bjensen/security \
-D "uid=bjensen,ou=People,dc=example,dc=com" -w - -A -S -Z \
uid=bjensen,ou=People,dc=example,dc=com
Old Password:
New Password:
Re-enter new Password:
Enter bind password:
ldappasswd: password successfully changed
$
```

EXAMPLE 4 Using Client Authentication

The following command uses client authentication during the bind, where the server only accepts binds by clients with trusted certificates, and the client must sign the certificate with a password-protected private key. Notice the options used in this example.

```
$ ./ldappasswd -h host -p 636 -A -S -P /home/bjensen/security \
-N "bjscert" -W keypassword uid=bjensen,ou=People,dc=example,dc=com
Old Password:
New Password:
Re-enter new Password:
ldappasswd: password successfully changed
$
```

- **Exit Status** The exit status returned reflects the return values of the underlying functions used, which may depend on return values sent by the server. Common exit status codes follow:
 - 0 Successful completion; LDAP_SUCCESS; 0x00.
 - Server encountered errors while processing the request; LDAP_OPERATIONS_ERROR; 0x01.
 - 2 Server encountered errors, such as a BER-decoding error, while processing the request; LDAP_PROTOCOL_ERROR; 0x02.
 - 10 Entry to modify belongs to an entry handled by neither server, and the referral URL identifies another server that handles the entry; LDAP_REFERRAL; 0x0a.
 - 32 Authentication ID belongs to an entry not handled by the server, and no referral URL is available for the entry; LDAP_NO_SUCH_OBJECT; 0x20.
 - 50 Bind DN user does not have permission to read the entry from the directory; LDAP_INSUFFICIENT_ACCESS; 0x32.
 - 53 Directory does not allow this user to perform this operation; LDAP_UNWILLING_TO_PERFORM; 0x35.
 - 81 One of the directories did not respond to the request, or the connection was lost; LDAP_SERVER_DOWN; 0x51.
 - 83 The request could not be BER-encoded; LDAP_ENCODING_ERROR; 0x53.
 - 84 A result could not be decoded; LDAP_DECODING_ERROR; 0x54.
 - An option or argument is not valid; LDAP_PARAM_ERROR; 0x59.
 - 91 A specified host name or port is not valid; LDAP_CONNECT_ERROR; 0x5b.
 - 92 At least one server supports only LDAPv2, and the -V 2 option was not used, or the -V 2 option was used, but the server no longer supports LDAP v2; LDAP_NOT_SUPPORTED; 0x5c.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE	
Availability	SUNWldapcsdk-tools	
Stability Level	Evolving	

See Also ldapcmp(1), ldapcompare(1), ldapdelete(1), ldapmodify(1), ldapsearch(1)

Name ldapsearch – find LDAP entries **Synopsis** *install-path*/dsrk6/bin/ldapsearch -b baseDN [options] filter [attribute]... install-path/dsrk6/bin/ldapsearch -b baseDN [options] -f filename [attribute]... **Description** The Ldapsearch command searches for entries stored by a directory server based on the specified LDAP filter. The Ldapsearch command displays results found in LDIF format, including the specified attributes, or all attributes returned if none are specified. Filter files, which are specified using the - f *filename* option, contain one filter per line. Specified LDAP filters must comply with RFC 2254. Options Unless the LDAP BASEDN environment variable is set, you must at minimum provide a *baseDN* argument to the -b option. The baseDN argument specifies the distinguished name (DN) of the LDAP entry at the base of the search scope. The following options are supported: -0 Ignore LDAP library version mismatches. When this option is omitted, the default behavior is to assert that the revision number of the LDAP API be greater than or equal to that used to compile the tool. Also, if the library and the tool have the same vendor name, the tool will assert that the vendor version number of the API be greater than or equal to that used to compile the tool. Revision and version numbers are based on the contents of the LDAPAPIInfo structure defined in <ldap.h> or header files included by <ldap.h>. -1 Omit leading version: 1 indication in LDIF output, meaning the output is not RFC 2849 compliant. - 3 Check host names in SSL certificates. - A Display non-ASCII values when the -v option is used. - C ps:changetype[:changesonly[:entrychangecontrols]] Perform a persistent search that stops when you type Control-C. By default, when used with the -C option the Ldapsearch command requests that the directory server return entry change controls with persistent search results. Adjust this

behavior with the following arguments:

display display display display display display display display display	, ete lify
Detern 0 f false	nines when to display search results. Possible values include: Display initial search results immediately, not waiting for changes. Then display new changes as they occur.
1	Display changes when they occur (default).
	nines whether to display entry change controls. Possible include:
0 f false 1	Do not display entry change controls. Display entry change controls (default).
	display add any del mod Detern 0 f false 1 Detern values 0 f false

-D bindDN

Use the specified bind DN to authenticate to the directory server.

If the bind DN and its password are omitted, the ldapsearch command binds anonymously. The bind DN determines what entries and attributes appear in the search results, according to the search permissions for the DN.

- E

Request that the directories expose (report) bind identities.

- F *sep*

Print specified separator character instead of = between attribute types and values.

- G pattern

Retrieve a virtual list view displaying a portion of the total search results. Use this option with the -S and -x options to sort entries returned.

The specified pattern may take one of two forms to specify the size of the virtual list view around a *target entry*:

entriesbefore:entriesafter:value

Return the target entry, which is the first entry in the sorted results whose sort attribute is greater than or equal to the specified value, as well as the

	-	nber of entries before the target e specified number of entries after the	
	16 entries in a attribute: 5 le	, -S sn -x -G 5:10: johnson returns alphabetical order of the surname ess than johnson, the entry equal to johnson, and the 10 subsequent	
entriesbefore:entriesafter:index:count	Return the target entry, as well as the specified number of entries before the target entry and the specified number of entries after the target entry. The target entry depends on the <i>index</i> and estimated <i>count</i> arguments.		
		gument may take the following he following results:	
	<i>count</i> == 0	The target is the entry at the specified <i>index</i> position, starting from 1, and relative to the entire list of sorted results.	
	<i>count</i> == 1	The target is the first entry in the list of sorted results.	
	<i>count</i> > 1	The target is the first entry in the slice of the list represented by the fraction <i>index/count</i> .	
		Use an <i>index</i> argument greater than the <i>count</i> argument to target the last result in the list.	
	closest to the the entire list target index v	-G 5:10:2:4 specifies the <i>index</i> beginning of the second quarter of . If the search yielded 100 entries, the would be 26, and this pattern would s 21 through 36.	
		of entries displayed before and after rry may be limited by the beginning	

the target entry may be limited by the beginning and end of the virtual list. The Ldapsearch command displays the control response, giving the count of entries in the virtual list and the index of the target entry. Use these values to

refine *index* and *count* arguments.

-H -help --help

--ne

Display usage information.

- I filename

Read SSL key password for the client key database specified using the -P option from *filename*.

The default is key3.db.

- J *controloid*[:*criticality*[:*value*|::*base64value*|:*<fileurl*]] Use the specified control OID.

The *criticality*, a boolean, is false by default.

An LDAP control can be associated with a value. Proxy authorization takes a proxy authorization ID, for example, passed with the control OID, and criticality. If a value is necessary you specify it using *value*, *base64value*, or *<fileurl*.

-K pathname

Use the SSL key database located in *pathname*, the full path to the key database file.

The default is to search for the key database file, key3.db, in the directory specified by the -P option.

- M

Manage referrals, searching the entry containing the referral instead of the entry obtained by following the referral.

- N certificate

Use the specified *certificate* for certificate-based client authentication, for example: -N "Client-Cert", where Client-Cert is the subject name of the user certificate.

-0 limit

Follow at maximum *limit* referral hops. Default is 5.

- P filename

Use the certificate database located in *filename*, the full path to the certificate database file.

The default is to search for the certificate database file, cert8.db, in the current directory.

-Q [token][:certificate-name] Use PKCS 11.

0.00

- R

Do not follow referrals automatically.

-S attrtype

Sort the results based on the specified attribute.

- T

Do not break long lines within individual attribute values.

Default is to break long attribute values according to LDIF rules.

- U

When generating temporary file output using the -t option, include URLs as attribute types whose value is a file, such as a photo or certificate.

- V n

Use LDAP protocol version *n*, where *n* is 2 or 3. Default is 3.

-W -

Prompt for the password for the client key database specified using the - P option.

The -W option is required for certificate-based client authentication.

-W password

Specify the password for the client key database specified using the - P option.

The -W option is required for certificate-based client authentication.

-X attrlist

When performing a search to get effective rights using the - c option, use the list of attributes provided.

-Y proxydn

Use the rights of the entry having the specified DN for performing LDAP operations. When using this option, you must also specify how to bind before you assume the rights of the proxy. Thus, when using simple authentication, you would also use the -D and -w options with this option.

Before proxy authentication can work in Directory Server, you must set up the appropriate access control instructions.

- Z

Use SSL to provide certificate-based client authentication.

The -Z option requires the -N and -W options and any other SSL options needed to identify the certificate and the key database.

- ZZ

Use Start TLS to provide certificate-based client authentication.

The -ZZ option requires the -N and -W options and any other SSL options needed to identify the certificate and the key database.

- a deref

Dereference aliases as specified during a search. Possible values for the *deref* argument include the following values:

- always Dereference aliases both when finding the base DN, and when searching below it.
- find Dereference aliases when finding the base DN.
- never Never dereference aliases (default).
- search Dereference aliases when searching below the base DN, but not when finding the base DN.

This option has no effect when used with directories that do not support alias dereferencing.

- c authzid

Use the specified authorization ID when to perform a get effective rights search. The following authorization IDs are supported:

	"" represents an empty string, meaning use the authorization ID already specified for the operation.
"bindDN"	Use the specified bind DN, such as uid=bjensen,ou=People,dc=example,dc=com.
"dn:"	Use anonymous as the authorization ID.

-d level

Set LDAP debug level to the specified value.

The following debug levels are supported:

- 1 Display verbose debugging messages; LDAP_DEBUG_TRACE.
- 2 Display messages about the content of network packets; LDAP_DEBUG_PACKETS.
- 320 Display messages about LDIF parsing; LDAP_DEBUG_PARSE.
- 16384 Display informational messages; LDAP_DEBUG_ANY.

Use the sum of the levels to specify more than one debug level. For example, to set the debug level to display both verbose debugging messages, and messages about the content of network packets, specify -d 3.

- e

Minimize base64-encoding of resulting attribute values.

- f filename

Read the search filters from the specified file.

File format is one search filter per line, where search filters conform to RFC 2254.

-h host

Contact the LDAP server on the specified host, which may be a host name or an IP address. Enclose IPv6 addresses in brackets ([]) as described in RFC 2732.

For example, when mapping the IPv4 address 192.168.0.99 to IPv6, pass the -h option with its argument as -h [::ffff:192.168.0.99]. Notice the brackets.

When using GSSAPI with Directory Server, specify the *host* as a fully-qualified host name which matches the value of the nsslapd-localhost attribute on the cn=config entry. The GSSAPI authentication process requires that the host name provided by the client match the one provided by the server.

The default is localhost.

-i charset

Use the specified character set to override the value of the LANG environment variable. This option is useful, as the command converts certain arguments you specify to UTF-8 before sending the request to the server. The following arguments are converted: base DN, bind DN, LDAP filter, and password.

You can prevent the command from converting passwords by using the -k option.

Examples of *charset* values include IS08859-1, IS08859-15, ibm-1275, and windows-1251.

- j filename

Read the bind password for simple authentication from the specified file.

- k

Do not convert the passwords to UTF-8.

-l timelimit

Interrupt the search if the specified time limit is exceeded.

-mpathname

Use the security module database located in the specified directory.

Use the -m option if the security module database is in a different directory from the certificate database itself.

- n

Show what would be done, but do not actually do it.

- o attrname=attrvalue

Use the specified attribute values when performing SASL authentication.

The following attrname arguments are supported:

- authid Use the specified authentication identity.
- authzid Use the specified authorization identity.
- mech Request the specified SASL mechanism for the bind.

realm Use the specified realm to complete the bind.

secProp Use the specified security level.

The attrvalue is a valid value corresponding to the attrname you specify.

-pport

Contact the LDAP server on the specified port.

The default is 389 (636 if SSL is used).

- s scope

Use the specified search scope.

The following values are supported for scope:

- base Examine only the entry specified by the argument to the -b option.
- one Examine only to the entry specified by the argument to the -b option and its immediate children.
- sub (Default) Examine the subtree whose base is the entry specified by the argument to the -b option.
- t

Write a temporary file as output for each attribute of each entry in the search results. Such files are written to the system temporary directory, typically /tmp. On standard output, write file names in place of attribute values.

When the -t option is used, no base64 encoding is performed on any attribute values, regardless of their content.

- u

Include user friendly entry names (ufn: *userfriendly*) in the results returned.

- V

Run in verbose mode, displaying diagnostics on standard output.

- W -

Prompt for the bind password for simple authentication.

-w password

Use the specified bind password for simple authentication.

- X

Have the directory server sort results based on entry DNs before returning the results.

- z sizelimit

Interrupt the search if the specified maximum number of entries returned is exceeded.

International
SearchesThis section focuses on international searches, and in particular the matching rule filter
portion of the ldapsearch command.

When you perform search operations, you can request that the directory sort the results based on any language for which the server has a supported *collation order*.

A *matching rule* provides special guidelines for how the directory compares strings during a search operation. In an international search, the matching rule tells the system what collation order and operator to use when performing the search operation. The syntax of the matching rule filter is as follows.

attr: matchingRule:=value

Here attr, matchingRule, and value mean the following.

- attr is an attribute belonging to entries you're searching for, such as cn or mail.
- *matchingRule* is a string that identifies either the collation order or the collation order and a relational operator, depending on the format you prefer.
- *value* is either the attribute value for which you want to search or a relational operator plus the attribute value for which you want to search. The syntax of the value portion of the filter depends on the matching rule format you use.

The matching rule portion of a search filter can be represented in one of the following ways.

• Use an OID for the matching rule.

Each locale supported by Directory Server has an associated collation order OID. Locales supported for Directory Server are listed in the reference documentation on *Identifying Supported Locales*. When you use this approach, the matching rule filter has the following form.

attr: OID:=relational-operator value

The relational operator is included in the value portion of the string, separated from the value by a single space. For example, to search for all departmentNumber attributes that are at or after N4709 in the Swedish collation order, use the following filter.

departmentNumber:2.16.840.1.113730.3.3.2.46.1:=>= N4709

• Use a language tag for the matching rule.

Each locale supported by Directory Server has an associated language tag. When you use this approach, the matching rule filter has the following form.

attr:language-tag:=relational-operator value

The relational operator is included in the value portion of the string, separated from the value by a single space. For example, to search the directory for all description attributes with a value of estudiante using the Spanish collation order, use the following filter.

cn:es:== estudiante

• Use an OID and suffix for the matching rule.

As an alternative to using a relational operator-value pair, you can append a suffix that represents a specific operator to the OID in the matching rule portion of the filter. Combine the OID and suffix.

```
attr:OID+suffix:=value
```

For example, to search for businessCategory attributes with the value Softwareprodukte in the German collation order, use the following filter.

businessCategory:2.16.840.1.113730.3.3.2.7.1.3:=Softwareprodukte

The .3 in the previous example is the equality suffix.

• Use a language tag and suffix for the matching rule.

As an alternative to using a relational operator-value pair, you can append a suffix that represents a specific operator to the language tag in the matching rule portion of the filter. Combine the language tag and suffix.

attr:language-tag+suffix:=value

For example, to search for all surnames that come at or after La Salle in the French collation order, use the following filter.

sn:fr.4:=La Salle

Directory Server supports the following types of international searches, designated in your search filter by adding either the search operator, or the search suffix to the OID or language code specifying the appropriate, collation dependent, matching rule.

equality	Search operator: =
	Suffix operator: .1
less than	Search operator: <
	Suffix operator: .2
less than or equal to	Search operator: <=
	Suffix operator: .3
greater than or equal to	Search operator: >=
	Suffix operator: .4
greater than	Search operator: >
	Suffix operator: .5
substring	Search operator: =*
	Suffix operator: .6

Approximate, or phonetic, and presence searches are supported only in English.

Examples Examples in this section use the following conventions:

- The directory server is located on a system named host.
- The directory server has been configured to support anonymous access for search and read. Therefore, you do not have to specify bind information.
- The directory server listens on port number 389, the default for non-SSL traffic.
- The directory server listens on port number 636, the default for SSL traffic. SSL is enabled.

```
EXAMPLE 1 Returning All Entries
```

The following command returns all entries in the suffix under the base DN. Use this only when you need to retrieve all entries and attributes:

```
$ ldapsearch -h host -b "dc=example,dc=com" "(objectclass=*)"
```

EXAMPLE 2 Narrowing a Search

The following command employs a more specific filter to narrow the search:

```
$ ldapsearch -h host -b "dc=example,dc=com" "(cn=Babs Jensen)"
```

```
EXAMPLE 3 Searching the Root DSE Entry
```

The following command searches the root DSE entry, requesting supported naming contexts and supported LDAP versions. Notice you specify the scope as only the base entry:

```
$ ldapsearch -h host -b "" -s base "(objectclass=*)" \
namingContexts supportedLDAPVersion
version: 1
dn:
namingContexts: dc=example,dc=com
supportedLDAPVersion: 2
supportedLDAPVersion: 3
```

```
EXAMPLE 4 Searching the Schema Entry
```

The following command searches the schema entry, which contains the directory schema. Notice that you can request the operational attribute subSchemaSubEntry on any entry to determine which entry holds the schema attributes, in this case cn=schema. Then you specify the scope as only the base entry:

```
$ ldapsearch -h host -b "" -s base "(objectclass=*)" subSchemaSubEntry
version: 1
dn:
```

```
EXAMPLE 4 Searching the Schema Entry (Continued)
subSchemaSubEntry: cn=schema
$ ldapsearch -h host -b "cn=schema" -s base "(objectclass=*)"
version: 1
dn: cn=schema
...
```

EXAMPLE 5 Setting the Base DN

The following commands set the LDAP_BASEDN environment variable, and then use it when searching the directory. The syntax of the first command may not work for your shell. Refer to the documentation about your shell for instructions on setting environment variables.

```
$ LDAP_BASEDN="dc=example,dc=com"; export LDAP_BASEDN
$ ldapsearch -h host "(givenname=Barbara)" cn uid
version: 1
dn: uid=bjablons, ou=People, dc=example,dc=com
cn: Barbara Jablonski
uid: bjablons
dn: uid=bhal2, ou=People, dc=example,dc=com
cn: Barbara Hall
uid: bhal2
dn: uid=bjensen, ou=People, dc=example,dc=com
cn: Barbara Jensen
cn: Babs Jensen
uid: bjensen
dn: uid=bmaddox, ou=People, dc=example,dc=com
cn: Barbara Maddox
uid: bmaddox
dn: uid=bfrancis, ou=People, dc=example,dc=com
cn: Barbara Francis
uid: bfrancis
$
```

```
EXAMPLE 6 Using a Filter File
```

The following commands demonstrate use of a filter file. The results show the directory server responds to separate searches for each filter.

```
EXAMPLE 6 Using a Filter File
                            (Continued)
$ cat filters
sn=Francis
givenname=Barbara
$ ldapsearch -b "dc=example,dc=com" -h host -f filters cn uid
version: 1
dn: uid=rfrancis, ou=People, dc=example,dc=com

$
EXAMPLE 7 Escaping Commas
```

The following command demonstrates use of the backslash $(\)$ to escape a comma within a base DN.

SSL Authentication The following examples demonstrate using SSL authentication for searches. Examples EXAMPLE 8 Using Server Authentication

The following command uses server authentication during the bind, where the server only accepts binds by clients with trusted certificates. Notice only the -P option is used without other SSL-related options.

```
$ ldapsearch -h host -p 636 -b dc=example,dc=com \
    -P /home/bjensen/security -D uid=bjensen,ou=people,dc=example,dc=com \
    -w - "(givenname=Barbara)"
Enter bind password:
```

EXAMPLE 9 Using Client Authentication

The following command uses client authentication during the bind, where the server only accepts binds by clients with trusted certificates, and the client must sign the certificate with a password-protected private key. Notice the options used in this example.

```
$ ldapsearch -h host -p 636 -b dc=example,dc=com \
    -P /home/bjensen/security -N "bjscert" -K /home/bjensen/security \
    -W keypassword "(givenname=Barbara)"
```

International Search Examples The following examples show search filters used to perform international searches on directory data. Each example gives all the possible matching rule filter formats so that you can become familiar with the formats and select the one that works best for you.

EXAMPLE 10 International Less Than Search

When you perform a locale-specific search using the less than operator (<) or suffix (.1), you search for all attribute values that come before the given attribute in a specific collation order.

Any of the following filters can be used to search for all surnames that come before the surname Marquez in the Spanish collation order.

```
sn:2.16.840.1.113730.3.3.2.15.1:=< Marquez
sn:es:=< Marquez
sn:2.16.840.1.113730.3.3.2.15.1.1:=Marquez
sn:es.1:=Marquez</pre>
```

EXAMPLE 11 International Less Than or Equal To Search

When you perform a locale-specific search using the less than or equal to operator (<=) or suffix (.2), you search for all attribute values that come at or before the given attribute in a specific collation order.

Any of the following filters can be used to search for all room numbers that come at or before room number CZ422 in the Hungarian collation order.

EXAMPLE 11 International Less Than or Equal To Search (Continued)

```
roomNumber:2.16.840.1.113730.3.3.2.23.1:=<= CZ422
roomNumber:hu:=<= CZ422
roomNumber:2.16.840.1.113730.3.3.2.23.1.2:=CZ422
roomNumber:hu.2:=CZ422</pre>
```

EXAMPLE 12 International Equality Search

When you perform a locale-specific search using the equal to operator (=) or suffix (.3), you search for all attribute values that match the given attribute in a specific collation order.

Any of the following filters can be used to search for all businessCategory attributes with the value Softwareprodukte in the German collation order.

```
businessCategory:2.16.840.1.113730.3.3.2.7.1:== Softwareprodukte
businessCategory:de:== Softwareprodukte
businessCategory:2.16.840.1.113730.3.3.2.7.1.3:=Softwareprodukte
businessCategory:de.3:=Softwareprodukte
```

EXAMPLE 13 International Greater Than or Equal To Search

When you perform a locale-specific search using the greater than or equal to operator (>=) or suffix (.4), you search for all attribute values that come at or after the given attribute in a specific collation order.

Any of the following filters can be used to search for all localities that come at or after Québec in the French collation order.

locality:2.16.840.1.113730.3.3.2.18.1:=>= Québec locality:fr:=>= Québec locality:2.16.840.1.113730.3.3.2.18.1.4:=Québec locality:fr.4:=Québec

EXAMPLE 14 International Greater Than Search

When you perform a locale-specific search using the greater than operator (>) or suffix (.5), you search for all attribute values that come at or before the given attribute in a specific collation order.

Any of the following filters can be used to search for all mail hosts that come after host schranka4 in the Czech collation order.

```
mailHost:2.16.840.1.113730.3.3.2.5.1:=> schranka4
mailHost:cs:=> schranka4
mailHost:2.16.840.1.113730.3.3.2.5.1.5:=schranka4
```

EXAMPLE 14 International Greater Than Search (Continued)

```
mailHost:cs.5:=schranka4
```

EXAMPLE 15 International Substring Search

When you perform an international substring search, you search for all values that match the given pattern in the specified collation order.

Any of the following filters can be used to search for all user IDs that end in ming in the Chinese collation order.

```
uid:2.16.840.1.113730.3.3.2.49.1:=* *ming
uid:zh:=* *ming
uid:2.16.840.1.113730.3.3.2.49.1.6*_:=*ming_*
uid:zh.6*_:=*ming_*
```

- **Exit Status** The exit status returned reflects the return values of the underlying functions used, which may depend on return values sent by the server. Common exit status codes follow:
 - 0 Successful completion; LDAP_SUCCESS; 0x00.
 - Server encountered errors while processing the request; LDAP_OPERATIONS_ERROR; 0x01.
 - 2 Server encountered errors, such as a BER-decoding error, while processing the request; LDAP_PROTOCOL_ERROR; 0x02.
 - 3 Search exceeded the time limit for operations on the server; LDAP_TIMELIMIT_EXCEEDED; 0×03.
 - 4 Search returned more results than the maximum number allowed by the server; LDAP_SIZELIMIT_EXCEEDED; 0x04.
 - 10 Base DN belongs to an entry handled by neither server, and the referral URL identifies another server that handles the entry; LDAP_REFERRAL; 0x0a.
 - 11 Search returned more results than the maximum number a client application is allowed by the server to retrieve; LDAP ADMINLIMIT EXCEEDED; 0x0b.
 - 32 Base DN belongs to an entry handled by neither server, and no referral URL is available for the entry; LDAP NO SUCH OBJECT; 0x20.
 - Base DN is not a valid DN; LDAP_INVALID_DN_SYNTAX; 0x22.
 - 50 Bind DN user does not have permission to read the entry from the directory; LDAP_INSUFFICIENT_ACCESS; 0x32.
 - 53 Directory is read-only; LDAP_UNWILLING_TO_PERFORM; 0x35.

- 81 The directory server did not respond to the request, or the connection was lost; LDAP_SERVER_DOWN; 0x51.
- 82 An error occurred while receiving results; LDAP_LOCAL_ERROR; 0x52.
- 83 The request could not be BER-encoded; LDAP_ENCODING_ERROR; 0x53.
- 84 A result could not be decoded; LDAP_DECODING_ERROR; 0x54.
- 85 The search exceeded the time limit specified using the -l option; LDAP_TIMEOUT; 0x55.
- 87 An error occurred while parsing and BER-encoding the specified filter; LDAP_FILTER_ERROR; 0x57.
- An option or argument is not valid; LDAP_PARAM_ERROR; 0x59.
- 90 Needed memory could not be allocated; LDAP_NO_MEMORY; 0x5a.
- 91 A specified host name or port is not valid; LDAP_CONNECT_ERROR; 0x5b.
- 92 The directory server supports only LDAPv2, and the -V 2 option was not used, or the -V 2 option was used, but the server no longer supports LDAP v2; LDAP_NOT_SUPPORTED; 0x5c.
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldapcsdk-tools
Stability Level	Evolving

See Also ldapcmp(1), ldapcompare(1), ldapdelete(1), ldapmodify(1), ldappasswd(1)

Name	ldapsubtdel – recursively delete a subtree of LDAP entries		
Synopsis	<pre>install-path/dsrk6/bin/ldapsubtdel -b baseDN [options]</pre>		
Description	The ldapsubtdel command attempts recursively to delete a subtree of LDAP entries under the entry having the distinguished name (DN) specified as a parameter to the -b option. You must bind as a user having access to delete the entries specified.		
Options	The ldapsubtdel co	ommand supports the following options:	
	- b <i>DN</i>	Delete entries under the entry with the specified DN.	
		Default is to delete entries under the specified entry, but not to delete the specified entry itself. Use the -r option to delete the specified entry as well.	
	-D bindDN	Use the specified bind DN to authenticate to the directory.	
		If the bind DN is not specified, the ldapsubtdel command attempts anonymous authentication.	
	- H	Display a usage message.	
	- h <i>hostname</i>	Connect to the directory on the specified host.	
		Default is to connect to the local host on the loopback address, 127.0.0.1.	
	- j filename	Use the bind password in the specified file to authenticate to the directory.	
	- M	Manage referrals, deleting the entries containing referrals instead of the entries obtained by following referrals.	
		Default is to follow referrals and delete the entries to which the entries in the subtree refer.	
	- n	Display what would be done, but do not carry out any deletions.	
		Default is to carry out the deletions.	
	-p <i>port</i>	Connect to the directory on the specified port.	
		Default is to connect to the default simple authentication port for LDAP, 389.	
	- r	Also delete the entry having the DN specified as the parameter to the -b option.	
		Default is not to delete the entry specified.	

-VLDAPVersion	Use the specified LDAP version, either 2 or 3.
	Default is to use version 3.
- V	Display verbose output, including information about each deletion performed.
-w password	Use the specified bind password to authenticate to the directory.
- W -	Prompt for the bind password so it does not appear on the command line.

Examples The example in this section uses the following conventions:

- The ldapsubtdel command is found in a directory present in the PATH used for the examples.
- The directory server is located on a system named host.
- The directory server listens on port 389, the default for non-SSL connections.

EXAMPLE 1 ldapsubtdel: Deleting an Entire Subtree

The following command demonstrates deletion of an entire test subtree of LDAP entries:

```
$ ldapsubtdel -h host -D uid=hmiller,ou=people,dc=example,dc=com -w - \
-b ou=test,dc=example,dc=com -r -v
Enter bind password:
Processing subtree ou=test,dc=example,dc=com
Deleting entry uid=test0,ou=test,dc=example,dc=com
...
Deleting entry uid=test99,ou=test,dc=example,dc=com
Deleting entry ou=test,dc=example,dc=com
Successfully deleted subtree ou=test,dc=example,dc=com
If you read Example.ldif, you see that hmiller's password is hillock.
```

- **Exit Status** The ldapsubtdel command exits with status 0 if it completes successfully. Otherwise it exits with non-zero status.
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	Zip distribution only
Stability Level	Evolving

Name ldif - format input by adding base64 encoding to make it suitable for inclusion in an LDIF file

- Synopsis install-path/dsee6/bin/ldif [-b] attrtype
- **Description** The ldif command formats input by adding base64 encoding to make it suitable for inclusion in an LDIF file. This makes it easy to include binary data, such as JPEG images, along with other textual attribute values. In an LDIF file, base64 encoded attribute values are indicated as :: encoded data.

In addition to binary data, other values that must be base64 encoded include any value that begins with a semicolon (;) or a space, and any value that contains non-ASCII data, including newlines. The ldif command takes any input and formats it with the correct line continuation and appropriate attribute information.

- **Options** The following options are supported:
 - -b Specifies that the ldif command should interpret the entire input as a single binary value.

As an alternative to the -b option, you can use the :<URL specifier notation, which is simpler to use. For example, jpegphoto:<file:///tmp/myphoto.jpg. Although the official notation requires three /// the use of one / is tolerated.

Exit Status The following exit values are returned:

- 0 Successful completion.
- 1 An error occurred.

On error, verbose error messages are output to standard output.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE

Name	ldifxform – refor	mat LDIF text		
Synopsis	install-path/dsrk6/bin/ldifxform [-h] [-i input.ldif] [-o output.ldif] -c command			
Description	The ldifxform command reformats LDAP Data Interchange Format (LDIF) text, converting between all of the most common character sets, extracting attribute values, modifying attribute names, ordering entries based on attribute values, or giving detailed statistics. In all cases, input LDIF is not changed.			
Options	The ldifxform command supports the following options:			
	- c command	Apply the specified reformatt	ing operation.	
		The ldifxform command sup	oports the following reformat	ting operations:
		Attribute Modification	The ldifxform command a attribute values and remove modify attributes, use the fo	e attribute. To
			-csuppressoptions	Remove all options other than binary from attribute types.
			-ctcut= <i>attribute</i>	Remove the specified attribute from output.
				Use this option once for each attribute to remove.
			-ctpreserve= <i>attribute</i>	Remove all attributes except the specified attribute from output.
				Use this option once for each attribute to retain.

-ctrepl	.ace=old:r	iew	Replace the old attributes with the new attribute type in output.
			Use this option once for each attribute to rename.
from one	e character	set to a	nother. To

Directory Analysis	statistical informa directory content.	mmand can generate tion to help you analyze To generate statistical he following options:
	-cstats	Generate statistical information and append it to the output.
	-cstatsonly	Generate statistical information instead of other output.
Sorting and Ordering	in the order that en database. The ldi and order the entr	directory. To sort LDIF,
	-corder	Sort entries into hierarchical order.
	-csort=attribute	Sort entries in increasing order according to their values for the specified attribute. This is equivalent to alphabetical order for string-valued attributes.
	-csort=^ <i>attribut</i>	e Sort entries in decreasing order according to their values for the specified attribute. This is equivalent to reverse alphabetical

		order for string-valued attributes.
	-csplit=number	Generate the specified number of LDIF files, which can be loaded into the server by multiple clients in parallel. Each output file has a name of the form <i>output_ldifxform_c_n</i> , where
	output	Reflects the file name passed to the -o option
	С	Corresponds to the number of components in the root DN of the LDIF file
	п	The number of the part from 1 to <i>number</i> , inclusive.
Text Transformations	number of text tran presentation and er	nmand can perform a sformations affecting the ncoding of the LDIF text. nsformations, use the
	-ccleanzero	Remove trailing zero bytes from attribute values.
		Use this option when processing LDIF from a buggy encoder.
	-clonglines	Do not wrap long lines at the 79th column.

		The output can be parsed again, but common tools such as sed and grep on some platforms may not handle lines longer than 1024 characters.
	- c nob64	Undo base64 encoding.
		The output cannot be parsed again if any attributes have values that are binary or that begin with special characters.
	-cnocomments	Remove comments from the output.
	- c nodn	Remove DNs from the output.
		The output is no longer LDIF.
	-cnotypes	Remove attribute types from the output.
		The output is no longer LDIF.
	-csevenbit	Base64 encode any attribute values containing bytes not present in ASCII.
Display a usage message briefly	y describing all opti	ons.
Read input from the file specifi	ied.	
When this option is omitted th	heldifxform.comr	nand reads from standard

When this option is omitted, the ldifxform command reads from standard input.

-o *output.ldif* Write output to the file specified.

- h

-i input.ldif

When this option is omitted, the ldifxform command writes to standard output.

Extended The ldifxform command acts as a stream filter, reading input from one file, performing transformations and writing the output to another file. Each transformation is specified by a *command* parameter to the - c option. Multiple compatible transformations may be performed simultaneously.

Some transformations produce LDIF output destined to be reloaded into a directory. For example, renaming an attribute can be more easily processed on an LDIF file than online through requests to a directory server.

Other transformations do not produce LDIF; they are intended to provide an analysis of directory contents. For example, you may extract all different values of a specific attribute and list them under the DN in which they occur. The statistical operations provide counts of entries and attributes.

Examples The examples in this section use the following conventions:

- The ldifxform command is found in a directory present in the PATH used for the examples.
- The directory server is located on a system named host.
- The directory has been configured to support anonymous access for search and read. Therefore, you do not have to specify bind information.
- The directory server listens on port 389, the default for non-SSL connections.

EXAMPLE 1 ldifxform: Transforming Search Results to a List

The following command reformats search results into a simple list of employees placed in order by their room number:

```
$ ldapsearch -h host -b dc=example,dc=com "(uid=*jensen)" | ldifxform \
-c "tpreserve=roomNumber" -c "tpreserve=cn" -c "sort=roomNumber" -c nodn -c notypes
version: 1
#:ordered: TRUE
Barbara Jensen
Babs Jensen
0209
Allison Jensen
0784
Kurt Jensen
1944
Richard Jensen
2631
```

```
EXAMPLE 1 ldifxform: Transforming Search Results to a List (Continued)
```

```
Gern Jensen
4609
Ted Jensen
4717
Jody Jensen
4882
```

EXAMPLE 2 Idifxform: Generating Statistical Output

The following command generates statistical output from search results:

```
$ ldapsearch -h host -b dc=example,dc=com "(uid=*jensen)" | ldifxform -c statsonly
# Basic statistics
#:linecount: 121
#:entrycount: 7
# Number of nonleaf entries (at least one subordinate)
#:nonleafcount: 1
# Number of leaf entries (no subordinates)
#:leafcount: 7
# Largest number of entries immediately below a single nonleaf entry
#:maximmsubr: 7
# Number of levels in the DIT hierarchy
#:maxdepth: 4
# Largest number of AVAs in an RDN forming an entry's DN, normally 1.
#:maxrdns: 1
# Attribute types used in the LDIF file
# e is number entries containing this attr, v is total number of values,
# l is total length, m is max length of any one value, s is general syntax
# and x is extra encoding information.
#:attrstatsinfo: t=description e=1 v=1 l=49 m=49 i=1 s=cis x=ascii
#:attrstatsinfo: t=roomnumber e=7 v=7 l=28 m=4 i=1 s=int
#:attrstatsinfo: t=facsimiletelephonenumber e=7 v=7 l=105 m=15 i=1 s=tel

#:attrdomaininfo: t=objectclass v=7 organizationalPerson

- **Exit Status** The ldifxform command exits with status 0 if it completes successfully. Otherwise, it exits with non-zero status.
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	Zip distribution only
Stability Level	Evolving

Name logconv – analyze Directory Server access logs **Synopsis** *install-path*/dsrk6/bin/logconv [options] logfile... **Description** The logconv command analyzes Directory Server access logs, specified as the *logfile* argument to the command, to extract usage statistics and count occurrences of significant events. As the logconv command depends on the content of the access logs, output depends on the quantity of information present in the access logs. Refer to the Directory Server documentation for instructions on how adjust how much information Directory Server writes to the access logs. The user running the logconv command must have at least read access to the Directory Server log files. The logconv command ignores log files named access.rotationinfo. **Options** The logconv command supports the following options. Options specified here without a preceding dash (-) may be specified in any order, but must be specified together as a single option such as -abcefgijlnrtux. - A0 filename Write statistics on client activity based on the number of operations to the specified file. This option overrides the use of options in the list -abcefgijlnrtux. Write statistics on client activity based on the number of connections to the -A1 filename specified file. This option overrides the use of options in the list -abcefgijlnrtux. List the most frequently used base DNs. - a - B filename Write statistics on the most frequently used bind DNs to the specified file. This option overrides the use of options in the list -abcefgijlnrtux. - b List the most frequently used bind DNs. Write statistics on the number of operations performed per connection to -C filename the specified file. This option overrides the use of options in the list -abcefgijlnrtux. - C List the number of occurrences for each type of connection code. -DELIM Generate a field-delimited, formatted report when using the -B or -R options. You can import this report into a spreadsheet application.

- d <i>rootDN</i>	Use the specified DN to identify operations performed by Directory Manager.
	Default is cn=Directory Manager.
- E errorCode	Generate statistics on occurrences of the specified error code.
	This option overrides the use of options in the list -abcefgijlnrtux.
-e	List the most frequently occurring error and return codes.
- f	List the bind DNs with the most failed binds due to invalid credentials.
- g	List details of all abandoned operations.
- h	Display the usage message.
- I interval	Use the specified interval for reporting when generating a report using the -B or -R options. The <i>interval</i> may be MINUTE, HOUR, DAY, or MONTH.
-i	List the IP addresses and connection codes for clients opening the most connections.
	This option helps detect clients that may attempt to compromise security.
- j	Generate recommendations based on the data collected.
-1	List the most frequently occurring search filters.
- N	Resolve IP addresses to host names.
	Using this option may impact performance.
- n	List the largest and most frequent number of entries per result (nentries).
- P filename	Write a report on pending operations to the specified file.
	This option overrides the use of options in the list -abcefgijlnrtux.
- R filename	Write a report on operations to the specified file.
	This option overrides the use of options in the list -abcefgijlnrtux.
- r	List the most frequently requested attributes.
-s number	Return the specified number of results per category.
	Default is 20.
-t	List the longest and most frequent operation times (etimes).
- u	List details about unindexed searches.
- V	Enable verbose output. Same as - abcefgijlnrtux.

	- V	Display version information and exit.	
		Exclude operations originating from clients with the specified IP address, for example when repeated health check operations come from a load balancer.	
		Repeat this option to exclude multiple addresses.	
	- X	List the number and OID of all extended operations requested.	

Extended The logconv command generates three types of statistics useful for monitoring Directory Description Server use and optimizing Directory Server configuration:

- Counts of events such as total binds and total searches performed
- Lists of the most frequently occurring parameters in LDAP requests

For example, the logconv command generates lists of the top ten bind DNs, base DNs, filter strings, and attributes returned. As generating such lists is computation intensive, you must explicitly request their generation using the appropriate options.

Counts of occurrences for error codes such as those defined in <ldap.h>

Performance of the logconv command is affected by the volume of data in the access logs. To ensure acceptable performance, avoid running the logconv command on more than 1 GB of access logs at a time.

Furthermore, some of the data extracted depends on connection and operation numbers reset when you restart Directory Server. To obtain the most accurate counts, avoid analyzing logs that span a server restart.

Examples Examples in this section use the following conventions:

- The logconv command is found in a directory present in the PATH used for the examples.
- Directory Server stores access logs in /var/ds/logs.
- The current user has read access to the logs.

EXAMPLE 1 logconv: Generating Statistics and Recommendations

The following command generates statistics on client connections, binds, abandoned operations, and unindexed searches, and generates recommendations for performance improvements and further investigation:

\$ logconv -ibgju /var/ds/logs/access*

EXAMPLE 2 logconv: Examining Binds with Invalid Credentials

The following command counts the number of times clients attempted to bind with invalid credentials, error 49 LDAP_INVALID_CREDENTIALS, resolving client IP addresses to host names:

EXAMPLE 2 logconv: Examining Binds with Invalid Credentials (Continued)

```
$ logconv -N -E 49 /var/ds/logs/access*
```

EXAMPLE 3 logconv: Generating a Report

The following command generates a field delimited report on operations, suitable for import into a spreadsheet application:

```
$ logconv -DELIM -R report.txt /var/ds/logs/access
$ cat report.txt
Year|Month|Day|Time|Operations|Results|Performance|Connections|
Searches|Modifications|Adds|Deletes|Modrdns|Binds|Extended Ops|Compares
2006|Apr|05|07:51:04|18119|18129|100.1%|10|0|0|0|0|0|18119|0|0

```

Long lines in this example have been wrapped for readability.

- **Exit Status** The logconv command exits with status 0 if it completes successfully. Otherwise it exits with non-zero status.
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	Zip distribution only
Stability Level	Evolving

Name	e makeldif – generate LDIF for import into a directory			
Synopsis	install-path/dsrk6/bin/makeldif [options] -t template -o output.ldif			
Description	The makeldif command generates LDAP Data Interchange Format (LDIF) files for import into a Lightweight Directory Access Protocol (LDAP) directory.			
Options	The makeldif command supports the following options:			
	- b filename	Write bind information to this file when generating LDIF.		
		Lines of this file include a DN followed by a password, separated by a tab:		
		DN password		
	-C delimiter	Use the specified character instead of a comma when reading from a comma-separated format using the -c option.		
	- c filename	Use the specified comma-separated variable format file as input for generating LDIF.		
	- D	Run in debug mode, displaying additional information about errors.		
	- d filename	Write DNs to this file when generating LDIF.		
	- F filename	Write search filters constructed to find the entries generated to the specified file when generating search filters with the -T option.		
	- f filename	Use the specified file containing a list of first names to use when generating LDIF.		
		When this option is not used, the makeldif command uses the first.names file expected in the current directory.		
	- H	Display usage information and exit.		
	-I	Ignore the first line when reading from a comma-separated format using the - c option. Use this option when the initial line is a header not containing data.		
	-i attribute	Use values of the specified attribute as login IDs when writing login information using the -L option.		
	- L filename	Write login information to this file when generating LDIF.		
		Lines of this file include a login ID followed by a password, separated by a tab:		
		loginID password

	-t template	Use the specif	ied LDIF template file when generating LDIF.
		Refer to EXTH	ENDED DESCRIPTION for details.
	- U	Always use U	NIX-style newline characters (\n).
	- V	Display versio	on information and exit.
	- W	Wrap long lin	es when generating LDIF.
			vrite one attribute type and value per line, potentially ery long lines for some values.
	-X maximum		ters that match no more than the specified number of generating substring search filters with the -T option.
		Default is unli	imited.
	-x maximum		e than the specified maximum number of entries under or each template when generating LDIF.
		Default is unli	imited.
Extended Description		command relies on a template file to customize how entries in the generated nized and what they contain. Template files may contain the following	
	Global Replacement	Definitions	Define strings used to replace variables in the template file itself when generating LDIF
	Branch Entry Definit	tions	Define branches in the directory information tree (DIT) structure
	Template Definitions		Define how to generate leaf entries and attribute values
	A sample you can cu Kit.	stomize, examp	le.template, is installed with Directory Server Resource
Global Replacement Definitions	Replacement definitions define strings used to replace variables in the template itself. For example, the following line defines a variable called suffix having the value dc=example, dc=com:		
	define suffix=dc=ex	ample,dc=com	
	replaced with dc=exa file are read into mer	ample, dc=com. nory, with the r	t occurrences of the string [suffix] in the template file are The replacement takes place when lines of the template result that replacements happen even in branch definitions are not parsed. Notice that the variable is surrounded by

brackets, []. When using brackets for purposes other than delimiting global replacement variables, escape them with a backslash, as in \[or \]. The backslash characters are removed during LDIF generation.

Branch Entry Branch entries are parents for other entries in a suffix. In other words, the branch entry at the root of the suffix for Example.com might be defined as:

branch: dc=example,dc=com

The makeldif command can then generate a corresponding branch entry represented in LDIF as follows:

dn: dc=example,dc=com
objectclass: top
objectclass: domain
dc=example

The makeldif command determines which object classes to use by examining the RDN of the entry, recognizing attribute types c (country), dc (domain component), l (location), o (organization), and ou (organizational unit). When you use RDNs having other attribute types, the makeldif command uses the object class extensibleObject for the entry.

To customize the branch entry itself, define additional attributes directly below the branch definition. For example, add a description attribute for the branch entry as follows:

```
branch: dc=example,dc=com
description: This is the description.
```

The resulting entry generated in LDIF appears as follows:

```
dn: dc=example,dc=com
objectclass: top
objectclass: domain
dc=example
description: This is the description.
```

To enable generation of entries below the branch entry, add subordinateTemplate definitions directly below the branch definition. For example, add a 1000 entries using the person template below ou=people, dc=example, dc=com as follows:

```
branch: ou=people,dc=example,dc=com
subordinateTemplate: person: 1000
```

You can add multiple subordinateTemplate definitions. For example, enable addition of 1000 entries using the person template and 500 entries using the personWithCertificate template below ou=people, dc=example, dc=com as follows:

```
branch: ou=people,dc=example,dc=com
subordinateTemplate: person: 1000
subordinateTemplate: personWithCertificate: 500
```

Template Definitions Template definitions contain prototype entries with special tags allowing the makeldif command to generate many unique, custom entries. For example, a person template definition might appear as follows:

```
template: person
rdnAttr: uid
objectclass: top
objectclass: person
objectclass: organizationalPerson
objectclass: inetOrgPerson
givenName: <first>
sn: <last>
cn: {givenName} {sn}
uid: {givenName}.{sn}
mail: {uid}@example.com
userPassword: <random:alphanumeric:8>
telephoneNumber: <random:telephone>
```

The first line of a template definition specifies the name of the template, here person. The makeldif command uses the name to identify the template when creating leaf entries under branch entries, based on subordinateTemplate definitions used with the branch entry definition. Each name must be unique.

A template entry may also have an rdnAttr line specifying the attribute type for the RDN of the generated entry. The rdnAttr takes a single value. Multi-valued RDNs are not supported. The default rdnAttr definition is cn if you do not provide one.

Other lines in a template definition reflect the attribute types and values to generate in the resulting LDIF. The makeldif command generates values for all recognized tokens.

Supported Attribute Value Tokens

The makeldif command support the following tokens:

```
<ancestordn:{depth}>
```

Replace this value with the DN of the entry's ancestor at the specified depth.

A depth of 1 specifies the parent entry; a depth of 2 specifies the grandparent, and so forth. If the entry does not have an ancestor at the specified depth, the makeldif command replaces the value with an empty string.

```
<base64:{value}>
```

Replace this value with a base64-encoded representation of the specified value.

The value is decoded to a byte array using the UTF-8 character set, and then the byte array is base64-encoded.

```
<base64:{charset}:{value}>
```

Replace this value with a base64-encoded representation of the specified value.

The value is decoded to a byte array using the specified character set, and then the byte array is base64-encoded.

<dn>

Replace this value with the DN of the current entry.

The RDN attribute for the entry must be assigned a value in the template before this token is used.

<exec:{command}>

Replace this value with the information sent to standard output when the specified command is executed on the system.

The replacement invokes a separate process each entry created using this template. Using this token can therefore slow LDIF generation considerably.

```
<exec:{command}, {arg1}, {arg2}, ..., {argN}>
```

Replace this value with the information sent to standard output when the specified command is executed on the system using the arguments provided.

The replacement invokes a separate process each entry created using this template. Using this token can therefore slow LDIF generation considerably.

<file:{filename}>

Replace this value with a randomly-chosen value from the specified file.

The file must contain one value per line. Weights cannot be assigned to the values in a file. To weight values, repeat their lines multiple times in the file.

<first>

Replace this value with a first name from the first name file specified using the -f option.

If both a first and last name are included in an entry, the combination of the first and last name is guaranteed to be unique. That is, no two entries in the generated LDIF file have the same combination of first and last name values. In order to guarantee uniqueness, the first and last names must be used in their entirety. You cannot use substrings of the form {givenName:5} for example.

<guid>

Replace this value with a GUID value in the containing hexadecimal digits in the form 12345678-90ab-cdef-1234-567890abcdef.

GUID values generated are unique within the LDIF generated.

<ifabsent:{attribute}>

Include this attribute only if the specified attribute is not present on the entry.

The specified attribute must be defined in the template file before it is referenced in the ifabsent tag.

<ifabsent:{attribute}:{value}>

Include this attribute only if the specified attribute is not present on the entry or if it does not have the specified value.

The specified attribute must be defined in the template file before it is referenced in the ifabsent tag. If the specified attribute has multiple values, the makeldif command checks only the first value.

```
<ifpresent:{attribute}>
```

Include this attribute only if the specified attribute is also present on the entry.

The specified attribute must be defined in the template file before it is referenced in the ifpresent tag.

```
<ifpresent:{attribute}:{value}>
```

Include this attribute only if the specified attribute is also present on the entry and has the specified value.

The specified attribute must be defined in the template file before it is referenced in the ifpresent tag. If the specified attribute has multiple values, the makeldif command checks only the first value.

<last>

Replace this value with a last name from the last name file specified using the -l option.

If both a first and last name are included in an entry, the combination of the first and last name is guaranteed to be unique. That is, no two entries in the generated LDIF file have the same combination of first and last name values. In order to guarantee uniqueness, the first and last names must be used in their entirety. You cannot use substrings of the form {givenName:5} for example.

```
<list:{value1}, {value2}, ..., {valueN}>
```

Replace this value with a randomly-chosen value from the specified, comma-delimited list.

Each value has an equal chance of being chosen.

<list: {value1}: {weight1}, {value2}: {weight2}, ..., {valueN}: {weightN}> Replace this value with a randomly-chosen value from the specified, comma-delimited list.

The weight associated with each list item determines how likely that value is to be chosen. A list item with a weight of 2 is twice as likely to be chosen as an item with a weight of 1. Specified only positive integer weights.

```
<loop:{start}:{end}>
```

Process this definition (*end* - *start* + 1) times, replacing this token each time with a number beginning at {*start*} and incrementing by one until reaching {*end*}.

You may include multiple loop tokens on the same line and using different {*start*} values, but only the first {*end*} value is used to determine how many copies of the line to create.

<parentdn>

Replace this value with the DN of the parent entry.

<presence:{percent}>

Include the attribute on the specified percentage of entries generated from this template definition. The percentage value is a number between 0 and 100.

Use this token only with attributes not required by the entry's object classes, and include something in the value of the attribute to be generated on entries including the attribute.

```
<random:alpha:{length}>
```

Replace this value with a string of {length} randomly-chosen alphabetic characters.

<random:alpha:{minlength}:{maxlength}>

Replace this value with a string of between {*minlength*} and {*maxlength*} randomly-chosen alphabetic characters.

- <random:alphanumeric:{*length*}> Replace this value with a string of {*length*} randomly-chosen alphanumeric characters.
- <random:alphanumeric:{minlength}:{maxlength}>
 Replace this value with a string of between {minlength} and {maxlength}
 randomly-chosen alphanumeric characters.
- <random:base64:{length}>

Replace this value with a string of {length} randomly-chosen base64 characters.

If the specified length is not a multiple of 4, then the base64 value produced is padded with equal signs so that the total length is a multiple of 4.

- <random:base64:{*minlength*}:{*maxlength*}> Replace this value with a string of between {*minlength*} and {*maxlength*}
- randomly-chosen base64 characters.
 <random: chars: {characters}: {length}>

Replace this value with a string of *{length}* characters that are randomly-selected from *{characters}*. *{characters}* may be any valid character other than the colon.

<random:hex:{length}>

Replace this value with a string of {length} randomly-chosen hexadecimal digits.

```
<random:hex:{minlength}:{maxlength}>
```

Replace this value with a string of between {*minlength*} and {*maxlength*} randomly-chosen hexadecimal digits.

<random:month>

Replace this value with the name of a randomly-chosen month. That is, t

The value is one of January, February, March, April, May, June, July, August, September, October, November, or December.

<random:month:{length}> Replace this value with the first {*length*} characters of the name of a randomly-chosen month. <random:numeric:{length}> Replace this value with a string of *{length}* randomly-chosen numeric digits. <random:numeric:{min}:{max}> Replace this value with a randomly-chosen number between {*min*} and {*max*}, inclusive. <random:numeric:{min}:{max}:{length}> Replace this value with a randomly-chosen number between {*min*} and {*max*}, inclusive. The value is padded with leading zeros so that it has at least {*length*} digits. <random:telephone> Replace this value with a string of randomly-chosen numeric digits in the form 123-456-7890. This uses a US-format telephone number. You can generate telephone numbers in the format used by other countries by combining other random tags. For example, to generate a telephone number in the UK format, use +44 <random:numeric:4> <random:numeric:6>. <sequential> Replace this value with a sequentially-increasing numeric value. The first value is zero. Sequential counters are separate on a per-attribute basis, so it is possible to use multiple sequential counters in the different attributes of the same entry without impacting each other. <sequential:{firstvalue}> Replace this value with a sequentially-increasing numeric value, where the first number starts at the specified value. Sequential counters are separate on a per-attribute basis, so it is possible to use multiple sequential counters in different attributes of the same entry without impacting each other. In addition to supported tokens, you can cause the makeldif command to generate attribute values from the values of attributes on the entry previously defined in the template by constructing prototype values using those attribute types in braces. For example, the following excerpt reuses givenName and sn (surname) values to define cn (common name) values: . . . givenName: <first> sn: <last> cn: {givenName} {sn}

When generating values from multi-valued attributes, the makeldif command uses the first value in the list.

To use only the first few characters of an attribute value to generate a value, add a colon followed by the length of the substring to use. For example, use {givenName:1}{sn:1}{employeeNumber} to generate values taking the first letter of the first name, followed by the first letter of the last name, followed by the employee number.

Subordinate Template Definitions

To create entries generated from one template definition below those generated by another template definition, include one or more subordinateTemplate definitions in the upper template definition.

Use this functionality with caution, however, as the makeldif command does not prevent you from generating circular references throwing the LDIF generation process into an infinite loop.

Inheritance

Template definitions support inheritance, whereby you specify a template definition that builds on a previously defined template, using the extends definition.

For example, to generate 10000 entries using the person template and an additional 1000 entries having the same structure as those generated from the person but also including a value for the userCertificate attribute, you create a template definition extending the person template as follows:

```
template: certificatePerson
rdnAttr: uid
extends: person
userCertificate: <random:base64:1000>
```

Given the person template defined previously, the certificatePerson template then has the same effect as the following:

```
template: certificatePerson
rdnAttr: uid
objectclass: top
objectclass: person
objectclass: organizationalPerson
objectclass: inetOrgPerson
givenName: <first>
sn: <last>
cn: {givenName} {sn}
uid: {givenName}.{sn}
mail: {uid}@example.com
userPassword: <random:alphanumeric:8>
telephoneNumber: <random:telephone>
userCertificate: <random:base64:1000>
```

You may use multiple levels of inheritance, but you must make sure both to specify the rdnAttr value for the inherited template as the parent's RDN attribute is not automatically used, and to avoid circular references that cause infinite loops in the LDIF generation process.

Examples Examples in this section use the following conventions:

- The makeldif command is found in a directory present in the PATH used for the examples.
- The sample files are located in the current directory.

```
EXAMPLE 1 makeldif: Generating LDIF
```

The following command generates LDIF using the sample template and other files delivered with Directory Server Resource Kit.

```
$ makeldif -t example.template -o sample.ldif
```

Processed 1000 entries Processed 2000 entries Processed 3000 entries Processed 4000 entries Processed 5000 entries Processed 6000 entries Processed 7000 entries Processed 8000 entries Processed 9000 entries Processed 10000 entries Processing complete. 10002 total entries written.

EXAMPLE 2 makeldif: Generating Search Filters and LDIF

The following command generates LDIF and corresponding search filters base.

```
$ makeldif -T uid:eq -T cn:eq,sub -F filters.txt -t example.template -o sample.ldif
Processed 1000 entries
Processed 2000 entries
Processed 3000 entries
Processed 4000 entries
Processed 5000 entries
Processed 6000 entries
Processed 7000 entries
Processed 8000 entries
Processed 9000 entries
Processed 10000 entries
Processing complete.
10002 total entries written.
Writing filters to filters.txt
Wrote 10000 equality filters for uid
Wrote 10000 equality filters for cn
```

EXAMPLE 2 makeldif: Generating Search Filters and LDIF (Continued)

Wrote 1827 subInitial filters for cn Wrote 7328 subAny filters for cn Wrote 2099 subFinal filters for cn

- **Exit Status** The makeldif command exits with status 0 if it completes successfully. Otherwise it exits with non-zero status.
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	Zip distribution only
Stability Level	Evolving

Name mmldif - combine multiple ldif files into a single, authoritative set of entries

- Synopsis install-path/ds6/bin/mmldif [-c][-D][-o out.ldif] files
- **Description** The mmldif command combines multiple LDIF files into a single authoritative set of entries. Typically each LDIF file is from a master server cooperating in a multi-master replication environment (for example, masters that refuse to sync up). Optionally, the mmldif command can generate LDIF change files that could be applied to the original file to bring it up to date with the authoritative version. At least two input files must be specified.
 - **Options** The following options are supported:
 - -c Write a change file (.delta) for each input file.
 - -D Print debugging information.
 - -o Write authoritative data to this file. If not specified, the command compares the input files, but does not generate output LDIF files.
 - *files* Two or more LDIF files to combine into a single set of entries. For example, in1.ldif in2.ldif.
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Evolving

See Also insync(1)

Name	modrate – measure modificat	drate – measure modification performance for an LDAP directory	
Synopsis	install-path/dsrk6/bin/modrate [options] -b baseDN -M attribute:length:regexp		
user-defined modifications. As with all r		sures the rate at which an LDAP directory can perform random, As with all measures of performance, results depend on many ns you pass to the modrate command, and also how the directory	
	The command uses LDAP v3, and cannot be used to authenticate to an LDAP v2 directory not supporting LDAP v3.		
Options	The modrate command supp	orts the following options:	
	- a	Run in asynchronous mode, not waiting for results before requesting subsequent modifications. The maximum number of threads the modrate command can use is limited by the number of file descriptors the operating system allows the process to use. The time is measured starts when the request is sent and finishes when the result is received.	
	-b targetDN	Use the specified DN for the target entry.	
		Refer to Random Target Syntax and Random Target Substitution for details.	
	- C messages	Display the specified number of results messages before exiting. Results messages appear by default as output on standard out, similar to the following:	
		Avg r= 272.00/thr (54.40/sec), total= 816	
		This shows output for three threads requesting modifications for five seconds. The average modify rate per thread is 54.40 per thread per second for the interval measured. The total shown for all threads is 816.	
		Default is to continue iterating until the command is interrupted.	
	-D bindDN	Use the specified bind DN to authenticate to the directory.	
		If the bind DN is not specified, the modrate command attempts anonymous authentication.	
	-E	Display the bind DN of entries for which modifications did not complete successfully.	

-е	Display the number of attempted modifications that did not complete successfully.
-h hostname	Connect to the directory on the specified host.
	Enclose IPv6 addresses in brackets ([]) as described in RFC 2732.
	Default is to connect to the local host on the loopback address, 127.0.0.1.
-i filename	Use the file specified to generate target entry base DNs at random.
	Refer to Random Target Syntax and Random Target Substitution for details.
-j seconds	Display results each specified number of seconds.
	Default is to display results every 5 seconds.
-К	Keep connections open and only bind once, measuring only the time required to perform the modify operation.
	Default is to measure the duration the connection is active as the modification sequence.
-k	Keep connections open, measuring only the time required to perform the bind and modify operations.
	Default is to measure the duration the connection is active as the modification sequence.
-M attribute:length:regexp	Generate random values for modifications on the specified attribute, having the specified integer length in characters. Generate the values from the specified regular expression, <i>regexp</i> , which has the form (c*(c-c)*)* where c represents an ASCII character.
	For example, the <i>regexp</i> parameter could be [A-Z][a-z][0-9], or simply aString
	If the attribute specified does not exist on the target entry, it is added, subject to schema checking.
-m maxIter	Perform no more than the specified number of modifications per thread.

	Default is for each thread to continue iterating until the command is interrupted.
-0 maxHops	Traverse no more than the specified number of hops when following referrals.
	Default is 5.
-p <i>port</i>	Connect to the directory on the specified port.
	Default is to connect to the default simple authentication port for LDAP, 389.
- q	Run in quiet mode, not displaying results.
	Default is to display results every 5 seconds, which you can adjust using the -j option.
- R	Do not follow referrals.
	Default is to follow referrals.
- r maxRand	Use the specified maximum to determine the range for random numbers replacing %d formatting specifications when modifying random target entries.
	When you use this option twice, the first occurrence generates random numbers in the range [0, <i>maxRand1</i> -1] for the first %d, the second [1, <i>maxRand2</i>] for the second %d.
	Refer to Random Target Syntax and Random Target Substitution for details.
- S randSeed	Use the specified seed, an unsigned int, for random number generation.
	Default seed is 0.
-t threads	Use the specified number of the threads to connect to the server.
	Default is to use one thread.
- V	Display verbose output.
-W filename	Read the bind password from the specified file.
-w password	Use the specified bind password to authenticate to the directory.
- w —	Prompt for the bind password so it does not appear on the command line or in a file.

Extended Description	The modrate command repeatedly requests modification operations of a directory server. Threads may be configured to keep open connections or perform LDAP bind with each operation. The command-line options let you specify the bind credentials.			
	The command uses LDAP v3, and cannot be used to authenticate to an LDAP v2 directory not supporting LDAP v3. Furthermore, the modrate command uses simple authentication, not secure binding.			
	The modrate command cannot set a time limit for operations.			
	By default, the modrate command continues its task indefinitely, displaying results periodically, and displaying any errors encountered as well without interrupting operation.			
Random Target Syntax	Include randomly generated numbers by specifying %d and %s placeholders in the base DN. These placeholders are then replaced according to the following rules:			
	%d Replace this placeholder with random integer values depending on the <i>maxRand</i> parameter to the -r option.			
	The -r option may be used at most two times to generate random target entries. Replacement values for the %d placeholder range over [0, <i>maxRand1</i> —1] for the first use of the -r option, and over [1, <i>maxRand2</i>] for the second.			
	%s Replace this placeholder with random strings from the file specified using the -i option.			
	Replacement values for this placeholder are randomly selected lines of the file specified.			
Random Target Substitution				
	• Use only one type of placeholder, either %d or %s, per invocation of the modrate command.			
	 Specify at least as many uses of the -r as %d placeholders used in the base DN. 			
	 Use %>d and %>s to specify literal strings %d and %s, respectively. 			
	In order to use this random modification mechanism, you must populate your directory accordingly. For example, you can measure the modification rate using the following command:			
	<pre>\$ modrate -D "uid=test%d,ou=test,dc=example,dc=com" -w "auth%d%d" -r 100</pre>			
	In order for the modrate command to bind effectively, your directory must contain entries corresponding to the following LDIF excerpt:			
	<pre>dn: uid=test0,ou=test,dc=example,dc=com userPassword: auth00</pre>			
	dn: uid=test1,ou=test,dc=example,dc=com			

```
userPassword: auth11
dn: uid=test2,ou=test,dc=example,dc=com
userPassword: auth22
...
dn: uid=test10,ou=test,dc=example,dc=com
userPassword: auth1010
...
dn: uid=test99,ou=test,dc=example,dc=com
userPassword: auth9999
```

Examples Examples in this section use the following conventions:

- The modrate command is found in a directory present in the PATH used for the examples.
- The directory server is located on a system named host.
- The directory server listens on port 389, the default for non-SSL connections.

EXAMPLE 1 modrate: Sample Output

The following command performs modifications until it has displayed five results messages. Notice that each line concerns only the elapsed interval.

```
$ modrate -h host -D uid=hmiller,ou=people,dc=example,dc=com -w - \
-C 5 -b "uid=test%d,ou=test,dc=example,dc=com" -r 100 -M "description:7:aString"
Enter bind password:
Avg r= 74.00/thr ( 14.80/sec), total= 74
Avg r= 118.00/thr ( 23.60/sec), total= 118
Avg r= 68.00/thr ( 13.60/sec), total= 68
Avg r= 39.00/thr ( 7.80/sec), total= 39
Avg r= 71.00/thr ( 14.20/sec), total= 71
All threads exited
```

If you read Example.ldif, you see that hmiller's password is hillock.

Notice also that a result message provides the following items of information:

- The average rate of modification per thread of execution
- The average rate of modification per second
- The total number of modification operations performed during the interval the results message concerns

EXAMPLE 2 modrate: Modification Rate Alone

The following command keeping the connection open and binds only once:

```
EXAMPLE 2 mod rate: Modification Rate Alone
                                          (Continued)
$ modrate -h host -D uid=hmiller,ou=people,dc=example,dc=com -w - \
-C 5 -b "uid=test%d,ou=test,dc=example,dc=com" -r 100 -M "description:7:aString" -K
Enter bind password:
Avg r= 272.00/thr ( 54.40/sec), total=
                                         272
Avg r= 183.00/thr ( 36.60/sec), total=
                                         183
Avg r= 180.00/thr ( 36.00/sec), total=
                                         180
Avg r= 257.00/thr ( 51.40/sec), total=
                                         257
Avg r= 226.00/thr ( 45.20/sec), total=
                                         226
All threads exited
```

If you read Example.ldif, you see that hmiller's password is hillock.

Exit Status The modrate command returns the following exit status codes.

0	Successful completion.
non-zero	An error occurred.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	Zip distribution only
Stability Level	Evolving

See Also authrate(1), makeldif(1), searchrate(1)

Name	pwdhash – print the encrypted form of a password by using one of the server's encryption algorithms		
Synopsis	install-path/ds6/bin/pwdhash -D instance-path [-H] [-c comparepwd -s scheme] password		
Description	The pwdhash command prints the encrypted form of a password using one of the encryption algorithms available to the server. If a user cannot log in, you can use this command to compare the user's password with the password stored in the directory.		
Options	The following options are supported:		
	- C	Specifies the encrypted password with which the user password is to be compared. The result of this comparison is either OK or password does not match.	
	-D instance-path	Specifies where the Directory Server instance is located.	
	- H	Specifies that the passwords are hex-encoded.	
	password	The clear password from which the encrypted form should be generated (or against which the password in the directory should be compared).	
	- S	Generates the encrypted passwords according to the encryption scheme. The available schemes are SSHA, SHA, CRYPT, and CLEAR.	

Examples EXAMPLE 1 Encrypting a Password

\$ pwdhash -D /local/ds -s SSHA mypassword
{SSHA}mtHyZSHfhOZ4FHmvQe09FQjvLZpnW1wbmW05cw==

EXAMPLE 2 Comparing Two Passwords

\$ pwdhash -D /local/ds \
-c "{SSHA}mtHyZSHfh0Z4FHmvQe09FQjvLZpnW1wbmW05cw==" aPassword
pwdhash: password does not match

- **Exit Status** The following exit values are returned:
 - 0 Successful completion.
 - 1 An error occurred.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Stable

Name	repldisc – discover a replication topology			
Synopsis	install-path/ds6/bin/repldisc [-D bindDN] [-w password] [-j file] [-t] [-n] [-a] [-p port] [-T timeout] [-J file] [-W keypassword] [-K keydbpath] [-N certname] [-P certdbpath] [-e SSL port] [-b ReplicaRoot] -s -S HostSpec			
Description	The repldisc command enables the discovery of a replication topology. Topology discovery starts with one server and constructs a graph of all known servers (using the RUVs and Replication Agreements). repldisc then prints an adjacency matrix describing the topology.			
Options	The followin	ng options are supported:		
	-a	Specifies that only the arcs between pairs of connected hosts are printed. For more information, see EXAMPLES.		
		Note – If the total line length of the output exceeds 80 characters, symbolic host names are used, accompanied by a legend. Otherwise, full host names are printed. Using the -a option ensures that symbolic host names are not used.		
	- b	The suffix (replica root) that has been specified for replication. If -b is not specified, the delay for all suffixes is printed.		
	- D	Distinguished name with which to bind to the server. This parameter is optional if the server is configured to support anonymous access. If a DN is specified in the <i>HostSpec</i> option, this overrides the -D option.		
	-j	If specifying the default password at the command-line poses a security risk, the password can be stored in a file. The - j option specifies this file.		
	- N	Specifies that repldisc should not run in interactive mode. Running in interactive mode allows you to re-enter the bindDN, password, host and port, if a bind error occurs.		
	- p	The TCP port used by the instance. The default port is 389. If a port is specified in the <i>HostSpec</i> , this overrides the -p option.		
	-t	Prints the mode of transport (SSL or CLEAR).		
	- T	Specifies the number of seconds after which repldisc times out if the server connection goes down.		
	- W	Password associated with the distinguished name specified by the -D option. If a password is specified in the <i>HostSpec</i> , this overrides the -w option.		
	HostSpec	Host specification, which takes the form [binddn:[password]@] <i>host</i> [:port]. The following is an example:		
		<pre>cn=admin,cn=Administrators,cn=config:mypword@myserver:1389</pre>		

If you are using SSL, use - S in the server specification. In this case, *HostSpec* specifies the certificate name and key password, rather than the bindDN and password.

- **Ssl Options** You can use the following options to specify that repldisc uses LDAPS when communicating with Directory Server. You can also use these options if you want to use certificate-based authentication. These options are valid only when LDAPS has been turned on and configured.
 - -e Default SSL port, 636.
 - -J This option has the same function as the j option, for the key password.
 - -К Specifies the name of the certificate key used for certificate-based client authentication. For example, -К *Server-Key*.
 - -N Specifies the certificate name to use for certificate-based client authentication. For example, N *Server-Cert*. If this option is specified, the -W option is required.
 - P Specifies the location of the certificate database.
 - -W Specifies the password for the certificate database identified by the -P option. For example, -W *serverpassword*.

Examples EXAMPLE 1 Single Replication Scenario

```
$ repldisc -D cn=admin,cn=Administrators,cn=config -w pwd \
    -b o=rtest -s myserver:1389
```

Topology for suffix: o=rtest

Legend:

- ^ : Host on row sends to host on column.
- v : Host on row receives from host on column.
- x : Host on row and host on column are in MM mode.
- H1 : france.example.com:1389
- H2 : spain:1389
- H3 : portugal:389
 - | H1 | H2 | H3 |

===+=================

H1 | ^ | |

EXAMPLE 1 Single Replication Scenario (Continued) H2 | V | | ^ | H3 | V | | EXAMPLE 2 Using the -a Option Topology for suffix: o=rtest Legend: The direction of the replication is indicated with arrows. Single-master: suppliers appear on left, consumers on right (->). Multi-master : servers are shown linked by a double arrow (<->). france.example.com:1389 -> spain:1389 spain:1389 -> portugal:389 **Exit Status** The following exit values are returned: 0 Successful completion.

1 An error occurred.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Stable

See Also insync(1), entrycmp(1)

Notes The node on which you are running the entrycmp, insync, and repldisc tools must be able to reach all the specified hosts. If these hosts are unavailable, you will encounter difficulties using these tools. Ensure that all servers are up and running before using these tools.

When you identify hosts, you must use either symbolic names or IP addresses for all hosts. The replication monitoring commands do not address resolution between symbolic names and IP addresses. Using a combination of symbolic names and IP addresses can cause problems. Moreover, on multi-homed hosts, referring to the same Directory Server instance using different names may cause unexpected results.

When SSL is enabled, the directory server on which you are running the tools must have a copy of all the certificates used by the other servers in the topology.

repldisc takes the host specification from the replication agreement, unless otherwise specified at the command line.

The replication monitoring tools rely on access to cn=config to obtain the replication status. This should be taken into account, particularly when replication is configured over SSL.

Name	searchrate – measure search performance for an LDAP directory			
Synopsis	install-path/dsrk6/bin/searchrate [options] -b baseDN -f filter			
Description	The searchrate command measures the rate at which an LDAP directory can perform random, user-defined searches. As with all measures of performance, results depend on many factors, including what options you pass to the searchrate command, and also how the directory service itself is tuned.			
Options	The searchrat	searchrate command supports the following options:		
	- A attribute	Retrieve only the specified attribute.		
		Repeat this option to specify multiple attributes.		
	- a	Run in asynchronous mode, not waiting for results before requesting subsequent searches. The maximum number of threads the searchrate command can use is limited by the number of file descriptors the operating system allows the process to use. The time is measured starts when the request is sent and finishes when the result is received.		
	-b baseDN	Use the specified base DN for the target entry.		
		Default is the root DSE, "".		
		Refer to Random Target Syntax and Random Target Substitution for details on number and string substitutions.		
	- C messages	Display the specified number of results messages before exiting. Results messages appear by default as output on standard out, similar to the following.		
		Avg r=2731.00/thr (1092.40/sec), total= 5462		
		This shows output for two threads searching for five seconds. The average search rate per thread is 2731 searches per thread for the interval measured, for 1092.40 searches per second on average. The total shown for both threads is 5462.		
		Default is to continue iterating until the command is interrupted.		
	-D bindDN	Use the specified bind DN to authenticate to the directory.		
		If the bind DN is not specified, the searchrate command attempts anonymous authentication.		
	- E	Display the bind DN and filter for searches that failed to retrieve an entry.		
	-e	Display the number of attempted searches that failed to retrieve an entry.		

- f filter	Use the specified RFC 2254 conformant filter for all searches.		
	Refer to Random Target Syntax and Random Target Substitution for details on number and string substitutions.		
- h <i>hostname</i>	Connect to the directory on the specified host.		
	Enclose IPv6 addresses in brackets ([]) as described in RFC 2732.		
	Default is to connect to the local host on the loopback address, 127.0.0.1.		
- i filename	Use the file specified to generate target entry base DNs at random.		
	Refer to Random Target Syntax and Random Target Substitution for details.		
- j seconds	Display results each specified number of seconds.		
	Default is to display results every 5 seconds.		
- K	Keep connections open and only bind once, measuring only the time required to perform the search operation.		
	Default is to measure the duration the connection is active as the search sequence.		
- k	Keep connections open, measuring only the time required to perform the bind and search operations.		
	Default is to measure the duration the connection is active as the search sequence.		
-l seconds	Set the search time-out at the specified number of seconds for synchronous searches.		
	Default is 10 seconds.		
-m maxIter	Perform no more than the specified number of searches per thread.		
	Default is for each thread to continue iterating until the command is interrupted.		
-p <i>port</i>	Connect to the directory on the specified port.		
	Default is to connect to the default simple authentication port for LDAP, 389.		
- q	Run in quiet mode, not displaying results.		
	Default is to display results every 5 seconds, which you can adjust using the - j option.		

	- r maxRand	Use the specified maximum to determine the range for random numbers replacing %d formatting specifications when searching random target entries.	
		When you use this option twice, the first occurrence generates random numbers in the range [0, <i>maxRand1</i> –1] for the first %d, the second [1, <i>maxRand2</i>] for the second %d.	
		Refer to	Random Target Syntax and Random Target Substitution for details.
	- S randSeed	Use the	specified seed, an unsigned int, for random number generation.
		Default	seed is 0.
	- s scope	Use the	specified scope when searching.
		The follo	owing values are supported for <i>scope</i> :
		base	Examine only the entry specified by the argument to the -b option.
		one	Examine only to the entry specified by the argument to the -b option and its immediate children.
		sub	(Default) Examine the subtree whose root is the entry specified by the argument to the -b option.
	-t threads	Use the	specified number of the threads to connect to the server.
		Default	is to use one thread.
	- V	Display	verbose output.
	-W filename	Read the	e bind password from the specified file.
	-w password	Use the	specified bind password to authenticate to the directory.
	- W —	Prompt for the bind password so it does not appear on the command line or in a file.	
Extended Description	Threads may be	e configu	nd repeatedly requests search operations of a directory server. red to keep open connections or perform LDAP binds with each d-line options let you specify the bind credentials.
	The command uses LDAP v3, and cannot be used to authenticate to an LDAP v2 directory not supporting LDAP v3. Furthermore, the searchrate command uses simple authentication, not secure binding.		
			te command continues its task indefinitely, displaying results ing any errors encountered as well without interrupting operation.
Random Target Syntax	Include randomly generated numbers by specifying %d and %s placeholders in the base DN and filters. These placeholders are then replaced according to the following rules:		

%d Replace this placeholder with random integer values depending on the *maxRand* parameter to the - r option.

The -r option may be used at most two times to generate random base DNs or filters. Replacement values for the %d placeholder range over [0,*maxRand1*–1].

%s Replace this placeholder with random strings from the file specified using the -i option.

Replacement values for this placeholder are randomly selected lines of the file specified.

Multiple - r and - i options are matched to the %d and %s placeholders, respectively, in the order they are used.

Random Target Substitution The searchrate command requires that you apply the following rules for substitutions, displaying an error message when the used incorrectly:

- Use only one type of placeholder, either %d or %s, per invocation of the searchrate command.
- Specify at least as many uses of the r as %d placeholders used.
- Use %%d and %%s to specify literal strings %d and %s, respectively.

In order to use this random mechanism, you must populate your directory accordingly. For example, you can measure the search rate using the following command:

\$ searchrate -b "ou=test,dc=example,dc=com" -f "uid=test%d" -r 100

In order for the searchrate command to find entries, your directory must contain entries corresponding to the following LDIF excerpt:

```
dn: uid=test0,ou=test,dc=example,dc=com
userPassword: auth00
dn: uid=test1,ou=test,dc=example,dc=com
userPassword: auth11
dn: uid=test2,ou=test,dc=example,dc=com
userPassword: auth22
...
dn: uid=test10,ou=test,dc=example,dc=com
userPassword: auth1010
...
dn: uid=test99,ou=test,dc=example,dc=com
userPassword: auth9999
```

Examples Examples in this section use the following conventions:

- The searchrate command is found in a directory present in the PATH used for the examples.
- The directory server is located on a system named host.
- The directory has been configured to support anonymous access for search and read. Therefore, you do not have to specify bind information.
- The directory server listens on port 389, the default for non-SSL connections.

EXAMPLE 1 searchrate: Sample Output

The following command performs searches until it has displayed five results messages. Notice that each line concerns only the elapsed interval.

```
$ searchrate -h host -b dc=example,dc=com -f "(uid=bjensen)" -C 5
Avg r=1349.00/thr (269.80/sec), total= 1349
Avg r=1312.00/thr (262.40/sec), total= 1312
Avg r=1334.00/thr (266.80/sec), total= 1334
Avg r=1346.00/thr (269.20/sec), total= 1346
Avg r=1340.00/thr (268.00/sec), total= 1340
All threads exited
```

Notice also that a result message provides the following items of information:

- The average search rate per thread of execution
- The average search rate per second
- The total number of search operations performed during the interval the results message concerns

EXAMPLE 2 searchrate: Search Rate Alone

The following command keeping the connection open and binds only once:

```
$ searchrate -h host -b dc=example,dc=com -f "(uid=bjensen)" -C 5 -K
Avg r=2706.00/thr (541.20/sec), total= 2706
Avg r=2706.00/thr (541.20/sec), total= 2706
Avg r=2739.00/thr (547.80/sec), total= 2739
Avg r=2717.00/thr (543.40/sec), total= 2717
Avg r=2731.00/thr (546.20/sec), total= 2731
All threads exited
```

```
EXAMPLE 3 searchrate: Using a Filter File
```

The following commands substitute filters from a file to perform searches:

```
$ cat filters
=Jen*
```

```
=Jensen
           >=Jensen
           <=Jensen
           ~=Jensen
           $ searchrate -h host -b dc=example,dc=com -f "(sn%s)" -i filters -C 5 -K
           Avg r= 59.00/thr ( 11.80/sec), total=
                                                     59
           Avg r= 64.00/thr ( 12.80/sec), total=
                                                     64
           Avg r= 63.00/thr ( 12.60/sec), total=
                                                     63
           Avg r= 64.00/thr ( 12.80/sec), total=
                                                     64
           Avg r= 61.00/thr ( 12.20/sec), total=
                                                     61
           All threads exited
Exit Status The searchrate command returns the following exit status codes.
                        Successful completion.
           0
                        An error occurred.
           non-zero
```

Administration Commands

Name dpadm – Manage the administration of Directory Proxy Server **Synopsis** *install-path*/dps6/bin/dpadm [subcommand] [global-options] [subcommand-options] [subcommand-operands] **Description** The dpadm command is the administration command for the Directory Proxy Server. Use the dpadm command with one of the subcommands described in this man page. **Subcommands** The following subcommands are supported: dpadm add-cert -i -W CERT_PW_FILE INSTANCE_PATH CERT_ALIAS CERT_FILE Adds a certificate to the certificate database. dpadm add-selfsign-cert [-i] [-W CERT_PW_FILE] [-s DN | --name NAME [--org ORG] [--org-unit ORG-UNIT] [--city CITY] [--state STATE] [--country COUNTRY]] [--keyalg KEYALG] [--sigalg SIGALG] INSTANCE PATH CERT ALIAS Creates a self-signed certificate and adds it to the certificate database. dpadm autostart [--off [-i]] INSTANCE PATH Enables or disables Directory Proxy Server instance startup at system boot. This command is only available if you installed with Sun Java Enterprise System or native packages, and is not available on Windows. dpadm backup INSTANCE PATH ARCHIVE DIR Creates a backup archive of the Directory Proxy Server instance. dpadm create [-i] [-p PORT] [-P SECURE PORT] [-u USER NAME -g GROUP_NAME] [-D DN] [-w PWD_FILE] INSTANCE_PATH Creates a Directory Proxy Server Instance. dpadm delete INSTANCE_PATH Deletes an instance of Directory Proxy Server. dpadm disable-service [-T TYPE] INSTANCE PATH Disables a Directory Proxy Server from being managed as a service. This command is on Windows distributions and Solaris native package distributions only. dpadm enable-service [-T TYPE] INSTANCE PATH [RESOURCE GRP] Enables a Directory Proxy Server instance to be managed as a service. This command is on Windows distributions and Solaris native package distributions only. dpadm get-flags INSTANCE_PATH [FLAG...] Displays the flag values for the Directory Proxy Server instance. dpadm import-cert [-i] [-W CERT_PW_FILE] [-I INPUT_PW_FILE] INSTANCE_PATH CERT_FILE Imports the public and private keys of a certificate in the certificate database.

dpadm info INSTANCE_PATH

Displays information about the status and configuration of the Directory Proxy Server instance.

dpadm list-certs [-i] [-C] [-W CERT_PW_FILE] INSTANCE_PATH Lists all certificates in the certificate database.

dpadm remove-cert [-i] [-W CERT_PW_FILE] INSTANCE_PATH CERT_ALIAS Removes a certificate from the certificate database.

dpadm renew-cert [-i] [-W CERT_PW_FILE] INSTANCE_PATH CERT_ALIAS
CERT_FILE

Renews a certificate in the certificate database.

dpadm request-cert [-i] [-W CERT_PW_FILE] [-s DN | --name NAME [--org ORG] [--org-unit ORG-UNIT] [--city CITY] [--state STATE] [--country COUNTRY]] [--sigalg SIGALG] [--keyalg KEYALG] [-o OUTPUT_FILE] INSTANCE_PATH CERT_ALIAS

Generates a certificate request.

dpadm restart [-i] [-W] [CERT_PW_FILE] [INSTANCE_PATH]
Restarts a Directory Proxy Server instance.

dpadm restore *INSTANCE_PATH ARCHIVE_DIR* Restores a Directory Proxy Server instance from a backup archive.

dpadm set-flags [-i] [-W CERT_PW_FILE] INSTANCE_PATH FLAG=VAL
[FLAG=VAL...]

Sets flag values for a Directory Proxy Server instance.

```
dpadm show-cert [-i] [-W CERT_PW_FILE] [-o OUTPUT_FILE] [-F FORMAT]
INSTANCE_PATH [CERT_ALIAS]
Displays a certificate.
```

If no CERT_ALIAS is specified, the default server certificate is displayed.

dpadm split-ldif *INSTANCE_PATH LDIF_FILEOUTPUT_FILE_DIR* Splits the LDIF file given by *LDIF_FILE* into multiple LDIF files according to the data distribution configured in Directory Proxy Server. One LDIF file is created for each data view defined in the *LDIF_FILE* file.

The LDIF files are stored in the *OUTPUT_FILE_DIR* directory and are automatically named after the data view, with the following format: *OUTPUT_FILE_DIR.DATA_VIEW_NAME*.ldif

The dpadm split-ldif command can be launched even if the Directory Proxy Server is running.

dpadm start [-Ei] [-W CERT_PW_FILE] INSTANCE_PATH Starts a Directory Proxy Server instance.

	dpadm stop INSTANCE_PATH Stops a Directory Proxy Server instance.			
Global Options	The following options are global, and are applicable to all commands and subcommands.			
	?			
	help	Displays instructions for acces	ssing help.	
	- V			
	version	<i>year.monthday.time DISTRIB</i> was built on December 4th, 20 type. <i>NAT</i> refers to the packag System. <i>ZIP</i> refers to the ZIP v	f dpadm. The version is provided in the format // <i>NAT/ZIP</i> . So version number 2007.1204.0035 007 at 00h35. <i>DISTRIB</i> indicates the distribution e version, installed through the Java Enterprise version. If the components used by dpadm are not dividual component is displayed.	
	- V			
	verbose	Displays instructions for acces	ssing verbose help.	
Subcommand	The following options are applicable to the subcommands where they are specified.			
Options	-C			
	ca		Lists Certificate Authority certificates only. The default is to list server certificates only.	
	city CITY		Adds L=CITY to the subject DN. Default is none.	
	country C	OUNTRY	Adds C=COUNTRY to the subject DN. The default is none.	
	-D <i>DN</i>			
	rootDN <i>DN</i>	Τ	Defines the Proxy Manager DN. The default is cn=Proxy Manager.	
	-E			
	safe		Starts Directory Proxy Server with the configuration used at the last successful startup.	
	-F FORMAT			
	format FO	RMAT	Specifies the output format. The options are readable and ascii. The default is readable.	
	-g GROUP_NAME			
	group GRC		Specifies the group name for the owner of the server instance. The default is the name of the current group.	

-i	
no-inter	Does not prompt for confirmation before performing the operation.
-I INPUT_PW_FILE	
input-pwd-file <i>INPUT_PW_FILE</i>	Specifies the certificate password. The default is to prompt for a password.
keyalg <i>KEYALG</i>	Specifies the key-pair generation algorithm (DSA or RSA).
sigalg <i>SIGALG</i>	Specifies the signature algorithm used to sign the certificate. The signature algorithm depends on the underlying key-pair generation algorithm. The default signature algorithm is SHA1withDSA when the key algorithm is DSA, and MD5withRSA when the key algorithm is RSA.
name NAME	Adds CN=NAME to the subject DN. The default is the hostname.
-O OUTPUT_PW_FILE	
output-pwd-file <i>OUTPUT_PW_FILE</i>	Reads the output password from the OUTPUT_FILE file. The default is a prompt for a password.
o OUTPUT_FILE	
output OUTPUT_FILE	Stores the command results in the OUTPUT_FILE file. The default is stdout.
off	Disables the autostart of an instance of Directory Proxy Server at system boot
org ORG	Adds 0=0RG to the subject DN. The default is none.
org-unit ORG-UNIT	Adds 0=0RG-UNIT to the subject DN. The default is none.
p PORT	
port PORT	Specifies the port for LDAP traffic. The default is 389 or 1389.
p <i>SECURE_PORT</i>	
secure-port SECURE_PORT	Specifies the secure SSL port for LDAP traffic. The default is 636 or 1636.

	S DN		C	he ash is at DN The default is	
	subjectDN <i>DN</i>			he subject DN. The default is _ <i>ALIAS</i> cn= <i>hostname</i> .	
	state STATE		Adds ST=5 the hostna	STATE to the subject DN. Default is ame.	
	T <i>TYPE</i>				
	type <i>TYPE</i>			pe. Can be SMF when using Solaris 10, RVICE when using Windows.	
	-u USER_NAME				
	username USER_NAN	ME	-	he user name for the owner of the tance. The default is the name of the ser.	
	W CERT_PW_FILE				
	cert-pwd-file CERT_PW_FILE			certificate database password from PW_FILE file. The default is a prompt ord.	
	w PW_FILE				
	pwd-file PW_FILE			password from the PW_FILE file. The a prompt for password.	
	The following operands are supported:				
Operands	ARCHIVE_DIR Specifies the path to instance.		the backup of the Directory Proxy Server		
	CERT_ALIAS Specifies the certific		ate alias.		
	CERT_FILE	Specifies the file that	contains the certificate.		
			represents a property operand when using the t-flags. Possible flags: cert-pwd-prompt,		
	FLAG=VALUESpecifies a flag and i the following values		its value. The <i>FLAG=VALUE</i> operand can have s:		
		cert-pwd-prompt=c	off	Sets the certificate database password storage mode to on. The certificate database password is stored on the file system. This is the default value.	
		cert-pwd-prompt=c	on	Sets the certificate database password storage mode to off. The	

certificate database password is not

stored on the file system. You are prompted to supply the certificate database password when needed.

jvm-args="arg1 arg2 ..." These values are arguments passed to the Java Virtual Machine (JVM).

The default value is jvm-args=-Xmx250M -Xms250M.

-Xmx*memory* is the maximum memory size for the JVM. The default value is -Xmx250M (250 MB).

-Xms*memory* is the startup memory size for the JVM. The default value is -Xms250M (250 MB). The startup memory size -Xms*memory* should be the same as the maximum memory size -Xmx*memory*.

-XX:NewRatio=*ratio* is applicable to the Sun Hotspot JVM only, and is the ratio between old and young generation memory. The recommended value is -XX:NewRatio=1, which is equal old and young generation memory.

The -d flag specifies which JVM is used (32-bits or 64-bits). By default, Directory Proxy Server is launched with a 64-bit JVM, if available, and with a 32-bit JVM otherwise. If you want to override this behavior and specify the JVM, set the jvm-args flag to either d-32 or d-64, for example jvm-args=-Xmx250M -Xms250M -d32

You can use the jvm-args flag to pass a list of arguments to the JVM. For information about JVM

arguments not described in this man page, see the java(1) man page.

	INSTANCE_PAT	H Specifies the path to the Directory Proxy Server instance.
	LDIF_FILE	Specifies the LDIF file that is to be split by using the split_ldif subcommand.
	OUTPUT_FILE_I	DIR Specifies the directory where LDIF files are placed after being split by the split_ldif subcommand.
Exit Status	The following exit	status values are returned:
	0 Suce	cessful completion.
	non-zero An	error occurred.
Examples	The following exa	mples show how the dpadm command is used.
	EXAMPLE 1 Creating	a Directory Proxy Server Instance
	The following exa	mple shows how to create a Directory Proxy Server instance.
	<pre>\$ dpadm create /</pre>	local/dps
	EXAMPLE 2 Starting a Directory Proxy Server Instance The following example shows how to start a Directory Proxy Server instance. \$ dpadm start /local/dps	
	EXAMPLE 3 Getting I	nformation about a Directory Proxy Server Instance
	The following exa instance.	mple shows how to get information about a Directory Proxy Server
	<pre>\$ dpadm info /lo</pre>	cal/dps

Name dpconf – Manage the configuration of Directory Proxy Server **Synopsis** *install-path*/dps6/bin/dpconf subcommand [global-options] [subcommand-options] [subcommand-operands] **Description** The dpconf command manages the configuration of Directory Proxy Server. An instance of Directory Proxy Server must be running in order for you to run the dpconf command. Subcommands The following subcommands are supported: dpconf add-jdbc-attr [-h host] [-p port] TABLE NAME ATTR NAME COLUMN NAME Add a JDBC attribute by using a SQL table. dpconf add-virtual-transformation [-h host] [-p port] VIEW NAME MODEL ACTION ATTR NAME [PARAM...] Add a virtual transformation to a data view. dpconf attach-jdbc-data-source [-h host] [-p port] POOL NAME SRC NAME [SRC NAME...] Attach one or more JDBC data sources to a JDBC data source pool. dpconf attach-ldap-data-source [-h host] [-p port] POOL NAME SRC NAME [SRC_NAME...] Attach one or more LDAP data sources to an LDAP data source pool. dpconf create-connection-handler [-h host] [-p port] NAME [NAME...] Create one or more new connection handlers. dpconf create-custom-search-size-limit [-h host] [-p port] POLICY_NAME LIMIT_NAME [LIMIT_NAME...] Create one or more new custom search size limits for a resource limits policy. dpconf create-jdbc-data-source [-h host] [-p port] -b DB_NAME -B DB_URL -J DRIVER_URL [-J DRIVER_URL]... -S DRIVER_CLASS SRC_NAME Create a JDBC data source that corresponds to an existing JDBC database. dpconf create-jdbc-data-source-pool [-h host] [-p port] NAME [NAME...] Create one or more JDBC data source pools. dpconf create-jdbc-data-view [-h host] [-p port] JDBC_VIEW_NAME POOL_NAME SUFFIX_DN Create a data view that enables LDAP applications to view JDBC tables. dpconf create-jdbc-object-class [-h host] [-p port] JDBC_VIEW_NAME OBJECTCLASS PRIMARY_TABLE [SECONDARY_TABLE...] DN_PATTERN Create a JDBC object class and attach it to a JDBC data view. At least one JDBC table, the primary table, must be specified. Additional tables can be specified if the JDBC data view is to be a join data view of more than one JDBC table.

dpconf create-jdbc-table [-h host] [-p port] TABLE_NAME DB_TABLE Create a IDBC table. dpconf create-join-data-view [-h host] [-p port] JOIN_NAME PRIMARY_NAME SECONDARY NAME SUFFIX DN Create a virtual data view that combines or aggregates two separate data views. One of these data views is the primary data view, and the other the secondary data view. Before you can create a join data view, you must define at least one join rule on the secondary data view. To define join rules, set the dn-join-rule or filter-join-rule properties of the secondary data view. dpconf create-ldap-data-source [-h host] [-p port] NAME HOST: PORT Create a new LDAP data source. dpconf create-ldap-data-source-pool [-h host] [-p port] NAME [NAME...] Create one or more new LDAP data source pools. dpconf create-ldap-data-view [-h host] [-p port] VIEW NAME POOL NAME SUFFIX DN Create a new LDAP data view. dpconf create-ldif-data-view [-h host] [-p port] VIEW NAME LDIF FILE NAME SUFFIX DN Create a new LDIF data view. dpconf create-request-filtering-policy [-h host] [-p port] NAME [NAME...] Create one or more new request filtering policies. dpconf create-resource-limits-policy [-h host] [-p port] NAME [NAME...] Create one or more new resource limits policies. dpconf create-search-data-hiding-rule [-h host] [-p port] POLICY_NAME RULE NAME [RULE NAME...] Create one or more new search data hiding rules for a request filtering policy. dpconf create-user-mapping [-h host] [-p port] NAME USER_DN USER_PWD_FILE Create a new user mapping. dpconf delete-connection-handler [-h host] [-p port] NAME [NAME...] Delete existing connection handlers. dpconf delete-custom-search-size-limit [-h host] [-p port] POLICY_NAME LIMIT_NAME [LIMIT_NAME...] Delete existing custom search size limit for a resource limits policy. dpconf delete-jdbc-data-source [-h host] [-p port] NAME [NAME...] Delete one or more IDBC data sources. dpconf delete-jdbc-data-source-pool [-h host] [-p port] NAME [NAME...] Delete one or more JDBC data source pools.

dpconf delete-jdbc-data-view [-h <i>host</i>] [-p <i>port</i>] <i>NAME</i> [<i>NAME</i>] Delete one or more JDBC data views.
<pre>dpconf delete-jdbc-object-class [-h host] [-p port] JDBC_VIEW_NAME OBJECTCLASS [OBJECTCLASS] Delete one or more JDBC object classes.</pre>
dpconf delete-jdbc-table [-h <i>host</i>] [-p <i>port</i>] <i>NAME</i> [<i>NAME</i>] Delete one or more JDBC tables.
dpconf delete-join-data-view [-h <i>host</i>] [-p <i>port</i>] <i>JOIN_NAME</i> Delete a join data view.
dpconf delete-ldap-data-source [-h <i>host</i>] [-p <i>port</i>] <i>NAME</i> [<i>NAME</i>] Delete existing LDAP data sources.
dpconf delete-ldap-data-source-pool [-h <i>host</i>] [-p <i>port</i>] <i>NAME</i> [<i>NAME</i>] Delete existing LDAP data source pools.
<pre>dpconf delete-ldap-data-view [-h host] [-p port] VIEW_NAME [VIEW_NAME] Delete existing LDAP data views.</pre>
<pre>dpconf delete-ldif-data-view [-h host] [-p port] VIEW_NAME [VIEW_NAME] Delete existing LDIF data views.</pre>
<pre>dpconf delete-request-filtering-policy [-h host] [-p port] NAME [NAME] Delete existing request filtering policies.</pre>
<pre>dpconf delete-resource-limits-policy [-h host] [-p port] NAME [NAME] Delete existing resource limits policies.</pre>
<pre>dpconf delete-search-data-hiding-rule [-h host] [-p port] POLICY_NAME RULE_NAME [RULE_NAME] Delete an existing search data hiding rule.</pre>
dpconf delete-user-mapping [-h <i>host</i>] [-p <i>port</i>] <i>NAME</i> [<i>NAME</i>] Delete existing user mappings.
dpconf detach-jdbc-data-source [-h <i>host</i>] [-p <i>port</i>] <i>POOL_NAME SRC_NAME</i> [<i>SRC_NAME</i>] Detach JDBC data sources from a JDBC data source pool.
dpconf detach-ldap-data-source [-h <i>host</i>] [-p <i>port</i>] <i>POOL_NAME SRC_NAME</i> [<i>SRC_NAME</i>] Detach LDAP data sources from an LDAP data source pool.
<pre>dpconf get-access-log-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] [PROP] View the properties of the access log.</pre>
<pre>dpconf get-attached-ldap-data-source-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] POOL_NAME SRC_NAME [PROP] View the properties of an attached LDAP data source.</pre>

View the properties of an attached LDAP data source.

dpconf get-connection-handler-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] NAME [PROP...] View the properties of a connection handler. dpconf get-custom-search-size-limit-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] POLICY_NAME LIMIT_NAME [PROP...] View the properties of custom search size limits for a resource limits policy. dpconf get-error-log-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] NAME [PROP...] View the properties of the error log. dpconf get-jdbc-attr-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] TABLE NAME ATTR NAME [PROP...] View the properties of a JDBC attribute. dpconf get-jdbc-data-source-pool-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] NAME [PROP...] View the properties of a JDBC data source pool. dpconf get-jdbc-data-source-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] NAME [*PROP*...] View the properties of a JDBC data source. dpconf get-jdbc-data-view-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] NAME [*PROP...*] View the properties of a JDBC data view. dpconf get-jdbc-object-class-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] NAME [PROP...] View the properties of a JDBC object class. dpconf get-jdbc-table-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] TABLE NAME [PROP] View the properties of a JDBC table. dpconf get-join-data-view-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] JOIN NAME [PROP...] View the properties of a join data view. dpconf get-ldap-data-source-pool-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] NAME [PROP...] View the properties of an LDAP data source pool. dpconf get-ldap-data-source-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] NAME [*PROP*...] View the properties of an LDAP data source. dpconf get-ldap-data-view-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] VIEW NAME [PROP...] View the properties of an LDAP data view.

dpconf get-ldap-listener-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] NAME
[PROP...]

View the properties of the LDAP listener.

```
dpconf get-ldaps-listener-prop [-h host] [-p port] [-M UNIT] [-Z UNIT]
[PROP...]
```

View the properties of the LDAPS listener.

dpconf get-ldif-data-view-prop [-h host] [-p port] [-M UNIT] [-Z UNIT]
VIEW_NAME [PROP...]

View the properties of an LDIF data view.

```
dpconf get-request-filtering-policy-prop [-h host] [-p port] [-M UNIT] [-Z
UNIT] NAME [PROP...]
```

View the properties of a request filtering policy.

```
dpconf get-resource-limits-policy-prop [-h host] [-p port] [-M UNIT] [-Z UNIT]
NAME [PROP...]
```

View the properties of the resource limits policy

dpconf get-search-data-hiding-rule-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] POLICY_NAME RULE_NAME [PROP...]

View the properties of search data hiding rules for a request filtering policy.

dpconf get-server-prop [-h *host*] [-p *port*] [-M *UNIT*] [-Z *UNIT*] [*PROP...*] View the properties of a Directory Proxy Server.

dpconf get-user-mapping-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] NAME
[PROP...]

View the properties of a user mapping.

dpconf get-virtual-aci-prop [-h host] [-p port] [PROP...]

View the properties of the data view defined to provide access to virtual ACIs.

dpconf get-virtual-transformation-prop [-h host] [-p port] [-M UNIT] [-Z UNIT] VIEW_NAME TRANSFORMATION_NAME [PROP...]

View the properties of a virtual transformation. Virtual transformation properties that can be specified include action, attr-name, model, internal-value and view-value.

dpconf help-properties [-r]

View information about the properties exposed by subcommands.

dpconf info

Display information about server configuration.

```
dpconf list-attached-jdbc-data-sources [-h host] [-p port] [-E]
[POOL NAME...]
```

List JDBC data sources that are attached to a data source pool.

dpconf list-attached-ldap-data-sources [-h host] [-p port] [-E] [POOL NAME...] List LDAP data sources that are attached to a data source pool. dpconf list-connection-handlers [-h host] [-p port] [-E] List the existing connection handlers. dpconf list-custom-search-size-limits [-h host] [-p port] [-E] [POLICY NAME...] List the existing custom search size limits for a resource limits policy. dpconf list-jdbc-attrs [-h host] [-p port] [-E] [TABLE_NAME...] List the JDBC attributes that have been defined using SQL tables. dpconf list-jdbc-data-source-pools [-h *host*] [-p *port*] [-E] List the existing JDBC data source pools. dpconf list-jdbc-data-sources [-h *host*] [-p *port*] [-E] List the existing JDBC data sources. dpconf list-jdbc-object-classes [-h host] [-p port] [-E] [JDBC VIEW NAME...] List the JDBC object classes that are attached to a JDBC data view. dpconf list-jdbc-tables [-h host] [-p port] [-E] List all JDBC tables. dpconf list-join-data-views [-h host] [-p port] [-E] List the existing join data views. dpconf list-ldap-data-source-pools [-h host] [-p port] [-E] List the existing LDAP data source pools. dpconf list-ldap-data-sources [-h host] [-p port] [-E] List the existing LDAP data sources. dpconf list-ldap-data-views [-h host] [-p port] [-E] List the existing LDAP data views. dpconf list-ldif-data-views [-h host] [-p port] [-E] List the existing LDIF data views. dpconf list-request-filtering-policies [-h host] [-p port] [-E] List the existing request filtering policies. dpconf list-resource-limits-policies [-h host] [-p port] [-E] List the existing resource limits policies. dpconf list-search-data-hiding-rules [-h host] [-p port] [-E] [POLICY_NAME...] List the existing search data hiding rules for a request filtering policy. dpconf list-user-mappings [-h host] [-p port] [-E] List the existing user mappings.

```
dpconf list-virtual-transformations [-h host] [-p port] [-E] [VIEW_NAME...] List the virtual transformations that are defined on a data view.
```

```
dpconf remove-jdbc-attr [-h host] [-p port] TABLE_NAME ATTR_NAME
[ATTR_NAME...]
Delete a JDBC attribute.
```

dpconf remove-virtual-transformation [-h host] [-p port] VIEW_NAME
TRANSFORMATION_NAME [TRANSFORMATION_NAME...]

Delete a virtual transformation.

dpconf rotate-log-now [-h *host*] [-p *port*] *LOG_TYPE* Launch the rotation of a log file.

dpconf set-access-log-prop [-h *host*] [-p *port*] *PROP*: *VAL* [*PROP*: *VAL*...] Change the properties of the access log. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-attached-ldap-data-source-prop [-h host] [-p port] POOL_NAME
SRC_NAME PROP:VAL [PROP:VAL...]

Change the properties of an attached LDAP data source. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-connection-handler-prop [-h host] [-p port] NAME PROP:VAL
[PROP:VAL...]

Change the properties of a connection handler. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-custom-search-size-limit-prop [-h host] [-p port] POLICY_NAME
LIMIT_NAME PROP:VAL [PROP:VAL...]

Change the properties of custom search size limits for a resource limits policy. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-error-log-prop [-h *host*] [-p *port*] *PROP*: *VAL* [*PROP*: *VAL*...] Change the properties of the error log. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-jdbc-attr-prop [-h host] [-p port] TABLE_NAME ATTR_NAME
PROP:VAL [PROP:VAL...]

Change the properties of a JDBC attribute. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-jdbc-data-source-pool-prop [-h host] [-p port] NAME PROP:VAL
[PROP:VAL...]

Change the properties of a JDBC data source pool. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-jdbc-data-source-prop [-h host] [-p port] NAME PROP:VAL
[PROP:VAL...]

Change the properties of a JDBC data source. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-jdbc-data-view-prop [-h host] [-p port] VIEW_NAME PROP:VAL
[PROP:VAL...]

Change the properties of a JDBC data view. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-jdbc-object-class-prop [-h host] [-p port] JDBC_VIEW_NAME
OBJECTCLASS PROP:VAL [PROP:VAL...]

Change the properties of a JDBC object class. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-jdbc-table-prop [-h host] [-p port] TABLE_NAME PROP:VAL
[PROP:VAL...]

Change the properties of a JDBC table. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-join-data-view-prop [-h host] [-p port] VIEW_NAME PROP:VAL
[PROP:VAL...]

Change the properties of a join data view. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-ldap-data-source-pool-prop [-h host] [-p port] NAME PROP:VAL
[PROP:VAL...]

Change the properties of an LDAP data source pool. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-ldap-data-source-prop [-h host] [-p port] NAME PROP:VAL
[PROP:VAL...]

Change the properties of an LDAP data source. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

set-ldap-data-view-prop [-h host] [-p port] VIEW_NAME PROP:VAL
[PROP:VAL...]

Change the properties of an LDAP data view. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-ldap-listener-prop [-h *host*] [-p *port*] *PROP*:*VAL* [*PROP*:*VAL*...] Change the properties of the LDAP listener. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-ldaps-listener-prop [-h *host*] [-p *port*] *PROP*: *VAL* [*PROP*: *VAL*...] Change the properties of the LDAPS listener. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-ldif-data-view-prop [-h host] [-p port] VIEW_NAME PROP:VAL
[PROP:VAL...]

Change the properties of an LDIF data view. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-request-filtering-policy-prop [-h host] [-p port] NAME PROP:VAL
[PROP:VAL...]

Change the properties of a request filtering policy. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-resource-limits-policy-prop [-h host] [-p port] NAME PROP:VAL
[PROP:VAL...]

Change the properties of a resource limits policy. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-search-data-hiding-rule-prop [-h host] [-p port] POLICY_NAME
RULE_NAME PROP:VAL [PROP:VAL...]

Change the properties of search data hiding rules for a request filtering policy. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-server-prop [-h *host*] [-p *port*] *PROP*: *VAL* [*PROP*: *VAL*...] Change the properties of a Directory Proxy Server instance. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-user-mapping-prop [-h host] [-p port] NAME PROP:VAL
[PROP:VAL...]

Change the properties of a user mapping. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dpconf set-virtual-aci-prop [-h *host*] [-p *port*] *PROP*: *VAL* [*PROP*: *VAL*...] Change the properties of the data view defined to provide access to virtual ACIs. If you do not specify a *VAL*, the value of the property is reset.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

	TRANSFORMATION_NA Change the properties do not specify a VAL, t	ansformation-prop [-h <i>host</i>] [-p <i>port</i>] <i>VIEW_NAME</i> <i>AME PROP:VAL</i> [<i>PROP:VAL</i>] of a virtual transformation that was defined on the data view. If you the value of the property is reset. erties, use <i>PROP</i> +: <i>VAL</i> to add a value, and <i>PROP-:VAL</i> to remove a
Global Options	The following options are	e global to all commands and subcommands:
	- ?	
	help	Displays help information for a command or subcommand.
	-c accept-cert	Does not ask for confirmation before accepting untrusted server certificates.
	-D <i>USER_DN</i> user-dn <i>USER_DN</i>	Binds as <i>USER_DN</i> . The dpconf command searches for a <i>USER_DN</i> value in the following order:
		 A USER_DN specified in the command line A USER_DN set by using the \$LDAP_ADMIN_USER environment variable
		If none of these are found, the default is to bind as the cn=Proxy Manager user.
	-e unsecured	Connects over LDAP with no secure connection. To connect over a clear connection by default, set the DIR_PROXY_UNSECURED environment variable.
	-h <i>HOST</i> hostname <i>HOST</i>	Connects to the proxy server on <i>HOST</i> . The dpconf command searches for a <i>HOST</i> value in the following order:
		 A <i>HOST</i> specified in the command line A <i>HOST</i> set by using the \$DIR_PROXY_HOST environment variable
		If none of these are found, the default is to use the local host.
	-i no-inter	Does not ask for confirmation or passwords.
	-j reject-cert	Does not ask for confirmation before rejecting untrusted server certificates in this session.

- p PORT		
port PORT	Connects to the proxy on <i>PORT</i> . The dpconf command searches for a <i>PORT</i> value in the following order:	
	 A <i>PORT</i> specified in the command line A <i>PORT</i> set by using the \$DIR_PROXY_PORT environment variable 	
	If none of these are found, the default is to use port 389.	
	This option is mutually exclusive with -P,secure-port.	
- P PORT		
secure-port PORT	Connects over SSL to the proxy on <i>PORT</i> . The dpconf command searches for a <i>PORT</i> value in the following order:	
	 A <i>PORT</i> specified in the command line A <i>PORT</i> set by using the \$DIR_PROXY_PORT environment variable 	
	If none of these are found, the default is to use port 1636.	
	This option is mutually exclusive with -p,port.	
- r		
attr-map	Displays help properties and their corresponding attributes in cn=config.	
- V		
verbose	Displays extra information. This option is especially useful in the list subcommands. For an example of the use of the verbose option, see Example 5.	
-Vversion	Displays the current version of dpconf. The version is provided in the format <i>year.monthday.time</i> . So version number 2007.1204.0035 was built on December 4th, 2007 at 00h35. If the components used by dpconf are not aligned, the version of each individual component is displayed.	
-w FILE		
pwd-file <i>FILE</i>	Specifies that the LDAP password is read from <i>FILE</i> . The dpconf command searches for a password <i>FILE</i> value in the following order:	
	 A password or password file specified in the command line A password file set by using the \$LDAP_ADMIN_PWF environment variable 	

password.				
Subcommand	The following options can be used with the subcommands:			
Options	- b			
	db-name	The name of the JDBC database for which you create a JDBC data source.		
	- B			
	db-url	The URL to the JDBC database for which you create a JDBC data source.		
	-E			
_		Modifies the display output to show one property value per line.		
	-J driver-url	The URL to the JDBC driver.		
	-M <i>UNIT</i> unit-time <i>UNIT</i>	Display time data with UNIT unit. The value for <i>UNIT</i> can be M, w, d, h, m, s, or ms (month, week, day, hour, minute, second, or milisecond).		
	- S			
	driver-class	The class of the JDBC driver.		
	- Z UNIT			
	unit-size UNIT	Display memory size data with UNIT unit. The value for <i>UNIT</i> can be T, G, M, k, or b (Terabyte, Gigabyte, Megabyte, kilobyte, or byte).		
Subcommand	The following operands can be used with the subcommands:			
Operands	ACTION	Describes what a transformation does to its target entry or entries. The following transformation actions are possible:		

PARAM operand.

operands.

operand.

If none of these are found, the default is to prompt for the password.

add-attr Add a new attribute. The value of the new

 add-attr-value Add a calculated value to an existing attribute. The value that must be added is defined by the

 attr-value-mapping Map one attribute to another attribute to provide the attribute value. The value is defined by the internal-value and view-value PARAM

 def-value Add a default value to an existing attribute. The value that must be added is defined by the PARAM

attribute is defined by the PARAM operand.

	 remove-attr Remove an attribute.
	 remove-attr-value Remove a value from an existing attribute. This action is usually used in the case of multi-value attributes when one of the values should be removed.
ATTR_NAME	The name of a virtual attribute or JDBC attribute to be added or removed.
COLUMN_NAME	The name of a column in an SQL table.
DB_TABLE	The name of an SQL table.
DN_PATTERN	The pattern that should be used to construct a DN from a JDBC table.
HOST	Contacts the LDAP server on the specified host, which may be a host name or an IP address.
	For example, when mapping the IPv4 address 192.168.0.99 to IPv6, pass the -h option with its argument as -h ::ffff:192.168.0.99.
JDBC_VIEW_NAME	The name of a JDBC data view.
JOIN_NAME	The name of a join data view.
LDIF_FILE_NAME	The name of a file on the Directory Proxy Server that contains the LDIF data.
LIMIT_NAME	The name of a custom search size limit.
LOG_TYPE	The type of log, log type can be access or error.
MODEL	The direction in which a transformation action will be applied. The transformation model can be one of mapping, read, or write.
	A mapping transformation is applied during the request, and its inverse is applied during the response. A write transformation is applied during the request, but not during the response. A write transformation changes the physical data in storage. A read transformation is applied only during the response to a request.
NAME	The name of an object to be created or deleted, or the name of an object for which you are getting or setting properties.
OBJECTCLASS	The name of a JDBC object class.

PARAM	The parameters to be applied to a virtual transformation. Depending on the transformation, <i>PARAM</i> can be one or more of the following:
	 value specifies the value of the virtual attribute for all transformation actions other than attrValueMapping.
	 internal-value:<i>value</i> used only with the attrValueMapping transformation action. Specifies the value of the virtual attribute that should be written to the physical data source.
	 view-value:value used only with the attrValueMapping transformation action. Specifies the value of the virtual attribute that should be returned to the client.
POLICY_NAME	The name of the resource limits policy or request filtering policy to which limits or rules are to be applied.
POOL_NAME	The name of an existing LDAP or JDBC data source pool.
PORT	The port number of the object to be created.
PRIMARY_NAME	The name of the primary data view that is the source for a join data view.
PRIMARY_TABLE	The name of the primary table in a JDBC database.
PROP	The name of the property. For a list of property names and values, use this command:
	dpconf help-properties.
	The rws and rwd keywords of a property indicate whether changes to the property require the server to be restarted. If a property has an rws (read, write, static) keyword, the server must be restarted when the property is changed. If a property has an rwd (read, write, dynamic) keyword, modifications to the property are implemented dynamically (without restarting the server).
	For multi-valued properties, use the syntax <i>PROP</i> +: <i>VAL</i> to add a value, and <i>PROP</i> -: <i>VAL</i> to remove a value.
	Multi-valued properties are identified by the M keyword. For a list of multi-valued properties, use this command:
	dpconf help-properties grep " M "
RULE_NAME	The name of a search data hiding rule.

SECONDARY_NAME	The name of the secondary data view that is the source for a join data view.
SECONDARY_TABLE	The name of the secondary table in a JDBC database.
SRC_NAME	The name of an LDAP or JDBC data source.
SUFFIX_DN	The DN of the suffix represented by the data view.
TABLE_NAME	The name of a JDBC table.
TRANSFORMATION_NAME	The name of a virtual transformation.
USER_DN	The DN of the user to be mapped.
USER_PWD_FILE	The name of the password file, or the value - meaning to prompt for the password.
VAL	The new value of the property. For a complete list of property names and values, use the command dpconf help-properties -v.
	When the VAL operand is used for passwords, it can have the following values:
	The name of the password file.The value -, meaning to prompt for the password.
VIEW_NAME	The name of a data view.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED_SSL_PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Exit Status The following exit status values are returned:

0	Successful completion
non-zero	An error occurred

Examples This section contains examples of how the dpconf command is used.

EXAMPLE 1 Getting Help With a Subcommand

This example shows how to get help for using a subcommand:

\$ dpconf create-connection-handler -? Usage: dpconf create-connection-handler NAME [NAME ...] Create new connection handlers For global options, use dpconf --help. NAME The name of a connection handler For more information, see dpconf(1M).

EXAMPLE 2 Getting Information About Properties

This example shows how to get information about the properties of the resource limits policy.

To view the properties exposed by all of the dpconf subcommands, run this command:

\$ dpconf help-properties

EXAMPLE 3 Getting Properties for Access Logs

This example shows how to get the access log properties, specifying that the log-rotation-size property is quoted in bytes.

EXAMPLE 3 Getting Properties for Access Logs (*Continued*) \$ dpconf get-access-log-prop -h host -p port -Zb default-log-level : info log-file-name : logs/access log-file-perm : 600 log-level-client-connections : log-level-client-disconnections : log-level-client-operations · · · log-level-connection-handlers : log-level-data-sources log-level-data-sources-detailed : log-rotation-frequency : 1h log-rotation-policy : size : 104,857,600b log-rotation-size log-rotation-start-day : 1 log-rotation-start-time : 0000 log-search-filters : false max-log-files : 10

EXAMPLE 4 Customizing Search Limits

This example shows how to define customized limits for search operations, based on the search base and search scope.

1. Create a custom search limit.

\$ dpconf create-custom-search-size-limit -h host -p port
POLICY-NAME LIMIT-NAME

- 2. Set the criteria for the custom search limit.
 - \$ dpconf set-custom-search-size-limit-prop -h host -p port POLICY-NAME LIMIT-NAME one-level-search-base-dn:VALUE subtree-search-base-dn:VALUE
- 3. Define the limit for the number of results returned when a search meets one of the above criteria.
 - \$ dpconf set-custom-search-size-limit-prop -h host -p port POLICY-NAME CUSTOM-SEARCH-LIMIT-NAME search-size-limit:VALUE
- 4. View the properties of a custom search limit.

\$ dpconf get-custom-search-size-limit-prop -h host -p port
POLICY-NAME LIMIT-NAME

EXAMPLE 5 Comparing Properties of Connection Handlers

This example shows how to view the properties of one connection handler and how to compare the properties of a set of connection handlers.

1. View all of the properties of one connection handler.

```
$ dpconf get-connection-handler-prop -h host -p port
CONNECTION-HANDLER-NAME
```

These are the default properties of a connection handler:

allowed-auth-methods	:	anonymous
allowed-auth-methods	:	sasl
allowed-auth-methods	:	simple
allowed-ldap-ports	:	ldap
allowed-ldap-ports	:	ldaps
bind-dn-filters	:	any
data-view-routing-custom-list	:	-
data-view-routing-policy	:	all-routable
description	:	-
domain-name-filters	:	any
enable-data-view-affinity	:	false
ip-address-filters	:	any
is-enabled	:	false
is-ssl-mandatory	:	false
priority	:	99
request-filtering-policy	:	no-filtering
resource-limits-policy	:	no-limits
user-filter	:	any

2. View the key properties and relative priorities of all of the connection handlers.

<pre>\$ dpconf list-connection-handlers -v</pre>					
Name	is-enabled priority description				
anonymous	false	99	unauthenticated connections		
myconnectionhandler	true	99	-		
default connection handler	true	100	default connection handler		

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE	
Availability	SUNWldap-proxy	
Stability Level	Evolving	

See Also dpadm(1M), dsconf(1M), and dsadm(1M)

Name dsadm - Manages a Directory Server instance

- Synopsis install-path/ds6/bin/dsadm subcommand options
- **Description** The dsadm command is the local administration command for Directory Server instances. Use the dsadm command with any of the subcommands described in this man page.

dsadm must be used while the server is stopped (except subcommands dsadm info, dsadm stop and dsadm restart). It must be run from the local machine where the server instance is located. This command must be run by the username that is the Operating System owner of the server instance, or by root.

Subcommands The following subcommands are supported:

dsadm add-cert [-Ci] [-W CERT_PW_FILE] INSTANCE_PATH CERT_ALIAS CERT_FILE

Adds a certificate to the certificate database.

dsadm add-selfsign-cert [-i] [-W CERT_PW_FILE] [-S DN] INSTANCE_PATH CERT_ALIAS OR

dsadm add-selfsign-cert [-i] [-W CERT_PW_FILE] [--name NAME] [--org ORG] [--org-unit ORG-UNIT] [--city CITY] [--state STATE] [--country COUNTRY] INSTANCE_PATH CERT_ALIAS

Creates a self-signed certificate and adds it to the certificate database.

dsadm autostart [--off] [-i] INSTANCE_PATH

Enables or disables Directory Server instance startup at system boot. This command is only available if you installed with Sun Java Enterprise System or native packages, and is not available on Windows. This command must be run as root.

dsadm backup [-f *FLAG*] ... *INSTANCE_PATH ARCHIVE_DIR* Creates a backup archive of the Directory Server instance.

dsadm create [-BiG] [-u USER_NAME] -g GROUP_NAME] [-h HOST_NAME [-p PORT] [-P SSL_PORT] [-D DN] [-w PW_FILE] INSTANCE_PATH Creates a Directory Server instance.

dsadm delete INSTANCE_PATH

Deletes a Directory Server instance.

dsadm disable-service [-T TYPE] INSTANCE_PATH

Disables a Directory Server instance from being managed as a service. This command is available on Windows distributions and on Solaris native package distributions only. The command must be run as root.

dsadm enable-service [-T TYPE] INSTANCE PATH [RESOURCE GRP] Enables a Directory Server instance to be managed as a service. This command is available on Windows distributions and on Solaris native package distributions only. The command must be run as root. dsadm export [-biQ] [-s DN] ... [-x DN] ... [-f FLAG] ... [-y [-W CERT PW FILE]] INSTANCE PATH SUFFIX DN [SUFFIX DN ...] LIDF FILE Exports suffix to LDIF format. dsadm export-cert [-i] [-y [-W CERT_PW_FILE]] [-o OUTPUT_FILE] [-0 OUTPUT_PW_FILE] INSTANCE_PATH CERT_ALIAS Exports an encrypted copy of the certificate and its public and private keys from the certificate database. dsadm generate-legacy-scripts [-i] INSTANCE_PATH Generates legacy scripts in a Directory Server instance. This command is not available on Windows. dsadm get-flags INSTANCE_PATH [FLAG ...] Displays the flag values for the Directory Server instance. dsadm import [-biK] [-x DN] ... [-f FLAG=VAL] ... [-y [-W CERT_PW_FILE]] INSTANCE_PATH LDIF_FILE [LDIF_FILE ...] SUFFIX_DN Populates an existing suffix with LDIF data. dsadm import-cert [-i] [-W CERT PW FILE] [-I INPUT PW FILE] INSTANCE PATH CERT FILE Adds a new certificate and its keys to the certificate database. dsadm import-selfsign-cert [-i] [-W CERT_PW_FILE] [-I INPUT_PW_FILE] INSTANCE PATH CERT FILE Adds a new self-signed certificate and its keys to the certificate database. dsadm info INSTANCE PATH Displays Directory Server instance status and some configuration information. dsadm list-certs [-Ci] [-W CERT PW FILE] INSTANCE PATH Lists all certificates in the certificate database. dsadm reindex [-bl] -t ATTR INDEX [-t ATTR INDEX ...] INSTANCE PATH SUFFIX_DN Regenerates existing indexes. dsadm remove-cert [-i] [-W CERT_PW_FILE] INSTANCE_PATH CERT_ALIAS Removes a certificate from the certificate database. The instance must be stopped before running this command. dsadm renew-cert [-i] [-W CERT_PW_FILE] INSTANCE_PATH CERT_ALIAS CERT FILE Replaces a certificate, but keeps the existing private key. The instance must be stopped before running this command.

dsadm renew-selfsign-cert [-i] [-W <i>CERT_PW_FILE</i>] <i>INSTANCE_PATH CERT_ALIAS</i>
Renews a self-signed certificate in the certificate database. The instance must be stopped before running this command.
dsadm repack [-b <i>backend</i>] <i>INSTANCE_PATH SUFFIX_DN</i> [<i>SUFFIX_DN</i>] Repacks or compacts an existing suffix. The -b option enables you to specify the name of the back end instead of the suffix name. At least one suffix DN or one back end name must be specified. The instance must be stopped before running this command.
dsadm request-cert [-i] [-W <i>CERT_PW_FILE</i>] -s <i>DN</i> [-F <i>FORMAT</i>] [-o <i>OUTPUT_FILE</i>] <i>INSTANCE_PATH</i> Or:
dsadm request-cert [-i] [-W CERT_PW_FILE]name NAME [org ORG] [org-unit ORG-UNIT] [city CITY] [state STATE] [country COUNTRY] [-F FORMAT] [-o OUTPUT_FILE] INSTANCE_PATH Generates a certificate request.
dsadm restart [-i] [-W CERT_PW_FILE] INSTANCE_PATH Restarts a Directory Server instance.
dsadm restore [-i] <i>INSTANCE_PATH ARCHIVE_DIR</i> Restores Directory Server instance from a backup archive.
<pre>dsadm set-flags [-i] [-W CERT_PW_FILE] INSTANCE_PATH FLAG=VAL [FLAG=VAL] Sets flags for a Directory Server instance.</pre>
dsadm show-access-log -A <i>DURATION INSTANCE_PATH</i> OR
dsadm show-access-log -L <i>LAST_LINES INSTANCE_PATH</i> Displays the contents of the access log.
<pre>dsadm show-cert [-i] [-W CERT_PW_FILE] [-o OUTPUT_FILE] [-F FORMAT] INSTANCE_PATH [CERT_ALIAS] Displays a certificate.</pre>
dsadm show-error-log -A <i>DURATION INSTANCE_PATH</i> OR
dsadm show-error-log -L <i>LAST_LINES INSTANCE_PATH</i> Displays the contents of the error log.
dsadm start [-Ei] [-W <i>CERT_PW_FILE</i>] <i>INSTANCE_PATH</i> Starts a Directory Server instance.
dsadm stop INSTANCE_PATH Stops a Directory Server instance.

Global Options The following options are global, and are applicable to all commands and subcommands.

	? help -V	Displays help information for a command or subcommand.		
	version	Displays the current version of dsadm. The version is provided in the format <i>year.monthday.time DISTRIB/ZIP/NAT</i> . So version number 2007.1204.0035 was built on December 4th, 2007 at 00h35. <i>DISTRIB</i> indicates the distribution type. <i>NAT</i> refers to the package version, installed through the Java Enterprise System. <i>ZIP</i> refers to the ZIP version. If the components used by dsadm are not aligned, the version of each individual component is displayed.		
	-V	Displays instructions for acco	aning yorkoog halp	
	verbose	Displays instructions for acce		
Subcommand Options	The following	options are applicable to the su	bcommands where they are specified.	
·	-ADURATION max-ageDURATION		Specifies the maximum age of lines to be returned from the access log or the error log. For example, to search for all entries younger than 24 hours, use -A 24h.	
	- B			
	below		Creates the Directory Server instance in an existing directory, specified by the <i>INSTANCE_PATH</i> . The existing directory must be empty. On UNIX machines, the user who runs this command must be root, or must be the owner of the existing directory. If the user is root, the instance will be owned by the owner of the existing directory.	
	C			
	Ca		Specifies a Certificate Authority certificate is to be used, or that the command should display information about CA certificates.	
	city CITY		Adds L=CITY to the subject DN. Default is none.	
	country COUNTRY		Adds C=COUNTRY to the subject DN. The default is none.	
	- D DN			
	rootDN <i>DN</i>		Defines the Directory Manager DN. The default is cn=Directory Manager.	

- E				
safe	Starts Directory Server with used at the last successful st	•		
-F <i>FORMAT</i> format <i>FORMAT</i>	Specifies output format. For dsadm			
	request - cert, the default is der, and the other possible output format is ascii. For dsadm show-cert, the default is readable, and other possible output formats are ascii and der.			
- f FLAG flags FLAG or FLAG=VAL	Customized values for optic	one		
- Trays ILAO OF ILAO - VAL	-			
	Possible flags for the dsadm subcommand are as follows			
	verify-db Check data	base integrity.		
	Possible flags for the dsadm subcommand are as follows			
	minimal-encode	Perform minimal base64 encoding.		
	multiple-output-file	Generate multiple LDIF output files.		
	not-export-unique-id	Do not export the unique ID generated on import.		
	not-folded-output	Do not fold long lines.		
	no-num-version	Delete the initial line specifying the LDIF version, version: 1, for backward compatibility.		
	not-print-entry-ids	Do not include entry IDs in the LDIF output.		
	use-main-db-file	Only export from the main database		

file.

Possible flags for the dsadm import subcommand are as follows.

chunk-size	Merge chunk size.
incremental-output-file	Import LDIF generated during incremental import.
purge-csn	Purge the Change Sequence Number (CSN). The purge-csn flag is set to off by default. Setting the purge-csn to on prevents old CSN data from being imported by the dsadm import operation. This reduces the size of entries by removing traces of previous updates.

-G --no-legacy-scripts

Does not create legacy scripts. If you do not use this option, command scripts that are similar to 5.x command scripts are created in the server instance.

- g GROUP_NAME	
- groupname GROUP_NAME	Sets the server instance owner's group ID. The default is the user's current UNIX group. This option is not available on Windows.
- h HOST_NAME	
hostname HOST_NAME	Specifies the hostname. The default is the name of the current host system.
- I INPUT_PW_FILE	
input-pwd-file <i>INPUT_PW_FILE</i>	Reads the input file password in the INPUT_PW_FILE file. The default is a prompt for password.
-i	
no-inter	Does not prompt for confirmation before performing the operation.
- K	
incremental	Specifies that the contents of the imported LDIF file are appended to the existing LDAP entries. If this option is not specified, the contents of the imported file replace the existing entries.
-LLAST_LINES	
last-lines <i>LAST_LINES</i>	Specifies the number of lines to be returned from the access log or the error log. <i>LAST_LINES</i> must be an integer. For example, to return the last 50 lines, use -L 50. If no value is specified, the default number of lines returned is 20.
l	
vlv	Specifies VLV (browsing) index.
name NAME	Adds CN=NAME to the subject DN.
0 OUTPUT_PW_FILE	
output-pwd-file OUTPUT_PW_FILE	Reads the output password from the OUTPUT_FILE file. The default is a prompt for password.
o OUTPUT_FILE	
output OUTPUT_FILE	Stores the command results in the OUTPUT_FILE file. The default is stdout, standard output.

off	Disables server instance startup at system boot
org ORG	Adds 0=0RG to the subject DN. The default is none.
org-unit ORG-UNIT	Adds 0=0RG-UNIT to the subject DN. The default is none.
P SSL_PORT	
ssl-port SSL_PORT	Specifies the secure SSL port for LDAP traffic. The default is 636 if dsadm is run by the root user, or 1636 if dsadm is run by a non-root user.
p PORT	
port PORT	Specifies the port for LDAP traffic. The default is 389 if dsadm is run by the root user, or 1389 if dsadm is run by a non-root user.
Qno-repl	Specifies that additional data needed for replication is not included in the export.
S DN	
subject DN	Specifies the subject DN. The default depends on the subcommand used, and is either CN=hostname or CN=CERT_ALIAS.
s DN	
include DN	Exports data from suffix DN.
state STATE	Adds ST=STATE to the subject DN. Default is none.
Т <i>ТҮРЕ</i>	
type TYPE	Service type. Can be CLUSTER when using Sun Cluster, SMF when using Solaris 10, or WIN_SERVICE when using Windows.
t ATTR_INDEX	
attr ATTR_INDEX	Specifies attribute index ATTR_INDEX
u USER_NAME	
username USER_NAME	Sets the server instance owner user ID. The default is the current UNIX user name. This option is not available on Windows.

W <i>CERT_PW_FILE</i> cert-pwd-file <i>CERT_PW_FILE</i>	Reads certificate database password from CERT_PW_FILE. The default is to prompt for password.
w <i>PW_FILE</i> pwd-file <i>PW_FILE</i>	Sets the password file for the Directory Manager (-D). The default is to prompt for password.
x DN exclude DN	Excludes the specified DN from the command.
y decrypt-attr	Decrypts encrypted attributes.

Operands The following operands are supported:

ARCHIVE_DIR	Specifies the path to the backup of the Directory Server instance.
CERT_ALIAS	Certificate alias name. A user-specified name that identifies a certificate.
CERT_FILE	Specifies the file that contains the certificate.
FLAG	Specifies a flag that represents a property operand when using the command dsadm get-flags. Possible flag: cert-pwd-prompt.
FLAG=VAL	Specifies a property flag operand and its value when using the command dsadm set-flags.
	cert-pwd-prompt flag possible values are: off on. Default: off. By default the dsadm command generates a certificate database password when creating a server instance. This password is stored, allowing dsadm to access the certificate database when necessary, for example, when the server starts listening for SSL connections. When the cert-pwd-prompt flag is changed to on, the dsadm command prompts for the certificate database password when needed.
INSTANCE_PATH	Path of the Directory Server instance.
LDIF_FILE	Filename of LDIF file.
RESOURCE_GRP	Cluster resource group. Required for CLUSTER service, not applicable for other types of services.
SUFFIX_DN	Suffix DN (Distinguished name).

Exit Status The following exit status values are returned:

0 Successful completion.

non-zero An error occurred.

Examples The following examples show how the dsadm command is used.

EXAMPLE 1 Creating a Directory Server Instance \$ dsadm create -p 6389 -P 6636 /local/ds

This command creates the server instance files in the directory /local/ds. The server instance is owned by the UNIX user who creates the command.

In this example, the LDAP port is specified as 6389, and the secure port is specified as 6636. If you do not specify port numbers, the default port numbers 389 and 636 (for root user) or 1389 and 1636 (for not-root user) are used. If you do not specify port numbers and the default port numbers are already being used, the dsadm create command aborts.

EXAMPLE 2 Starting a Directory Server Instance

The server instance path is /local/ds.

\$ dsadm start /local/ds

EXAMPLE 3 Getting Information About a Directory Server instance

This command shows information such as the owner, ports, and current state of the server instance. The instance path is /local/ds.

```
$ dsadm info /local/ds
```

EXAMPLE 4 Importing an LDIF File

Import an LDIF file, specifying that no user confirmation is required, and giving the suffix DN.

```
$ dsadm import -i /local/ds /local/ds/ldif/example.ldif \
dc=example,dc=com
```

EXAMPLE 5 Exporting an LDIF File

Export a suffix to an LDIF file.

```
$ dsadm export -x ou=People,dc=example,dc=com /local/ds \
dc=example,dc=com /local/ds/ldif/export.ldif
```

This command shows all data in the suffix dc=example, dc=com, excluding data in the subsuffix ou=People, dc=example, dc=com

EXAMPLE 6 Backing Up a Directory Server Instance

This command backs up the suffix data and the configuration data. The instance path is /local/ds and the archive directory is /local/dsbackup/20060722.

\$ dsadm backup /local/ds /local/dsbackup/20060722

EXAMPLE 7 Regenerating Attribute Indexes

To regenerate the existing cn and uid indexes:

\$ dsadm reindex -t cn -t uid /local/ds dc=example,dc=com

EXAMPLE 8 Renewing a Certificate

Use the following command to renew an existing server certificate with a new server certificate from your Certificate Authority.

\$ dsadm renew-cert /local/ds cert_alias /local/certfiles/new-cert

Name dsccsetup – Set up Directory Service Control Center

- **Synopsis** *install-path*/dscc6/bin/dsccsetup [subcommand] [options]
- Description The dsccsetup command is used to register Directory Service Control Center with Sun Java Web Console (DSCC), and to register local agents of the administration framework. Use the dsccsetup command with the subcommands described in this man page.

Subcommands The following subcommands are supported:

dsccsetup ads-create [-w file]

Initialize the DSCC registry, a local Directory Server instance for private use by DSCC to store configuration information. DSCC requires that this instance reside locally on the host where you run DSCC. Therefore, if you replicate the data in the instance for high availablity, set up one DSCC per replica host. If you do not provide the Directory Manager password for the DSCC registry in the file passed to the -w option, the command prompts for the password. The default port numbers used by the instance are 3998 for LDAP, and 3999 for LDAPS. The default instance path is /var/opt/SUNWdsee/dscc6/dcc/ads on Solaris systems, /var/opt/sun/dscc6/dcc/ads on HP-UX and Red Hat systems, and C:\Program Files\Sun\DSEE\var\dscc6\dcc\ads on Windows systems. The base DN for the suffix containing configuration information is cn=dscc. Use the dsccsetup status subcommand to read actual values for the DSCC registry instance. dsccsetup ads-delete Delete the Directory Server instance used by DSCC to store configuration information. Use the - i when not using the command interactively. dsccsetup cacao-reg [-t] Register the local DSCC agent with the Common Agent Container, cacao.

	Use the -t option if you want to restart the Common Agent Container manually at a later time.
dsccsetup cacao-unreg	Remove the local DSCC agent registration information from cacao.
dsccsetup console-reg [-t]	Register DSCC with the web application container, Sun Java Web Console.
	Use the - i when not using the command interactively.
	Use the -t option if you want to restart Sun Java Web Console manually at a later time.
dsccsetup console-unreg [-t]	Remove DSCC from Sun Java Web Console.
	Use the - i when not using the command interactively.
	Use the -t option if you want to restart Sun Java Web Console manually at a later time.
dsccsetup dismantle [-t]	Dismantle the DSCC administration framework, running the cacao-unreg, console-unreg, and ads-delete subcommands.
	Use the - i when not using the command interactively.
	Use the -t option if you want to restart Sun Java Web Console, and the Common Agent Container manually at a later time.
dsccsetup initialize [-t] [-w <i>file</i>]	Initialize the DSCC administration framework, running the ads-create, console-reg, and cacao-reg subcommands.
	Use the -i when not using the command interactively.
	Use the -t option if you want to restart Sun Java Web Console, or the Common Agent Container manually at a later time.

			If you do not provide the Directory Manager password for the DSCC registry in the file passed to the -w option, the command prompts for the password.
	dsccsetup sta	tus	Display whether DSCC has been registered with Sun Java Web Console, and with the Common Agent Container. Also, display whether the DSCC registry has been initialized.
	dsccsetup mfw	k-reg [-t]	Register the local Directory Server monitoring agent for Java Enterprise System Monitoring Framework with the Common Agent Container, cacao.
			Use the -t option if you want to restart the Common Agent Container manually at a later time.
	dsccsetup mfw	k-unreg	Remove the local Directory Server monitoring agent registration information from cacao.
Global Options	The following o	ptions apply to all comman	ds and subcommands:
	- ?		
	help	Display usage for the com	mand or for the specified subcommand.
	-i		
	no-inter	Do not prompt for confirm	nation before performing the operation.
	- V		
	version	format <i>year.monthday.tim</i> on December 4th, 2007 at	on of dsccsetup. The version is provided in the ne. So version number 2007.1204.0035 was built 00h35. If the components used by dsccsetup are reach individual component is displayed.
	- V		
	verbose	Display extra information	for debugging purposes.
Subcommand	The following options apply to the subcommands where they are specified:		
Options	-t		
	norestart	Do not restart the Com after performing the op	nmon Agent Container or Sun Java Web Console peration.
			mmon Agent Container using the cacaoadm start the Sun Java Web Console using the

smcwebserver command.

	-w <i>file</i> pwd-file	<i>file</i> Use the Directory Service Manager password specified in <i>file</i> .
		By default, dsccsetup prompts for a password.
Exit Status	The following exit status values are returned:	
	0	Successful completion
	non-zero	An error occurred.

Name dsconf – Manages Directory Server configuration

- Synopsis install-path/ds6/bin/dsconf subcommand options
- **Description** The dsconf command manages Directory Server configuration. It enables you to modify the configuration entries in cn=config.

The server must be running in order for you to run ds conf.

Subcommands The following subcommands are supported:

dsconf accord-repl-agmt [-h host] [-p port] [-I USER_DN] [-W FILE] SUFFIX_DN
HOST:PORT [HOST:PORT ...]

Ensures the authentication properties of the destination suffix are in accord with those of the replication agreement.

dsconf backup [-h *host*] [-p *port*] [-a] *ARCHIVE_DIR* Backs up Directory Server data (configuration data excluded).

dsconf change-repl-dest [-h host] [-p port] [-A NEW_PROTOCOL] [-J]
SUFFIX_DN HOST:PORT NEW_HOST:NEW_PORT

Changes the remote replica pointed to by an existing replication agreement. The suffix DN and configuration of the existing agreement remain the same.

dsconf create-encrypted-attr [-h host] [-p port] [--desc DESC] SUFFIX_DN
ATTR_NAME [ATTR_NAME ...] ENCRYPTION_ALGO

Declares that the values for an attribute are encrypted.

dsconf create-index [-h host] [-p port] SUFFIX_DN ATTR_NAME [ATTR_NAME
...]

Declares that an attribute is indexed. The default index types for the attribute are equality and presence.

dsconf create-plugin [-h *host*] [-p *port*] -H *LIB_PATH* -F *INIT_FUNCT* -Y *TYPE* [-G *ARG*]... *PLUGIN_NAME*

Declares a new client plugin. The plugin state is disabled.

dsconf create-repl-agmt [-h host] [-p port] [-A PROTOCOL] [-J] SUFFIX_DN
HOST:PORT [HOST:PORT ...]

Creates a replication agreement for existing suffix.

dsconf create-repl-priority [-h host] [-p port] SUFFIX_DN PRIORITY_NAME
PROP:VAL [PROP:VAL ...]

Creates a prioritized replication rule on a master.

dsconf create-suffix [-h host] [-p port] [-B NAME] [-L FILE] [-N] SUFFIX_DN
[SUFFIX_DN ...]

Creates a suffix.

dsconf delete-encrypted-attr [-h host] [-p port] SUFFIX_DN ATTR_NAME [ATTR_NAME ...] Declares that the values for an attribute are no longer encrypted. dsconf delete-index [-h host] [-p port] SUFFIX_DN ATTR_NAME [ATTR_NAME ...1 Declares that an attribute is no longer indexed. dsconf delete-plugin [-h host] [-p port] PLUGIN_NAME [PLUGIN_NAME ...] Declares that a plugin can not be used by the server any more. dsconf delete-repl-agmt [-h host] [-p port] SUFFIX_DN HOST:PORT [HOST:PORT ...1 Deletes a replication agreement. dsconf delete-repl-priority [-h host] [-p port] SUFFIX_DN PRIORITY_NAME [PRIORITY_NAME ...] Deletes a prioritized replication rule. dsconf delete-suffix [-h host] [-p port] SUFFIX_DN [SUFFIX_DN ...] Deletes suffix configuration and data. dsconf demote-repl [-h host] [-p port] SUFFIX_DN [SUFFIX_DN ...] Demotes the role of an existing replicated suffix. A master is demoted to a hub, a hub is demoted to a consumer. To demote a master to a consumer, run the command twice. dsconf disable-plugin [-h host] [-p port] PLUGIN_NAME [PLUGIN_NAME ...] Disables a plugin. dsconf disable-repl [-h host] [-p port] SUFFIX_DN [SUFFIX_DN ...] Disables replication for a replicated suffix. dsconf disable-repl-agmt [-h host] [-p port] SUFFIX_DN HOST: PORT [HOST:PORT ...] Disables replication with another Directory Server. dsconf enable-plugin [-h host] [-p port] PLUGIN NAME [PLUGIN NAME ...] Enables a plugin. dsconf enable-repl [-h host] [-p port] [-d REPL_ID] ROLE SUFFIX_DN [SUFFIX_DN ...] Enables replication by assigning a role to an existing suffix. dsconf enable-repl-agmt [-h host] [-p port] SUFFIX_DN HOST: PORT [HOST: PORT ...1 Enables replication with another Directory Server. dsconf export [-h host] [-p port] [-aQ] [-f FLAG] ... [-y [-C FILE]] [[-s DN] ... | [-x DN] ...] SUFFIX DN [SUFFIX DN...] LDIF FILE Exports suffix data to LDIF format.

```
dsconf get-index-prop [-h host] [-p port] [-T] SUFFIX_DN ATTR_NAME [PROP]
...1
  Displays the value of an index configuration property.
dsconf get-log-prop [-h host] [-p port] [-T] [-Z UNIT] LOG_TYPE [PROP ...]
  Displays server log property values.
dsconf get-plugin-prop [-h host] [-p port] [-T] PLUGIN NAME [PROP ...]
  Displays plugin property values.
dsconf get-repl-agmt-prop [-h host] [-p port] [-T] SUFFIX_DN HOST:PORT
[PROP ...]
  Displays replication agreement property values.
dsconf get-server-prop [-h host] [-p port] [-T] [-M UNIT] [-Z UNIT] [PROP ...]
  Displays server property values.
dsconf get-suffix-prop [-h host] [-p port] [-T] [-M UNIT] [-Z UNIT] SUFFIX_DN
[PROP \dots]
  Displays suffix property values.
dsconf help-properties [-r]
  Lists properties exposed by subcommands.
dsconf import [-h host] [-p port] [-aK] [-f FLAG=VAL] ... [-x DN] ...
LDIF_FILE [LDIF_FILE ...] SUFFIX_DN
  Populates existing suffixes with LDIF data.
dsconf info
  Displays information about server configuration such as port number, suffix name, server
  mode and task states.
dsconf init-repl-dest [-h host] [-p port] [-a] SUFFIX_DN HOST: PORT
[HOST:PORT ...]
  Launches a total update of the remote replica from a local suffix.
dsconf list-encrypted-attrs [-h host] [-p port] [-E] [-V] [SUFFIX_DN ...]
  Lists encrypted attributes. When used with -v, this command displays additional
  information related to encrypted attributes.
dsconf list-indexes [-h host] [-p port] [-E] [-v] [SUFFIX_DN ...]
  Lists indexed attribute configuration. When used with -v, this command displays
  additional information related to indexes.
dsconf list-plugins [-h host] [-p port] [-E] [-v]
  Lists plugins. When used with -v, this command displays additional information related to
  plugins.
dsconf list-repl-agmts [-h host] [-p port] [-E] [-v] [SUFFIX_DN ...]
  Lists replication agreements. When used with -v, this command displays additional
  information related to replication agreements.
```

dsconf list-repl-priorities [-h host] [-p port] [-E] [-V] [SUFFIX_DN ...] Lists prioritized replication rules. When used with -v, this command displays additional information related to prioritized replication rules. dsconf list-suffixes [-h host] [-p port] [-E] [-v] Lists suffixes. When used with -v, this command displays additional information related to suffixes. This includes the number of entries, the suffix role and the number of replication agreements, replication priority rules, indexes and encrypted attributes. dsconf promote-repl [-h host] [-p port] [-d REPL ID] SUFFIX DN [SUFFIX DN ...] Promotes the role of an existing replicated suffix. A consumer is promoted to a hub, a hub is promoted to a master. To promote a consumer to a master, run the command twice. dsconf pwd-compat [-h host] [-p port] [-a] NEW_MODE Changes Directory Server password compatibility state. dsconf reindex [-h host] [-p port] [-a] [-t ATTR] ... SUFFIX_DN [SUFFIX_DN ...1 Rebuilds index(es) of an existing suffix. dsconf restore [-h host] [-p port] [-a] ARCHIVE_DIR Restores Directory Server data from backup archive. dsconf rotate-log-now [-h host] [-p port] [-a] LOG_TYPE Closes and renames current log and creates fresh log. dsconf set-index-prop [-h host] [-p port] SUFFIX DN ATTR NAME PROP: VAL $[PROP: VAL \dots]$ Sets the index property value. For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value. dsconf set-log-prop [-h host] [-p port] LOG_TYPE PROP: VAL [PROP: VAL ...] Sets server log property value. For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value. dsconf set-plugin-prop [-h host] [-p port] PLUGIN_NAME PROP: VAL [PROP: VAL ...1 Sets plugin property value. For multi-valued properties, use PROP+:VAL to add a value, and PROP-:VAL to remove a value. dsconf set-repl-agmt-prop [-h host] [-p port] SUFFIX_DN HOST:PORT PROP:VAL $[PROP: VAL \dots]$ Sets replication agreement property value.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dsconf set-server-prop [-h host] [-p port] PROP:VAL [PROP:VAL ...]
Sets server property value.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

dsconf set-suffix-prop [-h host] [-p port] SUFFIX_DN PROP:VAL [PROP:VAL

...]

Sets suffix property value.

For multi-valued properties, use *PROP*+:*VAL* to add a value, and *PROP*-:*VAL* to remove a value.

```
dsconf show-repl-agmt-status [-h host] [-p port] [-I USER_DN] [-W FILE]
SUFFIX_DN HOST:PORT
```

Displays a comparison of a source and destination suffix configuration and the status of the replication agreement. When used with v, this command displays additional replication agreement information such as pending changes and delayed maximum duration.

```
dsconf show-task-status [-h host] [-p port]
```

Displays status of current directory server tasks. When used with v, this command displays additional information related to the task type.

```
dsconf update-repl-dest-now [-h host] [-p port] SUFFIX_DN HOST:PORT
[HOST:PORT ...]
```

Restarts replication updates after the destination server has been down by forcing updates to the remote replica from the local suffix.

Global Options The following options are global, and are applicable to all commands and subcommands.

-? help	Displays help information for a command or subcommand.
-c accept-cert	Does not ask for confirmation before accepting non-trusted server certificates.
-D USER_DN user-dn USER_DN	Binds as USER_DN. dsconf searches for a USER_DN value in the following order: First a a USER_DN specified in the command line, then a USER_DN set by using the environment variable \$LDAP_ADMIN_USER. If none of these are found, the default is to bind as the user cn=Directory Manager.

-e	
unsecured	Connects over LDAP with no secure connection. To connect over a clear connection by default, set the DIRSERV_UNSECURED environment variable.
- h HOST	
hostname HOST	Connects to the directory on <i>HOST</i> . dsconf contacts the LDAP server on the specified host, which may be a host name or an IP address. dsconf searches for a <i>HOST</i> value in the following order: First a <i>HOST</i> specified on the command line, then a <i>HOST</i> set by using the environment variable \$DIRSERV_HOST. If none of these are found, the default is to use the local host.
	For example, when mapping the IPv4 address 192.168.0.99 to IPv6, specify the HOST:PORT as follows: ::ffff:192.168.0.99.
-i	
no-inter	Does not prompt for confirmation before performing the operation.
- j	
reject-cert	Does not ask for confirmation before rejecting non-trusted server certificates (for current session only).
-p <i>PORT</i> port <i>PORT</i>	Connects to directory on <i>PORT</i> . dsconf searches for a <i>PORT</i> value in the following order: First a <i>PORT</i> specified in the command line, then a <i>PORT</i> set by using the environment variable \$DIRSERV_PORT. If none of these are found, the default is to use port 389.
	This option is mutually exclusive with -P,secure-port.
- P PORT	
secure-port PORT	Connects over SSL to the directory on <i>PORT</i> . The dpconf command searches for a <i>PORT</i> value in the following order:
	 A <i>PORT</i> specified in the command line A <i>PORT</i> set by using the \$DIR_SERV_PORT environment variable
	If none of these are found, the default is to use port 636.
	This option is mutually exclusive with -p,port.
-v -verbose	Displays extra information.

	-Vversion	Displays the current version of dsconf. The version is provided in the format <i>year.monthday.time</i> . So version number 2007.1204.0035 was built on December 4th, 2007 at 00h35. If the components used by dsconf are not aligned, the version of each individual component is displayed.		
	-w <i>FILE</i> pwd-file <i>FILE</i>	Binds using an LDAP password is read from <i>FILE</i> . dsconf sear- for a password <i>FILE</i> value in the following order: A password or password file specified in the command line. A password file set by using the environment variable \$LDAP_ADMIN_PWF. If none of these are found, the default is to prompt for the password.		
	-y decrypt-attr	Decrypts encrypted attributes. Thedecrypt-attr option is a boolean and is optional.		
Subcommand	The following options are applicable to the subcommands where they are specified.			
Options	- A PROTOCOL			
	auth-protocol PROTO	ЭСОL	Sets authentication protocol for replication agreements to <i>PROTOCOL</i> . For the create-repl-dest subcommand, the default value is clear. Other possible values are ssl-simple and ssl-client. For the change-repl-dest subcommand, the default value is the same as that of the HOST:PORT to which you are changing.	
	-a async		Launches a task and returns the command line accessible immediately.	
	-B <i>NAME</i> db-name <i>NAME</i>		Specifies a database name.	
	-C <i>FILE</i> cert-pwd-file <i>FILE</i>		Reads certificate database password from FILE. The default is to prompt for password.	
	-d <i>REPL_ID</i> repl-id <i>REPL_ID</i>		Specifies a replication ID for a master. It is only used when <i>ROLE</i> = master.	
	desc <i>DESC</i>		Specifies a description DESC.	

-E record	Modifies the display output to sho value per line.	ow one property
-F <i>INIT_FUNC</i> init-func <i>INIT_FUNC</i>	Sets initialization function for a p <i>INIT_FUNC</i> .	lugin to
-f <i>FLAG</i> or -f <i>FLAG=VAL</i> flags <i>FLAG</i> orflags <i>FLAG=VAL</i>	Customizes imported or exported	d LDIF.
	Import flags:	
	chunk-size= <i>INTEGER</i>	Sets the merge chunk size. Overrides the detection of when to start a new pass during import.
	incremental-output	Specifies whether an output file will be generated for later use in importing to large replicated suffixes. Default is yes. Possible values are yes and no. This flag can only be used when the -K option is used. If this flag is not used, an output file will

		automatically be generated.
incremental-output-file	e=PATH	Sets the path of the generated output file for an incremental (appended) import. The output file is used for updating a replication topology. It is an LDIF file containing the difference between the replicated suffix and the LDIF file, and replication information.
Export flags:		
multiple-output-file	Exports ea separate fi	ch suffix to a le.
use-main-db-file	Exports th database fi	
not-export-unique-id	Does not e id values.	export unique
output-not-folded	Does not v	vrap long lines.
not-print-entry-ids	Does not e IDs.	export entry
Sets plugin argument p	roperty to A	RG.

Sets plugin library path to *LIB_PATH*.

--lib-path LIB_PATH

--arguments ARG -HLIB_PATH

-GARG

-I USER_DN dest-bind-dn USER_DN	Binds as <i>USER_DN</i> on destination suffix (Default: same as the DN used for source suffix)
-J	
no-accord	For use with the create-repl-agmt and change-repl-dest subcommands. When the no-accord option is used with either create-repl-agmt and change-repl-dest subcommands, the accord-repl-agmt subcommand is not performed.
	When creating a new replication agreement or when changing the destination server of a replication agreement, dsconf tries to run the accord-repl-agmt operation to ensure the authentication properties of the destination suffix are in accord with those of replication agreement. If the destination server is unavailable or takes time to respond, the time to operate the command would be longer than necessary unless the no-accord subcommand option is used.
-К	-
incremental	Specifies that the contents of the imported LDIF file are appended to the existing LDAP entries. If this option is not specified, the contents of the imported file replace the existing entries.
-L <i>FILE</i>	
db-path <i>FILE</i>	Specifies database directory and path.
-M <i>UNIT</i> unit-time <i>UNIT</i>	Displays time in <i>UNIT</i> , where <i>UNIT</i> is one of: w, d, h, m, s (week, day, hour, minute, second).
- N	
no-top-entry	Does not create a top entry for the suffix. By default, a top-level entry is created when a new suffix is created (on the condition that the suffix starts with dc=, c=, o= or ou=). This option changes the default behavior.
- Q	
no-repl	Does not export additional data needed for replication.

-r attr-map	Displays help properties and their corresponding attributes in cn=config.
-s DN include DN	Exports all data under specified DN.
-T tab	Displays information in a table format.
-t <i>ATTR</i> attr <i>ATTR</i>	Reindexes the attribute <i>ATTR</i> (Default: All attributes).
-w FILE	
dest-pwd-file <i>FILE</i>	Binds on a destination suffix using the password read from <i>FILE</i> . The default is the same <i>FILE</i> used for the source suffix.
- x <i>DN</i>	
exclude DN	Does not import or export data contained under the specified DN.
- Y TYPE	
type <i>TYPE</i>	Sets plugin type to <i>TYPE</i> , where <i>TYPE</i> is one of: database, extendedop, preoperation, postoperation, matchingrule, syntax, internalpreoperation, internalpostoperation, object, pwdstoragescheme, reverpwdstoragescheme, ldbmentryfetchstore, beprecommit, archive2ldbm.
- Z UNIT	
unit-size <i>UNIT</i>	Displays memory size data in <i>UNIT</i> , where <i>UNIT</i> is one of: G, M, k, b (Gigabyte, Megabyte, kilobyte, byte).

Operands The following operands are supported:

ARCHIVE_DIR	Directory Server instance backup archive directory.
ATTR_NAME	Attribute name.
ENCRYPTION_ALGO	Algorithm to use for encryption. Possible values are: des, des3, rc2, rc4. These values signify respectively DES block cipher, Triple DES block cipher, RC2 block cipher, RC4 stream cipher.
HOST:PORT	Destination replicated suffix, defined by <i>HOST</i> and destination <i>PORT</i> .

LDIF_FILE	Path and filename for file in LDIF format.
LOG_TYPE	Type of log, where <i>LOG_TYPE</i> is one of: access, error, audit.
NEW_MODE	Desired mode for password compatibility policy. The default mode is DS5-compatible-mode. You can change it to to-DS6-migration-mode and then toto-DS6-mode.
PLUGIN_NAME	Plugin name. The plugin name is defined when the plugin is created.
PRIORITY_NAME	Name used to define or identify a prioritized replication rule.
PROP	Property name. For a list of PROP names and default values, use the command dsconf help-properties -v.
PROP:VAL	Property and corresponding value. For a list of PROP names and default values, use the command dsconf help-properties -v.
	For multi-valued properties, use <i>PROP</i> +: <i>VAL</i> to add a value, and <i>PROP-:VAL</i> to remove a value.
	Multi-valued properties are identified by the M keyword. For a list of multi-valued properties, use the command dsconf help-properties grep " M "
	Allowed values that are too wide for the help-properties output are listed below:
	LOG level (Access): acc-internal default acc-default_plus_referrals acc-timing. For definitions of log levels, see the man page log(5dsconf).
	LOG level (Error): default err-function-calls err-search-args err-connection err-packets err-search-filter err-config-file err-acl err-ldbm err-entry-parsing err-housekeeping err-replication err-entry-cache err-plugins err-dsml err-dsml-advanced. For definitions of log levels, see the man page log(5dsconf).
	PLG type and depends-on-type: database extendedop preoperation postoperation matchingrule syntax internalpreoperation internalpostoperation object pwdstoragescheme reverpwdstoragescheme ldbmentryfetchstore beprecommit archive2ldbm
	RAG transport-compression: no-compression default-compression best-speed best-compression

	SER dsml-client-auth-mode: client-cert-first http-basic-only client-cert-only
ROLE	Role of the replicated suffix , where <i>ROLE</i> is one of: master, hub, consumer.
SUFFIX_DN	Suffix DN (Distinguished Name)

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions,

thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Exit Status The following exit status values are returned:

Ø Successful completion.non-zero An error occurred.

Examples The following examples show how the dsconf command is used.

EXAMPLE 1 Create a Suffix

\$ dsconf create-suffix -h host -p port
dc=example,dc=com

In this example, non-default ports are specified.

Check to see if the suffix has been created.

```
$ dsconf list-suffixes -h host -p port -v
```

EXAMPLE 2 Import LDIF Data into the Suffix

\$ dsconf import -h host -p port
/local/ds/ldif/example.ldif dc=example,dc=com

EXAMPLE 3 Index an Attribute

In this example, the preferredLanguage attribute is going to be indexed.

1. Create an index entry for the attribute. By default, the index matching types are equity and presence.

\$ dsconf create-index -h host -p port dc=example,dc=com preferredLanguage

2. Check that the index entry has been created

\$ dsconf get-index-prop -h host -p port dc=example,dc=com preferredLanguage

```
EXAMPLE 3 Index an Attribute (Continued)
3. Generate the index for the attribute.
$ dsconf reindex -h host -p port
-t preferredLanguage dc=example,dc=com
EXAMPLE 4 Back Up the Directory Server Data
$ dsconf backup -h host -p port
```

/tmp/backupArchiveDir

For complete backup procedures, see the *Sun Java System Directory Server Enterprise Edition Administration Guide*.

EXAMPLE 5 Monitor and Change Cache Size for a Suffix

1. Search for the string cache within the dsconf help properties:

\$ dsconf help-properties | grep cache

2. Determine which property is most applicable and request more information. In the results of the preceding step, cache-mem-size seems to correspond. For additional information, use the verbose option:

```
$ dsconf help-properties -v | grep entry-cache-size
SUF entry-cache-size rw MEMORY_SIZE (Ex: 3G,2m,200k,10000b)
nsslapd-cachememsize
Cache size in term of memory space: (Default: 10M)
```

Use the following information to interpret the results above:

SUF	This property applies to a suffix.
entry-cache-size	The name of the property
rw	You have read and write access to the property when using get-suffix-prop and set-suffix-prop.
MEMORY_SIZE	Use memory size values as described in this man page.
nsslapd-cachememsize	The attribute under cn=config to which this property applies.
(Default: 10M)	The default value of this property

3. Determine the current value of entry-cache-size:

\$ dsconf get-suffix-prop -h host -p port dc=example,dc=com entry-cache-size entry-cache-size : 10M

4. Change the value of entry-cache-size to 12M:

```
EXAMPLE 5 Monitor and Change Cache Size for a Suffix (Continued)
$ dsconf set-suffix-prop -h host -p port
dc=example,dc=com entry-cache-size:12M
5. Check that the value has been changed:
$ dsconf get-suffix-prop -h host -p port
dc=example,dc=com entry-cache-size
entry-cache-size : 12M
EXAMPLE 6 Export to LDIF While Using Filters
$ dsconf export -h host -p port
f net print entry ide a provel of a provel of
```

```
-f not-print-entry-ids -s ou=people,dc=example,dc=com
-s ou=contractors,dc=example,dc=com dc=example,dc=com
/local/ds/ldif/export.ldif
```

This example shows a command that:

- Uses the flag not-print-entry-ids to request that entry IDs are not exported.
- Exports data from two suffixes ou=people, dc=example, dc=com and ou=contractors, dc=example, dc=com into one LDIF file/local/ds/ldif/export.ldif.

EXAMPLE 7 Rotate the Access Log and Modify the Rotation Delay for the Access Log

If you have a log which is getting very large, you can rotate the log. Rotation backs up the existing log file and creates a fresh log file. In this example, the access log is rotated.

1. Rotate the access log by using the command:

\$ dsconf rotate-log-now -h host -p port access

2. You can now modify the delay between log rotations for the access log.

Find the property which sets maximum log size:

\$ dsconf help-properties -v | grep LOG

The output from the previous command shows that the required property is rotation-interval.

3. To see the default setting for rotation-interval:

\$ dsconf get-log-prop -h host -p port
access rotation-interval

The default is one day 1d.

4. To increase the rotation delay to two days, use the command:

EXAMPLE 7 Rotate the Access Log and Modify the Rotation Delay for the Access Log (Continued)

```
$ dsconf set-log-prop -h host -p port
access rotation-interval:2d
```

EXAMPLE 8 Configure Replication in a Two-Master Topology

This procedure configures replication on a topology with two severs, and both are masters. Replication is configured first on one master, then on the second master. Master 1 is located on server1.example:1389. Master 2 is located on server2.example:2389.

1. On server 1: Create a suffix

\$ dsconf create-suffix -h server1.example -p 1389 dc=example,dc=com

2. On Server 1: Populate the suffix with LDIF data

\$ dsconf import -a -h server1.example -p 1389
/opt/SUNWdsee/ds6/ldif/Example.ldif dc=example,dc=com

If the import takes a long time, you can obtain status on the import operation using:

\$ dsconf info -h server1.example -p 1389

or

\$ dsconf show-task-status -h server1.example -p 1389 -v

Alternatively, you can view the status of the task while it is running by omitting the -a option in the command.

3. On Server 1: Enable replication on Master 1. This step assigns a replication role and ID to an existing suffix. It also sets the replication manager bind DN to the default replication manager DN.

\$ dsconf enable-repl -h server1.example -p 1389
-d 1 master dc=example,dc=com

4. On server 2: Create a suffix

\$ dsconf create-suffix -h server2.example -p 2389 dc=example,dc=com

5. On Server 2: Enable replication on Master 2. This step assigns a replication role and ID to an existing suffix. It also sets the replication manager bind DN to the default replication manager DN.

\$ dsconf enable-repl -h server2.example -p 2389
-d 2 master dc=example,dc=com

6. On Server 1: Create a replication agreement from Master 1 to Master 2.

EXAMPLE 8 Configure Replication in a Two-Master Topology (Continued)

\$ dsconf create-repl-agmt -h server1.example -p 1389 dc=example,dc=com server2.example:2389

7. On Server 2: Create a replication agreement from Master 2 to Master 1

\$ dsconf create-repl-agmt -h server2.example -p 2389 dc=example,dc=com server1.example:1389

8. On Server 1: Check that the replication agreement status is OK.

\$ dsconf show-repl-agmt-status -h server1.example -p 1389 dc=example,dc=com server2.example:2389

If the status is not OK, then accord the replication agreement.

\$ dsconf accord-repl-agmt -h server1.example -p 1389 dc=example,dc=com server2.example:2389

9. On Server 1: From Master 1, initialize replication on Master 2. This step initializes Master 2 with the data contained in the suffix on Master 1 and starts replication.

\$ dsconf init-repl-dest -h server1.example -p 1389 dc=example,dc=com server2.example:2389

The replication agreements in both directions are now active and replication is running.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE

Stability Level	Evolving

See Also dsadm(1M)

Name dsee_deploy - deploy Directory Server Enterprise Edition software

Synopsis ./dsee_deploy install -i install_path [OPTIONS]

install-path/dsee6/bin/dsee_deploy
uninstall -i install_path [OPTIONS]

Description The dsee_deploy command installs Directory Server Enterprise Edition software from zip distributions rather than native packages, and registers server software with the Cacao common agent container to allow remote administration. The dsee_deploy command also removes registration information from the Cacao common agent container, and removes Directory Server Enterprise Edition software installed from the zip distribution.

Software installed from a zip distribution does not require that you have super user or administrator access to the system. The software is self-contained and need not have dependencies outside the install path you choose.

Subcommands The following subcommands are supported:

install	Install component software.
	Use the command unpacked with the product distribution.
uninstall	Remove component software.
	Use the command placed under <i>install-path/</i> dsee6/bin/ by the install subcommand.

Options The following options are supported:

-h help	Display the usage message for the command.
- I	
no-inter	Install in non-interactive mode, accepting the license text without confirmation. This mode is useful for silent installation.
- i install_path	
install-path install_path	Install or remove Directory Server Enterprise Edition software under the specified file system directory.
	If the specified file system directory does not exist at installation time, the dsee_deploy command attempts to create it.
- N	
NO - CACAO	Do not use or configure the Cacao common agent container.

	If specified, you may use the dsconf(1M) command to manage Directory Server and the dpconf(1M) command to manage Directory Proxy Server, but not Directory Service Control Center.
-0	
non-overwrite	Never overwrite files during installation.
-p <i>cacao_port</i> cacao-port <i>cacao_port</i>	Configure the Cacao common agent container used for remote management to listen for JMX management communications on the specified port number.
	If specified, the port must not be in use.
	If no Cacao common agent contain port is specified, the default value is 11162.
-v verbose	Display extra messages during software installation and removal.

Exit Status The following exit values are returned:

0	Successful completion.
1	The unzip command could not be found.
2	The <i>install_path</i> file system directory could not be created.
3	The <i>install_path</i> is not a file system directory.
4	Permission was denied to create the <i>install_path</i> file system directory.
5	A <i>component_product</i> name was not recognized.
6	The specified <i>cacao_port</i> could not be used.
7	There was an internal memory error.
8	The unzip command returned an error.
9	The server(s) installed could not be registered with the Cacao common agent container.
10	A required zip file, normally located in the dsee_data/ file system directory next to the dsee_deploy command, could not be found.
11	The cacaoadm command issued to configure the Cacao common agent container failed.

12 The number of parameters was invalid.

Make sure you have specified at least all mandatory options.

- 13 The dsee_deploy command failed to configure the Cacao common agent container.
- 14 The dsee_deploy command failed to start the Cacao common agent container.
- 15 The specified subcommand was not valid.
- 16 The Cacao common agent container could not be removed.
- 17 The specified Cacao common agent container port is already in use.
- 18 An invalid option was specified.
- 19 An option was incorrectly specified more than once.
- 20 Permission to the specified file system directory was denied.
- 21 The dsee_deploy command, necessary for uninstallation, could not be copied to under the specified *install_path*.
- 22 A subcommand was missing. The dsee_deploy requires that you specify a subcommand (install | uninstall).
- 23 The -N option is not for use with the uninstall subcommand.
- 24 The -O option is not for use with the uninstall subcommand.
- 25 The -p option is not for use with the uninstall subcommand.
- 26 The Cacao common agent container is already configured. Use the -N option.
- 27 The specified component is not installed in the specified location, and therefore cannot be removed.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	Zip distributions only
Stability Level	Evolving

Name	dsmig – Migrates a Directory S	Server Instance	
	install-path/ds6/bin/dsmig subcommand [options] [operands]		
Description	The dsmig command is the migration command for a single Directory Server instance. Use the dsmig command with any of the subcommands described in this man page.		
	dsmig migrates a Directory Se	rver 5.1 instance to a Directory Server 6.3 instance.	
	dsmig must be run from the local machine on which the new instance will be located. If the new instance exists, migration subcommands are carried out on that instance. If the new instance does not exist, dsmig creates the new instance with the parameters specified in the global options.		
Subcommands	The following subcommands	are supported.	
	dsmig info	Displays information on the status of each migration step.	
		The format of the subcommand is:	
		dsmig info NEW_INSTANCE_PATH	
	dsmig migrate-all	Migrates the old instance to the new instance in a single step. This subcommand essentially combines the functionality of all the other subcommands.	
		The format of the subcommand is:	
		dsmig migrate-all [-R] [-N] [-c] [-j] [-e -Z] [-D USER_DN] [-w PWD_FILE] [-v] OLD_INSTANCE_PATH NEW_INSTANCE_PATH	
	dsmig migrate-config	Migrates the configuration from the old instance to the new instance.	
		The format of the subcommand is:	
		dsmig migrate-config [-R] [-N] [-c] [-j] [-e -Z] [-D USER_DN] [-w PWD_FILE] [-v] OLD_INSTANCE_PATH NEW_INSTANCE_PATH	
	dsmig migrate-data	Migrates the data from the old instance to the new instance. Migrating the change logs of the old instance is optional. Migration of the NetscapeRoot database must be specified as this database is not migrated by default.	
		The format of the subcommand is:	
		dsmig migrate-data [-R] [-N] [-v] <i>OLD_INSTANCE_PATH NEW_INSTANCE_PATH</i>	

	dsmig migrate-schema	Migrates the schema from the old instance to the new instance.		
		The format of the subcommand is:		
	dsmig migrate-schema [-v] C	DLD_INSTANCE_PATH NEW_INSTANCE_PATH		
	dsmig migrate-security	Migrates the security files from the old instance to the new instance.		
		The format of the subcommand is:		
	dsmig migrate-security [-v]	OLD_INSTANCE_PATH NEW_INSTANCE_PATH		
Global Options	The following options are glol	oal, and are applicable to all commands and subcommands.		
	? help i	Displays help information for a command or subcommand.		
	no-inter	Does not request confirmation before executing the command.		
	p PORT port PORT	The port used for LDAP traffic. The default LDAP port is 389 or 1389.		
	P SSL_PORT secure-port SSL_PORT	The port used for secure LDAP traffic. The default secure LDAP port is 636 or 1636.		
Subcommand Options				
	c accept-cert	Specifies that confirmation should not be requested before accepting non-trusted server certificates.		
	-D <i>USER_DN</i> user-dn <i>USER_DN</i>	Defines the Directory Manager DN. The default is cn=Directory Manager.		
	e			
	unsecured	Specifies an unsecured connection over LDAP. If this option is not used, a secure LDAP connection using StartTLS is made by default.		
	j			
	reject-cert	Specifies that confirmation should not be requested before rejecting non-trusted server certificates (for this session only.)		

	N	
	netscapeRoot	Specifies that data for the "o=netscapeRoot" suffix must be migrated. If this option is used with the migrate-config subcommand, it refers to the suffix configuration data. If this option is used with the migrate-data subcommand, it refers to the netscapeRoot database. Using the option with the migrate-all subcommand means that neither the configuration data nor the database is migrated.
	R	
	replication	Specifies that replication data should be migrated. If this option is used with the migrate-config subcommand, it refers to replication configuration data. If this option is used with the migrate-data subcommand, it refers to replication changelogs. Using the option with the migrate-all subcommand means that both replication configuration data and changelogs are migrated.
	V	
	verbose	Specifies that additional messages are displayed.
	w PWD_FILE pwd-file PWD_FILE	The file from which the Directory Manager password should be read. If this option is not specified, the command prompts for the password.
	- Z	
	secured	Specifies an SSL connection over LDAP.
Subcommand Operands		
operations	-OLD_INSTANCE_PATH Spe	ecifies the path to the 5.1 instance.
	-NEW_INSTANCE_PATH Spe	ecifies the path to the 6.0 instance.
Exit Status	The following exit status values are returned:	
	0 Successful comp	pletion.
	non-zero An error occurr	red.
Examples	The following examples show how the dsmig command is used.	
	EXAMPLE 1 Migrating the schema	
	<pre>\$ dsmig migrate-schema -p 6</pre>	
		<pre>2_instance /local/new_ds61_instance/</pre>

EXAMPLE 1 Migrating the schema (Continued)

This command migrates the schema from the old Directory Server instance to the new 6.0 instance.

In this example, the LDAP port is specified as 6389, and the secure port is specified as 6636. If you do not specify port numbers, the default port numbers 389 and 636 (for root user) or 1389 and 1636 (for not-root user) are used. If you do not specify port numbers and the default port numbers are already being used, the dsmig command aborts.

EXAMPLE 2 Migrating the configuration

```
$ dsmig migrate-config -N /local/ds52pX/slapd-old_52_instance
/local/new_ds61_instance/
```

This command migrates the configuration from the old Directory Server instance to the new instance.

In this example, configuration data for the "o=netscapeRoot" suffix and replication configuration data are migrated.

```
EXAMPLE3 Migrating the data
$ dsmig migrate-data -R -N /local/ds52pX/slapd-old_52_instance
/local/new ds61 instance/
```

This command migrates the data from the old Directory Server instance to the new instance.

In this example, the replication change logs are not migrated. The NetscapeRoot database is migrated.

EXAMPLE 4 Migrating everything in a single step
\$ dsmig migrate-all -R -N /local/ds52pX/slapd-old_52_instance
/local/new_ds61_instance/

In this example, replication configuration data is not migrated. Data for the "o=netscapeRoot" suffix is migrated.

EXAMPLE 5 Obtaining migration status information
\$ dsmig info /local/new_ds61_instance/
Old instance path : /local/ds52pX/slapd-old_52_instance
New instance path : /local/new_ds61_instance

EXAMPLE 5 Obtaining migration status information (*Continued*)

Schema Migration:CompletedSecurity Migration:Not completedConfig Migration:Completed except NetscapeRoot and Replication configurationData Migration:Not completed

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M)

Name	dsrepair – repair replicated directory entries
Synopsis	<pre>install-path/ds6/support_tools/bin/dsrepair subcommand [options] arguments</pre>
Description	The dsrepair command makes it possible to repair entries that prevent replication from preceeding normally. You must enable the replication repair plug-in to use the dsrepair command.
	Use the dsrepair command only under the supervision of qualified support personnel.
	The dsrepair command functions only in non-secure mode, with simple authentication.
	The ds repair command is not available on Windows systems, though it can be run against a Directory Server instance on a Windows system.
Subcommands	The following subcommands are supported:
	dsrepair add-entry [options] suffix entry.ldif Adds the entry specified in the entry.ldif file to the specified suffix.
	If an entry or tombstone entry having the same DN or nsUniqueID already exists, or if the parent entry does not exist, add-entry fails.
	dsrepair begin-repair-mode [<i>options</i>] <i>suffix</i> Puts the specified <i>suffix</i> in repair mode such that the only modify operations allowed are those performed using the dsrepair command.
	Read operations continue normally while the suffix is in repair mode.
	dsrepair delete-entry [<i>options</i>] <i>suffix entry.ldif</i> Deletes the entry specified in the <i>entry.ldif</i> file from the specified <i>suffix</i> , and any tombstone associated with the entry.
	If no entry or tombstone entry having the same DN or nsUniqueID already exists, or the specified entry has child entries, delete-entry fails.
	dsrepair end-repair-mode [<i>options</i>] <i>suffix</i> Returns the specified <i>suffix</i> from repair mode to its normal replication mode.
	dsrepair replace-entry [<i>options</i>] <i>suffix entry.ldif</i> Replaces an entry in the directory with the content specified in the <i>entry.ldif</i> file.
	If no entry having the DN or nsUniqueID exists, or the entries returned for based on the DN and nsUniqueID are different, replace-entry fails.
	dsrepair update-ruv [<i>options</i>] <i>suffix csn</i> Replaces the maximum change sequence number (CSN) in a replication update vector (RUV) element with the specified <i>csn</i> string.
Options	The following options are supported:

	-D bindDN		
	bind-dn $m{k}$	oindDN	Use the specified bind DN to authenticate to the directory server.
			The default is cn=Directory Manager.
	-h <i>host</i> hostname	host	Contact the LDAP server on the specified host, which may be a host name or an IP address.
			For example, when mapping the IPv4 address 192.168.0.99 to IPv6, pass the -h option with its argument as -h ::ffff:192.168.0.99.
			The default is localhost.
	-p <i>port</i>		
	port port		Contact the LDAP server on the specified port.
			The default is 389.
	-w file		
	pwd-file	file	Use the bind password in the specified <i>file</i> .
			If this option is not specified, the dsrepair command prompts for the password.
Exit Status	The following exit values are returned:		
	0	Successf	ul completion.
	non-zero	An error	occurred.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

Name	idsktune – generate system tuning recommendations for running Directory Server Enterprise Edition server software
Synopsis	./idsktune [-q] [-D] [-v] [-c] [-i install-path]
scription	The idektune command checks patch levels and kernel parameter settings for the system on

Description The idsktune command checks patch levels and kernel parameter settings for the system on which Directory Server or directory client applications run, making tuning recommendations as it performs the checks. Run the command as super user to obtain the widest range of tuning recommendations.

The idsktune command is delivered next to the dsee_deploy command with zip distribution software only.

The idsktune command suggests changes you make to the system, but does not itself make any changes. You must fix at least all ERROR conditions identified by the idsktune command.

The idsktune command reports as missing *all* patches recommended at the time of release and not installed on the system, even patches for packages not installed on the system.

Options The idsktune command supports the following options.

- C	Display tuning recommendations only for directory client applications.
	Default is to display recommendations for both directory client applications and for Directory Server.
- D	Run in debug mode, displaying messages to showing commands the idsktune command runs internally, preceded by DEBUG.
-i install-path	Check the specified installation directory to ensure enough space is available.
- q	Run in quiet mode, reporting only information about key system prerequisites and essential settings.
- V	Display the version information about the build and exit.

Extended The idsktune command verifies and reports on the following settings depending on the underlying system.

Operating system and kernel versions

- Solaris[™] and Red Hat version numbers
- Solaris kernel build date
- Solaris, and HP-UX patches

Memory and disk space

- Physical memory size
- Swap space or swap partition size
- Memory resource limits
- File descriptor resource limits

Scheduler settings

TCP settings

- Maximum threads per process for HP-UX
- Maximum files for HP-UX

Many of the following are system-specific TCP tuning settings.

- Listen backlog queue size
- tcbhashsize, tcbhashnum and tcp_msl
- sominconn and somaxconn
- ipport_userreserved_min
- tcp_close_wait_interval and tcp_time_wait_interval
- tcp_keepalive_interval
- tcp_max_listen
- tcp_conn_request_max
- tcp_conn_req_max_q and tcp_conn_req_max_q0
- tcp rexmit interval initial
- net.inet.ip.portrange.hifirst and tcp smallest anon port
- tcp slow start initial
- net.inet.tcp.delayed_ack and tcp deferred ack interval
- link speed on / dev / hme

Tuning system settings, especially network stack settings, involves considering potentially not just directory applications and Directory Server, but also other applications running on the system and in the environment. In general, however, implementing the recommendations optimizes directory performance whether the system is dedicated to Directory Server or shared with other applications.

- **Exit Status** The idsktune command exits with status 0 if it completes successfully and no ERRORs are found. Otherwise, it exists with non-zero status.
- **Attributes** See attributes(5) for descriptions of the following attributes:

Name ns-accountstatus - show whether an account is active **Synopsis** *install-path*/ds6/bin/ns-accountstatus [-D rootDN] {-w password | -w - | -j filename} [-p port] [-h host] -I accountDN Description The ns-accountstatus command shows whether the account corresponding to an entry is active. The command can also be used to show whether the accounts corresponding to a role are active. **Options** The following options are supported: - ? Display the usage message. Bind using the Directory Manager (directory super user) rootDN. -D rootDN When this option is not specified, the default bind DN, cn=Directory Manager, is used. -h host Bind to the specified *host* on which the Directory Server instance runs. Default: local host. -I accountDN Determine account status for the entry or role having Distinguished Name accountDN. - j filename Read the bind password for simple authentication from *filename*. -pport Bind to the specified *port* on which the Directory Server instance listens. Default: 389. Bind with simple authentication, specifying the password interactively. - W -Bind with simple authentication using the specified *password*. -w password **Exit Status** The following exit values are returned: 0 Successful completion. An error occurred. 1 On error, verbose error messages are displayed on standard output. **Examples** The examples in this section use sample data from the Example - roles.ldif file.

EXAMPLE 1 Examining Status of an Entry

The following command checks the status of Barbara Jensen's entry.

\$./ns-accountstatus -D "cn=Directory Manager" -j /tmp/pwd.txt \
> -I uid=bjensen,ou=people,dc=example,dc=com
uid=bjensen,ou=people,dc=example,dc=com activated.

EXAMPLE 2 Examining Status of a Role

The following command checks the status of the Directory Administrators role.

\$./ns-accountstatus -D "cn=Directory Manager" -j /tmp/pwd.txt \
> -I "cn=Directory Administrators,dc=example,dc=com"
cn=Directory Administrators,dc=example,dc=com activated.

Name	ns-activate – activate accounts			
Synopsis	install-path/ds6/bin/ns-activate [-D rootDN] {-w password -w - -j filename} [-p port] [-h host] -I accountDN			
Description	The ns-activate command activates an account corresponding to an entry. The command can also be used to activate accounts sharing a role.			
Options	The following options are supported:			
	- ?	Display the usage message.		
	-D rootDN	Bind using the Directory Manager (directory super user) <i>rootDN</i> .		
		When this option is not specified, the default bind DN, cn=Directory Manager, is used.		
	- h <i>host</i>	Bind to the specified <i>host</i> on which the Directory Server instance runs.		
		Default: localhost.		
	-I accountDN	Activate the account for the entry or accounts corresponding to the role having Distinguished Name <i>accountDN</i> .		
	- j filename	Read the bind password for simple authentication from <i>filename</i> .		
	-p <i>port</i>	Bind to the specified <i>port</i> on which the Directory Server instance listens.		
		Default: 389.		
	- W —	Bind with simple authentication, specifying the password interactively.		
	-w password	Bind with simple authentication using the specified <i>password</i> .		
Exit Status	The following exit	tit values are returned:		
	0 Successful co	ompletion.		
	1 An error occ	curred.		
	On error, ve	rbose error messages are displayed on standard output.		
Examples	The examples in the	his section use sample data from the Example-roles.ldif file.		
	EXAMPLE 1 Activating an Inactive Account Entry			

The following command activates Barbara Jensen's account.

\$./ns-activate -D "cn=Directory Manager" -j /tmp/pwd.txt \
> -I uid=bjensen,ou=people,dc=example,dc=com
uid=bjensen,ou=people,dc=example,dc=com activated.

EXAMPLE 2 Activating an Inactive Account Role

The following command activates the Directory Administrators role.

```
$ ./ns-activate -D "cn=Directory Manager" -j /tmp/pwd.txt \
> -I "cn=Directory Administrators,dc=example,dc=com"
cn=Directory Administrators,dc=example,dc=com activated.
```

Name	replcheck – diagnose and repair some replication failures		
Synopsis	<pre>install-path/ds6/support_tools/bin/replcheck subcommand options</pre>		
Description	The replcheck command allows you to diagnose and repair a replication halt. Use the replcheck command with one of the options described in this man page.		
Subcommands	The following subcommands are supported:		
	replcheck diagnose [-D DN] [-w PW_FILE] [-L LOG_DIR] [-v] TOPOLOGY_FILE Diagnoses the cause of the replication breakage and summarizes the proposed repair actions.		
	replcheck fix [-D DN] [-w PW_FILE] [-L LOG_DIR] [-v] TOPOLOGY_FILE Fixes the replication breakage.		
Global Options	The following op	otions	are global, and are applicable to all commands and subcommands.
	?		
	help	Displ	lays help information for a command or subcommand.
	-Vversion	form on D	lays the current version of replcheck. The version is provided in the at <i>year.monthday.time</i> . So version number 2007.1204.0035 was built ecember 4th, 2007 at 00h35. If the components used by replcheck are ligned, the version of each individual component is displayed.
Subcommand	The following op	he following options are applicable to the subcommands where they are specified.	
Options	-D bindDN		
bind-dn <i>bindDN</i> Use the spec		ΟN	Use the specified bind DN to authenticate to the directory server.
			The default is cn=Directory Manager.
	- L dir-path		
	log-dir <i>dir-pd</i>	ath	Creates a replcheck.log log file in this directory.
			If this option is not specified, the replcheck.log log file will be created in the home directory.
	- V		
	verbose		Displays additional information.
	-w <i>password-file</i> pwd-file <i>file</i>		Use the bind password in the specified <i>password-file</i> .
			If this option is not specified, the replcheck command prompts for the password.

Operands The following operands are supported:

TOPOLOGY_FILESpecifies the path to the file that describes the replication topology.This file contains one record for each line in the following format:
hostname:port:suffix_dn[:label]. The optional label field provides a
name that appears in any messages that are displayed or logged. If you
do not specify a label, the hostname:port are used instead.For example, the following topology file describes a replication
topology consisting of two hosts:
host1:389:dc=example,dc=com:Paris
host2:489:dc=example,dc=com:New YorkNateThe replicated commend must access the comment in the

Note – The replcheck command must access the servers in the topology using their non-secure ports. The topology file can not specify an SSL port.

Extended I Description

The replcheck command diagnoses and repairs a replication halt. The replcheck diagnose subcommand compares the RUVs for each of the servers in your replication topology to determine if the masters are synchronized. If the search results show that all of the consumer replica in-memory RUVs are evolving on time or not evolving but equal to those on the supplier replicas, the tool will conclude that a replication halt is not occurring.

However, if the command determines that the consumer RUVs do not change at all over time, then the replcheck diagnose subcommand displays the repair operation it would do and exits without making the repair. Then, you can launch the replcheck fix subcommand to repair the replication halt. For example, the command determines that replication is blocked on the entry associated with CSN 24 if a supplier has a CSN of 40, while the consumer has a CSN of 23 that does not evolve at all over time.

The replcheck command can repair two types of replication halt:

- The entry at which replication is halted, in our previous example CSN 24, exists on the supplier but not on the consumer. The replcheck command takes the entry from the instance that is at least more up-to-date than the consumer and then pushes it to the consumer.
- The entry at which replication is halted, CSN 24, is unknown to supplier A. This can occur if a server is reinitialized or a replication agreement is deleted, resulting in a consumer becoming out of date and breaking replication. The replcheck command looks at other servers in the topology to see if the CSN is recognized. If it finds the CSN on a new supplier, such as supplier B, it creates a replication agreement with supplier B and lets replication send the entry, CSN 24, to the consumer.

Exit Status The following exit status values are returned:

0 Successful completion.

non-zero An error occurred.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

Name schema_push - ensure manually modified schema are replicated to consumers

- **Synopsis** *install-path*/ds6/bin/schema_push *instance-path*
- Description When schema modifications are made manually by editing the .ldif files such as 99user.ldif directly, the schema_push command should be run to update the modification time used by replication. This ensures that the modified schema are replicated to the consumers.

The *instance-path* argument is the path to the instance where you updated schema files, such as /local/ds.

Note – When using the command on Windows systems, you may need to include Perl in your PATH, as shown in the following example.

C:\ds6\bin>set PATH=%PATH%;C:\dsee6\perl5\bin C:\ds6\bin>perl schema_push C:\servers\ds\

Once the script has been run, you must restart the server to trigger the schema replication.

REFERENCE

Directory Server Configuration

Description

Syntax	INTEGER or INTEGER inherited
Default Value	4000 or inherited
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

Name all-ids-threshold - Maximum number of values per index key in an index list

This property defines the maximum number of values per index key that the server maintains in an index list. It can be set for an entire server instance, for an entire suffix, and for an individual attribute type. You can also set individual thresholds for equality, presence, and substring indexes.

When you do not set specific threshold values, the values at each level are inherited from the more global values. Thus the default suffix threshold value is inherited from the setting for the server instance; the default attribute type value from the setting for the suffix. In addition to inheritance of default settings, this property handles settings as follows.

- inherited The threshold value is inherited from the more global setting.
- <2000 The threshold value is rounded up to 2000.
- >2000 The setting is used as a guaranteed minimum threshold. Because of internal mechanisms, the real value can be slightly more than the specified value.

After you modify this property for an entire server instance or an entire suffix, import all data from LDIF to reinitialize all indexes.

If you modify this property only for a specific attribute, it is usually most expedient to use the dsconf reindex command on the attribute for which you changed the threshold. The dsconf reindex command runs a directory task to reindex the attribute while the server instance is online.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED_SSL_PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Name db-path - Path to Directory Server database files

Description

Syntax	РАТН
Default Value	instance-path/db
Is readable	Yes
Is modifiable	No (server instance level), Yes (suffix level)
Is multi-valued	No

This property specifies the default file system directory containing the server database files.

This property is modifiable at the suffix level. At server instance level, the property is set when the server instance is created, and cannot be modified.

When changing this property, you must stop the server, delete the existing database, and reimport all suffixes from LDIF, before restarting the server.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED SSL CIPHER An SSL cipher supported by the server. See the Reference for a list of supported ciphers. SUPPORTED SSL PROTOCOL An SSL protocol supported by the server. See the Reference for a list of supported protocols. TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M), server(5dsconf), suffix(5dsconf)

Name desc - Optional description of configuration element

Description

Syntax	STRING
Default Value	None
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

Use this optional property to provide a short description of the configuration element.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED SSL PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M), encryption(5dsconf), index(5dsconf), plugin(5dsconf), repl-agmt(5dsconf)

Name ds5AgreementEnable – Whether replication is enabled

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	on off
Default Value	on
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

Specifies whether the replication agreement is enabled.

Examples ds5AgreementEnable: on

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds5BeginReplicaAcceptUpdates - Accept, rather than refer, update operations

Description [

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	start stop
Default Value	None
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5Replica entries.

When this attribute is set to start, the server accepts client updates rather than referring them to another server.

Examples ds5BeginReplicaAcceptUpdates: start

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds5LastInitTimeStamp – Time stamp for last initialization

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	N/A
Default Value	N/A
Syntax	Integer

This attribute is part of replica configuration for nsDS5Replica entries.

This attribute is reserved for internal use.

Examples ds5LastInitTimeStamp: 0

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds5ReferralDelayAfterInit – Accept update operations after the specified delay

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	0 to any 64-bit integer (seconds)
Default Value	Not set (unlimited)
Syntax	Integer

This attribute is part of replica configuration for nsDS5Replica entries.

When this attribute is set, the server starts accepting client updates after waiting the number of seconds you specify.

- **Examples** ds5ReferralDelayAfterInit: 100
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds5ReplicaAutomaticInit – Automatically initialize dedicated consumer

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	on off
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

When set to on, this attribute causes the server to perform a total update of the consumer replica as soon as replication fails to proceed normally. Use this attribute only in agreements toward read-only, dedicated consumer replica.

- **Examples** ds5ReplicaAutomaticInit: on
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds5ReplicaConsumerTimeout – Timeout for replication operations

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	0 maximum integer (seconds)
Default Value	300 (seconds)
Syntax	Integer

This attribute is part of replica configuration for nsDS5Replica entries.

When set, this attribute causes the consumer to close a replication connection with the current supplier, allowing it to open a replication session with another supplier.

This attribute takes effect under the following conditions on the consumer.

- The supplier sending updates on the current replication session connection has been idle for ds5ReplicaConsumerTimeout seconds.
- No local operation on the consumer is currently replaying updates from the current supplier.
- Another supplier is currently attempting to start a replication session.
- **Examples** Note Do not change the value of this attribute unless requested to do so by qualified support personnel.

ds5ReplicaConsumerTimeout: 300

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds5ReplicaForce51Protocol – Force use of DS 5.1 replication protocol

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	on off
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

When set to on, this attribute forces the supplier to use the DS 5.1 replication protocol with the consumer. Use of this attribute is *not* necessary to replicate with a DS 5.1 replica.

- Examples ds5ReplicaForce51Protocol: on
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Description	PROPERTY	VALUE
	Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
	Valid Range	0 1 2 3
	Default Value	0
	Syntax	Integer

Name ds5ReplicaTransportCompressionLevel – Compression used for replication

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

Specifies the type of compression used for replication protocol messages.

This attribute takes the following values:

- 0 No compression
- 1 Default zlib compression (zlib numeric value = -1)
- 2 Fastest zlib compression (zlib numeric value = 1)
- 3 Strongest zlib compression (zlib numeric value = 9)

If the bottleneck for replication in your environment is network bandwidth, this attribute can potentially help you tune the replication protocol for better performance.

Examples ds5ReplicaTransportCompressionLevel: 2

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds5ReplicaTransportConcurrencyLevel – Throttle replication concurrency

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	0 1 2
Default Value	2
Syntax	Integer

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

This attribute lets you force the supplier to replay replicated updates on the consumer in the order they occurred on the supplier, or even by a single thread so that the replayed updates happen sequentially. The following values are supported:

- 0 Replay updates in sequential order using a single thread. This can reduce throughput.
- 1 Replay updates in sequential order using multiple threads. This can still reduce throughput compared to the default behavior.
- 2 (Default) Replay unrelated updates in parallel to increase throughput.

Avoid tweaking this attribute as in most cases all you will manage to do is reduce replication performance.

- **Examples** ds5ReplicaTransportConcurrencyLevel: 2
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Description	PROPERTY	VALUE
	Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
	Valid Range	1 to 255
	Default Value	1
	Syntax	Integer

Name ds5ReplicaTransportGroupSize – Grouping size for replication updates

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

When this attribute is set, the supplier groups updates, for an incremental update, or entries, for total update, before sending those updates or entries to the consumer.

If the bottleneck for replication in your environment is network bandwidth, this attribute can potentially help you tune the replication protocol for better performance.

- Examples ds5ReplicaTransportGroupSize: 10
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds5ReplicaTransportGrpPktSize – Effective group packet size

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	0 to 65536
Default Value	N/A
Syntax	Integer

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

This attribute governs the effective packet size sent by the supplier such that maximum BER size is not exceeded on the consumer.

Do not modify this attribute unless told to do so by qualified support personnel.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

cn=agreement name, cn=replica, cn=suffix name, cn=mapping

Description	PROPERTY

Entry DN

 $\label{eq:state} \textbf{Name} \quad ds 5 Replica Transport Window Size - Window size for replication updates$

	tree, cn=config
Valid Range	1 to 65535
Default Value	10
Syntax	Integer

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

VALUE

The supplier sends up to the specified number of replication messages to the consumer before waiting for a response from the consumer to continue.

If the bottleneck for replication in your environment is network latency or network bandwidth, this attribute can potentially help you tune the replication protocol for better performance.

Examples ds5ReplicaTransportWindowSize: 100

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds6ruv - Replication update vector, version 6

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	N/A
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

This attribute is responsible for managing the internal state of the replica via the replication update vector. It is always present and must not be changed.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name dsChangelogMaxAge – Maximum age of change log entries

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	See the description that follows.
Default Value	7d (one week)
Syntax	IntegerTimeUnit

This attribute is part of replica configuration for nsDS5Replica entries.

The change log contains a record for each directory modification and is used when synchronizing consumer servers. Each record contains a timestamp. Any record with a timestamp that is older than the value specified in this attribute is removed.

When this attribute is set, the server purges change log entries older than the time you specify. Age is specified as a number followed by a letter s for seconds, m for minutes, h for hours, d for days, or w for weeks. If this attribute is set to 0, entries are not removed according to their age. If this attribute is not present, the default age limit on change log records is one week (7d).

Examples dsChangelogMaxAge: 7d

See Also replication(5dsconf)

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name dsChangelogMaxentries – Maximum number of change log records

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	- 1 to maximum integer
Default Value	-1 (unlimited)
Syntax	Integer

This attribute is part of replica configuration for nsDS5Replica entries.

The change log contains a record for each directory modification and is used when synchronizing consumer servers. Each record contains a timestamp. Any record with a timestamp that is older than the value specified in this attribute is removed.

When this attribute is set, the server purges entries from the change log after the maximum you specify is reached. If this attribute is absent, or if it is set to -1, the server does no limit the number of entries in the change log.

Examples dsChangelogMaxentries: 5000

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

 Description
 PROPERTY
 VALUE

 Entry DN
 cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config (supplier), cn=replica, cn=suffix name, cn=mapping tree, cn=config (consumer)

 Valid Range
 N/A

 Default Value
 N/A

 Syntax
 DirectoryString

Name dsFilterSPConfigchecksum – Checksum for partial replication

This attribute is part of replica configuration for nsDS5Replica and nsDS5ReplicationAgreement entries.

This read-only attribute is reserved for internal use. Do not modify its value.

- **Examples** dsFilterSPConfigchecksum: 0
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	ds-hdsml-clienta	uthmethod – DSML SSL client authentication
Description	Defines how the server will identify a client on a secure (SSL) connection.	
	Entry DN	<pre>cn=DSMLv2-SOAP-HTTP,cn=frontends,cn=plugins, cn=config</pre>
	Valid Range	clientCertOnly: the server uses the credentials from the client certificate to identify the client.
		httpBasicOnly: the server uses the credentials from the HTTP authorization header to identify the client.
		clientCertFirst: the server attempts to use the client certificate credentials to identify the client. If there are no client certificate credentials, credentials from the HTTP authorization header are used.
	Default Value	clientCertFirst
	Syntax	DirectoryString
	Example	ds-hdsml-clientauthmethod: clientCertFirst

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds-hdsml-dsmlschemalocation - DSMLv2 schema location

DescriptionThe path to the DSMLv2 schema. This is generated automatically and should not be changed.Entry DNcn=DSMLv2-SOAP-HTTP, cn=frontends, cn=plugins, cn=configValid RangeAny valid path to the directory storing the DSML schema.Default Valueinstall-path/ds6/lib/DSMLv2.xsdSyntaxDirectoryStringExampleds-hdsml-dsmlschemalocation: /opt/SUNWdsee/ds6/lib/DSMLv2.xsd

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds-hdsml-iobuffersize – buffer size for DSML requests

Description The size of the buffer in which the DSML request is stored. If Directory Server receives many large DSML requests, such as large modify requests, then increasing this value may allow fewer buffers to be passed from the HTTP front end to the DSML parsers.

Entry DN	<pre>cn=DSMLv2-SOAP-HTTP,cn=frontends,cn=plugins, cn=config</pre>
Valid Range	1 to an appropriate upper limit for your deployment, with a maximum of 2147483647 (2^31-1). The value must be a multiple of 256.
Default Value	8192
Syntax	Integer
Example	ds-hdsml-buffersize: 8192

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds-hdsml-poolmaxsize - maximum number of DSML parsers

Description The maximum number of DSML parsers kept ready to handle DSML requests. If you expect sustained traffic of many concurrent DSML requests, you may choose to increase the value of this attribute.

Entry DNcn=DSMLv2-SOAP-HTTP, cn=frontends, cn=plugins, cn=configValid Range1 to an appropriate upper limit for your deployment, with a maximum of
2147483647 (2³¹-1).Default Value10SyntaxIntegerExampleds-hdsml-poolmaxsize: 10

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds-hdsml-poolsize - default number of DSML parsers

Description The minimum, default number of DSML parsers kept ready to handle DSML requests. If you expect sustained traffic of many concurrent DSML requests, you may choose to increase the value of this attribute.

Entry DN	<pre>cn=DSMLv2-SOAP-HTTP,cn=frontends,cn=plugins, cn=config</pre>
Valid Range	1 to an appropriate upper limit for your deployment, with a maximum of 2147483647 $(2^{31}-1)$.
Default Value	5
Syntax	Integer
Example	ds-hdsml-poolsize: 5

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds-hdsml-port – DSML port number

Description The HTTP port used for DSML communications. The selected port must be unique on the host system; make sure no other application is attempting to use the same port number. Specifying a port number of less than 1024 requires Directory Server to run as super user.

You must restart the server for a port number change to be taken into account.

Entry DNcn=DSMLv2-SOAP-HTTP, cn=frontends, cn=plugins, cn=configValid Range1-65535Default ValuedisabledSyntaxIntegerExampleds-hdsml-port: 8080

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds-hdsml-requestmaxsize - maximum DSML request size

Description The maximum size of a DSML request. If the request is larger than this value, the server responds with the error message REQUEST_ENTITY_TOO_LARGE and closes the connection to prevent the client from continuing the request.

Entry DN	<pre>cn=DSMLv2-SOAP-HTTP,cn=frontends,cn=plugins, cn=config</pre>
Valid Range	1-2147483647 (2 ³¹ -1)
Default Value	32768

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name ds-maxheaphigh, ds-maxheaplow - Specify soft and hard thresholds for heap memory use

Description

PROPERTY	VALUE
Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	Range depends on the deployment. The value is checked against the run-time values.
Default Value	Not set by default.
Syntax	Integer

These attributes specify threshold values for dynamic memory footprint. When the memory threshold is reached, Directory Server attempts to free memory from the entry caches, and limit memory use.

- When ds-maxheaplow is reached, Directory Server attempts to free memory concurrently with other operations.
- When ds-maxheaphigh is reached, Directory Server prevents operations on the cache while memory is freed.

These attributes safeguard against sudden increases of memory footprint due to changes in allocation patterns. As such, the memory thresholds should be higher than the sum of all entry caches, plus the memory footprint at startup.

ds-maxheaphigh and ds-maxheaplow must be configured in conjunction with each other, as follows.

- If ds-maxheaphigh is zero or is not set, ds-maxheaplow is ignored.
- If ds -maxheaphigh is set, its value must be at least one gigabyte.
- If ds -maxheaphigh is set, the value of ds -maxheaplow must be less than that of ds -maxheaphigh.
- If ds maxheaphigh is set to a value other than zero, ds maxheaplow is automatically set by default to 7/8 of the value of ds - maxheaphigh.
- If ds-maxheaphigh and ds-maxheaplow are both set to a value other than zero, ds-maxheaplow must be greater than or equal to (ds-maxheaphigh + minheap)/2, where minheap is the amount of memory used by the server at startup. If this condition is not met, ds-maxheaplow is automatically set by default to 7/8 of the value of ds-maxheaphigh.

The number of times the memory thresholds have been exceeded can be monitored by using the heapmaxhighhits and heapmaxlowhits attributes.

Name dsReplFractionalExclude – Attribute types to exclude from replication

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	Any valid attribute type
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

When this multi-valued fractional replication configuration attribute is set, the supplier does not send updates for the specified attribute types when replicating to the consumer. This attribute is mutually exclusive with dsReplFractionalInclude(5dsconf).

Examples dsReplFractionalExclude: userPassword

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

See Also replication(5dsconf)

	Name	dsReplFractionalInclude - Att	ribute types to include in replication
--	------	-------------------------------	----------------------------------------

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	Any valid attribute type
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

When this multi-valued fractional replication configuration attribute is set, the supplier send updates only for the specified attribute types when replicating to the consumer. This attribute is mutually exclusive with dsReplFractionalExclude(5dsconf).

```
Examples dsReplFractionalInclude: cn
dsReplFractionalInclude: mail
dsReplFractionalInclude: objectClass
dsReplFractionalInclude: sn
```

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

See Also replication(5dsconf)

Name enabled - Whether the configuration element is operational

Description

Syntax	on off
Default Value	Depends on the configuration element
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

Use this property to turn on the configuration element.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED SSL PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M), log(5dsconf), plugin(5dsconf), repl-agmt(5dsconf), suffix(5dsconf)

Name encryption, algorithm - DS attribute encryption (ETA) properties

Description Directory Server allows you to encrypt individual attributes to protect sensitive information stored in the directory. The encryption does not prevent client applications from reading the attributes. Instead it works at the database index file level to prevent users with access to read database index files from being able to search through the indexes for sensitive information.

For example, before attribute encryption is configured for uid attributes, a user with read access to database index files could easily find out that bjensen is a uid attribute value:

```
$ strings example_uid.db3 | grep bjensen
=bjensen
$
```

Once uid attributes are encrypted, the job is not so easy:

```
$ strings example_uid.db3 | grep bjensen
$
```

Notice however that encrypted RDN values are not fully hidden. Instead they appear in clear in the DN index:

```
$ strings example_entrydn.db3 | grep bjensen
=uid=bjensen,ou=people,dc=example,dc=com
=uid=bjensen,ou=people,dc=example,dc=com
$
```

PROPERTY:algorithm

Syntax	des des3 rc2 rc4
Default Value	None
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

Directory Server uses a cipher to encrypt a specified attribute in a given suffix. This property specifies the cipher used.

The following property values are supported:

- des DES block cipher
- des3 Triple-DES block cipher
- rc2 RC2 block cipher
- rc4 RC4 stream cipher

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED_SSL_PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Name heapmaxhighhits, heapmaxlowhits – Counts the number of times ds-maxheaphigh or ds-maxheaplow has been exceeded

Description PROPERTY

PROPERTY	VALUE
Entry DN	cn=monitor
Valid Range	N/A
Default Value	N/A
Syntax	Integer

This read-only attribute counts the number of times that the heapmaxhighhits attribute or the heapmaxlowhits attribute has been exceeded:

- heapmaxhighhits counts the number of times ds -maxheaphigh has been exceeded
- heapmaxlowhits counts the number of times ds-maxheaplow has been exceeded

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

See Also ds-maxheaphigh(5dsconf)

- Name index, all-ids-threshold-eq, all-ids-threshold-pres, all-ids-threshold-sub, approx-enabled, eq-enabled, matching-rule, pres-enabled, sub-enabled, system DS attribute indexing (IDX) properties
- **Description** Directory Server can index attributes, making them faster to search. The dsconf command helps you configure five of the six supported index types:
 - 1. *Equality indexes* to determine expediently whether an attribute value is equal to a specified value
 - 2. Presence indexes to determine whether a specified attribute has any values
 - 3. *Substring indexes* to determine whether a specified attribute has values containing a specified string, also used to compare regular expressions to attribute values
 - 4. *Approximate indexes*, based on metaphone approximation and useful for English language strings only, to determine whether a specified attribute has any values that sound like the specified string
 - 5. *International indexes*, also called matching rule indexes, to expedite sorting and searching in accordance with the language rules of a particular locale

The ds conf command does not help you configure virtual list view, also known as browsing, indexes.

The ds conf command does help you assign *all IDs threshold* values to indexes. As the number of entries and attribute values grows in a directory, the number of attribute values to index also grows, as does therefore the size of the indexes. In some deployments a server can end up maintaining index lists so large that the cost of rebuilding an index when attributes are modified or added outweighs the benefit the index provides for searches. All IDs thresholds limit the growth of large indexes by definining the maximum number of entry identifiers Directory Server maintains in an index list. You can define all IDs thresholds for individual indexes and for some types of indexes.

Some indexes are maintained by the server for its own use. These are called *system indexes*. In general, do not modify or remove systems indexes; such modifications could have severe repercussions on performance.

See *Directory Server Indexing* in *Sun Java System Directory Server Enterprise Edition Reference* for further details about indexing.

PROPERTY:	
all-ids-threshold	

Syntax	INTEGER inherited
Default Value	inherited
Is readable	Yes
Is modifiable	Yes

Is multi-valued No	T 1.1 1 1
	Is multi-valued

This property defines the maximum number of entry IDs the server maintains in an index list for the specified attribute type. By default its value is inherited from the all-ids-threshold setting for the suffix, whose default value in turn is inherited from the all-ids-threshold setting for the server, which by default is 4000. In addition to inheritance of default settings, this property handles settings as follows:

inherited	The threshold is inherited from the more global setting.
<2000	The threshold value is rounded up to 2000.
>2000	The setting is used as a guaranteed minimum threshold. Because of internal mechanisms, the real value can be slightly more than the specified value.

After you modify this property, reindex the attribute for which you changed the threshold. For example:

```
$ dsconf set-index-prop dc=example,dc=com uid all-ids-threshold:5000
$ dsconf reindex -t uid dc=example,dc=com
## example: Indexing attribute: uid
## example: Finished indexing.
Task completed (slapd exit code: 0).
$
```

```
PROPERTY: all-ids-threshold-eq
```

pe	Syntax	INTEGER inherited
	Default Value	inherited
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property defines the all IDs threshold for equality indexes of the specified attribute. By default its value is inherited from the all-ids-threshold setting for the attribute type. See all-ids-threshold(5dsconf) for more information.

PROPERTY: all-ids-threshold-pre	Syntax	INTEGER inherited
	Default Value	inherited
	Is readable	Yes

Is modifiable	Yes
Is multi-valued	No

This property defines the all IDs threshold for presence indexes of the specified attribute. By default its value is inherited from the all-ids-threshold setting for the attribute type. See all-ids-threshold(5dsconf) for more information.

PROPERTY: all-ids-threshold-su

: sub	Syntax	INTEGER inherited
	Default Value	inherited
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property defines the all IDs threshold for substring indexes of the specified attribute. By default its value is inherited from the all-ids-threshold setting for the attribute type. See all-ids-threshold(5dsconf) for more information.

PROPERTY: approx-enabled

Syntax	on off
Default Value	off
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property determines whether approximate indexes are maintained for the specified attribute type. You cannot set an all IDs threshold value for approximate indexes.

PROPERTY:desc

С	Syntax	STRING
	Default Value	None
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

Use this optional property to provide a short description of the index configuration.

PROPERTY: eq-enabled

Syntax	on off
Default Value	on
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property determines whether equality indexes are maintained for the specified attribute type.

PROPERTY: matching-rule

:RIY: rule	Syntax	STRING
	Default Value	None
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	Yes

This property specifies the matching rule indexes maintained for the specified attribute type.

Values for this property must be valid collation order object identifiers (OIDs). See *Directory Server Internationalized Directory* in *Directory Server Enterprise Edition Reference* for the OIDs corresponding to supported locales.

PROPERTY:	Synta
pres-enabled	- Oymu

ΓY: ed	Syntax	on off
	Default Value	on
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property determines whether presence indexes are maintained for the specified attribute type.

PROPERTY: sub-enabled	Syntax	on off
	Default Value	off

Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property determines whether substring indexes are maintained for the specified attribute type.

PROPERTY:system

Syntax	true false
Default Value	false
Is readable	Yes
Is modifiable	No
Is multi-valued	No

This property identifies whether the specified index is a system index, and therefore should be left alone.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

 SUPPORTED_SSL_CIPHER An SSL cipher supported by the server. See the Reference for a list of supported ciphers.
 SUPPORTED_SSL_PROTOCOL An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M), all-ids-threshold(5dsconf), desc(5dsconf)

- Name log, buffering-enabled, level, max-age, max-disk-space-size, max-file-count, max-size, min-free-disk-space-size, path, perm, rotation-interval, rotation-min-file-size, rotation-time, verbose-enabled – DS logging configuration (LOG) properties
- **Description** Directory Server writes to three main types of log files you can configure, the *INSTANCE_PATH*/logs/access, *INSTANCE_PATH*/logs/audit, and *INSTANCE_PATH*/logs/errors logs, where *INSTANCE_PATH* is the full path where the server instance is located, such as /local/ds.

When you specify one of these properties with dsconf get-log-prop or dsconf set-log-prop, you must specify which type of log configuration, access, audit, or errors, you want to examine. For example, to see whether audit logging is enabled for a server instance:

```
$ dsconf get-log-prop audit enabled
enabled : off
$
```

PROPERTY: buffering-enabled

Syntax	on off
Default Value	on for access, not applicable to audit and errors logs
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property indicates whether Directory Server writes access log entries directly to disk, or use a buffer, by default.

PROPERTY: enabled S

Syntax	on off
Default Value	on for access, off for audit, on for errors
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property indicates whether the specified log type is enabled.

PROPERTY:level

Syntax	See the description that follows.
Default Value	default

е

Is readable	Yes
Is modifiable	Yes
Is multi-valued	Yes

This property defines which kinds of messages get logged. This property is applicable only to access, and errors logs.

access log levels The following settings are supported:

8	888888	· · · · · · · · · · · · · · · · · · ·	
	acc-internal		Log access information for internal operations.
	default		Log client access to entries.
	acc-default_plus_refe	errals	As default, but also log access to referrals.
	acc-timing		Use precise timing for microsecond resolution of elapsed times.
errors log levels	The following settings are	e supporte	ed:
	default	Log star	tup, shutdown, errors, and warnings.
	err-function-calls	Log whe	en server enters or exits a function.
	err-search-args	Log sear	ch arguments.
	err-connection	Connect	tion management.
	err-packets	Log pacl	kets sent and received.
	err-search-filter	Log sear	ch filter information.
	err-config-file	0	rmation for changes to the ration file dse.ldif.
	err-acl	Log acce	ess control processing information.
	err-ldbm	Log info plugin.	rmation from the ldbm database
	err-entry-parsing	Log LDI	F parsing errors.
	err-housekeeping	Log ever	nt queue information.
	err-replication	Log info	rmation about replication operations.
	err-entry-cache	Log entr	y cache information.
	err-plugins	Log info	rmation from server plug-ins.
	err-dsml	Log info	rmation from DSML front end.

err-dsml-advanced Debugging information for DSML.

PROPERTY:max-age

Syntax	DURATION unlimited
Default Value	1M (one month)
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property defines the age beyond which the specified type of log file is deleted.

PROPERTY: max-disk-space-size

IIIdX	- u	12	K -	5	μa	ce	- 1	51	LZ	e

Syntax	MEMORY_SIZE unlimited
Default Value	500M
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property defines the maximum disk space the specified type of log is allowed to consume. When the limit is reached, the server deletes the oldest log file to reclaim disk space.

PROPERTY: max-file-count

Syntax	Integer
Default Value	10 for access, 2 for errors, 1 for audit
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property defines the maximum number of log files, including rotated logs, of the specified type that the server allows to be created in the log file directory. When the limit is reached, the server deletes the oldest log file to reclaim disk space.

When you set this property to 1, the specified log is not rotated.

PROPERTY:max-size	Syntax	MEMORY_SIZE unlimited
	o y mult	

Default Value	100M
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property defines the maximum file size for the specified log. When the limit is reached, the server rotates the log file, unless max-file-count is set to 1.

PROPERTY: min-free-disk-space

: e-s	Syntax ize	MEMORY_SIZE
	Default Value	5M
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property defines the minimum free space allowed on the disk where the specified log is stored. When the limit is reached, the server deletes the oldest log files until enough space is available.

PROPERTY:path

Syntax	PATH
Default Value	INSTANCE_PATH/logs/access, INSTANCE_PATH/logs/audit, INSTANCE_PATH/logs/errors
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property defines the full path to the specified log file type.

PROPERTY:perm

Syntax	OCTAL_MODE
Default Value	600
Is readable	Yes
Is modifiable	Yes

Is multi-valued	No

This property defines the read, write, and execute permissions on the specified log file.

PROPERTY: rotation-interval

/: 1	Syntax	DURATION unlimited
	Default Value	1d (one day) for access, 1w (one week) for audit and errors
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property defines the duration between rotations of the specified log file.

PROPERTY: cotation-min-file-size

Y: ∙siz	Syntax ze	MEMORY_SIZE undefined
	Default Value	undefined
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property defines the minimum size the specified log file must have before the server rotates it.

PROPERTY: rotation-time

'Y: ne	Syntax	TIME undefined
-	Default Value	undefined
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property defines the time of day when the server rotates the specified log file.

PROPERTY: verbose-enabled

Syntax	on off
Default Value	off

Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property determines whether extra informational messages are written to the errors log.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.

- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED_SSL_PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M), enabled(5dsconf)

Name moddn-enabled – Whether the server accepts mod DN operations

Description

Syntax	on off
Default Value	off (inherited at suffix level)
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies whether the server accepts requests to perform modify DN operations (to move entries).

All server instances in a replication topology must be recent enough to have support for modify DN operations before you set this property to on.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED SSL PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M), server(5dsconf), suffix(5dsconf)

- Name nsAbandonedSearchCheckInterval interval between checks for abandoned chaining operations
- **Description** The number of seconds that pass before the server checks for abandoned operations.

Entry DN	<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>
Valid Range	0 to 2147483647 seconds
Default Value	2
Syntax	Integer
Example	nsabandonedsearchcheckinterval: 10

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsActiveChainingComponents – components using chaining

Description Lists the components using chaining. A component is any functional unit in the server. The value of this attribute overrides the value in the global configuration attribute. To disable chaining on a particular database instance, use the value None.

This attribute also allows you to alter the components used to chain. By default, no components are allowed to chain. For this reason, this attribute does not appear in a list of cn=config, cn=chaining database, cn=config attributes, as LDAP considers empty attributes to be nonexistent.

Entry DN	<pre>cn=config,cn=chaining database,cn=plugins,cn=config</pre>
Valid Range	Any valid component entry.
Default Value	None
Syntax	DirectoryString
Example	<pre>nsActiveChainingComponents: cn=uid uniqueness,cn=plugins,cn=config</pre>

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsBindConnectionsLimit – maximum TCP connections for chaining

Description Maximum number of TCP connections the chained suffix establishes with the remote server.

Entry DN	<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>
Valid Range	1 to 50 connections
Default Value	3
Syntax	Integer
Example	nsbindconnectionslimit: 3

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsBindRetryLimit - maximum bind attemps for chaining suffix

Description Number of times a chained suffix attempts to bind with the remote server if the initial bind attempt is unsuccessful. A value of 0 here indicates that the chained suffix will only attempt to bind once only.

Entry DN	<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>
Valid Range	0 to 5
Default Value	3
Syntax	Integer
Example	nsbindretrylimit: 3

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsBindTimeout – timeout for chaining binds	
Description	Period of time before the bind attempt times out. There is no real Valid Range for this attribute, except reasonable patience limits.	
	Entry DN	<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>
	Valid Range	0 to 60 seconds
	Default Value	15
	Syntax	Integer
	Example	nsbindtimeout:15

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsCheckLocalACI - evaluate access control on chained suffix

Description Reserved for advanced use only. Controls whether ACIs are evaluated on the chained suffix as well as the remote data server. Changes to this attribute only take effect once the server has been restarted.

Entry DN	<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>	
Valid Range	on off	
Default Value	off	
Syntax	DirectoryString	
Example	nschecklocalaci: on	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsConcurrentBindLimit	- maximum c	concurrent binds o	n TCP	connection for chaining	
------	-----------------------	-------------	--------------------	-------	-------------------------	--

Description The maximum number of concurrent bind operations per TCP connection.

Entry DN	<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>
Valid Range	1 to 25 binds
Default Value	10
Syntax	Integer
Example	nsconcurrentbindlimit:10

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsConcurrentOperationsLimit - maximum concurrent operations for chaining

Description The maximum number of concurrent operations allowed.

Entry DN	<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>
Valid Range	1 to 50 operations
Default Value	50
Syntax	Integer
Example	nsconcurrentoperationslimit: 50

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsConnectionLife - connection lifetime for chaining

Description Specifies the connection lifetime. You can keep connections between the chained suffix and the remote server open for an unspecified time, or you can close them after a specific period of time. Keeping the connections open is faster, but uses more resources. When the value is 0 and a list of failover servers is provided in the nsFarmServerURL attribute, the "main" server is never contacted after failover to the alternate server.

Entry DN	<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>
Valid Range	0 to limitless seconds (where 0 means forever)
Default Value	0
Syntax	Integer
Example	nsconnectionlife: 0

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsds50ruv - Replication update vector, version 5

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	N/A
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

This attribute is responsible for managing the internal state of the replica via the replication update vector. It is always present and must not be changed.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsds5BeginReplicaRefresh – Force initialization of the consumer

Description [

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	start stop
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

When set to start, this attribute causes the supplier to perform at total update of the consumer.

- **Examples** nsds5BeginReplicaRefresh: start
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5Flags - Change logging and referral flags

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	0 1 4 5
Default Value	1 (master), 0 (consumer)
Syntax	Integer

This attribute is part of replica configuration for nsDS5Replica entries.

This attribute takes one of the following values:

- 0 No changes are logged. Automatic referrals are not overwritten.
- 1 Changes are logged. Automatic referrals are not overwritten.
- 4 No changes are logged. Automatic referrals are overwritten.
- 5 Changes are logged. Automatic referrals are overwritten.

Examples nsDS5Flags: 1

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicaAutoReferral - Reserved for internal use

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	N/A
Default Value	None
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5Replica entries.

This attribute is reserved for internal use.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicaBindDN – Bind DN for replication operations

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	Any valid account DN
Default Value	<pre>cn=replication manager,cn=replication,cn=config</pre>
Syntax	DN

This attribute is part of replica configuration for nsDS5Replica, and nsDS5ReplicationAgreement entries.

When this multi-valued attribute is set, the accounts with the specified DNs can be used by the server to bind before performing replication operations. The DNs specified in this attribute can be used in replication agreements on the supplier side, and to bind on the consumer side. The DN can either be a local entry on the consumer server or, in the case of an SSL connection, the certificate identity associated with the same DN.

- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsDS5ReplicaBindMethod - 1	Bind protocol used for replication
------	----------------------------	------------------------------------

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	SIMPLE SSLCLIENTAUTH
Default Value	SIMPLE
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

Specifies the bind protocol used for replication. When this attribute is set to SIMPLE, simple authentication is used. When this attribute is set to SSLLCIENTAUTH, SSL client authentication is used.

- **Examples** nsDS5ReplicaBindMethod: SIMPLE
- Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicaChangeCount – Number of entries in the change log

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	N/A
Default Value	N/A
Syntax	Integer

This attribute is part of replica configuration for nsDS5Replica entries.

This read-only attribute shows the number of entries remaining in the change log. The change log is purged according to how nsslapd-changelogmaxage and nsslapd-changelogmaxentries are set.

- Examples nsDS5ReplicaChangeCount: 10
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsds5replicaChangesSentSinceStartup – Number of updates since startup

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	0 maximum integer
Default Value	None
Syntax	Integer

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

This read-only attribute shows the number of changes sent to this replica since the server started.

Examples nsds5replicaChangesSentSinceStartup: 161803399

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Description	PROPERTY	VALUE
	Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
	Valid Range	N/A
	Default Value	N/A
	Syntax	DirectoryString

Name nsDS5ReplicaCredentials – Credentials for replication operations

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

Specifies the credentials on the consumer for the account with DN nsDS5ReplicaBindDN(5dsconf) used for replication configured to use simple authentication.

- Examples nsDS5ReplicaCredentials:: e0RFU31JakduS3VZSWhEcThEcExDQlU2
 VlN2QTdjcUw4emhDdXl3Sldmc3NTZ2t3eS9mWmR4VmpUZlVYRE1NLzR2T
 UVBDQpyZVdYU3A3U1ZwYz0=
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicaHost – Host name of consumer

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	Any valid host name
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

Specifies the hostname for the host where the consumer replica is located. Do not modify this attribute after it has been set.

- **Examples** nsDS5ReplicaHost: ds.example.com
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicaId – Replica identification number

Description [

I	PROPERTY	VALUE
]	Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
,	Valid Range	1-65534 (master), 65535 (consumer or hub)
]	Default Value	None
Ś	Syntax	Integer

This attribute is part of replica configuration for nsDS5Replica entries.

This attribute specifies a unique ID for a master replica in a particular topology, or the ID 65535 for a consumer, or for a hub.

- **Examples** nsDS5ReplicaId: 1
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsds5replicaLastInitEnd – Time of last initialization

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	A valid timestamp
Default Value	None
Syntax	GeneralizedTime

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

This read-only attribute shows when the most recent initialization of the replica finished.

Examples nsds5replicaLastInitEnd: 20051223113229

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsds5replicaLastInitStart – Time of last initialization

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	A valid timestamp
Default Value	None
Syntax	GeneralizedTime

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

This read-only attribute shows when the most recent initialization of the replica started.

Examples nsds5replicaLastInitStart: 20051223113214

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsds5replicaLastInitStatus – Replica initialization status

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	A message concerning initialization
Default Value	None
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

This read-only attribute shows the status of the most recent replication initialization.

Examples nsds5replicaLastInitStatus: 0 Consumer Initialization Succeeded

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsds5replicaLastUpdateEnd – Time of last update

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	A valid timestamp
Default Value	None
Syntax	GeneralizedTime

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

This read-only attribute shows when the most recent update of the replica finished.

Examples nsds5replicaLastUpdateEnd: 20051223113229

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsds5replicaLastUpdateStart – Time of last update

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	A valid timestamp
Default Value	None
Syntax	GeneralizedTime

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

This read-only attribute shows when the most recent update of the replica started.

Examples nsds5replicaLastUpdateStart: 20051223113214

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsds5replicaLastUpdateStatus – Replica update status

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	A message concerning the last update
Default Value	None
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

This read-only attribute shows the status of the latest update of the replica.

Messages include the following.

-1 Could not bind to replica

Solution: The credentials are wrong for the replication manager bind DN. Fix the replication agreement.

- -1 Incremental update has failed and requires a total update Solution: Reinitialize the replica. See the errors log to determine what led to the problem.
- -1 Incremental update has failed and requires administrator action Solution: Reinitialize the replica. See the errors log to determine what led to the problem.
- -1 Internal error: Could not get access to the replica RUV Solution: Replication stopped and requires a total update. Reinitialize the replica.
- -1 Partial replication configuration error **Solution:** Replication stopped and requires configuration fix. Fix the configuration.
- -1 Partial replication configuration has changed **Solution:** Replication stopped and requires a total update. Reinitialize the replica.
- -1 Total update required **Solution:** Reinitialize the replica. See the errors log to determine what led to the problem.
- 0 Incremental update session interrupted Solution: A directory administrator has stopped or disabled replication.
- 0 Incremental update session started Solution: Replication is proceeding normally.

- 0 Incremental update session stopped: nothing to replicate Solution: Replication is proceeding normally.
- 0 Incremental update session succeeded Solution: Replication is proceeding normally.
- 0 Incremental update started Solution: Replication is proceeding normally
- Incremental update stopped : Nothing acquired
 Solution: Replication is proceeding normally. Another supplier is replicating to the consumer, and replication from this supplier will resume after that operation finishes.
- 0 Incremental update succeeded Solution: Replication is proceeding normally.
- No replication sessions started since server startup
 Solution: No replication operation has been attempted yet and therefore no status is available. This is typically the case when restarting replication.
- 0 Replica acquired successfully Solution: Replication is proceeding normally.
- 0 Replication session successful Solution: Replication is proceeding normally.
- Replication error acquiring replica: replica busy
 Solution: Another supplier is replicating to the consumer, and replication from this supplier will resume after that operation finishes.
- 11 Replication error acquiring replica: duplicate replica ID detected **Solution:** More than one master is using the same replica ID. Fix the configuration.
- 12 Replication session aborted Solution: The consumer is disabled. Error 8194 should also appear in the errors log. Investigate the cause of the problem, fix it, and restart replication.
- 2 Replication error acquiring replica: excessive clock skew. Solution: The time difference for clocks on different replicas is too big for replication to handle. Synchronize the system clocks.

- 202 Incremental update session aborted: Timeout while waiting for change
 acknowledgement [hostname:port-number]
 Solution: Replication is proceeding normally. A timeout temporarily prevented replication
- 3 Replication error acquiring replica: permission denied Solution: The credentials are wrong for the replication manager bind DN. Fix the replication agreement.
- 4 Replication error acquiring replica: decoding error **Solution:** A protocol error occurred.

from continuing.

- 401 Incremental update session stopped: Could not parse update vector **Solution:** Replication is proceeding normally. A parse error temporarily prevented replication from continuing.
- 401 Replication session failed, consumer replica needs to be initialized Solution: The database on the consumer has not been initialized. Either perform a total update on the consumer, or initialize the consumer with the same data as the supplier.
- 402 Replication session failed, consumer replica has a different data version **Solution**: The database on the consumer has been initialized with different data from that of the supplier. Either perform a total update on the consumer, or initialize the consumer with the same data as the supplier.
- 5 Replication error acquiring replica: unknown update protocol Solution: The consumer does not support the same replication protocol as the supplier.
- 6 Replication error acquiring replica: no such replica Solution: The consumer is not configured for replication for the suffix to be replicated.
- 7 Replication error acquiring replica: csn below purge point Solution: The replication change log has been purged and therefore no longer contains the changes necessary to update the consumer.
- 8 Replication error acquiring replica: internal error Solution: The consumer failed to replay an replication operation. See the errors log on the consumer to determine what led to the problem.

801 Incremental update session aborted : Unable to adjust the time between replicas

Solution: The time difference for clocks on different replicas is too big for replication to handle. Synchronize the system clocks, perhaps using the network time protocol (NTP).

810 Replication error acquiring replica: Supplier and consumer use the same replica ID

Solution: More than one replica is using the same replica ID. Fix the configuration.

820 Incremental update session stopped: unable to replicate schema Solution: Replication is proceeding normally, but schema could not be replicated. If this message is observed repeatedly, replicate schema to the consumer manually.

829 Replication error acquiring replica: not able to use partial replication to read-write replica

Solution: Only consumers can be partial replica. Fix the configuration.

9 Replication error acquiring replica: replica released **Solution:** Replication is proceeding normally.

Examples nsds5replicaLastUpdateStatus: 0 replica acquired successfully

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduledfor removal after this release

Name nsDS5ReplicaName – Unique replica identifier

Description

1	PROPERTY	VALUE
	Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
	Valid Range	N/A
	Default Value	N/A
	Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5Replica entries.

This attribute value is allocated by the server when the replica is created. Reserved for internal use.

Examples nsDS5ReplicaName: d2e14d02-600311da-80ace5db-c83e55ac

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicaPort – Port number on which consumer listens

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	Any valid port number
Default Value	N/A
Syntax	Integer

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

Specifies the hostname for the port number on which the consumer replica listens. Do not modify this attribute after it has been set.

Examples nsDS5ReplicaPort: 389

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicaPurgeDelay – Maximum time to keep tombstones

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	0 (keep forever) to max. integer seconds
Default Value	604800 (one week)
Syntax	Integer

This attribute is part of replica configuration for nsDS5Replica entries.

When this attribute is set, the server deletes tombstone entries older than the number of seconds you specify. Tombstone entries are those entries that have been marked for deletion but not yet removed, and the associated replication state information. When setting this attribute, ensure that the purge delay is longer than the longest replication cycle in your replication policy to avoid incurring conflict resolution problems and divergence between replica.

Examples nsDS5ReplicaPurgeDelay: 604800

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicaReferral – Referrals for a replica

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	Any valid LDAP URL
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5Replica entries.

This attribute should be set on a consumer only. When this multi-valued attribute is set, the server returns these referrals when a client attempts to update a read-only consumer.

If this attribute is not set, the read-only consumer refers clients to supplier servers on update.

- Examples nsDS5ReplicaReferral: ldap://master.example.com
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicaRoot - Base DN for replication

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	DN of replicated suffix
Default Value	None
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5Replica entries.

The server replicates entries below the entry with this DN. This DN must correspond to the root DN of a replicated suffix. Once set, this attribute must not be modified.

Examples nsDS5ReplicaRoot: dc=example,dc=com

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicatedAttributeList - Attributes not to replicate

Description

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	Any valid attribute types
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

When this multi-valued attribute is set, the supplier does not replicate updates to the specified attribute types to the consumer.

Examples nsDS5ReplicatedAttributeList: userPassword

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsds5ReplicaTimeout – Timeout for replication operations

Description |

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	0 maximum integer (seconds)
Default Value	600 (seconds)
Syntax	Integer

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

When set, this attribute causes the supplier to wait at most the specified number of seconds for a response from the consumer concerning a replication operation.

If you see Warning: timed out messages in the errors log file, then you should increase the value of this attribute. You can find out the amount of time the operation actually lasted by examining the access log on the consumer. You can then tune this attribute to optimize performance.

Examples nsds5ReplicaTimeout: 1200

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicaTombstonePurgeInterval – Time interval between tombstone purge operations

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	0 to maximum integer (seconds)
Default Value	300 (five minutes)
Syntax	Integer

This attribute is part of replica configuration for nsDS5Replica entries.

When this attribute is set, the server waits the number of seconds you specify after each operation to purge tombstone entries. Bear in mind that purge operations can be time consuming.

Examples nsDS5ReplicaTombstonePurgeInterval: 300

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Description	PROPERTY	VALUE
	Entry DN	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
	Valid Range	LDAP SSL
	Default Value	N/A
	Syntax	DirectoryString

Name nsDS5ReplicaTransportInfo – Transport used for replication

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

Specifies the type of transport used for replication. When this attribute is set to LDAP, standard LDAP connections are used. When this attribute is set to SSL, LDAPS connections are used. Do not modify this attribute after it has been set.

Examples nsDS5ReplicaTransportInfo: SSL

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsDS5ReplicaType - Role of the replica

Description

PROPERTY	VALUE
Entry DN	<pre>cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	0 1 2 3
Default Value	3 (master), 2 (consumer)
Syntax	Integer

This attribute is part of replica configuration for nsDS5Replica entries.

When this attribute is set, the server starts accepting client updates after waiting the number of seconds you specify.

Examples nsDS5ReplicaType: 3

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsds5replicaUpdateInProgress – Indicate whether or not a replication schedule update is in progress

VALUE

Description PROPERTY

	VALOL
Entry DN	<pre>cn=Replication Agreement Name,cn=replica,cn=Suffix Name, cn=mapping tree,cn=config</pre>
Valid Range	true false
Default Value	None
Syntax	Boolean

This read-only attribute states whether or not a replication schedule update is in progress.

Examples nsds5replicaUpdateInProgress: true

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name	nsDS5ReplicaU	pdateSchedule – When r	eplication is scheduled
------	---------------	------------------------	-------------------------

Dece	intion	
Desc	ription	

PROPERTY	VALUE
Entry DN	<pre>cn=agreement name,cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
Valid Range	hhmm-hhmm 0123456 *
Default Value	*
Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5ReplicationAgreement entries.

When set to *, this attribute causes the supplier to replicate as necessary. This attribute can alternatively take multiple values of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, then finishing hour in 24-hour time format, from 0000-2359, and the second specifies which days, starting with Sunday (0) to Saturday (6).

Examples The following setting specifies the supplier should replicate to the consumer between midnight and 4 am on Sundays, Tuesdays, Thursdays, and Saturdays:

nsDS5ReplicaUpdateSchedule: 0000-0400 0246

- **See Also** replication(5dsconf)

Name nsDS5Task – Internal replication tasks

Description

1	PROPERTY	VALUE
	Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
	Valid Range	N/A
	Default Value	None
	Syntax	DirectoryString

This attribute is part of replica configuration for nsDS5Replica entries.

This attribute is reserved for internal use.

Examples nsDS5Task: CL2LDIF

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

See Also replication(5dsconf)

Name	nsFarmServerURL – LDA	P URL for chaining farm server
------	-----------------------	--------------------------------

Description The LDAP URL of the remote server. A *farm server* is contains data in one or more databases. This attribute can contain optional servers for failover, separated by spaces. For cascading chaining, this URL can point to another chained suffix.

Entry DN	<pre>cn=chainedSuffix,cn=chaining database, cn=plugins,cn=config</pre>
Valid Range	Any valid remote server LDAP URL.
Default Value	N/A
Syntax	DirectoryString
Example	nsFarmServerURL: ldap://epdiote.example.com:alternate_server:3333

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nshoplimit - maximum hops for chaining

Description Specifies the maximum number of times a suffix is allowed to chain, that is, the number of times a request can be forwarded from one chained suffix to another.

Entry DN	${\tt cn} = chainedSuffix, {\tt cn} = {\tt chaining database, cn} = {\tt plugins, cn} = {\tt config}$
Valid Range	1 to an appropriate upper limit for your deployment.
Default Value	10
Syntax	Integer
Example	nsHopLimit: 3

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Description

Name nsIndexType – type of index

This optional, multivalued attribute specifies the types of index used in Directory Server operations and the values of the attributes to be indexed. Each index type must be entered on a separate line.			
Entry DN	<pre>cn=default indexes,cn=config,cn=ldbm database, cn=plugins,cn=config</pre>		
Valid Range			
	approx	Approximate, sounds alike, index	
	browse	Virtual list view index	
	eq	Equality index	
	matching rule	Matching rule index	
	pres	Presence index	
	sub	Substring index	
Default Value	Not applicable		
Syntax	DirectoryString		
Example	nsindextype: eq		

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsLookthroughLimit - maximum number of entries checked during search

Description This performance-related attribute specifies the maximum number of entries that Directory Server checks when examining candidate entries in response to a search request. If you bind as Directory Manager, unlimited is set by default and overrides any other settings you may specify here.

Binder based resource limits work for this limit, which means that if a value for the operational attribute nsLookThroughlimit is present in the entry used to bind, the default limit is overridden. If you attempt to set a value that is not a number or is too big for a 64-bit signed integer, you receive an LDAP_UNWILLING_TO_PERFORM error message with additional error information explaining the problem.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	-1 to the maximum number of entries, where -1 is unlimited
Default Value	5000
Syntax	Integer
Example	nsLookthroughLimit: 5000

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsMatchingRule – collation order OID for international index	
Description	This optional, multivalued attribute specifies the collation order object identifier, OID, required for Directory Server to operate international indexing.	
	Entry DN cn=default indexes,cn=monitor,cn=ldbm database, cn=plugins,cn=config	
	Valid Range Any valid collation order object identifier (OID)	
	Default Value None	
	Syntax DirectoryString	
	Example nsMatchingRule: 1.3.6.1.4.1.42.2.27.9.4.23.1	
		(For Bulgarian)

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsMaxResponseDelay - maximum delay for chained response

Description This error detection, performance related attribute specifies the maximum period of time it can take a remote server to respond to an LDAP operation request made by a chained suffix before an error is suspected. Once this delay period has been met, the chained suffix tests the connection with the remote server.

Entry DN	<pre>cn=config,cn=chaining database,cn=plugins,cn=config</pre>
Valid Range	Any valid delay period in seconds.
Default Value	60 seconds
Syntax	Integer
Example	nsMaxResponseDelay: 60

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsMaxTestResponseDelay – maximum delay to test chaining response

Description This error detection, performance related attribute specifies the duration of the test issued by the chained suffix to check whether the remote server is responding. If a response from the remote server is not returned within this period, the chained suffix assumes the remote server is down and the connection is not used for subsequent operations.

Entry DN	<pre>cn=config,cn=chaining database,cn=plugins,cn=config</pre>
Valid Range	Any valid delay period in seconds.
Default Value	15 seconds
Syntax	Integer
Example	nsMaxTestResponseDelay: 15

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsMultiplexorBindDN - bind DN for chaining multiplexor

Description DN of the administrative entry used to communicate with the remote server. The *multiplexor* is the server that contains the chained suffix and communicates with the farm server. This bind DN cannot be the Directory Manager. If this attribute is not specified, the chained suffix binds as anonymous.

Entry DN	<pre>cn=chainedSuffix,cn=chaining database, cn=plugins,cn=config</pre>
Valid Range	Not applicable
Default Value	DN of the multiplexor.
Syntax	DirectoryString
Example	nsMultiplexorBindDN: cn=proxy manager

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsMultiplexorCredentials – bind password for chaining multiplexor

Description Password for the administrative user, in plain text. If no password is provided, users can bind as anonymous. The password is encrypted in the configuration file. Please note that the example below is what you *view*, *not* what you type.

Entry DN	<pre>cn=chainedSuffix,cn=chaining database, cn=plugins,cn=config</pre>
Valid Range	Any valid password (that is encrypted using the DES reversible password encryption schema.)
Default Value	Not applicable
Syntax	DirectoryString
Example	<pre>nsMultiplexorCredentials: {DES} 9Eko69APCJfF</pre>

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsOperationConnectionsLimit – maximum number of LDAP connections for chaining

Description Maximum number of LDAP connections the chained suffix establishes with the remote server.

Entry DN	cn=default instance config,cn=chaining database, cn=plugins,cn=config
Valid Range	1 to 20 connections
Default Value	10
Syntax	Integer
Example	nsoperationconnectionslimit:10

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsProxiedAuthorization - disable proxy authorization for chaining

Description Reserved for advanced use only, this attribute permits you to disable proxied authorization. A value of off means that proxied authorization is disabled, and that all binds for chained operations are executed as the user specified in nsMultiplexorBindDN.

<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>
on off
on
DirectoryString
nsproxiedauthorization: on

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsReferralOnScopedSearch - referrals for chained searches

Description Controls whether referrals are returned for searches with scope of one level or subtree. When nsReferralOnScopedSearch is set to on, Directory Server returning referrals for such searches, instead of chaining the searches, allowing clients that can handle referrals to access the appropriate directory directly.

Entry DN	<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>	
Valid Range	on off	
Default Value	off	
Syntax	DirectoryString	
Example	nsreferralonscopedsearch: off	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-accesscontrol - Turn access control on and off

Description

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	on off
Default Value	on
Syntax	DirectoryString

This attribute turns access control on and off. If this attribute has a value off, any valid bind attempt including an anonymous bind results in full access to all information stored in Directory Server.

Note – Do not set this attribute to off unless you are told to do so by technical support personnel.

- Examples nsslapd-accesscontrol: on
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog, nsslapd-auditlog, nsslapd-errorlog – Specify the path and filename of the access|audit|errorlog

Description PROPERTY

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	Any valid file name
Default Value	See description that follows.
Syntax	DirectoryString

These attributes specify the path and filename of the log used to record each database access. Default values are:

install-path/logs/access
install-path/logs/audit
install-path/logs/errors

The following information is recorded in the access log file by default:

- IP address of the client machine that accessed the database
- Operations performed such as search, add, modify
- Result of the access such as the number of entries returned for a search

The information recorded in the error log depends on the error log level but typically contains at least the server startup and shutdown times, and the server port number.

For logging to be enabled, both of the following conditions must be met:

- The nsslapd-*log attribute must be set to a valid file name.
- The nsslapd-*log-logging-enabled attribute must be set to on.

Other configurations result in logging being disabled.

Examples nsslapd-accesslog: /local/ds/logs/access nsslapd-auditlog: /local/ds/logs/audit nsslapd-errorlog: /local/ds/logs/errors

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Stable

Name nsslapd-accesslog-level, nsslapd-auditlog-level, nsslapd-errorlog-level – Control what is logged to the access, audit, or error log

Description [

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	See the description that follows.
Default Value	256
Syntax	Integer

This attribute specifies the access log levels. Log levels can be added together to provide you with the exact type of logging you require. For example, 516 (4 + 512) obtains the internal access operation, entry access, and referral logging. The following levels are supported:

- 0 No access logging
- 4 Logging for internal access operations
- 256 Logging for access to an entry
- 512 Logging for access to an entry and referrals
- 131072 Precise timing of operation duration. This gives microsecond resolution for the elapsed time item in the access log.
- **Examples** nsslapd-accesslog-level: 256
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog-list, nsslapd-auditlog-list, nsslapd-errorlog-list – Provide a list of log files used in access, audit, or error log rotation.

Description PROPERTY

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	Not applicable
Default Value	None
Syntax	DirectoryString

This attribute provides a list of log files used in access, audit, or error log rotation. This attribute is read only and cannot be set.

Examples nsslapd-accesslog-list:accesslog2,accesslog3

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog-logbuffering, nsslapd-auditlog-logbuffering, nsslapd-errorlog-logbuffering – Determines whether the server writes access log entries directly to disk

Description

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	on off
Default Value	on
Syntax	DirectoryString

When this attribute is set to off, the server writes all access log entries directly to disk.

Examples nsslapd-accesslog-logbuffering: off

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog-logexpirationtime, nsslapd-auditlog-logexpirationtime, nsslapd-errorlog-logexpirationtime – Specify the maximum age that an access, audit, or error log file is allowed to reach before it is deleted

Description

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	1 to the maximum 32–bit integer value (2147483647)
Default Value	1
Syntax	Integer

Specifies the maximum age that an access, audit, or error log file is allowed to reach before it is deleted. This attribute supplies only the number of units. The units are provided by the nsslapd-accesslog-logexpirationtimeunit, nsslapd-auditlog-logexpirationtimeunit, or nsslapd-errorlog-logexpirationtimeunit attribute.

Examples nsslapd-accesslog-logexpirationtime: 2

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog-logexpirationtimeunit, nsslapd-auditlog-logexpirationtimeunit, nsslapd-errorlog-logexpirationtimeunit – Determines the unit of the log expiration time

Description

Property	Value
Entry DN	cn=config
Valid Range	month week day
Default Value	month
Syntax	DirectoryString

Specifies the unit for the nsslapd-accesslog-logexpirationtime, nsslapd-auditlog-logexpirationtime, or nsslapd-errorlog-logexpirationtime attribute. If the unit is unknown by the server, the log will never expire.

Examples nsslapd-accesslog-logexpirationtimeunit: day

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog-logging-enabled, nsslapd-auditlog-logging-enabled, nsslapd-errorlog-logging-enabled – Enable or disable access, audit, or error logging

Description PROPERTY

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	on off
Default Value	Access logging on, Audit logging off
Syntax	DirectoryString

This attribute is used in conjunction with the nsslapd-accesslog, nsslapd-auditlog, or nsslapd-errorlog attribute to disable and enable access, audit, or error logging. The nsslapd-accesslog, nsslapd-auditlog, or nsslapd-errorlog attributes specify the path and filename of the access, audit, and error logs, respectively.

For logging to be enabled, the nsslapd-accesslog-logging-enabled, nsslapd-auditlog-logging-enabled, or nsslapd-errorlog-logging-enabled attribute must be switched to on, and the respective nsslapd-accesslog, nsslapd-auditlog, or nsslapd-errorlog attribute must have a valid path and filename.

For information about the combinations of values for these attributes, see the nsslapd-accesslog, nsslapd-auditlog, or nsslapd-errorlog man page.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog-logmaxdiskspace, nsslapd-auditlog-logmaxdiskspace, nsslapd-errorlog-logmaxdiskspace – Specify the maximum amount of disk space in megabytes that the access, audit or error logs are allowed to consume

Description	PROPERTY	VALUE
	Entry DN	cn=config
	Valid Range	-1 1 to the maximum 32-bit integer value (2147483647). A value of -1 means that the disk space allowed for the log is unlimited in size.
	Default Value	Access logs 500, audit logs and error logs 100
	Syntax	Integer

Specifies the maximum amount of disk space in megabytes that the access, audit or error logs are allowed to consume. If this value is exceeded, the oldest access, audit or error log is deleted.

When setting the maximum disk space, consider the total number of log files that can be created due to log file rotation. As there are three different log files – access log, audit log, and error log – maintained by Directory Server, each of which consume disk space. Compare these considerations to the total amount of disk space that you want to be used by the each log.

Examples nsslapd-accesslog-logmaxdiskspace: 200

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog-logminfreediskspace, nsslapd-auditlog-logminfreediskspace, nsslapd-errorlog-logminfreediskspace – Specify the minimum amount of free disk space in megabytes that is allowed before an access, audit, or error log is deleted

Description P

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	1 to the maximum 32–bit integer value (2147483647)
Default Value	5
Syntax	Integer

Specifies the minimum amount of free disk space in megabytes that is allowed before an access, audit, or error log is deleted. When the amount of free disk space falls below the value specified by this attribute, the oldest access, audit, or error log is deleted until enough disk space is freed to satisfy this attribute.

Examples nsslapd-accesslog-logminfreediskspace: 4

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog-logrotationtime, nsslapd-auditlog-logrotationtime, nsslapd-errorlog-logrotationtime – Specify the time interval, the time of the day, and the minimum file size for rotation of the access log, audit log, or error log

```
Synopsis nsslapd-accesslog-logrotationtime:
        {time-interval} [time-of-day | *] [min-file-size | *]
```

Description [

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	See description that follows.
Default Value	1 * *
Syntax	DirectoryString

This attribute specifies the time interval, the time of the day, and the minimum file size for access, audit, or error rotation. The unit of the time interval is specified by the nsslapd-accesslog-logrotationtimeunit, nsslapd-auditlog-logrotationtimeunit, or nsslapd-errorlog-logrotationtimeunit attribute.

The valid range for this attribute is as follows.

time-interval

Time interval at which the log is rotated. The unit of the time interval is given by the nsslapd-auditlog-logrotationtimeunit attribute.

time-of-day

Time of the day, on a 24-hour clock, at which the log is rotated.

The value * means that no time of day is specified.

min-file-size

Minimum file size in kilobytes at which the log file is rotated. The log file is rotated if the file size is greater than the specified number of kilobytes.

The value * means that no minimum file size is specified.

This attribute must be used in conjunction with the nsslapd-accesslog-logrotationtimeunit, nsslapd-auditlog-logrotationtimeunit, or nsslapd-errorlog-logrotationtimeunit attribute.

Examples EXAMPLE 1 To Rotate the Access Log at 11:30 pm Every Day Regardless of the Size of the Log File

To specify when the access log is rotated, the nsslapd-accesslog-logrotationtime and the nsslapd-accesslog-logrotationtimeunit attributes must be set.

To rotate the log daily, the nsslapd-accesslog-logrotationtimeunit must be set as follows:

EXAMPLE 1 To Rotate the Access Log at 11:30 pm Every Day Regardless of the Size of the Log File *(Continued)*

nsslapd-accesslog-logrotationtimeunit: day

To rotate the log at 11:30 pm daily, the nsslapd-accesslog-logrotationtime must be set as follows:

nsslapd-accesslog-logrotationtime: 1 2330

The *min-file-size* is not specified, therefore, the log is rotated irrespective of the file size.

EXAMPLE 2 To Rotate the Error Log at 11:30 pm Every Day if the File Size is Greater Than 10 KB

To specify when the error log is rotated, the nsslapd-errorlog-logrotationtime and the nsslapd-errorlog-logrotationtimeunit attributes must be set.

To rotate the log daily, the nsslapd-accesslog-logrotationtimeunit must be set as follows:

nsslapd-accesslog-logrotationtimeunit: day

To rotate the log at 11:30 pm daily if the file size is greater than 10 KB, the nsslapd-accesslog-logrotationtime must be set as follows:

nsslapd-accesslog-logrotationtime: 1 2330 10

EXAMPLE 3 TO Rotate the Error Log at Any Time if the File Size is Greater Than 10 KB

To specify when the error log is rotated, the nsslapd-errorlog-logrotationtime and the nsslapd-errorlog-logrotationtimeunit attributes must be set.

To rotate the log every minute if the file size is greater the 10 KB, the nsslapd-errorlog-logrotationtimeunit attribute must be set as follows:

nsslapd-accesslog-logrotationtimeunit: Minute

To rotate the log when the file size is greater than 10 KB, the nsslapd-errorlog-logrotationtime must be set as follows:

nsslapd-errorlog-logrotationtime: 1 * 10

The time-of-day is specified as *, therefore, no specific time of day is specified.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog-logrotationtimeunit, nsslapd-auditlog-logrotationtimeunit, nsslapd-errorlog-logrotationtimeunit – Specify the unit for the time-interval part of the nsslapd-access|audit|errorlog-logrotationtime attribute

Description PROPERTY

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	Month Week Day Hour Minute
Default Value	Day
Syntax	DirectoryString

Specifies the unit for the time-interval part of the nsslapd-*access*|*audit*|*error*log-logrotationtime attribute.

This attribute must be used in conjunction with the nsslapd-*access*|*audit*|*error*log-logrotationtime attribute.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog-maxlogsize, nsslapd-auditlog-maxlogsize, nsslapd-errorlog-maxlogsize – Specify the maximum size of the access, audit, or error log in megabytes

Description [

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	-1 1 to the maximum 32–bit integer value (2147483647). A value of -1 means the log file is unlimited in size.
Default Value	100
Syntax	Integer

This attribute specifies the maximum size of the access, audit, or error log in megabytes. When this value is reached, the log is rotated.

If the nsslapd-accesslog-maxlogsperdir, nsslapd-auditlog-maxlogsperdir, or nsslapd-errorlog-maxlogsperdir attribute is set to 1, the server ignores the respective nsslapd-accesslog-maxlogsize, nsslapd-auditlog-maxlogsize, or nsslapd-errorlog-maxlogsize attribute.

When you set a maximum log size, consider the total number of log files that can be created due to log file rotation. Also, remember that there are three different log files (access log, audit log, and error log) maintained by Directory Server, each of which will consume disk space. Compare these considerations to the total amount of disk space that you want to be used by the log.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-accesslog-maxlogsperdir, nsslapd-auditlog-maxlogsperdir, nsslapd-errorlog-maxlogsperdir – Specify the total number of access, audit, or error logs that can be contained in the access, audit, or error logs directory

Description P

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	1 to the maximum 32–bit integer value (2147483647)
Default Value	10
Syntax	Integer

This attribute specifies the total number of access, audit, or error logs that can be contained in the respective directory.

Each time the access log is rotated, a new log file is created. When the number of files contained in the access log directory exceeds the value stored on this attribute, the oldest version of the log file is deleted. The same scenario is true for audit logs and error logs.

If you set this value to 1, the server will not rotate the log and it will grow indefinitely.

If the value for this attribute is higher than 1, check the nsslapd-accesslog-logrotationtime,nsslapd-auditlog-logrotationtime, or nsslapd-errorlog-logrotationtime attribute to establish whether or not log rotation is specified.

If the nsslapd-accesslog-logrotationtime, nsslapd-auditlog-logrotationtime, or nsslapd-errorlog-logrotationtime attribute has a value of -1, there is no rotation of the respective log.

For more information, refer to the nsslapd-accesslog-logrotationtime, nsslapd-auditlog-logrotationtime, or nsslapd-errorlog-logrotationtime man page.

A	TTRIBUTE TYPE	ATTRIBUTE VALUE
A	Availability	SUNWldap-directory
S	Stability Level	Unstable

- Name nsslapd-accesslog-permissions, nsslapd-auditlog-permissions, nsslapd-errorlog-permissions Specify the permissions for the log files
- Synopsis nsslapd-accesslog-permissions: permissions

D ·		
Descri	ntion	PI
Deserie	P	- PI

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	See description that follows.
Default Value	600
Syntax	UNIX style octal permissions.
	Not supported on Windows platforms.

This attribute specifies the permissions for the log file.

Valid range is 001 to 777.

The permission 000 is not allowed because the server might have trouble starting for non-root users.

On Windows platforms, this attribute is ignored and a warning message is logged.

- **Examples EXAMPLE 1** To Set the Access Log Permssions to 644 nsslapd-accesslog-permissions: 644
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-allidsthreshold - Maximum number of values per index key in an index list

Description This attribute defines a threshold to limit the length of an index list. The threshold is called the *index list threshold*. If the number of entries in the list for a particular key exceeds the index list threshold, an unindexed search is performed.

The value of the nsslapd-allidsthreshold attribute can be configured globally for a Directory Server instance, or can be configured for a suffix, or can be configured for an index type. If the value of the nsslapd-allidsthreshold attribute is configured globally for a suffix, it can then be changed for a specific index.

You must rebuild all indexes after you change the nsslapd-allidsthreshold attribute.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Damas	

Valid Range

	0	The nsslapd-allidsthreshold attribute is not used. The global configured value is used.
	<2000	Values less than 2000 are rounded up to 2000.
	>2000	The value is the minimum guaranteed value. Because of internal mechanisms, the real value can be slightly more than the specified value.
	-1	No limit
Default Value	4000	
Syntax	Integer	
Error Messages	LDAP_UNWILLING_TO_PERFORM means ou have set a value that is not a number or the value is too big for a 64-bit signed integer. Additional error information is provided to explain the problem.	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

- Name nsslapd-attribute-name-exceptions allow non-standard characters in attribute names
- **Description** Allows non-standard characters in attribute names to be used for backward compatibility with older servers.

Entry DN	cn=config
Valid Range	on off
Default Value	off
Syntax	DirectoryString
Example	nsslapd-attribute-name-exceptions: on

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-backend - suffix used to process requests

Description Gives the name of the suffix or chained suffix used to process requests. This attribute can be multivalued if you are using a custom distribution plug-in, with one suffix name per value. In this case, you must also specify the nsslapd-distribution-plugin and nsslapd-distribution-funct attributes.

Note - Use Directory Proxy Server, rather than a Directory Server plug-in, for distribution.

This attribute is required when the value of the nsslapd-state attribute is set to backend, or to referral on update.

Entry DN	<pre>cn="suffixName",cn=mapping tree,cn=config</pre>	
Valid Range	Any valid partition name.	
Default Value	None	
Syntax	DirectoryString	
Example	nsslapd-backend: example	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsslapd-berbufsize – initial BER buffer size
------	----------------------------------------------

Description This attribute defines the initial size in bytes of the buffer used to handle BER values.

In some cases where searches retrieving very large static groups, the default buffer size may cause slow performance due to the number of memory reallocation requests.

Entry DN	cn=config
Valid Range	0 - nsslapd-maxbersize, in bytes
	A value of 0 indicates that the default value should be used.
Default Value	1024
Syntax	Integer
Example	nsslapd-berbufsize: 16384

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-cachememsize – cache memory size

Description Specifies the entry cache size in terms of the available memory space. Limiting cache size in terms of memory occupied is the simplest method. If you attempt to set a value that is not an integer or is too big for a 64-bit unsigned integer, or a 32-bit unsigned integer for 32-bit installations, you receive an LDAP_UNWILLING_TO_PERFORM error message with additional error information explaining the problem.

Entry DN	<pre>cn=dbName,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	200 KB to 2^{64} -1 Bytes (200 KB to 2^{32} -1 Bytes for 32-bit installations)
Default Value	10 485 760 (10Mb)
Syntax	Integer
Example	nsslapd-cachememsize:10

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-cachesize - cache size

Description Specifies the entry cache size in terms of the number of entries it can hold. Note that it is simpler to limit the cache by memory size only using the nsslapd-cachememsize attribute. If you attempt to set a value that is not an integer or is too big for a 64-bit unsigned integer, or a 32-bit unsigned integer for 32-bit installations, you receive an LDAP_UNWILLING_TO_PERFORM error message with additional error information explaining the problem.

Entry DN	cn=dbName, cn=ldbm database, cn=plugins, cn=config
Valid Range	1 to 2,147,483,647 (or -1 which means unlimited) entries
Default Value	-1
Syntax	Integer
Example	nsslapd-cachesize: -1

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-certmap-basedn - certificate map search base

Description This attribute can be used when client authentication is performed using SSL certificates in order to avoid limitation of the security subsystem certificate mapping, configured in certmap.conf.

Depending on the certmap.conf configuration, the certificate mapping may be done using a directory subtree search based at the root DN. Note that if the search is based at the root DN, then the nsslapd-certmap-basedn attribute may force the search to be based at some entry other than the root.

Entry DN	cn=config
Valid Range	The DN of an entry in the directory
Default Value	Not applicable
Syntax	DN
Example	<pre>nsslapd-certmap-basedn: ou=people,dc=example,dc=com</pre>

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-changelogdir - changelog path

Description This required attribute specifies the name of the directory in which the change log is created. Whenever a change log configuration entry is created it must contain a valid directory or the operation will be rejected.

Note – For performance reasons, it is recommended that you store this database on a different physical disk from other databases.

If you change this value after enabling replication, the old changelog is deleted and a new changelog is created. Therefore, you should not change the value of this attribute after replication has been enabled and consumers initialized.

Entry DNs	<pre>cn=Retro Changelog Plugin,cn=plugins,cn=config</pre>
Valid Range	Any valid path to the directory storing the change log
Default Value	None
Syntax	DirectoryString
Example	nsslapd-changelogdir: /local/fastdisk/changelog

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-changelogmaxage - maximum changelog age

Description Specifies the maximum age of any entry in the change log. The change log contains a record for each directory modification and is used when synchronizing consumer servers. Each record contains a timestamp. Any record with a timestamp that is older than the value specified in this attribute will be removed. If this attribute is absent, there is no age limit on change log records.

Entry DNs	<pre>cn=Retro Changelog Plugin,cn=plugins,cn=config</pre>	
Valid Range	0 (meaning that entries are not removed according to their age) to maximum integer (2147483647)	
Default Value	0	
Syntax	DirectoryString IntegerTimeunit	
	Here, <i>Timeunit</i> is s for seconds, m for minutes, h for hours, d for days, w for weeks.	
Example	nsslapd-changelogmaxage: 30d	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-changelogmaxentries - maximum number of changelog records

Description Specifies the maximum number of records the change log may contain. If this attribute is absent, there is no maximum number of records the change log can contain.

Entry DNs	<pre>cn=Retro Changelog Plugin,cn=plugins,cn=config</pre>
Valid Range	0 (no limit to the number of entries) to the maximum 32 bit integer value (2147483647).
Default Value	0
Syntax	Integer
Example	<pre>nsslapd-changelogmaxentries: 0</pre>

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsslapd-config – DN of the server configuration
Description	This read-only attribute is the configuration DN.

/	8
Entry DN	cn=config
Valid Range	Any valid config DN.
Default Value	cn=config
Syntax	DirectoryString
Example	nsslapd-config: cn=config

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsslapd-dbcachesize -	database cache size
------	-----------------------	---------------------

Description This performance tuning related attribute specifies database cache size. Note that this is neither the index cache nor the entry cache. If you activate automatic cache resizing, you override this attribute, by replacing these values with its own guessed values at a later stage of the server startup.

If you attempt to set a value that is not a number or is too big for a 32-bit or 64-bit signed integer, you receive an LDAP_UNWILLING_TO_PERFORM error message with additional error information explaining the problem.

Note – The actual cache used may be significantly higher than what is specified in the nsslapd-cachememsize and nsslapd-dbcachesize attributes. It is therefore recommended that you do not specify a total cache size of more than 2 GB for 32-bit servers.

Changes to database cache size take effect after the server has been restarted.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	500 KB to 4 GB for 32-bit platforms and 500 KB to 2^64-1 for 64-bit platforms
Default Value	32 MB
Syntax	Integer
Example	nsslapd-dbcachesize: 100 MB

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-db-checkpoint-interval – database checkpoint interval

Description The amount of time in seconds after which Directory Server sends a checkpoint record to the database transaction log. The database transaction log contains a sequential listing of all recent database operations and is used for database recovery only. A checkpoint record indicates which database operations have been physically written to the directory database. The checkpoint records are used to determine where in the database transaction log to begin recovery after a system failure. The nsslapd-db-checkpoint-interval attribute is absent from dse.ldif. To change the checkpoint interval, you add the attribute to dse.ldif. This attribute can be dynamically modified using ldapmodify.

This attribute is provided only for system modification and diagnostics. It should be changed only with the guidance of Sun engineering staff and Sun Professional Services. Inconsistent settings of this attribute and other configuration attributes may cause Directory Server to be unstable.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	10 to 300 seconds
Default Value	60
Syntax	Integer
Example	nsslapd-db-checkpoint-interval: 120

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBU	ТЕТҮРЕ	ATTRIBUTE VALUE
Availab	ility	SUNWldap-directory
Stabilit	y Level	Obsolete: Scheduled for removal after this release

Name nsslapd-db-circular-logging - circulate through transaction logs

DescriptionSpecifies circular logging for the transaction log files. If this attribute is switched off, old
transaction log files are not removed, and are kept renamed as old log transaction files.
Turning circular logging off can severely degrade server performance. It should therefore only
be modified with the guidance of Sun Professional Services.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	on off
Default Value	on
Syntax	DirectoryString
Example	nsslapd-db-circular-logging: on

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-db-durable-transactions - when to write transactions to disk

Description Indicates whether database transaction log entries are immediately written to the disk. The database transaction log contains a sequential listing of all recent database operations and is used for database recovery only.

With durable transactions enabled, every directory change is physically recorded in the log file and is therefore able to be recovered in the event of a system failure. However, the durable transactions feature may also slow down the performance of Directory Server. With durable transactions disabled, all transactions are logically written to the database transaction log but may not be physically written to disk immediately. If there is a system failure before a directory change is physically written to disk, that change is not recoverable.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	on off
Default Value	on
Syntax	DirectoryString
Example	nsslapd-db-durable-transactions: on

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-db-home-directory - database file location

Description Used to fix a situation where the operating system endlessly flushes pages. This flushing can be so excessive that performance of the entire system is severely degraded.

This situation will occur only for certain combinations of the database cache size, the size of physical memory, and kernel tuning attributes. In particular, this situation should not occur if the database cache size is less than 100 MB.

For example, if your Solaris host seems excessively slow and your database cache size is around 100 MB or more, then you can use the iostat utility to diagnose the problem. Use iostat to monitor the activity of the disk where the Directory Server database files are stored. If all of the following conditions are true, then you can use the nsslapd-db-home-directory attribute to specify a subdirectory of a tempfs type file system.

- The disk is heavily used, more than 1 MB per second of data transfer.
- Service time is long, more than 100 ms.
- There is mostly write activity.

Note – The directory referenced by the nsslapd-db-home-directory attribute must be a subdirectory of a file system of type tempfs, such as /tmp.

If you have multiple Directory Server instances on the same machine, their nsslapd-db-home-directory attributes must be configured with different directories. Failure to do so will result in the databases for both directories becoming corrupted.

Finally, use of this attribute causes internal Directory Server database files to be moved to the directory referenced by the attribute. It is possible, but unlikely, that the server will no longer start after the files have been moved because not enough memory can be committed. This is a symptom of an overly large database cache size being configured for your server. If this happens, reduce the size of your database cache size to a value where the server will start again.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	Any valid directory name in a tempts file system, such as /tmp.
Default Value	Not applicable
Syntax	DirectoryString
Example	nsslapd-db-home-directory: /tmp/dsl-db

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-db-idl-divisor - number of blocks per database page

Description Specifies the index block size in terms of the number of blocks per database page. The block size is calculated by dividing the database page size by the value of this attribute. A value of 1 makes the block size exactly equal to the page size. The default value of 0 sets the block size to the page size minus an estimated allowance for internal database overhead. Before modifying the value of this attribute export all databases to LDIF. Once the modification has been made, reload the databases from LDIF.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	0 to 8
Default Value	0
Syntax	Integer
Example	nsslapd-db-idl-divisor: 2

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-db-locks - number of database locks used

Description Specifies the number of locks that can be used by the database. Increase the value of this attribute if you observe the following error:

libdb: Lock table is out of available locks

The current number of locks being used, the number of locks configured, and the maximum number of locks reached during the life of the process can be checked using the attributes nsslapd-db-current-locks, nsslapd-db-configured-locks, and nsslapd-db-max-locks respectively, under the entry cn=database, cn=monitor, cn=ldbm dababase, cn=plugins, cn=config.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	1 to maximum integer
Default Value	20000
Syntax	Integer
Example	nsslapd-db-locks: 20000

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Description Specifies the log information buffer size. Log information is stored in memory until the buffer fills up or the transaction commit forces the buffer to be written to disk. Larger buffer sizes can significantly increase throughput in the presence of highly concurrent applications, or transactions producing large amounts of data. The nsslapd-db-logbuf-size attribute is only valid if the nsslapd-db-durable-transaction attribute is set to on.

Note – You must be prepared to export all databases to LDIF, remove existing databases, and import all databases from LDIF when modifying this attribute.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	0, 32768 to 2097152 bytes (limited by the transaction log file size, which is 10 MB by default)
	0 is equivalent to 32768 bytes
Default Value	524288 for new instances
Syntax	Integer
Example	nsslapd-db-logbuf-size: 524288

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-db-logdirectory – database transaction log directory

Description The path to the directory containing the database transaction log. The database transaction log contains a sequential listing of all recent database operations and is used for database recovery only. By default, the database transaction log is stored in the same directory as the directory entries themselves, *instance-path*/db.

For fault-tolerance and performance reasons, you can move this log file to another physical disk. The nsslapd-db-logdirectory attribute is absent from dse.ldif. To change the location of the database transaction log, add the attribute to dse.ldif.

Note – You must be prepared to export all databases to LDIF, remove existing databases, and re-import all databases from LDIF when modifying this attribute.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	Any valid path and directory name.
Default Value	Not applicable
Syntax	DirectoryString
Example	nsslapd-db-logdirectory: /logs/txnlog

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-db-logfile-size - maximum size of single database log file

Description Specifies the maximum size of a single file in the log in bytes. By default, or if the value is set to 0, a maximum size of 10 MB is used. The maximum size is an unsigned four byte value. The value of this attribute can have significant impact on performance, as it can be tuned to avoid extensive log switching in the event of heavy entries.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>	
Valid Range	0 to unsigned four byte integer	
Default Value	10 (MB)	
Syntax	Integer	
Example	nsslapd-db-logfile-size: 10	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-dbncache - split database cache

Description This attribute allows you to split the ldbm cache into equally sized separate pieces of memory. It is possible to specify caches that are large enough so that they cannot be allocated contiguously on some architectures. For example, some releases of Solaris limit the amount of memory that may be allocated contiguously by a process. If nsslapd-dbncache is 0 or 1, the cache will be allocated contiguously in memory. If it is greater than 1, the cache will be broken up into ncache equally sized separate pieces of memory.

This attribute is provided only for system modification, and diagnostics. It should be changed only with the guidance of Sun Professional Services. Inconsistent settings of this attribute and other configuration attributes may cause Directory Server to be unstable.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	Positive integer or 0
Default Value	0
Syntax	Integer
Example	nsslapd-dbncache: 0

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-db-page-size – size of database pages in bytes

Description Specifies the size of the pages used to hold items in the database, in bytes. Valid page sizes are 512, 1024, 2048, 4096, 8192, 16384, 32768, and 65536 bytes. If the page size is not explicitly set, Directory Server defaults to a page size of 8192 bytes. Ideally, page size is set such that entries fit in database pages without wasting space. Whether it is possible to achieve an ideal database page size depends on your entries, and on whether they are subject to change in size.

Note – You must be prepared to export all databases to LDIF, remove existing databases, and import all databases from LDIF when modifying this attribute.

For ZFS file systems, you may find performance is best when the file system block size is set to equal the database page size. For example, try setting both to 32K or 64K.

To change the value of nsslapd-db-page-size, perform the following steps.

- 1. Shut down the Directory Server instance using the dsadm command.
- 2. Back up the Directory Server databases to LDIF using the dsadm export command.
- 3. Change the value of the attribute in dse.ldif.
- 4. Restore the Directory Server databases from LDIF using the dsadm import command.
- 5. Restart the Directory Server instance using the dsadm command.

Changing this default value can have significant performance impact. If the page size is too small, it results in extensive page splitting and copying, whereas if the page size is too large, it can waste disk space.

You can find entries in the overflowed pages using the following command:

install-path/ds6/lib/64/ns-slapd dbtest -D instance-path -n database

The maximum size of an entry that can fit in a normal page is *db-page-size*/4 – 24 (24 is the per page binary tree internal structure).

For example, in a database of 40 million entries, if the database page size is 8K, and an entry size is greater than 2024 bytes then it results in an overflowed page. If all entries in the database are larger than 2024 bytes, the 40 million overflowed pages are obtained. A search operation has to perform increased number of database input and output operations, that is, the initial block of the overflowed page and the total number of continuation blocks in the overflowed page, which in turn affects the performance.

If there are no or very few overflow pages in your database, then do not change the page size. Increasing the page size may result in more lock contention and increased input and output operations. The impact depends on the file system and its page size. If possible, matching database page size to the file system page size is the best practice.

The following list describes the characteristics of this configuration attribute.

Entry DN cn=config, cn=ldbm database, cn=plugins, cn=config

Valid Range	512 bytes to 64 KB
Default Value	8192 (bytes)
Syntax	Integer
Example	nsslapd-db-page-size: 8192

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-db-transaction-batch-val - number of database transactions to batch before commit

Description Specifies how many transactions are batched before being committed. You can use this attribute to improve update performance when full transaction durability is not required. This attribute can be dynamically modified using ldapmodify.

If you do not define this attribute or set it to a value of 0, transaction batching will be turned off and it will be impossible to make remote modifications to this attribute via LDAP. However, setting this attribute to a value greater than 0 causes the server to delay committing transactions until the number of queued transactions is equal to the attribute value. A value greater than 0 also allows you to modify this attribute remotely via LDAP. A value of 1 for this attribute allows you to modify the attribute setting remotely via LDAP, but results in no batching behavior. A value of 1 at server startup is therefore useful for maintaining normal durability, while also allowing transaction batching to be turned on and off remotely when desired. Bear in mind that the value you choose for this attribute may require you to modify the nsslapd-db-logbuf-size attribute to ensure sufficient log buffer size for accommodating your batched transactions. In practice, values should be positive numbers. Values larger than 100 bring few benefits.

Note – The nsslapd-db-transaction-batch-val attribute is only valid if the nsslapd-db-durable-transaction attribute is set to on.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	-2147483647 to 2147483648
Default Value	0 (meaning turned off)
Syntax	Integer
Example	nsslapd-db-transaction-batch-val: 5

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-db-tx-max - maximum concurrent database transactions

Description Specifies the maximum number of concurrent transactions that can be handled by the database. Increase the value of this attribute if you observe the following error.

Serious Error---Failed in dblayer_txn_begin, err=12 (Not enough space)

- Entry DN cn=config,cn=ldbm database,cn=plugins,cn=config
- Valid Range1 to maximum integerDefault Value210SyntaxIntegerExamplensslapd-db-tx-max: 210

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsslapd-directory – absolute path to database instance	
Description	Specifies the absolute path to the database instance. If the database instance is created manually, this attribute must be included. Once the database instance has been created, do not modify this path as any changes risk preventing the server from accessing data.	
	Entry DN	<pre>cn=dbName,cn=ldbm database,cn=plugins,cn=config</pre>
	Valid Range	Any valid absolute path to the database instance.
	Default Value	None
	Syntax	DirectoryString
	Example	nsslapd-directory: /local/ds/db

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-disk-full-threshold - full disk threshold to limit database updates

Description When the minimum free space on the disk in MB. When the available free space on any one of the disks used by a database instance falls below the value specified by this attribute, no updates are permitted and the server returns an LDAP_UNWILLING_TO_PERFORM error. Updates are allowed again as soon as free space rises above the threshold.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	0 to unsigned 4-byte integer
Default Value	10
Syntax	Integer
Example	nsslapd-disk-full-threshold: 10

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-disk-low-threshold – low disk threshold to limit database updates

Description Specifies the "low" free space on the disk (in MB). When the available free space on any one of the disks used by a database instance falls below the value specified by this attribute, protocol updates on that instance are permitted only by Directory Manager.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	0 to unsigned 4-byte integer
Default Value	100
Syntax	Integer
Example	nsslapd-disk-low-threshold: 100

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-distribution-funct - distribution plug-in function

Description Specifies the name of your distribution function within the library named by nsslapd-distribution-plugin. This attribute is required along with nsslapd-distribution-plugin when you have specified more than one database in the nsslapd-backend attribute.

Note - Use Directory Proxy Server, rather than a Directory Server plug-in, for distribution.

Entry DN	<pre>cn="suffixName",cn=mapping tree,cn=config</pre>
Valid Range	The name of the distribution function.
Default Value	None
Syntax	DirectoryString
Example	nsslapd-distribution-funct: alphaNumDistrib

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE	
Availability	SUNWldap-directory	
Stability Level	Obsolete: Scheduled for removal after this release	

- Name nsslapd-distribution-plugin distribution plug-in library
- **Description** Specifies the full path and filename of the shared library for the custom distribution plug-in. This attribute is required along with nsslapd-distribution-funct when you have specified more than one suffix in the nsslapd-backend attribute.

Note – Use Directory Proxy Server, rather than a Directory Server plug-in, for distribution.

Entry DN	<pre>cn="suffixName",cn=mapping tree,cn=config</pre>
Valid Range	The full path and filename of the plug-in library.
Default Value	None
Syntax	DirectoryString
Example	<pre>nsslapd-distribution-plugin: /custom/plugins/myDistrib.so</pre>

Once you have distributed entries, you cannot redistribute them. The following restrictions apply.

- You cannot change your distribution function once you have deployed entry distribution.
- You cannot use the ldapmodify command to change an entry if that would cause them to be distributed into a different database.
- You cannot replicate databases that are distributed over multiple databases.

Violating these restrictions prevents Directory Server from correctly locating and returning entries.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE ATTRIBUTE VALUE	
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-dn-cachememsize – DN cache memory size

Description Specifies the DN cache size in terms of the available memory space.

Entry DN	cn=config
Valid Range	Integer >= 1048576 Bytes
Default Value	10 485 760 (10Mb)
Syntax	Integer
Multi-valued	No
Read-write access	RW
Restart needed	Yes
Example	$\texttt{nsslapd-dn-cachememsize:} \texttt{2097152}\;(2Mb)$

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE	
Availability	SUNWldap-directory	
Stability Level	Obsolete: Scheduled for removal after this release	

Name nsslapd-dn-cachesize - DN cache size

- **Description** Specifies the DN cache size in terms of the number of entries it can hold. The value that can be assigned to nsslapd-dn-cachesize has the following impact on its behavior.
 - 0 means disabled
 - -1 means not limited by number of DNs but limited by the size specified in nsslapd-dn-cachememsize
 - >=1 cache is limited to the size that you specify here

Entry DN	cn=config
Valid Range	Integer >= 1, 0, or -1
Default Value	-1
Syntax	Integer
Multi-valued	No
Read Write access	RW
Restart Needed	Yes
Example	nsslapd-dn-cachesize: -1

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE	
Availability	SUNWldap-directory	
Stability Level	Obsolete: Scheduled for removal after this release	

Name nsslapd-ds4-compatible-schema – allow 4.x style schema definitions

Description Makes the schema in cn=schema compatible with 4.x versions of Directory Server.

Note – When this attribute is set to on, Directory Server can read schema from 4.x configuration files, which use syntax for attribute types and object classes that differs from the standard syntax defined by RFC 2252. As a result, when this attribute is set to on, schema cannot be modified using administrative tools, but must instead be modified manually.

Entry DN	cn=config
Valid Range	on off
Default Value	off
Syntax	DirectoryString
Example	nsslapd-ds4-compatible-schema: off

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE	
Availability	SUNWldap-directory	
Stability Level	Obsolete: Scheduled for removal after this release	

Name nsslapd-enquote-sup-oc – enable superior object class enquoting

Description Controls whether the quoting in the objectclasses attributes contained in the cn=schema entry conforms to the quoting specified by internet draft RFC 2252. By default, Directory Server does not place single quotes around the superior object class identified on the objectclasses attributes contained in cn=schema. RFC 2252 indicates that this value should not be quoted.

That is, Directory Server publishes objectclasses attributes in the cn=schema entry as follows:

```
objectclasses: ( 2.5.6.6
NAME 'person'
DESC 'Standard ObjectClass'
SUP 'top'
MUST ( objectclass $ sn $ cn )
MAY ( aci $ description $ seealso $ telephonenumber $ userpassword ) )
```

However, RFC 2252 indicates that this attribute should be published as follows:

```
objectclasses: ( 2.5.6.6
NAME 'person'
DESC 'Standard ObjectClass'
SUP top
MUST ( objectclass $ sn $ cn )
MAY ( aci $ description $ seealso $ telephonenumber $ userpassword ) )
```

Notice the absence of single quotes around the word top.

Turning this attribute on means that some LDAP clients will no longer function, as they require the schema as defined in RFC 2252.

Turning this attribute off causes Directory Server to conform to RFC 2252, but doing so may interfere with some earlier LDAP clients.

Entry DN	cn=config
Valid Range	on off
Default Value	off
Syntax	DirectoryString
Example	<pre>nsslapd-enquote-sup-oc: off</pre>

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE	
Availability	SUNWldap-directory	
Stability Level	Obsolete: Scheduled for removal after this release	

Name	nsslapd-exclude-from-ex	port – attributes excluded	during database export

Description Specifies a list of attributes that are excluded when the database is exported.

<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>
N/A
entrydn entryid dncomp parentid numSubordinates
DirectoryString
nsslapd-exclude-from-export: entrydn entryid

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-groupevalnestlevel - level of access control nesting for group evaluations

Description Specifies the number of levels of nesting that the access control system will perform for group evaluation.

Entry DN	cn=config
Valid Range	0 to the maximum 64-bit integer value
Default Value	0
Syntax	Integer
Example	nsslapd-groupevalnestlevel: 5

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-idletimeout - idle timeout

Description Specifies the amount of time in seconds after which an idle LDAP client connection is closed by the server. A value of 0 indicates that the server will never close idle connections.

Entry DN	cn=config
Valid Range	0 to the maximum 32-bit integer value (2147483647)
Default Value	0
Syntax	Integer
Example	nsslapd-IdleTimeout: 0

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-import-cachesize - database cache size for import

Description This performance tuning related attribute determines the size of the database cache used in the bulk import process. By setting this attribute value so that the maximum available system physical memory is used for the database cache during bulk importing, you can optimize bulk import speed. If you attempt to set a value that is not a number or is too big for a 32-bit signed integer, you receive an LDAP_UNWILLING_TO_PERFORM error message with additional error information explaining the problem.

Note – A cache is created for each load that occurs. For example, if the user sets the nsslapd-import-cachesize attribute to 1 GB, then 1 GB is used when loading one database, 2 GB is used when loading 2 databases, and so forth.

Ensure that you have sufficient physical memory to prevent swapping from occurring, as this results in performance degradation.

Entry DN	<pre>cn=config,cn=ldbm database,cn=plugins,cn=config</pre>	
Valid Range	$20~\mathrm{MB}$ to $4~\mathrm{GB}$ for 32-bit platforms and $20~\mathrm{MB}$ to 2^{64-1} for 64-bit platforms	
Default Value	64 MB	
Syntax	Integer	
Example	nsslapd-import-cachesize: 209715200	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-infolog-area – Specify the component for which logging information should be provided.

Description [

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	See description that follows.
Default Value	0
Syntax	Integer

Specifies the component for which logging information should be provided. Each component is identified as an area, whose value is a decimal translation of the hex values in slapi-plugin.h. The valid range includes the following values:

- 0 Default logging area, used for critical errors and other messages that are always written to the error log, for example server startup messages. Messages at this level are always included in the error log regardless of the nsslapd-infolog-level setting.
- 1 Trace function calls. Logs a message when the server enters and exits a function.
- 4 Search arguments processing.
- 8 Connection management
- 16 Print out packets sent/received
- 32 Search filter processing
- 64 Config file processing
- 128 Access control list processing
- 512 LDBM processing.
- 2048 Log LDIF entry parsing debugging
- 4096 Housekeeping thread debugging
- 8192 Replication debugging
- 32768 Database cache debugging.
- 65536 Server plug-in debugging. An entry is written to the log file when a server plug-in calls slapi_log_info_ex().

The log area is additive. For example, to enable logging on search filter processing (32) and Config file processing (64), you would set this attribute to 96 (32+64).

Examples nsslapd-infolog-area: 4096

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-infolog-level – Specify the level of logging information that should be returned for the server component defined by the nsslapd-infolog-area attribute

Description

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	0 1
Default Value	0
Syntax	Integer

Specifies the level of logging information that should be returned for the server component defined by the nsslapd-infolog-area attribute. A value of 0 means that only default logging information is returned for the selected area. Setting this attribute to 1 enables additional logging information to be returned for the selected area.

Examples nsslapd-infolog-level: 1

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Unstable

Name nsslapd-instancedir - instance path

- **Description** Specifies the full path to the directory where this server instance is installed, by default the *instance-path* given at installation time. Do *not* change this value after installation.
 - Entry DNcn=configValid RangeAny valid file path.Default Valueinstance-pathSyntaxDirectoryStringExamplensslapd-instancedir: /local/ds

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Description Specifies the amount of time in milliseconds after which the connection to a stalled LDAP client is closed. An LDAP client is considered to be stalled when it has not made any I/O progress for read or write operations.

Entry DN	cn=config
Valid Range	0 to the maximum 32-bit integer value (2147483647)
Default Value	30000
Syntax	Integer
Example	nsslapd-ioblocktimeout: 1800000

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-lastmod - track modification time

- **Description** Specifies whether Directory Server maintains the modification attributes for Directory Server entries. These attributes include the following.
 - modifiersname, which is the distinguished name of the person who last modified the entry.
 - modifytimestamp, which is the timestamp, in GMT format, for when the entry was last modified.
 - creatorsname, which is the distinguished name of the person who initially created the entry.
 - createtimestamp, which is the timestamp for when the entry was created in GMT format.

Entry DN	cn=config
Valid Range	on off
Default Value	on
Syntax	DirectoryString
Example	<pre>nsslapd-lastmod: off</pre>

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-listenBacklog - maximum number of pending connections

Description Allows you to configure the maximum number of pending connections on a socket used by Directory Server. This configuration value is passed as the *backlog* parameter to the listen() call on Solaris systems for example.

cn=config
$\ensuremath{\mathfrak{0}}$ to the maximum int for the system
128
Integer
nsslapd-listen-backlog: 1024

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-listenhost - listen to IP address

Description Allows multiple Directory Server instances to run on a multi-homed machine, and makes it possible to limit listening to one or more interfaces of a multi-homed machine. Provide the host name or host names corresponding to the IP interface or interfaces you want to specify as values for this attribute. Directory Server responds only to requests sent to the interface or interfaces corresponding to the host name or host names specified. This prevents other programs from using the same port as Directory Server on the specified interfaces.

Entry DN	cn=config
Valid Range	Any host name or host names
Default Value	Not applicable
Syntax	DirectoryString
Example	<pre>nsslapd-listenhost: host_name</pre>

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsslapd-localhost – local host system name	
Description	This read-only attribute specifies the host system on which Directory Server runs.	
	Entry DN	cn=config
	Valid Range	Any fully qualified hostname.
	Default Value	Hostname of installed machine.
	Syntax	DirectoryString
	Example	nsslapd-localhost: myServer.example.com

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-localuser – local user name

Description Specifies the user under which Directory Server runs. The group under which the user runs is derived from this attribute, by examining the groups that the user is a member of. Should the user change, all the files in the installation directory must be owned by this user.

Entry DN	cn=config
Valid Range	Any valid user on the local system.
Default Value	To run as the same user who started Directory Server.
Syntax	DirectoryString
Example	nsslapd-localuser: nobody

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

NL	1 1 1			
Name	nsslapd-maxb	ersize –	maximum	message size
	noonap a mane	erone		meeoodge onde

Description Defines the maximum size in bytes allowed for an incoming message. This limits the size of LDAP requests that can be handled by Directory Server. Limiting the size of requests prevents some kinds of denial of service attacks.

The limit applies to the total size of the LDAP request. For example, if the request is to add an entry, and the entry in the request is larger than two megabytes, then the add request is denied. Care should be taken when changing this attribute.

Entry DN	cn=config
Valid Range	0 - 2 GB (2,147,483,647 bytes), where a value of 0 indicates that the default value should be used.
Default Value	2097152
Syntax	Integer
Example	nsslapd-maxbersize: 2097152

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-maxconnections – maximum number of connections

Description This attribute limits the number of simultaneous connections the server can manage. The value of this attribute is not set by default. If it is not set manually, its implicit value is the maximum number of file descriptors a process can open on the system.

You can use this attribute to limit the amount of memory used by Directory Server. Directory Server allocates n*512 bytes of data, where n is equal to the value of nsslapd-maxconnections, if set, or to the maximum number of file descriptors a process can open on the system.

For example, on Solaris 9 systems, the maximum number of file descriptors is 64000. If nsslapd-maxconnections is not set, Directory Server allocates 35 MB of data, which may cause problems for some deployments. Setting nsslapd-maxconnections to a suitable value can help to alleviate this problem.

Entry DN	cn=config
Valid Range	<pre>nsslapd-reservedescriptors +1 to maxdescriptors.</pre>
	If the maxdescriptors attribute is not set, the maximum value of nsslapd-maxconnections is the maximum number of file descriptors a process can open on the system.
Default Value	N/A
Syntax	Integer
Example	nsslapd-maxconnections: 4096

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

- Name nsslapd-maxdescriptors maximum file descriptors
- Description This attribute sets the maximum, platform-dependent number of file descriptors that Directory Server will try to use. A file descriptor is used whenever a client connects to the server. It is also used for some server activities such as index maintenance. The number of available file descriptors for TCP/IP connections is the total for the nsslapd-maxdescriptors attribute minus the number of file descriptors used by the server for non-client connections, such as index management and managing replication, as specified in the nsslapd-reservedescriptors attribute.

The number that you specify here should not be greater than the total number of file descriptors that your operating system allows the ns-slapd process to use. This number will differ depending on your operating system. Some operating systems allow you to configure the number of file descriptors available to a process. Refer to your operating system documentation for details on file descriptor limits and configuration. It is worth noting that the included idsktune program can be used to suggest changes to the system kernel or TCP/IP tuning attributes, including increasing the number of file descriptors if necessary. You should consider increasing the value on this attribute if Directory Server is refusing connections because it is out of file descriptors. When this occurs, the following message is written to the Directory Server errors log file:

Not listening for new connections -- too many fds open

Note – UNIX shells usually have configurable limits on the number of file descriptors. Refer to your operating system documentation for further information regarding limit and ulimit as these limits can often cause problems.

This parameter is not applicable on Windows.

Entry DN	cn=config
Valid Range	1 to 65535
Default Value	Maximum number of file descriptors allowed for a process
Syntax	Integer
Example	nsslapd-maxdescriptors: 8192

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-maxpsearch – maximum number of persistent searches

Description Defines the maximum number of persistent searches that can be performed on Directory Server. The persistent search mechanism provides an active channel through which entries that change, and information about the changes that occur, can be communicated. Because each persistent search operation uses one thread, limiting the number of simultaneous persistent searches prevents certain kinds of denial of service attacks.

Entry DN	cn=config
Valid Range	1 to maximum thread number
Default Value	30
Syntax	Integer
Example	nsslapd-maxpsearch: 30

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-maxthreadsperconn - maximum threads per connection

Description Defines the maximum number of threads that a connection should use. For normal operations where a client binds and performs only one or two operations before unbinding, you should use the default value. For situations where a client binds and simultaneously issues many requests, you should increase this value to allow each connection enough resources to perform all the operations.

Entry DN	cn=config
Valid Range	1 to maximum thread number
Default Value	5
Syntax	Integer
Example	nsslapd-maxthreadsperconn: 5

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsslapd-mode – database index file permissions		
Description	Specifies the permissions used for newly created index files.		
	Entry DN cn=config,cn=ldbm database,cn=plugins,cn=config		
	Valid Range	Any four-digit octal number. However, mode 0600 is recommended. This allows read and write access for the owner of the index files, which is the server user, and no access for other users.	
	Default Value	0600	
	Syntax	Integer	
	Example	nsslapd-mode: 0600	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-nagle - delay sending responses

Description When the value of this attribute is of f, the TCP_NODELAY option is set so that LDAP responses, such as entries or result messages, are sent back to a client immediately. When the attribute is turned on, default TCP behavior applies. That is, the sending of data is delayed, in the hope that this will enable additional data to be grouped into one packet of the underlying network MTU size, which is typically 1500 bytes for Ethernet.

Entry DN	cn=config
Valid range	on off
Default value	off
Syntax	DirectoryString
Example	nsslapd-nagle: off

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsslapd-plugin, nsslapd-plugin-depends-on-named, nsslapd-plugin-depends-on-type, nsslapd-pluginDescription, nsslapd-pluginEnabled, nsslapd-pluginId, nsslapd-pluginInitfunc, nsslapd-pluginPath, nsslapd-pluginType, nsslapd-pluginVendor, nsslapd-pluginVersion – Directory Server plug-in legacy configuration			
Description	The nsslapd-plugin attribute on cn=config is multi-valued, read-only attribute lists the syntaxes and matching rules loaded by the server. This manual page covers server plug-in configuration, rather than the nsslapd-plugin attribute.			
	This manual page provides an overview of legacy configuration information for server plug-ins. This manual page covers the individual plug-in configuration entry attributes. Also, this manual page covers the plug-ins provided with Directory Server, including configurable options, configurable arguments, default setting, dependencies, general performance related information, and further reading.			
	Note – In most circumstances, you configure plug-in functionality using the dsconf(1M) command. See plugin(5dsconf) for a list of configurable properties.			
ATTRIBUTES FOR			attribute.	
PLUG-IN CONFIGURATION ENTRIES	nsslapd-plugin-depends-on-named	This is a multivalued attribute, used to ensure that plug-ins are called by the server in the correct order. It takes a value that corresponds to the cn value of a plug-in. The plug-in whose cn value matches one of the values below it is started by the server prior to this plug-in. If the plug-in does not exist, the server fails to start.		
		Entry DN	cn= <i>pluginName</i> ,cn=plugins, cn=config	
		Valid Range	Plug-in name	
		Default Value	None	
		Syntax	DirectoryString	
		Example	nsslapd-plugin-depends-on-named: Class of Service	
	nsslapd-plugin-depends-on-type	plug-ins are called It takes a value th plug-in, containe nsslapd-plugin	ued attribute, used to ensure that d by the server in the correct order. at corresponds to the type of a d in the attribute Type, and requires that plug-ins of ed before the present plug-in. cn= <i>pluginName</i> , cn=plugins,	
		·	cn=config	

	Valid Range	Plug-in type
	Default Value	None
	Syntax	DirectoryString
	Example	nsslapd-plugin-depends-on-type: database
nsslapd-pluginDescription	Provides a descr	ription of the plug-in.
	Entry DN	<pre>cn=pluginName,cn=plugins,cn=config</pre>
	Valid Range	Any DirectoryString
	Default Value	None
	Syntax	DirectoryString
	Example	nsslapd-pluginDescription: acl access check plug-in
nsslapd-pluginEnabled	attribute can be	er or not the plug-in is enabled. This changed over protocol, but will only the server is next restarted.
	Entry DN	<pre>cn=pluginName,cn=plugins,cn=config</pre>
	Valid Range	on off
	Default Value	on
	Syntax	DirectoryString
	Example	nsslapd-pluginEnabled: on
nsslapd-pluginId	Specifies the plu	ıg-in ID.
	Entry DN	<pre>cn=pluginName,cn=plugins,cn=config</pre>
	Valid Range	Any valid plug-in ID.
	Default Value	None
	Syntax	DirectoryString
	Example	nsslapd-pluginId: chaining database
nsslapd-pluginInitfunc	Specifies the plu	g-in function to be initiated.
	Entry DN	<pre>cn=pluginName,cn=plugins,cn=config</pre>
	Valid Range	Any valid plug-in function.
	Default Value	None

	Syntax	DirectoryString
	Example	nsslapd-pluginInitfunc: NS7bitAttr_Init
nsslapd-pluginPath	Specifies the full	l path to the plug-in.
	Entry DN	<pre>cn=pluginName,cn=plugins,cn=config</pre>
	Valid Range	Any valid path
	Default Value	None
	Syntax	DirectoryString
	Example	nsslapd-pluginPath: /opt/SUNWdsee/ds6/lib/uid-plugin.so
nsslapd-pluginType	Specifies the plu	ıg-in type.
	Entry DN	<pre>cn=pluginName,cn=plugins,cn=config</pre>
	Valid Range	Any valid plug-in type.
	Default Value	None
	Syntax	DirectoryString
	Example	nsslapd-pluginType: preoperation
nsslapd-pluginVendor	Specifies the ver	ndor of the plug-in.
	Entry DN	<pre>cn=pluginName,cn=plugins,cn=config</pre>
	Valid Range	Any approved plug-in vendor.
	Default Value	Sun Microsystems, Inc.
	Syntax	DirectoryString
	Example	nsslapd-pluginVendor: Sun Microsystems, Inc.
nsslapd-pluginVersion	Specifies the plu	ig-in version.
	Entry DN	<pre>cn=pluginName,cn=plugins,cn=config</pre>
	Valid Range	Any valid plug-in version.
	Default Value	Product version
	Syntax	DirectoryString
	Example	nsslapd-pluginVersion: 6.0

7-BIT CHECK PLUG-IN Consider the following aspects of this plug-in.

0 1	
Plug-In Name	7-Bit Check (NS7bitAttr)
DN of Configuration Entry	<pre>cn=7-bit check,cn=plugins,cn=config</pre>
Description	Checks certain attributes are seven-bit clean.
Configurable Options	on off
Default Setting	on
Configurable Arguments	List of attributes, uid mail userpassword, followed by a comma, and then by the suffix or suffixes on which the check is to occur.
Dependencies	None
Performance Related Information	None
Further Information	If your Directory Server uses non-ASCII characters such as Japanese and other languages for some attributes, remove those attributes from the list of attributes checked by this plug-in.
	When adding or modifying an attribute value checked by this plug-in, and the new value violates the seven-bit check, the client receives a LDAP_CONSTRAINT_VIOLATION (19) return code, and a message such as the following: Value of attribute <i>attr</i> contains extended (8-bit) characters: <i>value</i>

ACL PLUG-IN Consider the following aspects of this plug-in.

	Plug-In Name	ACL Plugin
	DN of Configuration Entry	<pre>cn=ACL Plugin,cn=plugins,cn=config</pre>
	Description	ACL access check plug-in
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Leave this plug-in running at all times.
ACL PREOPERATION PLUG-IN	Consider the following aspects of this	plug-in.
F LOG-IN	Plug-In Name	ACL preoperation

	DN of Configuration Entry	<pre>cn=ACL preoperation,cn=plugins,cn=config</pre>
	Description	ACL access check plug-in.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	Database
	Performance Related Information	Leave this plug-in running at all times.
BINARY SYNTAX	Consider the following aspects of this	plug-in.
PLUG-IN	Plug-In Name	Binary Syntax
	DN of Configuration Entry	<pre>cn=Binary Syntax,cn=plugins,cn=config</pre>
	Description	Syntax for handling binary data.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
BOOLEAN SYNTAX Consider the following aspects of this plug-in.		plug-in.
PLUG-IN	Plug-In Name	Boolean Syntax
	DN of Configuration Entry	cn=Boolean Syntax,cn=plugins,cn=config
	Description	Syntax for handling booleans.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
CASE EXACT STRING	Consider the following aspects of this	plug-in.
SYNTAX PLUG-IN	Plug-In Name	Case Exact String Syntax

	DN of Configuration Entry	cn=Case Exact String Syntax,cn=plugins,cn=config
	Description	Syntax for handling case-sensitive strings.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
CASE IGNORE STRING	Consider the following aspects of this	plug-in.
SYNTAX PLUG-IN	Plug-In Name	Case Ignore String Syntax
	DN of Configuration Entry	cn=Case Ignore String Syntax,cn=plugins,cn=config
	Description	Syntax for handling case-insensitive strings.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
CHAINING DATABASE	Consider the following aspects of this	plug-in.
PLUG-IN	Plug-In Name	Chaining Database
	DN of Configuration Entry	<pre>cn=Chaining database,cn=plugins,cn=config</pre>
	Description	Syntax for handling DNs.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.

CLASS OF SERVICE	Consider the following aspects of this plug-in	
B1116 111		

CLASS OF SERVICE PLUG-IN	Consider the following aspects of this plug-in.		
	Plug-In Name	Class of Service	
	DN of Configuration Entry	<pre>cn=Class of Service,cn=plugins,cn=config</pre>	
	Description	Allows for sharing of attributes between entries.	
	Configurable Options	on off	
	Default Setting	on	
	Configurable Arguments	Set the nsslapd-pluginarg0 attribute to:	
		 Ø (default) to enable fast lookup of classic CoS templates 	
		 1 to disable fast lookup for classic CoS template selection 	
		 2 to disable checks for ambiguous pointer and classic CoS definitions 	
		Ambiguous definitions result when more than one value could be returned for the same attribute of the same entry. When checking remains enabled, Directory Server logs an informational message upon encountering such an ambiguity, provided you have set the log level to allow plug-ins to log informational messages.	
		• 3 to disable both	
		Restart Directory Server for modifications to take effect.	
	Dependencies	None	
	Performance Related Information	Leave this plug-in running at all times.	
COUNTRY STRING	Consider the following aspects of this plug-in.		
SYNTAX PLUG-IN	Plug-In Name	Country String Syntax	
	DN of Configuration Entry	<pre>cn=Country String Syntax,cn=plugins,cn=config</pre>	
	Description	Syntax for handling countries.	
	Configurable Options	on off	
	Default Setting	on	
	Configurable Arguments	None	

	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
DISTINGUISHED NAME	Consider the following aspects of this	plug-in.
SYNTAX PLUG-IN	Plug-In Name	Distinguished Name Syntax
	DN of Configuration Entry	cn=Distinguished Name Syntax,cn=plugins,cn=config
	Description	Syntax for handling DNs.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
DSML FRONTEND	Consider the following aspects of this plug-in.	
SYNTAX PLUG-IN	Plug-In Name	Frontend
	DN of Configuration Entry	<pre>cn=DSMLv2-SOAP-HTTP,cn=frontends,cn=plugins, cn=config</pre>
	Description	Enables you to access the directory using DSML v2 over SOAP/HTTP.
	Configurable Options	on off
	Default Setting	off
	Configurable Arguments	ds-hdsml-soapschemalocation
		ds-hdsml-dsmlschemalocation
	Dependencies	None
	Performance Related Information	None
GENERALIZED TIME	Consider the following aspects of this plug-in.	
SYNTAX PLUG-IN	Plug-In Name	Generalized Time Syntax
	DN of Configuration Entry	cn=Generalized Time Syntax,cn=plugins,cn=config

Description	Syntax for dealing with dates, times, and time zones.
Configurable Options	on off
Default Setting	on
Configurable Arguments	None
Dependencies	None
Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
Further Information	The Generalized Time String consists of the four digit year, two digit month (for example, 01 for January), two digit day, two digit hour, two digit minute, two digit second, an optional decimal part of a second and a time zone indication. We strongly recommend that you use the Z time zone indication (Greenwich Mean Time).

INTEGER SYNTAX Consider the following aspects of this plug-in. PLUG-IN

N	Plug-In Name	Integer Syntax
	DN of Configuration Entry	<pre>cn=Integer Syntax,cn=plugins,cn=config</pre>
	Description	Syntax for handling integers.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.

 $\ensuremath{\mathsf{INTERNATIONALIZATION}}$ Consider the following aspects of this plug-in. PLUG-IN

Plug-In Name	Internationalization Plugin
DN of Configuration Entry	cn=Internationalization Plugin,cn=plugins,cn=config
Description	Syntax for handling DNs.
Configurable Options	on off
Default Setting	on

	Configurable Arguments	None. In contrast to previous versions of Directory Server, the collation orders and locales used by the internationalization plug-in are now stored in the configuration.
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
LDBM DATABASE	Consider the following aspects of this	plug-in.
PLUG-IN	Plug-In Name	ldbm database plug-in
	DN of Configuration Entry	<pre>cn=ldbm database plug-in,cn=plugins,cn=config</pre>
	Description	Implements local databases.
	Configurable Options	None
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Leave this plug-in running at all times.
	Consider the following aspects of this	plug-in.
REPLICATION PLUG-IN	Plug-In Name	Multimaster Replication Plugin
	DN of Configuration Entry	<pre>cn=Multimaster Replication plugin,cn=plugins, cn=config</pre>
	Description	Enables replication between two Directory Server suffixes.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	database
	Performance Related Information	None
	Further Information	You can turn this plug-in off if you have only one server, which will never replicate.
OCTET STRING SYNTAX	Consider the following aspects of this	plug-in.
PLUG-IN	Plug-In Name	Octet String Syntax

	DN of Configuration Entry	<pre>cn=Octet String Syntax,cn=plugins,cn=config</pre>
	Description	Syntax for handling octet strings.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
CLEAR PASSWORD	Consider the following aspects of this	s plug-in.
STORAGE PLUG-IN	Plug-In Name	CLEAR
	DN of Configuration Entry	cn=CLEAR,cn=Password Storage Schemes,cn=plugins, cn=config
	Description	CLEAR password storage scheme used for password encryption.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
CRYPT PASSWORD	Consider the following aspects of this plug-in.	
STORAGE PLUG-IN	Plug-In Name	CRYPT
	DN of Configuration Entry	cn=CRYPT,cn=Password Storage Schemes,cn=plugins, cn=config
	Description	CRYPT password storage scheme used for password encryption.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None

	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
NS-MTA-MD5	Consider the following aspects of this	plug-in.
PASSWORD STORAGE SCHEME PLUG-IN	Plug-In Name	NS-MTA-MD5
	DN of Configuration Entry	<pre>cn=NS-MTA-MD5,cn=Password Storage Schemes, cn=plugins,cn=config</pre>
	Description	NS-MTA-MD5 password storage scheme for password encryption.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
	Further Information	You can no longer choose to encrypt passwords using the NS-MTA-MD5 password storage scheme. The storage scheme is still present, but for backward compatibility only. The data in your directory still contains passwords encrypted with the NS-MTA-MD5 password storage scheme.
RMCE PASSWORD	This password storage scheme plug-in	n is used for example by the administration framework

RMCE PASSWORD This password storage scheme plug-in is used for example by the administration framework and is reserved for internal use.

SHA PASSWORD STORAGE SCHEME PLUG-IN	Consider the following aspects of this plug-in.		
	Plug-In Name	SHA	
	DN of Configuration Entry	<pre>cn=SHA,cn=Password Storage Schemes,cn=plugins, cn=config</pre>	
	Description	SHA password storage scheme for password encryption.	
	Configurable Options	on off	
	Default Setting	on	
	Configurable Arguments	None	
	Dependencies	None	

	Performance Related Information	If there are no passwords encrypted using the SHA password storage scheme, you may turn this plug-in off. If you want to encrypt your password with the SHA password storage scheme, choose SSHA instead. SSHA is a far more secure option.
SSHA PASSWORD	Consider the following aspects of this	plug-in.
STORAGE SCHEME PLUG-IN	Plug-In Name	SSHA
	DN of Configuration Entry	cn=SSHA,cn=Password Storage Schemes,cn=plugins, cn=config
	Description	SSHA password storage scheme for password encryption.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.
STRONG PASSWORD CHECK PLUG-IN	When Directory Server is configured to check password quality, and this plug-in is enabled, the plug-in checks the following each time a password is added or modified.	
	• Clear text password values contain the classes of characters specified by the configuration.	
	 Clear text password values do not contain any sequence of four characters present in the dictionary file specified by the configuration. 	
	Hashed password values such as {SSHA}0Ri1g2yqlH3GTZcuRQ4uS22syCQLBKAU2ypLSw== are not checked.	
	Consider the following aspects of this	plug-in.

Plug-In Name	Strong Password Checking plug-in
DN of Configuration Entry	cn=Strong Password Check,cn=plugins,cn=config
Configurable options and arguments	on off
	nsslapd-pluginarg0, which takes an integer representing a mask of values representing the character classes that must be present in a valid

	sum of the following values, not counting the special values 16 and 17.
	 1 means the password must contain special characters. 2 means the password must contain numeric characters. 4 means the password must contain upper case characters. 8 means the password must contain lower case characters. 16 is a special value meaning at least three of the four character classes. 17 is a special value meaning at least two of the four character classes.
	The default setting is 15.
	nsslapd-pluginarg1, which takes the absolute file system path to an ASCII dictionary file. If the argument is missing, the dictionary check is skipped. The plug-in does not initialize and Directory Server does not start if the value of this attribute is invalid or refers to an inaccessible file.
Default settings	off
Dependencies	Default password file, <i>install-path</i> /ds6/plugins/words-english-big.txt

password. Set nsslapd-pluginarg0 to one of or a

PLUG-IN

POSTAL ADDRESS Consider the following aspects of this plug-in. STRING SYNTAX

Ň	Plug-In Name	Postal Address Syntax
	DN of Configuration Entry	<pre>cn=Postal Address Syntax,cn=plugins,cn=config</pre>
	Description	Syntax used for handling postal addresses.
	Configurable Options	on off
	Default Setting	on
	Configurable Arguments	None
	Dependencies	None
	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.

PTA PLUG-IN Consider the following aspects of this plug-in.

PTA PLUG-IN	Consider the following aspects	of this plug-in.
	Plug-In Name	Pass Through Authentication
	DN of Configuration Entry	cn=Pass Through Authentication,cn=plugins, cn=config
	Description	Enables pass-through authentication, the mechanism that allows one directory to consult another to authenticate bind requests.
	Configurable Options	on off
	Default Setting	off
	Configurable Arguments	The LDAP URL to the configuration directory.
		nsslapd-pluginarg0: ldap://config.example.com/o=example
	Dependencies	None
REFERENTIAL	Consider the following aspects of this plug-in.	
INTEGRITY POSTOPERATION PLUG-IN	Plug-In Name	Referential Integrity Postoperation
1 LOG-IN	DN of Configuration Entry	<pre>cn=Referential Integrity Postoperation, cn=plugins,cn=config</pre>
	Description	Enables the server to ensure referential integrity.
		All attributes in all databases that are used by the referential integrity plug-in must be indexed. The indexes need to be created in the configuration of all the databases. When the retro change log is enabled, the cn=changelog suffix must be indexed.
	Configurable Options	All configuration and on off
	Default Setting	off
	Configurable Arguments	When enabled, the post operation Referential Integrity plug-in performs integrity updates on the member, uniquemember, owner, and seeAlso attributes immediately after a delete or rename operation. You can reconfigure the plug-in to perform integrity checks on all other attributes.
		The following arguments are configurable:
		1. (nsslapd-pluginarg0) Check for referential integrity
		-1 = no check for referential integrity

		<pre>0 = check for referential integrity is performed immediately</pre>
		positive integer = request for referential integrity is queued and processed at a later stage. This positive integer serves as a wake-up call for the thread to process the request, at intervals corresponding to the integer specified.
		 (nsslapd-pluginarg1) Log file for storing the change, for example /local/ds/logs/referint
		3. (nsslapd-pluginarg2) Reserved for future use.
		 (Other nsslapd-pluginarg* attributes) Attribute names to be checked for referential integrity.
	Dependencies	database type
	Tuning Recommendations	Do the following when you use the referential integrity plug-in in a multi-master replication environment:
		 Enable the referential integrity plug-in on all servers containing master replicas
		 Enable the referential integrity plug-in with the same configuration on every master
		Set the first argument to a positive value, such as 10, meaning ten seconds, to ensure that work performed by this plug-in happens asynchronously, rather than synchronously.
		When enabling the plug-in, also create equality indexes for all attributes configured for use with the plug-in. The plug-in uses such indexes when searching for entries to update. Without equality indexes for the attributes it uses, the plug-in must perform costly unindexed searches that have negative impact on performance.
RETRO CHANGE LOG	Consider the following aspects	of this plug-in.
PLUG-IN	Plug-In Name	Retro Changelog Plugin
	DN of Configuration Entry	<pre>cn=Retro Changelog Plugin,cn=plugins,cn=config</pre>
	Description	Used by LDAP clients for maintaining application compatibility with Directory Server 4.x versions.
		Maintains a log of all changes occurring in Directory Server. The retro change log offers the same functionality as the changelog in the 4.x versions of

Directory Server.

on off
off
The following arguments can be configured for the retro change log plug-in:
 nsslapd-pluginarg0: -ignore_attributesconfigures the retro change log plug-in to ignore attributes specified by the following nsslapd-pluginarg. This argument is configured by default.
 nsslapd-pluginarg1: copyingFromspecifies a list of attributes to be ignored by the preceding nsslapd-pluginarg. This argument is configured by default.
 nsslapd-pluginarg2: suffixes="suffix1", "suffix2" configures the retro change log to record updates to specified suffixes only
 nsslapd-pluginarg3: deletedEntryAttributes=attribute1,attribute2 configures the retro change log to record specified attributes of an entry when that entry is deleted
None
May slow down Directory Server performance.
plugins,cn=config /ds6/lib/retrocl-plugin.so lugin_init atabase butes people","dc=example","dc=com" trributes="objectclass","employeenumber" b/changelog

nsslapd-pluginVersion: 6.0
<pre>nsslapd-pluginVendor: Sun Microsystems, Inc.</pre>
nsslapd-pluginDescription: Retrocl Plugin
ds-pluginSignatureState: valid signature

ROLES PLUG-IN Consider the following aspects of this plug-in.

Plug-In Name	Roles Plugin
DN of Configuration Entry	<pre>cn=Roles Plugin,cn=plugins,cn=config</pre>
Description	Enables the use of roles in Directory Server.
Configurable Options	on off
Default Setting	on
Configurable Arguments	None
Dependencies	State Change Plugin
Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.

STATE CHANGE Consider the following aspects of this plug-in.

PLUG-IN

Plug-In Name	State Change Plugin
DN of Configuration Entry	<pre>cn=State Change Plugin,cn=plugins,cn=config</pre>
Description	State change notification service plug-in for detecting updates, such as configuration changes, and triggering callbacks when updates happen.
	This plug-in is used internally by the roles plug-in.
Configurable Options	on off
Default Setting	on
Configurable Arguments	None
Dependencies	None

SUBTREE ENTRY Consider the following aspects of this plug-in. COUNTER PLUG-INS

Plug-In Name	Subtree Entry Counter For ObjectClass
DN of Configuration Entry	cn=Subtree Entry Counter for <i>ObjectClass</i> ,cn=plugins, cn=config
Description	Maintain a count of entries with a particular object class. The following plug-ins are provided.

		Subtree entry conSubtree entry conSubtree entry con	unter for departments in domains unter for domains within a domain unter for mail lists unter for nested departments unter for total domains unter for users		
	Configurable Options	on off			
	Default Setting	off			
	Configurable Arguments	None			
	Dependencies	None			
	Performance Related Information	Server only, and are	rovided for use with Messaging disabled by default. Leave these less your Messaging Server		
	Counter Attributes Maintained				
		nsNumDepts	Either the number of departments within a domain, or the number of departments within a department (nested departments), depending on the DN of the entry.		
		nsNumDomains	Either the number of total domains, or the number of domains within a domain or nested domain, depending on the DN of the entry.		
		nsNumMailLists	Number of mail lists.		
	Consider the following aspects of this plug-in.				
PLUG-IN	Plug-In Name	Telephone Syntax			
	DN of Configuration Entry	<pre>cn=Telephone Syntax,cn=plugins,cn=config</pre>			
	Description	Syntax for handling telephone numbers.			
	Configurable Options	on off			
	Default Setting	on			
	Configurable Arguments	None			
	Dependencies	None			

	Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.	
	Consider the following aspects of this plug-in.		
PLUG-IN	Plug-In Name	UID Uniqueness	
	DN of Configuration Entry	<pre>cn=UID Uniqueness,cn=plugins,cn=config</pre>	
	Description	Checks that the values of specified attributes are unique each time a modification occurs on an entry.	
	Configurable Options	on off	
	Default Setting	off	
	Configurable Arguments	You may configure this plug-in in either of two different ways.	
		 Specify attributes that must be unique for a series of one or more subtrees identified by DNs. For example, to specify that employeeNumber and uid attribute values must be unique across both o=org1, dc=example, dc=com and o=org2, dc=example, dc=com, configure the arguments in the configuration entry as follows: 	
		nsslapd-pluginarg0: employeeNumber nsslapd-pluginarg1: uid nsslapd-pluginarg2: o=org1,dc=example,dc=com nsslapd-pluginarg3: o=org2,dc=example,dc=com	
		2. You specify attributes that must be unique inside congruent subtrees, optionally only on entries of a specified object class. For example, to specify that employeeNumber and uid attribute values must be unique in either o=org1, dc=example, dc=com or o=org2, dc=example, dc=com, but only on entries of the inetOrgPerson object class, configure the arguments in the configuration entry as follows:	
	nsslapd-pluginarg0: employeeNumber nsslapd-pluginarg1: uid nsslapd-pluginarg2: MarkerObjectCL RequiredObjectClass="inetOrgPerson		
	Dependencies	database type	

Performance Related Information	Directory Server provides the UID Uniqueness plug-in by default. To ensure unique values for other attributes, you can create instances of the UID Uniqueness plug-in for those attributes.
	The UID Uniqueness plug-in may slow down Directory Server performance.

URI PLUG-IN Consider the following aspects of this plug-in.

Plug-In Name	URI Syntax
DN of Configuration Entry	<pre>cn=URI Syntax,cn=plugins,cn=config</pre>
Description	Syntax for handling URIs (Unique Resource Identifiers) including URLs (Unique Resource Locators.)
Configurable Options	on off
Default Setting	on
Configurable Arguments	None
Dependencies	None
Performance Related Information	Do not modify the configuration of this plug-in. Leave this plug-in running at all times.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-port – LDAP port number

Description TCP/IP port number used for LDAP communications. If you want to run SSL/TLS over this port, you can do so through the Start TLS extended operation. This selected port must be unique on the host system; make sure no other application is attempting to use the same port number. Specifying a port number of less than 1024 requires Directory Server to run as super user.

Note – Be aware when changing this port number of other applications whose configurations you may have to modify to reflect the change.

You must restart the server for the port number change to be taken into account.

Entry DN	cn=config
Valid Range	1 to 65535
Default Value	389
Syntax	Integer
Example	nsslapd-port: 389

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-privatenamespaces - private naming contexts

Description Contains the list of the private naming contexts cn=config, cn=schema, and cn=monitor.

Entry DN	cn=config
Valid Range	<pre>cn=config, cn=schema, and cn=monitor</pre>
Default Value	N/A
Syntax	DirectoryString
Example	nsslapd-privatenamespaces: cn=config

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-pwdgeneratorpwdlen – Generated password length

Description

PROPERTY	VALUE
Entry DN	cn=config
Valid Range	6 to 512
Default Value	6
Syntax	Integer

This attribute specifies the length of the password generated by Directory Server when a password is reset using the LDAP Password Modify Extended Operation defined in RFC 3062 and no new password value is specified.

Examples nsslapd-pwdgeneratorpwdlen: 8

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-readonly - read only mode

Description Specifies whether the whole server, or an individual database, is in read-only mode, meaning that neither data in a database nor configuration information can be modified. Any attempt to modify a database in read-only mode returns an error indicating that the server is unwilling to perform the operation.

Entry DN	cn=config
	<pre>cn=dbName,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	on off
Default Value	off
Syntax	DirectoryString
Example	nsslapd-readonly: off

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-referral - referral

Description This multivalued attribute specifies the LDAP URL or URLs to be returned by the suffix, when the server receives a request for an entry not belonging to the local tree, that is, an entry whose suffix does not match the value specified on any of the suffix attributes. For example, suppose the database contains only the entries under the following DN.

ou=People, dc=example,dc=com

Yet, the request is for an entry under the following DN.

ou=Groups, dc=example,dc=com

In this case, the referral is returned so the client may contact the corresponding directory for the requested entry. Although only one referral is allowed per Directory Server instance, this referral can have multiple values.

Note – If you want to use SSL and TLS communications, the referral attribute should be of the following form.

ldaps://hostname

Start TLS does not support referrals.

For suffix configuration entries, this attribute is required when the value of the nsslapd-state attribute is set to referral.

Entry DNs	cn=config
	<pre>cn="suffixName",cn=mapping tree,cn=config</pre>
Valid Range	Valid LDAP URL in the following format: ldap:// hostname
Default Value	Not applicable
Syntax	DirectoryString
Example	nsslapd-referral: ldap://alternate.example.com

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-referralmode – referral mode

Description When set, this attribute causes the server send back the referral for *any* request on *any* suffix.

Entry DN	cn=config
Valid Range	Valid LDAP URL in the following format: ldap://serverHost
Default Value	Not applicable
Syntax	DirectoryString
Example	nsslapd-referralmode: ldap://backup.example.com

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsslapd-require-index	- allow only indexed searches
------	-----------------------	-------------------------------

Description When switched to on, this attribute allows you to refuse unindexed searches. This performance related attribute avoids saturating the server with erroneous searches.

Entry DN	<pre>cn=dbname,cn=ldbm database,cn=plugins,cn=config</pre>
Valid Range	on off
Default Value	off
Syntax	DirectoryString
Example	nsslapd-require-index: off

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-reservedescriptors - reserve file descriptors

DescriptionThis read-only attribute specifies the number of file descriptors that Directory Server reserves
for managing non-client connections, such as index management and managing replication.
The number of file descriptors that the server reserves for this purpose subtracts from the total
number of file descriptors available for servicing LDAP client connections.

Most installations of Directory Server should never need to change this attribute. However, consider increasing the value on this attribute if all of the following are true:

- The server is replicating to a large number of consumer servers (more than 10), or the server is maintaining a large number of index files (more than 30).
- The server is servicing a large number of LDAP connections.
- You get error messages reporting that the server is unable to open file descriptors (the
 actual error message will differ depending on the operation that the server is attempting to
 perform), but these error messages are NOT related to managing client LDAP
 connections.

Increasing the value on this attribute may result in more LDAP clients being unable to access your directory. Therefore, when you increase the value on this attribute, increase the value on the nsslapd-maxdescriptors attribute also. Note that you may not be able to increase the nsslapd-maxdescriptors value if your server is already using the maximum number of file descriptors that your operating system allows a process to use. Refer to your operating system documentation for details. If this is the case, then reduce the load on your server by causing LDAP clients to search alternative directory replicas.

To assist you in computing the number of file descriptors you set for this attribute, use the following formula:

nsslapd-reservedescriptor = 20 + (NumBackends * 4) + NumGlobalIndexes + ReplicationDescriptors + ChainingBackendDescriptors + PTADescriptors + SSLDescriptors

The terms in the formula are as follows.

NumldbmBackends	Number of LDBM databases.
NumGlobalIndexes	Total number of configured indexes for all databases including system indexes. By default, there are 8 system indexes and 17 additional indexes per database.
ReplicationDescriptors	NumSupplierReplicas + 8

		Where <i>NumSupplierReplicas</i> is number of replicas in the server that can act as a supplier (hub or master).
Chaining Backend Descriptors		<pre>NumChainingBackends* nsOperationConnectionsLimit</pre>
		Where nsOperationConnectionsLimit is defined in the chained suffix configuration and 10 by default.
PTADescripto	ors	3 if PTA is configured, 0 if PTA is not configured.
SSLDescripto	rs	5 (4 files + 1 listen socket) if SSL is configured, 0 if SSL is not configured.
Entry DN	cn=config	
Valid Range	1 to 65535	
Default Value	64	
Syntax	Integer	
Example	nsslapd-reservedescriptors: 64	

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-return-exact-case - return exact case

Description Returns the exact case of attribute names, as defined in the schema.

Attribute names are case-insensitive by default. However, when an attribute is returned by Directory Server. as the result of a search operation, some client applications require attribute names to match the case of the attribute as it is listed in the schema. Other client applications require attribute names to be returned in lower case.

nsslapd-return-exact-case is enabled by default. You should disable this attribute if you have legacy clients that expect attribute names to be returned in lower case for backward compatibility with Directory Server 4.x. You must stop and restart the server for changes to this attribute to be taken into account.

Note that if the attribute name is specified in the search, it is returned in the case in which it is specified, regardless of the value of nsslapd-return-exact-case.

For example, the following search command:

ldapsearch -b "cn=config" -s base objectclass=* "PassWordMinAGe"

Returns the attribute as PassWordMinAGe=0, whether nsslapd-return-exact-case is set to on or off.

If nsslapd-return-exact-case is set to on, the following search command:

ldapsearch -b "cn=config" -s base objectclass=*

Returns the attribute as passwordMinAge=0, which is how this attribute is defined in the schema.

If nsslapd-return-exact-case is set to off, the same search command:

ldapsearch -b "cn=config" -s base objectclass=*

Returns the attribute as passwordminage=0, in lower case.

Entry DN	cn=config
Valid Range	on off
Default Value	on
Syntax	DirectoryString
Example	nsslapd-return-exact-case: on

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-rootdn - Directory Manager DN

Description Specifies the distinguished name of an entry that is not subject to access control restrictions, administrative limit restrictions for operations on the directory or resource limits in general. The attributes nsslapd-sizelimit, nsslapd-timelimit, and nsslapd-schemacheck do not apply to this DN either. nsslapd-idletimeout does however apply to connections opened by this DN.

Entry DN	cn=config
Valid Range	Any valid distinguished name
Default Value	cn=Directory Manager
Syntax	DN
Example	nsslapd-rootdn: cn=Directory Manager

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsslapd-rootpw -	isslapd-rootpw – Directory Manager password	
Description	provide the root p	u to specify the password associated with the Directory Manager DN. When you he root password, it will be encrypted according to the encryption method you or nsslapd-rootpwstoragescheme.	
		m the dse.ldif file, this attribute shows the encryption method followed by ing of the password.	
	password. Howev editing of the file. directory as you a	configure a root DN at server installation time, you must also provide a root owever, it is possible for the root password to be deleted from dse.ldif by direct e file. In this situation, the root DN can only obtain the same access to your you allow for anonymous access. Always make sure that a root password is e.ldif when a root DN is configured for your database.	
	Entry DN	cn=config	
	Valid Range	Any valid password encrypted by any one of the encryption methods described in passwordStorageScheme(5dsat).	
	Default Value	Not applicable	
	Syntax	DirectoryString: {encryption_method}encrypted_password	
	Example	<pre>nsslapd-rootpw: {SSHA}fp+C/eJCYVV0ZlXDE52Pd9uOzjvJVk4B10biAg==</pre>	

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-rootpwstoragescheme - root password storage scheme

Description This attribute indicates the encryption method used for the root password.

Entry DN	cn=config
Valid Range	Any encryption method described in passwordStorageScheme(5dsat)
Default Value	SSHA
Syntax	DirectoryString
Example	nsslapd-rootpwstoragescheme: SSHA

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsslapd-schemacheck - schema checking	
------	---------------------------------------	--

Description Specifies whether the database schema will be enforced during entry insertion or modification. When this attribute has a value of on, Directory Server will not check the schema of existing entries until they are modified. The database schema defines the type of information allowed in the database. You can extend the default schema using the objectclasses and attribute types.

Note – Schema checking works by default when database modifications are made using an LDAP client, such as ldapmodify, the Directory Server console, or when importing a database from LDIF.

If you turn schema checking off, you will have to verify manually that your entries conform to the schema. If schema checking is turned on, the server sends an error message to inform you of the entries that do not match the schema. Make sure that the attributes and object classes you create in your LDIF statements are both spelled correctly and identified in dse.ldif. You will need to create a file in LDIF format in the schema directory or add the elements to 99user.ldif.

Entry DN	cn=config
Valid Range	on off
Default Value	on
Syntax	DirectoryString
Example	nsslapd-schemacheck: on

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-schema-repl-useronly - replicate only user-defined schema elements

Description This attribute allows you to have greater control over the schema that is replicated. The attribute is off by default, implying that the entire schema is replicated. If the attribute is set to on, only schema with an X-ORIGIN of user-defined is replicated. This setting greatly improves the performance of schema replication.

If you are replicating from a current Directory Server to a 5.1 server, you *must* set this attribute to on. Otherwise the current schema will be pushed to the 5.1 server and the 5.1 server will be unable to restart, due to duplicate objects.

Entry DN	cn=config
Valid Range	on off
Default Value	off
Syntax	DirectoryString
Example	nsslapd-schema-repl-useronly: off

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-search-tune – Skip check for modifications during search before returning entries

Description

PROPERTY	VALUE
Entry DN	cn=config,cn=ldbm database,cn=plugins,cn=config
Valid Range	See description that follows.
Default Value	Not defined
Syntax	Integer

This attribute specifies that Directory Server should skip the double-check it normally does to verify that search results returned include the most current version of the entry content, even if the entry has been modified during the search. This double-check verification involves testing the search filter against each entry to return in response to the search.

Allowing Directory Server to skip the filter test when the search involves complex filters and large static groups can result in significant performance improvement.

When nsslapd-search-tune is set, the access log identifies searches for which the filter test is skipped with the tag notes=F.

Set nsslapd-search-tune to a sum of the following values:

- 1 Enable the filter test to be skipped before the entry is returned.
- 2 Reserved, do not use.
- 4 Reserved, do not use.
- 8 Skip the filter test even if the attribute in the filter is in the list of requested attributes. This could potentially cause the server to return entries that no longer correspond to search criteria.
- 16 Skip the filter test when search filters are complex, using & and |.
- 32 Always finish building the list of candidate entries from the index.

Examples nsslapd-search-tune: 49

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-securelistenhost - listen to IP address for secure connections

Description Allows multiple Directory Server instances to run on a multi-homed machine, using secure SSL/TLS connections, and makes it possible to limit listening to one or more interfaces of a multi-homed machine. Provide the hostname or host names corresponding to the IP interface or interfaces you want to specify as the values for this attribute. Directory Server responds only to requests sent to the interface or interfaces corresponding to the host name or host names specified. This prevents other programs from using the same port as Directory Server on the interfaces specified.

Entry DN	cn=config
Valid Range	Any secure host name or host names
Default Value	Not applicable
Syntax	DirectoryString
Example	<pre>nsslapd-securelistenhost: secure-hostname</pre>

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-securePort - encrypted LDAP port number

Description TCP/IP port number used for SSL/TLS communications. This selected port must be unique on the host system; make sure no other application is attempting to use the same port number. Specifying a port number of less than 1024 requires that Directory Server runs as super user.

Note – Be aware when changing this port number of other applications whose configurations you may have to modify to reflect the change.

The default value 636 is only used if the server has been configured with a private key and a certificate; otherwise it does not listen on this port.

You must restart the server for the port number change to be taken into account.

Entry DN	cn=config
Valid Range	1 to 65535
Default Value	636
Syntax	Integer
Example	nsslapd-securePort: 636

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-security – security

Description Enables the use of security features, SSL/TLS and attribute encryption, in Directory Server. If you require secure connections, or the use of the attribute encryption feature, this attribute should be set to on.

Entry DN	cn=config
Valid Range	on off
Default Value	off
Syntax	DirectoryString
Example	<pre>nsslapd-security: off</pre>

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-sizelimit - size limit

Description Specifies the maximum number of entries to return from a search operation. If this limit is reached, the server returns any entries it has located that match the search request, as well as an exceeded size limit error.

When no limit is set, the server will return every matching entry to the client regardless of the number found. To set a no limit value whereby Directory Server will wait indefinitely for the search to complete, specify a value of -1 for this attribute in the dse.ldif file.

This limit applies to everyone regardless of their organization.

Entry DN	cn=config
	<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>
Valid Range	-1 to the maximum 32 bit integer value (2147483647)
Default Value	2000
Syntax	Integer
Example	nsslapd-sizelimit: 2000

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsslapd-state – how a suffix handles operations		
Description	Determines how the suffix handles operations.		
	Entry DN	<pre>cn="suffixName",cn=mapping tree,cn=config</pre>	
	Valid Range		
		backend	The backend database is used to process all operations.
		disabled	The database is not available for processing operations. The server returns a "No such search object" error in response to requests made by client applications.
		referral	A referral is returned for requests made to this suffix.
		referral on update	The database is used for all operations except update requests, which receive a referral.
	Default Value	backend	
	Syntax	DirectoryString	
	Example	nsslapd-state: backer	nd

Note – You can manually change the value of the nsslapd-state attribute. For example, you can change the value to referral or referral on update if you want the server to be read-only for the duration of a backup.

However, if replication is enabled, replication manages the value of the nsslapd-state attribute, and overwrites the value you have manually set.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Description Specifies the chained suffix. This is a single-valued attribute as each database instance can have only one suffix. Previously, it was possible to have more than one suffix on a single database instance but this is no longer the case. Any changes made to this attribute after the entry has been created take effect only after you restart the server containing the chained suffix.

Entry DN	cn=dbName,cn=ldbm database,cn=plugins,cn=config
Valid Range	Any valid DN
Default Value	Not applicable
Syntax	DirectoryString
Example	nsslapd-suffix: o=example

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-threadnumber – thread number

Description Defines the number of operation threads that Directory Server creates during startup. The nsslapd-threadnumber value should be increased if you have many directory clients performing time-consuming operations such as add or modify. This ensures that there are other threads available for servicing short-lived operations such as simple searches.

Entry DN	cn=config
Valid Range	1 to the number of threads supported by your system
Default Value	30
Syntax	Integer
Example	nsslapd-threadnumber: 60

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-timelimit - time limit

Description Specifies the maximum number of seconds allocated for a search request. If this limit is reached, Directory Server returns any entries it has located that match the search request, as well as an exceeded time limit error.

When no limit is set, the server returns every matching entry to the client regardless of the time it takes. To set a no limit value whereby Directory Server waits indefinitely for the search to complete, specify a value of -1 for this attribute in the dse.ldif file. A value of zero causes no time to be allowed for searches. The smallest time limit is 1 second.

Entry DN	cn=config	
	<pre>cn=default instance config,cn=chaining database, cn=plugins,cn=config</pre>	
Valid range	-1 to the maximum 32 bit integer value (2147483647) in seconds	
Default value	3600	
Syntax	Integer	
Example	nsslapd-timelimit: 3600	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsslapd-versionstring – version string

Description Specifies the server version number.

Entry DN	cn=config
Valid range	Any valid server version number.
Default value	Not applicable
Syntax	DirectoryString
Example	<pre>nsslapd-versionstring: Sun-Java(tm)-System-Directory/6.0</pre>

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsSSL2 – SSL v2 support	
Description	Supports SSL version 2.	
	Entry DN	<pre>cn=encryption,cn=config</pre>
	Valid Range	on off
	Default Value	off
	Syntax	DirectoryString
	Example	nsSSL2: on

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsSSL3 – SSL v3 support	
Description	Supports SSL version 3.	
	Entry DN	<pre>cn=encryption,cn=config</pre>
	Valid Range	on off
	Default Value	off
	Syntax	DirectoryString
	Example	nsSSL3: on

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Description	This multivalued attribute specifies the set of encryption ciphers Directory Server uses during SSL communications. The default value, all, does not mean all the supported SSL ciphers, as supported ciphers with NULL key length are removed from the list.		
	Entry DNcn=encryption, cn=configValid RangeCiphers shown as supportedSSLCiphers on the root DSE, or all		
	Default Value	all	
	Syntax	DirectoryString	
		Use the + symbol to enable or - symbol to disable ciphers, followed by the cipher identifier. Blank spaces are not allowed in the list of ciphers.	
		To enable all ciphers, except rsa_null_md5 which must be specifically called, you can specify all.	
	Example	<pre>nsSSL3ciphers: +RSA_NULL_MD5,+RC4_56_SHA,-RC4_56_SHA</pre>	

Name nsSSL3ciphers – SSL encryption ciphers

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsSSLClientAuth – use SSL client authentication

Description In an SSL connection, this attribute specifies whether a client certificate is allowed, required, or should not be sent, off, to the SSL server.

Entry DN	<pre>cn=encryption,cn=config</pre>	
Valid Range	off allowed required	
Default Value	allowed	
Syntax	DirectoryString	
Example	nsSSLClientAuth: allowed	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsSSLServerAuth – use SSL server authentication

Description Specifies the action that the SSL client should take on the server certificate sent by the SSL server in an SSL connection.

Entry DN	<pre>cn=encryption,cn=config</pre>	
Valid Range		
	cert	Verify whether the server certificate is from a trusted certificate authority.
	cncheck	Verify whether the server certificate is from a trusted certificate authority <i>and</i> verify the DN contained in the server certificate, to avoid man-in-the middle attacks on the server.
	weak	Make no attempt to verify whether the server certificate is from a trusted certificate authority.
Default Value	cert	
Syntax	DirectorySt	ring
Example	nsSSLServe	erAuth: cert

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsSSLSessionTimeout – SSL session time out

Description Specifies the lifetime duration of an SSL session for both SSLv2 and SSLv3. The minimum timeout value is 5 seconds and if you enter a value below this, it is automatically replaced by 5 seconds. Values outside the valid ranges are replaced by the default value of 100 seconds for SSLv2.

Entry DN	<pre>cn=encryption,cn=config</pre>
Valid Range	(SSLv2) 5 seconds to 100 seconds
	(SSLv3) 5 seconds to 24 hours
Default Value	0, which translates to 100 seconds if you are running SSLv2 and 24 hours if you are running SSLv3 $$
Syntax	Integer
Example	nsSSLSessionTimeout: 5

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name	nsState –	Clock state for a	eplication, uni	que ID generation
------	-----------	-------------------	-----------------	-------------------

Description

PROPERTY	VALUE	
Entry DN	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>	
	<pre>cn=uniqueid generator,cn=config</pre>	
Valid Range	N/A	
Default Value	N/A	
Syntax	Binary	

This attribute is part of replica configuration for nsDS5Replica entries.

This attribute is reserved for internal use for handling clock skew and detecting backward clock errors. Do not edit the value of this attribute.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

See Also replication(5dsconf)

Name nsSystemIndex – identify index as system index

Description This mandatory attribute specifies whether the index is a system index, that is, an index that is vital for Directory Server operations. If this attribute has a value of true, it is system essential. System indexes must not be removed as this seriously disrupts server functionality.

Entry DN	<pre>cn=default indexes,cn=config,cn=ldbm database, cn=plugins,cn=config</pre>
Valid Range	true false
Default Value	Depends on the index
Syntax	DirectoryString
Example	nssystemindex: true

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name nsTransmittedControls - chained LDAP controls

- **Description** This attribute, which can be both a global, and thus dynamic, configuration, or a cn=chained suffix instance, cn=chaining database, cn=plugins, cn=config instance configuration attribute, allows you to alter the controls that the chained suffix forwards. The following controls are forwarded by default.
 - Managed DSA, object identifier: 2.16.840.1.113730.3.4.2.
 - Virtual list view (VLV), object identifier: 2.16.840.1.113730.3.4.9
 - Server side sorting, object identifier: 1.2.840.113556.1.4.473

Entry DN	<pre>cn=config,cn=chaining database,cn=plugins,cn=config</pre>
Valid Range	Any valid OID or the above listed controls forwarded by the chained suffix.
Default Value	None
Syntax	Integer
Example	nsTransmittedControls: 1.2.840.113556.1.4.473

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name plugin, argument, depends-on-named, depends-on-type, feature, init-func, lib-path, type, vendor, version – DS plug-in configuration (PLG) properties

Description Directory Server implements some key functionality as *plug-ins*. Plug-ins take the form of libraries loaded when the server starts, and called at different points in the processing of client application requests. When you create custom plug-ins, you must configure the server to load and use them, then restart Directory Server to load the newly configured plug-ins.

PROPERTY:argument

Syntax	STRING
Default Value	None
Is readable	Yes
Is modifiable	Yes
Is multi-valued	Yes

This property specifies arguments passed to the plug-in when it is loaded by Directory Server. Arguments are passed in the order you specify them. Updating the list of arguments replaces all the existing arguments previously specified when the plug-in is loaded again.

PROPERTY: depends - on - named

FY: ed	Syntax	STRING
	Default Value	None
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	Yes

This property specifies names of plug-ins that must be available and loaded before Directory Server loads the current plug-in.

PROPERTY: depends-on-type

: e	Syntax	STRING (See the description that follows.)	
	Default Value	None	
	Is readable	Yes	
	Is modifiable	Yes	
	Is multi-valued	Yes	

This property specifies types of plug-ins that must be available and loaded before Directory Server loads the current plug-in. The value must be the value of a plug-in type property.

PROPERTY: feature

Syntax	STRING
Default Value	None
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the plug-in identifier from the Slapi_PluginDesc structure.

PROPERTY:init-func

Syntax	STRING
Default Value	None
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the name of function called by Directory Server to initialize the plug-in.

PROPERTY:lib-path

Syntax	PATH
Default Value	None
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the absolute file system path to the library containing plug-in.

PROPERT	'Y:type
---------	---------

Syntax	STRING (See the description that follows.)
Default Value	None
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the plug-in type. The following plug-in types are supported.

ldbmentryfetchstore	Entry store and fetch plug-in
extendedop	Extended operation plug-in
passwordcheck	Password check plug-in
postoperation	Post-operation plug-in
preoperation	Pre-operation plug-in
internalpostoperation	Internal post-operation plug-in
internalpreoperation	Internal pre-operation plug-in
matchingrule	Matching rule plug-in for extensible match search filters
object	Generic plug-in type, sometimes used to register other plug-ins
passwordcheck	Strong password check plug-in
pwdstoragescheme	Password storage scheme plug-in

PROPERTY: vendor

Syntax	STRING
Default Value	Vendor name in plug-in configuration
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the plug-in vendor from the Slapi_PluginDesc structure.

PROPERTY:version

Syntax	STRING
Default Value	Version string in plug-in configuration
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the plug-in version from the Slapi_PluginDesc structure.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED_SSL_PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Stable

See Also dsconf(1M), desc(5dsconf), enabled(5dsconf)

Name referral-url - Whether the server accepts mod DN operations

Description

Syntax	LDAP_URL undefined
Default Value	undefined
Is readable	Yes
Is modifiable	Yes
Is multi-valued	Yes

This property specifies the URLs returned as referrals when clients request an operation not supported by the server instance or suffix for the target entry.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED_SSL_PROTOCOL An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M), server(5dsconf), suffix(5dsconf)

- Name repl-agmt, auth-bind-dn, auth-protocol, auth-pwd, repl-fractional-exclude-attr, repl-fractional-include-attr, repl-schedule, transport-compression, transport-group-size, transport-window-size – DS replication agreement configuration (RAG) properties
- **Description** A *replication agreement* governs how a Directory Server supplier updates a Directory Server consumer. Although this configuration element is called an agreement, it concerns the configuration only of the supplier.

PROPERTY: auth-bind-dn

Syntax	DN undefined
Default Value	undefined
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the bind DN used by the supplier to bind to the consumer in order to perform replication-related updates. This bind DN must be present on the consumer.

PROPERTY: auth-protocol

r: l	Syntax	<pre>clear ssl-simple ssl-client</pre>
	Default Value	clear
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the protocol used by the supplier to bind to the consumer in order to perform replication-related updates. The default is to bind with simple authentication in clear text without securing the connection, as most replications connections are made on an internal network. You may however configure replication to use SSL and simple authentication to protect the connection from malicious snooping, or SSL with client authentication to further protect the connection.

PROPERTY:auth-pwd

Syntax	STRING
Default Value	None
Is readable	Yes
Is modifiable	No

Is multi-valued

No

This property specifies the password used by the supplier to bind to the consumer. You provide it using auth-pwd-file.

PROPERTY:

a	uτ	n.	- p	wc	- 1	Т	1	ι

Syntax	РАТН
Default Value	nu
Is readable	No
Is modifiable	Yes
Is multi-valued	No

This property specifies the file from which the bind password for replication is read to create the replication agreement. The file is read once on replication agreement creation, and the password is stored for future use.

PROPERTY: repl-fractional-exclu	Svr
repl-fractional-exclu	ide-

: clu	Syntax de-attr	ATTR_NAME ""
	Default Value	ни
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	Yes

This property specifies the list of attributes not to replicate. This property is mutually exclusive with repl-fractional-include-attr.

PROPERTY: repl-fractional-inclu	Syntax Ide-attr	ATTR_NAME ""
·	Default Value	88
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	Yes

This property specifies the list of attributes to replicate. This property is mutually exclusive with repl-fractional-exclude-attr.

PROPERTY: repl-schedule

Syntax	INTERVAL always
Default Value	always
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the times and days when replication can take place.

Τ.

PROPERTY: S transport-compression

i. Sior	Syntax	<pre>best-compression best-speed default-compression no-compression</pre>
	Default Value	no-compression
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the level of libz(3) compression used on replication updates from the supplier to the consumer. Supported settings are as follows.

no-compression	No compression
default-compression	Default zlib compression (zlib numeric value = -1)
best-speed	Fastest zlib compression (zlib numeric value = 1)
best-compression	Strongest zlib compression (zlib numeric value = 9)

If the bottleneck for replication in your environment is network bandwidth, this property can potentially help you tune the replication protocol for better performance.

PROPERTY: transport-group-size	Syntax	INTEGER
	Default Value	1
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies how many replication messages are grouped on the supplier before being sent to the consumer. Valid range is 1 to 255.

If the bottleneck for replication in your environment is network bandwidth, this property can potentially help you tune the replication protocol for better performance.

PROPERTY: Stransport-window-size

: ize	Syntax	INTEGER
	Default Value	10
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the number of replication messages sent from the supplier to the consumer before waiting for a response from the consumer to continue. Valid range is 1 to 65535.

If the bottleneck for replication in your environment is network latency or network bandwidth, this property can potentially help you tune the replication protocol for better performance.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER An SSL cipher supported by the server. See the Reference for a list of supported ciphers. SUPPORTED_SSL_PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M), desc(5dsconf), enabled(5dsconf)

Name	replication, ns DS5 Replica, ns DS5 Replication Agreement, Repl Priority Rule-Directory Server replication configuration
Description	Note – In most cases you do not need to know how to manage the object classes and attributes mentioned here. Instead you handle replication configuration through Directory Service Control Center or the $dsconf(1M)$ command. The information here is included primarily for those of you who are familiar with command-line configuration for replication in previous Directory Server versions.
	Replication works in Directory Server using extended operations. Changes to a suffix on a supplier server are replayed on the consumer server. Each server stores configuration information defining its role in replication, and defining the user account that has access to perform replication operations. The supplier server also stores configuration information about the replication agreement it has with the consumer.
	Replication configuration is reflected in object classes and attributes under cn=config of the Directory Server instance.
Replica Configuration	The configuration entry that indicates a suffix is replicated has a DN of the following form.
	<pre>cn=replica,cn=suffix name,cn=mapping tree,cn=config</pre>
	For example, the following configuration entry DN corresponds to the suffix dc=example, dc=com.
	<pre>cn=replica,cn=dc\=exampledc\=com,cn=mapping tree,cn=config</pre>
	Such entries have the object class nsDS5Replica.
Replication Agreement Configuration	The configuration entries that describe replication agreements with other servers have DNs of the following form.
	<pre>cn=agreement name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
	For example, the following configuration entry DN corresponds to the suffix dc=example, dc=com.
	<pre>cn=ds.example.com:389,cn=replica,cn=dc\=exampledc\=com, cn=mapping tree,cn=config</pre>
	Replication agreement entries have the object class nsDS5ReplicationAgreement.
Replication Priority	The configuration entries that describe replication priority rules have DNs of the form:
Configuration	<pre>cn=rule name,cn=replica,cn=suffix name,cn=mapping tree, cn=config</pre>
	For example, the following configuration entry DN corresponds to the suffix dc=example, dc=com.

cn=pwdReplPrio,cn=replica,cn=dc\=example\,dc\=com,cn=mapping tree, cn=config Replication priority rule entries have the object class ReplPriorityRule. The configuration entry for the account used to bind and perform replication has, by default, Replication Manager Configuration the DN: cn=replication manager,cn=replication,cn=config The account entry is a standard person(5dsoc) object class. It defines the DN and userPassword for replication. The password policy for the account used to bind and perform replication has, by default, the DN: cn=Password Policy,cn=replication manager,cn=replication, cn=config The password policy entry is governed by the schema for pwpolicy(5dssd). As both person and pwpolicy related object classes and attribute types are described elsewhere, they are not further described here. **Extended** This section examines replication configuration on a master supplier server, and on a Description dedicated consumer server. The sample configurations shown here were created using the dsconf to configure replication. On the supplier side, the key configuration entries are the replica configuration and the Supplier Side Configuration replication agreement. **Supplier Replica Configuration** For a master supplier, an nsDS5Replica configuration entry looks something like the following: dn: cn=replica,cn=\dc=example\,dc\=com,cn=mapping tree,cn=config nsDS5ReplicaRoot: dc=example,dc=com nsDS5ReplicaBindDN: cn=replication manager,cn=replication,cn=config objectClass: top objectClass: nsDS5Replica

In this example, the key attributes are the following:

nsDS5ReplicaRoot Holds the DN of the root of the replicated suffix. Once set, it must not be modified.

nsDS5ReplicaBindDN	repli	ls the DN of the account used to bind for replication. If cation is performed over SSL, this attribute can hold the ficate identity associated with the DN.
nsDS5ReplicaId	_	ifies the unique ID of this master supplier server, a value from 534, inclusive.
	Ahu	b uses the same replica ID as a consumer, 65535.
nsDS5Flags		erns change logging and automatic referrals. It takes one of the wing values:
	0	No changes are logged. Automatic referrals are not overwritten.
	1	Changes are logged. Automatic referrals are not overwritten.
	4	No changes are logged. Automatic referrals are overwritten.
	5	Changes are logged. Automatic referrals are overwritten.
nsDS5ReplicaType	Defines the role this replica plays in replicating with other servers takes one of the following values:	
	0	Reserved for internal use
	1	Dedicated supplier
	2	Dedicated consumer (read-only)
	3	Supplier/consumer (read-write)
cn	This	attribute names the replica. Once set, it must not be modified.
nsState		es the state of the clock for handling synchronization. Reserved nternal use.
nsDS5ReplicaName	Read	l-only unique identifier for the replica.

The replica configuration entry can also hold the following attributes not shown here:

ds5BeginReplicaAcceptUpdates(5dsconf) ds5ReplicaConsumerTimeout(5dsconf) ds5LastInitTimeStamp(5dsconf) ds5ReferralDelayAfterInit(5dsconf) dsChangelogMaxAge(5dsconf) dsChangelogMaxentries(5dsconf) dsFilterSPConfigchecksum(5dsconf) nsDS5ReplicaAutoReferral(5dsconf) nsDS5ReplicaChangeCount(5dsconf) nsDS5ReplicaPurgeDelay(5dsconf) nsDS5ReplicaReferral(5dsconf) nsDS5ReplicaTombstonePurgeInterval(5dsconf) nsDS5Task(5dsconf)

Supplier Replication Agreement

For a master supplier, an nsDS5ReplicationAgreement configuration entry looks something like the following:

```
dn: cn=ds.example.com:389,cn=replica,cn=dc\=example\,dc\=com,
cn=mapping tree,cn=config
nsDS5ReplicaHost: ds.example.com
nsDS5ReplicaUpdateSchedule: *
nsDS5ReplicaTransportInfo: LDAP
objectClass: top
objectClass: nsDS5ReplicationAgreement
nsDS5ReplicaPort: 389
nsDS5ReplicaBindMethod: SIMPLE
cn: ds.example.com:389
nsDS5ReplicaRoot: dc=example,dc=com
nsDS5ReplicaBindDN: cn=replication manager, cn=replication,
cn=config
nsDS5ReplicaCredentials:: e0RFU31JakduS3VZSWhEcThEcExDQlU2
VlN2QTdjcUw4emhDdXl3Sldmc3NTZ2t3eS9mWmR4VmpUZlVYRE1NLzR2T
UVBDQpyZVdYU3A3U1ZwYz0=
```

In this example, the key attributes are the following:

nsDS5ReplicaHost	Holds the host name where the consumer runs.
nsDS5ReplicaUpdateSchedule	Specifies when replication happens. If you must restrict the time when replication can happen, set this attribute. This attribute can take multiple values of the form <i>hhmm-hhmm 0123456</i> , where the first element specifies the time span, and the second specifies which days, starting with Sunday (0) to Saturday (6).
nsDS5ReplicaTransportInfo	Specifies the transport used for replication, LDAP or SSL.
nsDS5ReplicaPort	Holds port number on which the consumer listens.
cn	This attribute names the replication agreement. Once set, it must not be modified.
nsDS5ReplicaBindMethod	Specifies bind protocol, SIMPLE, SSLCLIENTAUTH.
nsDS5ReplicaRoot	Holds the DN of the root of the replicated suffix. Once set, it must not be modified.

nsDS5ReplicaBindDN	Holds the DN of the account on the consumer used for replication.
nsDS5ReplicaCredentials	Holds the bind credentials of the account on the consumer used for replication.

The replication agreement entry can also hold the following attributes not shown here:

description(5dsat) ds5AgreementEnable(5dsconf) ds5ReplicaAutomaticInit(5dsconf) ds5ReplicaForce51Protocol(5dsconf) ds5ReplicaTransportCompressionLevel(5dsconf) ds5ReplicaTransportConcurrencyLevel(5dsconf) ds5ReplicaTransportGroupSize(5dsconf) ds5ReplicaTransportGrpPktSize(5dsconf) ds5ReplicaTransportWindowSize(5dsconf) ds6ruv(5dsconf) dsReplFractionalExclude(5dsconf) dsReplFractionalInclude(5dsconf) nsDS5ReplicaUpdateSchedule(5dsconf) nsds50ruv(5dsconf) nsds5BeginReplicaRefresh(5dsconf) nsds5ReplicaTimeout(5dsconf) nsds5replicaChangesSentSinceStartup(5dsconf) nsds5replicaLastInitEnd(5dsconf) nsds5replicaLastInitStart(5dsconf) nsds5replicaLastInitStatus(5dsconf) nsds5replicaLastUpdateEnd(5dsconf) nsds5replicaLastUpdateStart(5dsconf) nsds5replicaLastUpdateStatus(5dsconf) nsds5replicaUpdateInProgress(5dsconf)

Supplier Priority Rule

For a master supplier, a ReplPriorityRule configuration entry looks something like the following:

```
dn: cn=pwdReplPrio,cn=replica,cn=dc\=example\,dc\=com,cn=mapping tree,cn=config
objectClass: top
objectClass: ReplPriorityRule
replPriorityType: mod
replPriorityAttribute: userPassword
nsDS5ReplicaRoot: dc=example,dc=com
cn: pwdReplPrio
```

In this example, the key attributes are the following:

replPriorityType	Specifies the type of operation which are replicated with high priority.
replPriorityAttribute	Specifies the attribute whose changes are replicated with high priority.
nsDS5ReplicaRoot	Holds the DN of the root of the replicated suffix to which this priority rule applies.
cn	This attribute names the priority rule.

The replication priority rule entry can also hold the following attributes not shown here:

replPriorityBaseDN(5dsconf)
replPriorityBindDN(5dsconf)

Consumer Side On the consumer side, the key configuration entry is the replica configuration. On a dedicated consumer, it is also useful to see how the mapping tree entry for the suffix is configured to refer updates to the supplier.

Consumer Replica Configuration

For a dedicated consumer, an nsDS5Replica configuration entry looks something like the following:

Key attributes in this example are explained in Supplier Replica Configuration.

A hub uses the same replica ID as a consumer, 65535.

Referrals On Consumer

For a dedicated consumer suffix, the mapping tree configuration entry refers client applications to the supplier for write operations:

```
dn: cn=dc\=example\,dc\=com,cn=mapping tree,cn=config
objectClass: top
objectClass: extensibleObject
objectClass: nsMappingTree
nsslapd-backend: example
cn: dc=example,dc=com
numSubordinates: 1
nsslapd-referral: ldap://master.example.com:389/dc%3Dexample,dc%3Dcom
nsslapd-state: referral on update
```

Notice that the nsslapd-referral attribute refers clients to the master on host master.example.com and port 389 when they request update operations that would write to the directory. These attributes are set by the server when replication is initialized. The dedicated consumer then accepts write operations only from the supplier replica.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

See Also dsconf(1M), person(5dsoc), pwpolicy(5dssd)

Name repl-priority, attr, base-dn, bind-dn, op-type – DS prioritized replication configuration (RPR) properties

Description Prioritized replication lets you force a Directory Server supplier to assign higher priority to certain updates replicated on a Directory Server consumer. You prioritize replication operations by creating replication priority rules.

PROPERTY:attr S

Syntax	ATTR_NAME
Default Value	None
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the attribute type to which the replication priority rule applies.

PROPERTY: base - dn

Syntax	DN
Default Value	None
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the DN under which the replication priority rule applies. For example, if you set base-dn:ou=administrators,dc=example,dc=com, then changes to uid=myAdmin,ou=administrators,dc=example,dc=com might be replicated with high priority, but changes to uid=bjensen,ou=people,dc=example,dc=com would not.

PROPERTY:bind-dn

dn	Syntax	DN
	Default Value	None
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies a bind DN for an account whose updates might be replicated with high priority.

PROPERTY:op-type

Syntax	add mod del
Default Value	None
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies a type of operation for which updates might be replicated with high priority.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED_SSL_PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M)

Name replPriorityAttribute – Attribute to replicate with high priority

Description

PROPERTY	VALUE
Entry DN	<pre>cn=rule name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	Any valid attribute type
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for ReplPriorityRule entries.

When this multi-valued attribute is set, the server replicates changes to the attribute you specify with high priority.

- **Examples** replPriorityAttribute: userPassword
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name replPriorityBaseDN – Replicate changes under this base with high priority

Description

PROPERTY	VALUE
Entry DN	<pre>cn=rule name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	Any valid DN inside the replicated suffix
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for ReplPriorityRule entries.

When this attribute is set, the server replicates changes to entries under the specified DN with high priority.

Examples replPriorityBaseDN: ou=people,dc=example,dc=com

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name replPriorityBindDN – Replicate changes performed by this user with high priority

Description

PROPERTY	VALUE
Entry DN	<pre>cn=rule name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	Any valid DN
Default Value	N/A
Syntax	DirectoryString

This attribute is part of replica configuration for ReplPriorityRule entries.

When this attribute is set, the server replicates changes made by the user having the specified bind DN with high priority.

Examples replPriorityBindDN: uid=admin,ou=Administrators,dc=example,dc=com

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name replPriorityType – Operation type to replicate with high priority

Description

PROPERTY	VALUE
Entry DN	<pre>cn=rule name, cn=replica, cn=suffix name, cn=mapping tree, cn=config</pre>
Valid Range	add del mod
Default Value	All update operations
Syntax	DirectoryString

This attribute is part of replica configuration for ReplPriorityRule entries.

When this attribute is set, the server replicates changes of the type you specify with high priority as follows:

- add Additions and deletions are replicated with high priority.
- del Deletions are replicated with high priority.
- mod Modifications are replicated with high priority.

Examples replPriorityType: mod

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

- **Description** The behavior of a Directory Server instance is configured according to server properties documented here and in the documentation specified under the SEE ALSO section.

PROPERTY: check-schema-enabled	Syntax	on off
	Default Value	on
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether the server checks that entries being updated still conform to the server schema.

PROPERTY: check-syntax-enabled

леск-	Syntax	enableu

Syntax	on off
Default Value	off
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies whether the server checks that attribute values being updated have valid syntax. The server logs an error message when encountering an invalid value and prevents the update. When this property is set to on, the server checks updates to attribute values defined as Boolean, DN, Directory String, Generalized Time, IA5 String, INTEGER, or Telephone Number syntax. This behavior holds both for offline import and for normal write operations.

By default, syntax checking is off. When syntax checking is on, all import and update operations are checked. Directory Manager (directory super user) cannot bypass syntax checking.

Syntax is not checked on existing entries in the database. To clean up existing data, dump the database to LDIF, turn syntax checking on, and reload the database. Data that violates the syntax is visible in the errors log, and can be corrected and reloaded. You can also repair existing bad data by deleting or replacing the bad value using an LDAP client. If syntax checking is on, when a database is reloaded from LDIF, invalid syntax values are skipped and recorded in the errors log. Valid syntax values are reloaded.

PROPERTY: config-magic-number

Syntax	STRING
Default Value	D-A00
Is readable	Yes
Is modifiable	No
Is multi-valued	No

This property specifies a value used by the Directory Server administration framework and tools to determine the capabilities of a server instance.

PROPERTY: db-batched-transactio	Syntax n-count	INTEGER
	Default Value	0
	Is readable	Yes

Is modifiable	Yes
Is multi-valued	No

This property specifies how many server transactions are gathered into a batch before being written to the transaction log. If writes to the transaction log are a bottleneck, you may potentially improve performance by increasing this value. Valid range is 0-30, 0 meaning that batching is turned off.

PROPERTY: db-cache-size

Syntax	MEMORY_SIZE
Default Value	32M
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the amount of physical memory Directory Server requests from the operating system to cache indexes for all suffixes supported by the server instance. See *Directory Server Data Caching* in *Directory Server Enterprise Edition Reference* for suggestions on sizing cache.

PROPERTY: db-checkpoint-interva	Syntax	DURATION
·	Default Value	60s
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the interval between checkpoints recorded in the database transaction log.

PROPERTY: db-env-path

Syntax	РАТН
Default Value	instance-path/db
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies a valid directory, unique to the server instance, on a tmpfs file system used to limit the time spent flushing pages for a server instance handling a high write load. There must be enough space available on the tmpfs file system to house at least the actual size of the database cache.

When changing this property, you must stop the server, delete the existing database, and reimport all suffixes from LDIF, before restarting the server.

PROPERTY: db-lock-count

Syntax	INTEGER
Default Value	20000
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the number of locks available to the server instance database. Increase this value if you observe the following message in the errors log:

libdb: Lock table is out of available locks

PROPERTY: db-log-buf-size

Syntax	MEMORY_SIZE
Default Value	512k
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the transaction log buffer size. Valid range is 0 to the size of the transaction log, which is 10M by default.

After changing this property, you must restart the server in order to take the change into account.

PROPERTY: db-log-path

: 1	Syntax	РАТН
	Default Value	instance-path/db
	Is readable	Yes
	Is modifiable	Yes

Is multi-valued No

This property specifies the file system directory containing the database transaction log.

When changing this property, you must stop the server, delete the existing database, and reimport all suffixes from LDIF, before restarting the server.

PROPERTY: def-repl-manager-pwd

Syntax	STRING
Default Value	See the description that follows.
Is readable	Yes
Is modifiable	No
Is multi-valued	No

This property lets you read the password used for replication binds performed using simple authentication. Either you specify the password before setting up replication by setting def-repl-manager-pwd-file to specify the file containing the password you want to use, or you accept the password value generated by the dsconf accord-replication subcommand.

PROPERTY: def-repl-manager-pwd-	Syntax file	PATH ""
	Default Value	nn
	Is readable	No
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the file from which the default replication password is read and stored for future use when setting up replication.

PROPERTY:	
dn-cache-count	

Syntax	INTEGER unlimited disabled
Default Value	unlimited
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the size of the DN cache in terms of number of entries. The value of dn-cache-count is unlimited by default. The value of dn-cache-count can be an integer, unlimited, and disabled and each of these has the following effect on dn-cache-size.

- unlimited cache is limited to the cache size specified for dn-cache-size.
- disabled caching is disabled and dn-cache-size is ignored.
- INTEGER cache is limited to the number of DNs specified by the value that you provide and dn-cache-size is ignored. The value must be 1 or greater than 1.

Changing this property requires you to restart the server.

PROPERTY: dn-cache-size

ize	Syntax	MEMORY_SIZE
	Default Value	10M
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the size of the DN cache in terms of memory space. This property is set by default. The cache size must be larger than 1M. The DN cache size specified for this property is taken into account only when dn-cache-count is set to unlimited.

Changing this property requires you to restart the server.

PROPERTY: dsml-answer-size

Syntax	MEMORY_SIZE
Default Value	64k
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the maximum size of a server response to a DSML request. Larger responses are chunked.

PROPERTY:
dsml-buffer-size

Syntax	MEMORY_SIZE
Default Value	8k
Is readable	Yes

Is modifiable	Yes
Is multi-valued	No

This property specifies the size of the buffer used to store DSML requests. If the server receives many DSML requests larger than this limit, increase the buffer size.

PROPERTY: dsml-client-auth-mode	Syntax	<pre>clientCertOnly httpBasicOnly clientCertFirst</pre>
	Default Value	httpBasicOnly
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies how the server identifies a client application. The following settings are supported.

clientCertOnly	Use credentials from the client certificate to identify the client.
httpBasicOnly	Use credentials from the HTTP authorization header to identify the client.
clientCertFirst	Attempt to use the client certificate credentials to identify the client. If there are no client certificate credentials, credentials from the HTTP authorization header are used.

PROPERTY: dsml-enabled

': d	Syntax	on off
-	Default Value	off
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether the server accepts DSML requests.

PROPERTY: dsml-max-parser-count	Syntax	INTEGER
	Default Value	5
	Is readable	Yes

Is modifiable	Yes
Is multi-valued	No

This property specifies the maximum number of DSML parsers allocated to handle client requests. Increase the value of this property if the server must handle sustained, high numbers of DSML client requests.

PROPERTY dsml-min-parser-co

'Y: ount	Syntax	INTEGER
	Default Value	10
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the minimum number of DSML parsers allocated to handle client requests. Increase the value of this property if the server must handle sustained, high numbers of DSML client requests.

PROPERTY:dsml-port

Syntax	INTEGER disabled
Default Value	disabled
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the port number on which the server listens for DSML requests. Changing the value requires that you restart the server.

PROPERTY: Syntax dsml-relative

ROPERTY: ve-root-ur	Syntax	STRING
	Default Value	/dsml
	Is readable	Yes
	Is modifiable	Yes

This property specifies the root URL HTTP clients should specify in their POST requests.

No

Is multi-valued

PROPERTY: dsml-request-max-size	Syntax	MEMORY_SIZE
·	Default Value	32k
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the maximum size for DSML client requests.

PROPERTY: dsml-secure-port

Syntax	INTEGER disabled
Default Value	disabled
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the port number on which the server listens for DSML requests over HTTPS. Changing the value requires that you restart the server.

PROPERTY: file-descriptor-count	Syntax	INTEGER
·	Default Value	1024
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the maximum number of file descriptors the server instance attempts to use to handle client requests. Increase this value if you observe the following message in the errors log:

Not listening for new connections -- too many fds open

PROPERTY: heap-high-threshold-s	Syntax ize	MEMORY_SIZE undefined
	Default Value	undefined
	Is readable	Yes

Is modifiable	Yes
Is multi-valued	No

This property specifies a threshold value for the dynamic memory footprint. When the threshold memory is reached, Directory Server attempts to free memory from the entry caches, and to limit memory use.

- When heap-low-threshold-size is reached, Directory Server attempts to free memory concurrently with other operations.
- When heap-high-threshold-size is reached, Directory Server prevents operations on the cache while memory is freed.

heap-high-threshold-size and heap-low-threshold-size must be configured in conjunction with each other, as follows.

- If heap-high-threshold-size is set to undefined or is not set, heap-low-threshold-size is ignored.
- If heap-high-threshold-size is set, its value must be at least one gigabyte.
- If heap-high-threshold-size is set, the value of heap-low-threshold-size must be less than that of heap-high-threshold-size. If not, heap-low-threshold-size is automatically set by default to 7/8 of the value of heap-high-threshold-size.
- If heap-high-threshold-size is set to a value other than undefined, heap-low-threshold-size is automatically set by default to 7/8 of the value of heap-high-threshold-size.
- If heap-high-threshold-size and heap-low-threshold-size are both set to a value other than undefined, heap-low-threshold-size must be greater than or equal to (heap-high-threshold-size + minheap)/2, where minheap is the amount of heap memory used by the server at startup. If this condition is not met, heap-low-threshold-size is automatically set by default to 7/8 of the value of heap-high-threshold-size.

The number of times the memory thresholds have been exceeded can be monitored by using the heapmaxhighhits and heapmaxlowhits attributes on cn=monitor.

PROPERTY: heap-low-threshold-si	Syntax ze	MEMORY_SIZE undefined
·	Default Value	undefined
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

See the description for heap-high-threshold-size.

PROPERTY: host-access-dir-path

h	Syntax	PATH ""
	Default Value	пи
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the local directory path on the server host where hosts.allow and hosts.deny files are located. If this property is not set, or if the files are not found, Directory Server does not enable the additional connection-based access controls provided by these files.

PROPERTY: idle-timeout

Syntax	INTEGER none
Default Value	none
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies how many seconds the server waits for traffic on an idle LDAP client connection before closing the connection.

PROPERTY: import-cache-size

Syntax	MEMORY_SIZE
Default Value	64M
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the amount of physical memory Directory Server requests from the operating system to cache data used when initializing a suffix from LDIF. See *Directory Server Data Caching* in *Directory Server Enterprise Edition Reference* for suggestions on sizing cache.

PROPERTY:	0	
THOT LITT.	Syntax	РАТН
instance-path	1	

Default Value	Path set at server creation	
Is readable	Yes	
Is modifiable	No	
Is multi-valued	No	

This property specifies the file system directory under which the server instance was created using the dsadm create command.

PROPERTY:ldap-port

Syntax	INTEGER disabled
Default Value	389 1389
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the port on which the server listens for LDAP client requests. The default port is 389 when the instance is created by the system super user, 1389 otherwise. Changing this property requires that you restart the server.

If you set both ldap-port and ldap-secure-port to disabled, you can no longer use dsconf to configure the server.

PROPERTY: ldap-secure-port

ldap-secure-port

Syntax	INTEGER disabled	
Default Value	636 1636	
Is readable	Yes	
Is modifiable	Yes	
Is multi-valued	No	

This property specifies the port on which the server listens for LDAPS client requests using TLS or SSL. The default port is 636 when the instance is created by the system super user, 1636 otherwise. Changing this property requires that you restart the server.

If you set both ldap-port and ldap-secure-port to disabled, you can no longer use dsconf to configure the server.

PROPERTY:

listen-address

Syntax	STRING
Default Value	0.0.0
Is readable	Yes
Is modifiable	Yes
Is multi-valued	Yes

This property specifies the IP address at which the server listens for LDAP client requests using the regular LDAP port. You can specify more than one listen address for the same port number. The default listen address is 0.0.0.0. Changing this property requires that you restart the server.

PROPERTY: look-through-limit

Syntax	INTEGER unlimited
Default Value	5000
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the maximum number of entries the server examines when checking candidates to respond to a search request.

PROPERTY: max-psearch-count

Syntax	INTEGER
Default Value	30
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the maximum number persistent searches allowed. You can read the number of active persistent searches in the value of currentpsearches on cn=monitor.

PROPERTY: max-thread-count

RTY: ount	Syntax	INTEGER
	Default Value	30
	Is readable	Yes

Is modifiable	Yes
Is multi-valued	No

This property specifies the number of threads created at startup to process operations. When tuning server performance, try setting this to twice the number of processors or 20 plus the number of simultaneous updates expected. You can read the number of active threads in the value of threads on cn=monitor.

PROPERTY: max-thread-per-connec	Syntax tion-count	INTEGER
	Default Value	5
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the maximum number of concurrent threads used to process operations on a single connection.

PROPERTY: mod-tracking-enabled	Syntax
mod-tracking-enabled	e) intair

: ed	Syntax	on off
	Default Value	on
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether the server maintains modification timestamps for updated entries.

PROPERTY: polling-thread-count

it	Syntax	INTEGER	
	Default Value	1	
	Is readable	Yes	
	Is modifiable	Yes	
	Is multi-valued	No	

This property is not supported on Microsoft Windows platforms. This property is not supported in releases prior to Directory Server Enterprise Edition version 6.3.

Changing the value requires the server to be restarted.

PROPERTY: pwd-accept-hashed-pw

owo	Syntax -enabled	on off
	Default Value	N/A
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether the server accepts modifications with hashed password values without checking their content. This property takes effect only when pwd-check-enabled is on.

PROPERTY: pwd

l-check-enabled	
	Default Value
	Is readable

Syntax	on off
Default Value	off
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies whether the server checks the quality of password values when they are modified.

PROPERTY: pwd-compat-mode

Syntax	DS5-compatible-mode DS6-migration-mode DS6-mode
Default Value	DS5-compatible-mode
Is readable	Yes
Is modifiable	No
Is multi-valued	No

This property specifies the password policy compatibility mode for the server. Change it using dsconf pwd-compat. See Directory Server Enterprise Edition Administration Guide for details on password policy.

PROPERTY: Syntax pwd-expire-no-warning-enabled PROPERTY: on | off

Default Value	on
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies whether a password can expire without prior warning to a client application.

PROPERTY: Sy pwd-expire-warning-dela

/: - de	Syntax Lay	DURATION disabled
	Default Value	ld
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the duration preceding password expiration during which the server returns warnings about the password expiring to client applications binding using the password.

PROPERTY: pwd-failure-count-int	Syntax terval	DURATION disabled
	Default Value	10m
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the age beyond which password failures are purged from the failure count.

PROPERTY: pwd-grace-login-limit	Syntax	INTEGER disabled
	Default Value	disabled
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the number of times an expired password can be used to authenticate.

PROPERTY: pwd-keep-last-auth-ti

ti	Syntax me-enabled	on off
	Default Value	off
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether to record authentication times in the pwdLastAuthTime operational attribute on user entries.

PROPERTY: pwd-lockout-duration	Syntax	DURATION disabled
F	Default Value	lh
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the how long before the server unlocks an account that is locked.

PROPERTY: pwd-lockout-enabled

Syntax	on off
Default Value	off
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies whether the server locks accounts after a specified number, pwd-max-failure-count, of consecutive failed attempts to bind.

PROPERTY: pwd-lockout-repl-pric	Syntax prity-enabled	on off
	Default Value	off
	Is readable	Yes

Is modifiable	Yes
Is multi-valued	No

This property specifies whether password lockout attributes are replicated with high priority.

PROPERTY: pwd-max-age

Syntax	DURATION disabled
Default Value	disabled
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the age beyond which a password expires.

PROPERTY: pwd-max-failure-count

nt	Syntax	INTEGER disabled
	Default Value	3
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the number of consecutive failed bind attempts after which the password may not be used to authenticate to the server.

PROPERTY: pwd-max-history-count

Y: Syntax INTEGER | disabled Out Default Value disabled Is readable Yes Is modifiable Yes Is multi-valued No

This property specifies the number of password values stored in the password history of the entry. These values cannot be used again until they are no longer present in the history.

PROPERTY: pwd-min-age

:	Syntax	DURATION disabled
	Default Value	disabled
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the minimum duration between password modifications.

PROPERTY: pwd-min-length

pwd-mod-gen-

Syntax	INTEGER disabled
Default Value	6
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the minimum number of characters allowed in a password value when quality checking has been enabled.

PROPERTY: gen-length	Syntax	INTEGER disabled
	Default Value	6
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the length of the password generated by Directory Server when a password is reset using the LDAP Password Modify Extended Operation defined in RFC 3062 and no new password value is specified.

Although the syntax for this property is integer, its value must be between 6 and 512, inclusive.

PROPERTY: pwd-must-change-enabl	Syntax ed	on off
. 5		off
	Is readable	Yes

Is modifiable	Yes
Is multi-valued	No

This property specifies whether the password must be changed after the initial client bind after the password has been set or reset by another user.

PROPERTY: pwd-root-dn-bypass-en

er	Syntax abled	on off
	Default Value	off
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether the directory super user is allowed to update passwords with values that violate password policy.

PROPERTY: S pwd-safe-modify-enabled

ıb1	Syntax ed	on off
	Default Value	off
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether the current password must be provided with the request to modify the password.

PROPERTY: pwd-storage-scheme

Syntax	STRING
Default Value	SSHA
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the algorithm used to encode password values.

PROPERTY: pwd-strong-check-dict	Syntax tionary-path	PATH none
		<pre>install-path/ds6/plugins/words-english-big.txt</pre>
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the path to the dictionary file used for strong password checks.

PROPERTY: Syntax on | off pwd-strong-check-enabled Off Default Value off Is readable Yes Is modifiable Yes Is multi-valued No

This property specifies whether the server checks new password values to ensure they match with pwd-strong-check-require-charset settings, and do not match records in the dictionary file.

PROPERTY: pwd-strong-check-requ	Syntax ire-charset	lower upper digit special any-two any-three
	Default Value	lower && upper && digit && special
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	Yes

This property specifies the sets of characters that must be present in a password value modification.

- lower The new password must include a lower case character.
- upper The new password must include an upper case character.
- digit The new password must include a digit.
- special The new password must include a special character.
- any-two The new password must include at least one character from each of at least two of the abovementioned character sets.

any-three The new password must include at least one character from each of at least three of the abovementioned character sets.

PROPERTY: S pwd-supported-storage

r: rage	Syntax -scheme	STRING
5	Default Value	See the following description.
	Is readable	Yes
	Is modifiable	No
	Is multi-valued	Yes

This property specifies the set of encryption storage schemes supported for Directory Server user passwords. Supported storage schemes include CRYPT, SHA, SSHA, NS-MTA-MD5, and CLEAR.

PROPERTY: pwd-user-change-enables Syntax on | off Default Value on Is readable Yes Is modifiable Yes Is multi-valued No

This property specifies whether users may change their own passwords.

PROPERTY: read-write-mode

Syntax	read-only read-write frozen
Default Value	read-write
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies whether the suffixes and configuration data on the server can be modified. Use frozen when quiescing a server for online file system backup.

PROPERTY: ref-integrity-attr	Syntax	ATTR_NAME ""
5 ,	Default Value	н
	Is readable	Yes

Is modifiable	Yes
Is multi-valued	No

This property specifies attributes for which referential integrity must be checked on update.

PROPERTY: ref-integrity-check-c	Syntax et ay	DURATION undefined
	Default Value	undefined
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the delay between referential integrity checks. The default is no delay.

PROPERTY: ref-integrity-enabled	Syntax	on off
5 5	Default Value	off
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether referential integrity checks are performed by the server.

PROPERTY: repl-user-schema-enab

ab	Syntax led	on off
	Default Value	off
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether only schema elements with X-ORIGIN of user-defined are replicated. This can be useful when replicating between server versions with schema that are not fully compatible.

PROPERTY: Synt

at	Syntax led	on off
	Default Value	on
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether the server rejects simple authentication attempts to bind that do not include a password.

```
PROPERTY: Syntax
```

ntr	Syntax y-attr	ATTR_NAME ""
	Default Value	пи
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	Yes

This property specifies the attributes to record in the retro change log when an entry is deleted.

PROPERTY: retro-cl-enabled

RTY: led	Syntax	on off
	Default Value	off
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether the server maintains a retro changelog of all changes occurring on the server instance.

PROPERTY: retro-cl-ignored-attr	Syntax	ATTR_NAME ""
-	Default Value	пп
	Is readable	Yes
	Is modifiable	Yes

Is multi-valued

No

This property specifies the list of attributes not to record in the retro changelog when updates occur.

PROPERTY: retro-cl-max-age

Syntax	DURATION undefined
Default Value	undefined
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the maximum age of records in the retro changelog. Older records are purged.

PROPERTY:

retro-cl-max-entry-c

co	Syntax	INTEGER
	Default Value	0
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the maximum number of records in the retro changelog. Older records are purged. The value 0 corresponds to an unlimited number.

PROPERTY: retro-cl-path

Syntax	РАТН
Default Value	<i>instance-path</i> /db/changelog
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the file system directory in which the changelog is created.

PROPERTY: retro-cl-suffix-dn	Syntax	DN undefined

Default Value	undefined
Is readable	Yes
Is modifiable	Yes
Is multi-valued	Yes

This property specifies the suffixes for which retro changelog records are maintained.

PROPERTY:root-dn

Syntax	DN
Default Value	cn=Directory Manager
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the Distinguished Name of the Directory Manager user, a user not subject to access controls.

PROPERTY: root - pwd

d	Syntax	STRING
	Default Value	None
	Is readable	Yes
	Is modifiable	No
	Is multi-valued	No

This property specifies the password for the Directory Manager user. It is show hashed according to the password storage scheme used.

PROPERTY: root-pwd-file

:	Syntax	PATH ""	
-	Default Value	п	
	Is readable	No	
	Is modifiable	Yes	
	Is multi-valued	No	

This property specifies the file containing the password for the Directory Manager user. The file is read once, and the password is stored for future use.

PROPERTY: Synta root-pwd-storage-scheme

che	Syntax me	STRING
	Default Value	SSHA
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the algorithm used to encrypt the password for the Directory Manager user. It must be one of the schemes specified by the pwd-supported-storage-scheme property.

PROPERTY: search-size-limit

Syntax	INTEGER unlimited
Default Value	2000
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the maximum number of entries the server returns for a search operation.

PROPERTY: search-time-limit

Syntax	INTEGER unlimited
Default Value	3600
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the maximum number of seconds allocated by the server to respond to a search request.

PROPERTY: secure-listen-addres

ERTY: address	Syntax	STRING
	Default Value	0.0.0
	Is readable	Yes
	Is modifiable	Yes

Is multi-valued	Yes

This property specifies the IP address at which the server listens for LDAP client requests using the secure LDAP port. You can specify more than one secure listen address for the same port number. The default secure listen address is 0.0.0.0. Changing this property requires that you restart the server.

PROPERTY: ssl-cipher-family

Syntax	STRING all
Default Value	all
Is readable	Yes
Is modifiable	Yes
Is multi-valued	Yes

This property specifies the SSL ciphers the server can use for SSL communications. The default value, all, does not mean all the supported SSL ciphers, as supported ciphers with NULL key length are removed from the list.

PROPERTY: Ssl-client-auth-mode

node	Syntax	allowed required disabled
	Default Value	allowed
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether the server allows, requires, or does not allow SSL client authentication, in which the client application authenticates sending its SSL certificate to the server.

PROPERTY: ssl-enabled

Syntax	on off
Default Value	off
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies whether the server accepts SSL connnections.

PROPERTY: ssl-rsa-cert-name

Syntax	STRING
Default Value	defaultCert
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the name of the SSL certificate for the server.

PROPERTY: ssl-rsa-security-devi

IY: devi	Syntax ce	STRING
	Default Value	internal (software)
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the name of the security device used by the server.

PROPERTY: ssl-supported-ciphers	Syntax	STRING
		Depends on underlying SSL library
	Is readable	Yes
	Is modifiable	No
	Is multi-valued	No

This property specifies the full list of SSL ciphers the server can support.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED_SSL_PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M), all-ids-threshold(5dsconf), db-path(5dsconf), moddn-enabled(5dsconf), referral-url(5dsconf)

- Name suffix, db-name, entry-cache-count, entry-cache-size, entry-count, parent-suffix-dn, referral-mode, repl-accept-client-update-enabled, repl-cl-max-age, repl-cl-max-entry-count, repl-id, repl-manager-bind-dn, repl-purge-delay, repl-rewrite-referrals-enabled, repl-role, require-index-enabled – DS suffix configuration (SUF) properties
- **Description** Each Directory Server suffix you create is configured according to the suffix properties documented here and in the documentation specified under the SEE ALSO section.

PROPERTY:db-name

Syntax	STRING
Default Value	suffixName
Is readable	Yes
Is modifiable	No
Is multi-valued	Yes

This property specifies the the suffix used to process requests involving the database.

PROPERTY: entry-cache-count

Syntax	INTEGER unlimited
Default Value	unlimited
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the number of entries allowed in the entry cache of the suffix.

PROPERTY: entry-cache-size

Syntax	MEMORY_SIZE
Default Value	10M
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the maximum amount of memory Directory Server requests for the entry cache of the suffix.

PROPERTY: [entry-count]

Syntax	INTEGER
Default Value	0
Is readable	Yes
Is modifiable	No
Is multi-valued	No

This property specifies the number of entries stored in the suffix.

PROPERTY: parent-suffix-dn

Syntax	DN undefined
Default Value	DN of the parent entry
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the DN of the parent entry for the suffix. The value of this property must logically be a parent of the suffix.

For instance, if you have a suffix with DN dc=com and a suffix dc=example, dc=com, you can set dc=com as the parent-suffix-dn of dc=example, dc=com, and subtree searches with based DN dc=com then also travers dc=example, dc=com.

PROPERTY: referral-mode

Syntax	disabled enabled only-on-write
Default Value	disabled
Is readable	Yes
Is modifiable	Yes, if the suffix is not replicated
Is multi-valued	No

This property specifies how referrals are used when a client makes a request involving the suffix.

disabled	Handle requests locally; do not return referral URLs.
enabled	Return referral URLs to client requests.
only-on-write	Return referral URLs to client requests only for write operations

PROPERTY: Synt

up	Syntax date-enabled	on off
	Default Value	on
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether the replicated suffix accepts write operations from client applications, or instead returns referral URLs.

PROPERTY: repl-cl-max-age

)PERTY: ax-age	Syntax	DURATION undefined
5	Default Value	7d
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the maximum age for a record in the replication changelog. Older records are purged.

PROPERTY: repl-cl-max-entry-cou	Syntax Int	INTEGER
		0 (meaning undefined)
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies the maximum number of records in the replication changelog. When the limit is exceeded, older records are purged.

PROPERTY:repl-id

d	Syntax	INTEGER
	Default Value	None
	Is readable	Yes
	Is modifiable	Yes, using the subcommands to manage replication

Is multi-valued No

This property specifies the replica identification number, 1-65534 for a supplier, 65535 for a consumer or a hub. Once set, this property cannot be modified.

PROPERTY: repl-manager-bind-dn

dn	Syntax	DN undefined
	Default Value	undefined
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	Yes

This property specifies the bind DNs of users allowed to bind to perform replication operations on the suffix.

PROPERTY: repl-purge-delay

Syntax	DURATION never
Default Value	7d
Is readable	Yes
Is modifiable	Yes
Is multi-valued	No

This property specifies the maximum age of tombstone entries used by replication. Tombstone entries are entries marked for deletion that have not yet been removed, and also replication state information associated with the entries. When setting this attribute, ensure that the purge delay is longer than the longest replication cycle in your replication policy to avoid incurring conflict resolution problems and divergence between replicas.

PROPERTY: repl-rewrite-referral	Syntax s-enabled	on off
	Default Value	off
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property specifies whether referrals you set can be automatically overwritten by the server to reference replicas.

PROPERTY: repl-role

Syntax	not-replicated master hub consumer
Default Value	not-replicated
Is readable	Yes
Is modifiable	Yes, using the subcommands to manage replication
Is multi-valued	No

This property specifies the role played by the suffix in a replicated topology.

not-replicated	The suffix is not part of a replicated toplogy.	
master	This suffix is a supplier of replication updates in a replicated topology. It can accept both read and write operations.	
hub	This suffix is a supplier of replication updates in a replicated topology. It can accept read operations and replication updates.	
consumer	This suffix is a dedicated consumer of replication updates in a replicated topology. It can accept read operations and replication updates, but not writes from clients.	

To promote a replica, use the dsconf promote-repl command. To demote a replica, use the dsconf demote-repl command.

PROPERTY: require-index-enabled	Syntax	on off
	Default Value	off
	Is readable	Yes
	Is modifiable	Yes
	Is multi-valued	No

This property determines whether unindexed searches are allowed. When on, unindexed searches return LDAP_UNWILLING_TO_PERFORM.

Description Syntax values shown in lower case or partly in lower case are literal values.

Those shown in upper case are syntax types, defined as follows:

ATTR_NAME

A valid attribute type name such as cn or objectClass.

BOOLEAN

true or false.

DN

A valid distinguished name such as ou=People, dc=example, dc=com.

DURATION

A duration specified in months (M), weeks (w), days (d), hours (h), minutes (m), seconds (s), and miliseconds (ms), or some combination with multiple specifiers. For example, you can specify one week as 1w, 7d, 168h, 10080m, or 604800s. You can also specify one week as 1w0d0h0m0s.

DURATION properties typically do not each support all duration specifiers (Mwdhms). Examine the output of dsconf help-properties for the property to determine which duration specifiers are supported.

EMAIL_ADDRESS

A valid e-mail address.

HOST_NAME

An IP address or host name.

INTEGER

A positive integer value between 0 and the maximum supported integer value in the system address space. On 32-bit systems, 2147483647. On 64-bit systems, 9223372036854775807.

INTERVAL

An interval value of the form *hhmm-hhmm 0123456*, where the first element specifies the starting hour, the next element the finishing hour in 24-hour time format, from 0000-2359, and the second specifies days, starting with Sunday (0) to Saturday (6).

IP_RANGE

An IP address or range of address in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted decimal quads.
- All address. A catch-all for clients that are note placed into other, higher priority groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

LDAP_URL

A valid LDAP URL as specified by RFC 2255 (http://www.ietf.org/rfc/rfc2255.txt).

MEMORY_SIZE

A memory size specified in gigabytes (G), megabytes (M),kilobytes (k), or bytes (b). Unlike DURATION properties, MEMORY_SIZE properties cannot combine multiple specifiers. However, MEMORY_SIZE properties allow decimal values, for example, 1.5M.

NAME

A valid cn (common name).

OCTAL_MODE

A three-digit, octal file permissions specifier. The first digit specifies permissions for the server user ID, the second for the server group ID, the last for other users. Each digit consists of a bitmask defining read (4), write (2), execute (1), or no access (0) permissions, thus 640 specifies read-write access for the server user, read-only access for other users of the server group, and no access for other users.

PASSWORD_FILE

The full path to the file from which the bind password should be read.

PATH

A valid, absolute file system path.

STRING

A DirectoryString value, as specified by RFC 2252 (http://www.ietf.org/rfc/rfc2252.txt).

SUPPORTED_SSL_CIPHER

An SSL cipher supported by the server. See the Reference for a list of supported ciphers.

SUPPORTED_SSL_PROTOCOL

An SSL protocol supported by the server. See the Reference for a list of supported protocols.

TIME

A time of the form *hhmm* in 24-hour format, where *hh* stands for hours and *mm* stands for minutes.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory-client
Stability Level	Evolving

See Also dsconf(1M), all-ids-threshold(5dsconf), db-path(5dsconf), enabled(5dsconf), moddn-enabled(5dsconf), referral-url(5dsconf)

Name useAuthzIdForAuditAttrs - record proxied authorization information

Description Specifies whether Directory Server records the authentication ID, such as the bind DN, of the proxy acting on behalf of the user, or the authorization ID of the user for whom the proxy is requesting the operation.

When useAuthzIdForAuditAttrs is set to on, Directory Server records the authorization ID in the creatorsName or modifiersName during a write operation on an entry. By default Directory Server records the authentication ID.

Entry DN	cn=config	
Valid range	on off	
Default value	off	
Syntax	DirectoryString	
Example	useAuthzIdForAuditAttrs:	on

Attributes See attributes(5) for descriptions of the following attributes:

REFERENCE

Directory Proxy Server Configuration

Name aci-data-view – Directory Proxy Server configuration property

Description S

Syntax	dnReference
Default value	disabled
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the data view that Directory Proxy Server uses to store access controls.

The value of this property is the name of one of the following configuration entities: jdbc-data-view, join-data-view, ldap-data-view, ldif-data-view.

The default behavior for this property is as follows: No virtual access control policy.

This property is used to configure the following features:

virtual-aci

The virtual ACI contains pools of access controls applicable to all entries. This will be used for the purpose of virtualization.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

See Also dpconf(1M)

Description	Syntax	dn
	Default value	none
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name aci-manager-bind-dn – Directory Proxy Server configuration property

This property specifies the distinguished name of the identity used by Directory Proxy Server to access the access control data view.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: Proxy uses an anonymous access to access the access control data view.

This property is used to configure the following features:

virtual-aci

The virtual ACI contains pools of access controls applicable to all entries. This will be used for the purpose of virtualization.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

See Also dpconf(1M)

Name aci-manager-bind-pwd - Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	No
Is multivalued	No
Requires restart	No

This property specifies the password of the identity used by Directory Proxy Server to access the access control data view.

This property is read-only. To change the password, use the aci-manager-bind-pwd-file property.

The default behavior for this property is as follows: Proxy uses an anonymous access to access the access control data view.

This property is used to configure the following features:

virtual-aci

The virtual ACI contains pools of access controls applicable to all entries. This will be used for the purpose of virtualization.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

See Also dpconf(1M)

 Description
 Syntax
 password

 Default value
 No default is defined.

 Must be set
 No

 Is modifiable
 Yes

 Is multivalued
 No

 Requires restart
 No

Name aci-manager-bind-pwd-file - Directory Proxy Server configuration property

This property specifies the file from which to read the password of the identity used by Directory Proxy Server to access the access control data view. The temporary file is read once, and the password is stored for future use.

This property takes a path to a file that contains the password value.

This property is used to configure the following features:

virtual-aci

The virtual ACI contains pools of access controls applicable to all entries. This will be used for the purpose of virtualization.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name aci-source - Directory Proxy Server configuration property

Description [

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the name of the set of access controls that will apply to the connection handler.

The default behavior for this property is as follows: ACIs are unset. Proxy will reject WRITE operations on non-LDAP data views.

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name action – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property defines the transformation action. A transformation action describe what the transformation does to its target entry or entries.

This property can take the following values in addition to the default.

add-attr Add an attribute remove-attr Remove an attribute add-attr-value

Add a value to an attribute

def-value Set a default value

remove-attr-value Remove a value of an attribute

attr-value-mapping Attribute value mapping

This property is used to configure the following features:

virtual-transformation

Virtual data transformations create a virtual data view from a physical data view. Practically, you never define a virtual data view. Instead, you specify the transformations that you require and define these on an existing physical data view. A transformation performs a specific action in a certain direction. The direction of a transformation determines the transformation model. When you define a virtual data transformation, you create a virtual attribute that exists only in the context of the virtual data view. **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name add-weight – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	disabled
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the proportion of add requests that are sent to the attached data source.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

disabled

Do not forward any add requests to the data source

This property is used to configure the following features:

attached-ldap-data-source

A data source can be attached to one or more data source pools for load balancing and failover. When attached to a data source pool, a data source is called an attached data source.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allow-add-operations – Directory Proxy Server configuration property

Description S

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not associated connection handlers accept LDAP add operations.

This property is true or false.

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allow-bind-operations – Directory Proxy Server configuration property

Description S

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not associated connection handlers accept LDAP bind operations.

This property is true or false.

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allow-cert-based-auth – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	allow
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not clients must present their own certificates when establishing connections to Directory Proxy Server.

This property can take the following values in addition to the default.

deny

Clients are not allowed to use certificate based authentication

allow

Clients are allowed to use certificate based authentication

require

Clients must use certificate based authentication

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allow-compare-operations – Directory Proxy Server configuration property

Description S

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not associated connection handlers accept LDAP compare operations.

This property is true or false.

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allow-delete-operations – Directory Proxy Server configuration property

Description [

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not associated connection handlers accept LDAP delete operations.

This property is true or false.

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allowed-auth-methods – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	anonymous
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies a set of authentication methods. Clients must use one of the specified authentication methods in order for the connection to be accepted by the connection handler.

This property can take the following values in addition to the default.

anonymous Anonymous authentication

simple Simple authentication

sasl

SASL/External authentication

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allowed-comparable-attrs – Directory Proxy Server configuration property

Description Sv

Syntax	string
Default value	all
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies a set of LDAP attribute types that can be compared in an LDAP search filter or compare operation.

The default behavior for this property is as follows: All attribute types can be compared

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allowed-ldap-controls – Directory Proxy Server configuration property

Description

Syntax	oid
Default value	Default behavior is not defined.
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies a set of LDAP control OIDs. The control OIDs determine which LDAP controls are forwarded by Directory Proxy Server.

This property can take the following values in addition to the default.

```
proxy-auth-v1
   Proxy authorization v1
proxy-auth-v2
   Proxy authorization v2
persistent-search
   Persistent search
manage-dsa
   Manage DSA
auth-request
   Authentication request
real-attributes-only
   Real attributes only
chaining-loop-detection
   Chaining loop detection
vlv-request
   Virtual list view (VLV) request
server-side-sorting
   Server side sorting
get-effective-rights
   Get effective rights
This property is used to configure the following features:
```

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 Description
 Syntax
 enumeration

 Default value
 Idap

 Must be set
 No

 Is modifiable
 Yes

 Is multivalued
 Yes

 Requires restart
 No

Name allowed-ldap-ports – Directory Proxy Server configuration property

This property specifies a set of IP port numbers. A client connection must come through one of the specified ports in order for the connection to be accepted by the connection handler.

This property can take the following values in addition to the default.

ldap

The LDAP port of Directory Proxy Server

ldaps

The LDAPS port of Directory Proxy Server

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allowed-search-scopes - Directory Proxy Server configuration property

Description _S

Syntax	enumeration
Default value	base
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies a set of LDAP search scopes that are accepted by associated connection handlers.

This property can take the following values in addition to the default.

base

Base entry searches

one-level Base + first level searches

subtree Subtree searches

This property is used to configure the following features:

```
request-filtering-policy
Request filtering policies control what data can be accessed by clients.
```

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allowed-subtrees – Directory Proxy Server configuration property

Description S

Syntax	dn
Default value	
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies a set of subtrees that can be accessed by clients.

This property takes a Distinguished Name (DN) value.

This property is used to configure the following features:

request-filtering-policy

Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name allow-extended-operations – Directory Proxy Server configuration property

Description _S

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not associated connection handlers accept LDAP extended operations.

This property is true or false.

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allow-inequality-search-operations – Directory Proxy Server configuration property

Description

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not associated connection handlers accept LDAP searches based on inequality filters.

This property is true or false.

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allow-ldapv2-clients – Directory Proxy Server configuration property

Description [

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not clients can connect to Directory Proxy Server by using LDAPv2.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name allow-modify-operations – Directory Proxy Server configuration property

Description S

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not associated connection handlers accept LDAP modify operations.

This property is true or false.

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allow-persistent-searches – Directory Proxy Server configuration property

Description Sv

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not Directory Proxy Server allows clients to use persistent searches.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name allow-rename-operations - Directory Proxy Server configuration property

Description S

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not associated connection handlers accept LDAP modify DN operations.

This property is true or false.

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allow-sasl-external-authentication – Directory Proxy Server configuration property

Description St

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not clients can authenticate to Directory Proxy Server by using SASL/External authentication.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name allow-search-operations – Directory Proxy Server configuration property

Description S

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not associated connection handlers accept LDAP search operations.

This property is true or false.

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name allow-unauthenticated-operations – Directory Proxy Server configuration property

Description S

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not Directory Proxy Server allows anonymous clients to perform operations.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	dn
	Default value	Default behavior is not defined.
	Must be set	No
	Is modifiable	Yes
	Is multivalued	Yes
	Requires restart	No

Name alternate-search-base-dn – Directory Proxy Server configuration property

This property specifies the DN of an alternate search base.

When an alternate search base is specified in a subordinate data view, search operations targeted at the superior data view are performed in both the superior data view and the subordinate data view.

By default, Directory Proxy Server automatically configures the alternate search base in the subordinate data view. However, the automatic configuration can be disabled and the feature can be configured manually.

This property takes a Distinguished Name (DN) value.

This property is used to configure the following features:

```
jdbc-data-view
```

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name	attr-name - Director	y Proxy Server	configuration property	

Description

Syntax	string
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property provides the name of a virtual attribute.

This property is used to configure the following features:

jdbc-attr

JDBC attributes map LDAP attributes to entries in relational database tables. The definition of a JDBC attribute includes the name of the LDAP attribute, and the relational database table and column in which the corresponding information is located.

virtual-transformation

Virtual data transformations create a virtual data view from a physical data view. Practically, you never define a virtual data view. Instead, you specify the transformations that you require and define these on an existing physical data view. A transformation performs a specific action in a certain direction. The direction of a transformation determines the transformation model. When you define a virtual data transformation, you create a virtual attribute that exists only in the context of the virtual data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name attr-name-mappings – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property defines a list of attribute name mappings.

When a client makes a request, the mapped attributes are renamed to match the names on the server side. When the result is returned to the client, the attributes are renamed back to match the names on the client side.

The syntax of this string is <client-attr>#<source-attr>.

An attribute mapping of the form <client attribute>#<source attribute>

The value of this property must match the pattern ^[a-zA-Z][-a-zA-Z0-9]+#[a-zA-Z][-a-zA-Z0-9]+\$.

The default behavior for this property is as follows: No attribute name mappings

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name attrs - Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies a list of attributes for a search data hiding rule. The rule-action(5dpconf) property defines whether the specified attributes are filtered out of the search result, or whether the unspecified attributes are filtered out of the search result.

The syntax of this string is ATTR_NAME.

An attribute name

The value of this property must match the pattern ^[a-zA-Z][-a-zA-Z0-9]+\$.

The default behavior for this property is as follows: No filtering is applied.

This property is used to configure the following features:

search-data-hiding-rule

Search data hiding rules determine what parts of the result of a search operation are returned to a client. Search data hiding rules are defined for a given request filtering policy.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name base-dn – Directory Proxy Server configuration property

Description

Syntax	dn
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the DN of the subtree represented by the data view.

This property takes a Distinguished Name (DN) value.

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name bind-dn – Directory Proxy Server configuration property

Description

Syntax	dn
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the DN used by the proxy to bind to the LDAP data source when this data source is configured to use proxy authorization.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: Proxy does not bind to the LDAP data source.

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	string
	Default value	any
	Must be set	No
	Is modifiable	Yes
	Is multivalued	Yes
	Requires restart	No

Name bind-dn-filters – Directory Proxy Server configuration property

This property specifies a set of regular expressions. The bind DN of a client must match at least one regular expression in order for the connection to be accepted by the connection handler.

The default behavior for this property is as follows: All client bind DNs are accepted

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name bind-pwd – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	No
Is multivalued	No
Requires restart	No

This property specifies the password used by the proxy to bind to the LDAP data source when this data source is configured to use proxy authorization.

This property is read-only. To change the password, use the bind-pwd-file property.

The default behavior for this property is as follows: The proxy will not use any password to bind to the LDAP data source

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name bind-pwd-attr – Directory Proxy Server configuration property

Description

Syntax	string
Default value	userPassword
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the name of the attribute used to contain authentication passwords.

This property is used to configure the following features:

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name bind-pwd-file – Directory Proxy Server configuration property

Description

Syntax	password
Default value	No default is defined.
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the file from which to read the password for proxy authorization. The temporary file is read once, and the password is stored for future use.

This property takes a path to a file that contains the password value.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name bind-weight – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	disabled
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the proportion of bind requests that are sent to the attached data source.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

disabled

Do not forward any bind requests to the data source

This property is used to configure the following features:

attached-ldap-data-source

A data source can be attached to one or more data source pools for load balancing and failover. When attached to a data source pool, a data source is called an attached data source.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name cert-data-view-routing-custom-list - Directory Proxy Server configuration property

Description

Syntax	dnReference
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the set of data views that Directory Proxy Server uses to find certificates if the cert-data-view-routing-policy(5dpconf) property is set to custom.

The value of this property is the name of one of the following configuration entities: jdbc-data-view, join-data-view, ldap-data-view, ldif-data-view.

The default behavior for this property is as follows: If the cert-data-view-routing-policy is custom, proxy has no route to map the certificate.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name cert-data-view-routing-policy – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	all-routable
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag that indicates whether or not Directory Proxy Server should use all routable data views or the list of data views specified by

 $cert-data-view-routing-custom-list (5 dp conf) \ when \ searching \ for \ certificates.$

This property can take the following values in addition to the default.

all-routable

All routable data views

custom

Customized set of data views

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name cert-search-attr-mappings – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies mappings that map attributes in the certificate subject to attributes in the LDAP server.

The syntax of this string is <subject-attr>:<user-attr>.

An attribute mapping of the form <subject attribute>:<user attribute>

The value of this property must match the pattern ^[a-zA-Z][-a-zA-Z0-9]+: [a-zA-Z][-a-zA-Z0-9]+\$.

The default behavior for this property is as follows: No attributes in the certificate subject are mapped

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	dn
	Default value	none
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name cert-search-base-dn – Directory Proxy Server configuration property

This property specifies the base DN of a search operation that finds user entries when a user's name is not specified in their certificate.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: This property is required when proxy should not use a user certificate subject as the user DN.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name cert-search-bind-dn – Directory Proxy Server configuration property

Description [

Syntax	dn
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies an optional identity to be used when searching for certificates.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: Proxy uses an anonymous access to bind when searching for certificates.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 Syntax
 string

 Default value
 none

 Must be set
 No

 Is modifiable
 No

 Is multivalued
 No

 Requires restart
 No

Name cert-search-bind-pwd – Directory Proxy Server configuration property

This property specifies the password of the optional identity to be used when searching for certificates.

This property is read-only. To change the password, use the cert-search-bind-pwd-file property.

The default behavior for this property is as follows: Proxy uses an anonymous access to bind when searching for certificates.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy

Name cert-search-bind-pwd-file – Directory Proxy Server configuration property

Description

Syntax	password
Default value	No default is defined.
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the file from which to read the password of the optional identity used when searching for certificates. The temporary file is read once, and the password is stored for future use.

This property takes a path to a file that contains the password value.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name cert-search-user-attr – Directory Proxy Server configuration property

Description

Syntax	string
Default value	userCertificate
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is the name of an LDAP attribute used to contain certificates in user entries.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name client-affinity-policy – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	write-affinity-after-write
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the algorithm that determines when requests from the same client should be directed to the same LDAP data source.

This property can take the following values in addition to the default.

```
write-affinity-after-write
Affinity for write requests after the first write request
```

```
read-write-affinity-after-write
Affinity for all requests after the first write request
```

```
read-write-affinity-after-any
Affinity for all requests after the first read request or write request
```

```
read-affinity-after-write
```

Affinity for the first read request after a write request

This property is used to configure the following features:

ldap-data-source-pool One or more data sources are attached to a data source pool for load balancing and failover.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name client-affinity-timeout – Directory Proxy Server configuration property

Description Sv

Syntax	duration
Default value	20000
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the duration of the client affinity.

The duration is expressed in milliseconds.

This property is used to configure the following features:

ldap-data-source-pool

One or more data sources are attached to a data source pool for load balancing and failover.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name client-cred-mode - Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	use-client-identity
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies how client credentials are used to authenticate the client to an LDAP data source.

This property can take the following values in addition to the default.

```
use-specific-identity
Use the identity specified by the bind-dn(5dpconf) and bind-pwd(5dpconf) properties.
```

```
use-client-identity
```

Use the identity provided by the client.

```
use-proxy-auth
```

Use the identity specified by the bind-dn(5dpconf) and bind-pwd(5dpconf) properties, and include the client identity in the proxyAuth control.

```
use-proxy-auth-for-write
```

Use the identity specified by the bind-dn(5dpconf) and bind-pwd(5dpconf) properties, and include the client identity in the proxyAuth control for write operations only.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name compare-weight – Directory Proxy Server configuration property

Description S

Syntax	integer
Default value	disabled
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the proportion of compare requests that are sent to the attached data source.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

disabled

Do not forward any compare requests to the data source

This property is used to configure the following features:

attached-ldap-data-source

A data source can be attached to one or more data source pools for load balancing and failover. When attached to a data source pool, a data source is called an attached data source.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name configuration-manager-bind-dn – Directory Proxy Server configuration property

Description

Syntax	dn
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the distinguished name of the Proxy Manager that is the user allowed to manage the configuration of Directory Proxy Server.

This property takes a Distinguished Name (DN) value.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name configuration-manager-bind-pwd - Directory Proxy Server configuration property

Description

Syntax	string
Default value	No default is defined.
Must be set	No
Is modifiable	No
Is multivalued	No
Requires restart	No

This property specifies the password of the Proxy Manager that is the user allowed to manage the configuration of Directory Proxy Server.

This property is read-only. To change the password, use the configuration-manager-bind-pwd-file property.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name configuration-manager-bind-pwd-file – Directory Proxy Server configuration property

Description

Syntax	password
Default value	No default is defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the file from which to read the Proxy manager bind password. The temporary file is read once, and the password is stored for future use.

This property takes a path to a file that contains the password value of at least 8 characters in length.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name connection-idle-timeout – Directory Proxy Server configuration property

Description S

Syntax	duration
Default value	3600
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum length of time a client connection can remain idle before being closed.

The duration is expressed in seconds.

This property is used to configure the following features:

ldap-listener

The LDAP listener represents the network interface of Directory Proxy Server.

ldaps-listener

The LDAP listener represents the network interface of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name connection-pool-wait-timeout – Directory Proxy Server configuration property

Description

Syntax	duration
Default value	3000
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum length of time that Directory Proxy Server waits for a connection to an LDAP server to become available if a connection pool is empty when a request is made.

The duration is expressed in milliseconds.

The value of this property must be at least 1.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name connection-read-data-timeout – Directory Proxy Server configuration property

Description _S

Syntax	duration
Default value	2000
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum length of time that the listener can wait for new data to be available.

The duration is expressed in milliseconds.

This property is used to configure the following features:

ldap-listener

The LDAP listener represents the network interface of Directory Proxy Server.

ldaps-listener

The LDAP listener represents the network interface of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name connection-write-data-timeout – Directory Proxy Server configuration property

Description [

Syntax	duration
Default value	3600000
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum length of time that the listener can wait to send results back to clients.

The duration is expressed in milliseconds.

This property is used to configure the following features:

ldap-listener

The LDAP listener represents the network interface of Directory Proxy Server.

ldaps-listener

The LDAP listener represents the network interface of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name	connect-timeout -	Directory Proxy Server	r configuration property
------	-------------------	------------------------	--------------------------

Description S

Syntax	duration
Default value	10000
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum length of time that a connection between Directory Proxy Server and a data source is attempted before the connection attempt fails.

The duration is expressed in milliseconds.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name contains-shared-entries - Directory Proxy Server configuration property

Description _S

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property determines what should be done if an entry in a secondary data view is used by more than one entry in a primary data view.

This property is applicable to secondary data views only.

If it is set to TRUE, the secondary data view entry is deleted when the virtual entry is deleted. If the entry does not exist in the secondary data view, it is created when the virtual entry is created.

This property is true or false.

This property is used to configure the following features:

```
jdbc-data-view
```

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

jdbc-table

A JDBC table is created for each relational database table that will be used in the JDBC data view. When you create a JDBC table you specify the name of the table in the relational database, and the name you want to assign to this table in the JDBC data view.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

```
ldap-data-view
```

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name custom-distribution-algorithm – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the class name to use for custom distribution algorithm. This property can be set only if distribution-algorithm property is set to none.

This property accepts the string value that contains Java class name. String value in PackageName.AlgoClassName format is valid.

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name data-source-read-timeout – Directory Proxy Server configuration property

Description _S

Syntax	duration
Default value	20000
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum length of time that Directory Proxy Server waits for a data source to complete a read request.

The duration is expressed in milliseconds.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name data-view-automatic-routing-mode – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	automatic
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag that indicates whether Directory Proxy Server automatically routes requests, or whether Directory Proxy Server relies on manual routing configuration.

This property can take the following values in addition to the default.

automatic

Directory Proxy Server automatically routes requests and ignores data view exclusion bases and alternate search bases.

limited

Directory Proxy Server automatically routes requests but will take into consideration data view exclusion bases if present.

manual

Directory Proxy Server does not automatically route requests. Instead, Directory Proxy Server routes requests according to the exclusion bases and alternate search bases specified in the data views.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name data-view-routing-custom-list – Directory Proxy Server configuration property

Description

Syntax	dnReference
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the list of data views to which Directory Proxy Server routes client requests if data-view-routing-policy(5dpconf) is custom.

The value of this property is the name of one of the following configuration entities: jdbc-data-view, join-data-view, ldap-data-view, ldif-data-view.

The default behavior for this property is as follows: Proxy does not route requests.

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name data-view-routing-policy – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether Directory Proxy Server routes client requests to all routable data views or to a custom set of data views.

This property can take the following values in addition to the default.

all-routable All routable data views

custom

Customized set of data views

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name db-name – Directory Proxy Server configuration property

Description

Syntax	string
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the database name of the JDBC data source.

This property is used to configure the following features:

jdbc-data-source

A JDBC data source is defined for each relational database to which you want LDAP clients to have access. Currently, only one JDBC data source is supported per JDBC data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name db-pwd – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	No
Is multivalued	No
Requires restart	No

This property specifies the database user password of the JDBC data source.

This property is read-only. To change the password, use the db-pwd-file property.

The default behavior for this property is as follows: The proxy will not use any password to connect to the JDBC data source.

This property is used to configure the following features:

jdbc-data-source

A JDBC data source is defined for each relational database to which you want LDAP clients to have access. Currently, only one JDBC data source is supported per JDBC data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name db-pwd-encryption – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	clear-text
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the mechanism used to store authentication passwords.

This property can take the following values in addition to the default.

clear-text

Passwords are stored in the clear

sha

Passwords are stored using SHA

ssha

Passwords are stored using SSHA

This property is used to configure the following features:

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name db-pwd-file – Directory Proxy Server configuration property

Description

Syntax	password
Default value	No default is defined.
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the file from which to read the database user password of the JDBC data source. The temporary file is read once, and the password is stored for future use.

This property takes a path to a file that contains the password value.

This property is used to configure the following features:

jdbc-data-source

A JDBC data source is defined for each relational database to which you want LDAP clients to have access. Currently, only one JDBC data source is supported per JDBC data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name db-url – Directory Proxy Server configuration property

Description

Syntax	string
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the database URL of the JDBC data source.

This property is used to configure the following features:

jdbc-data-source

A JDBC data source is defined for each relational database to which you want LDAP clients to have access. Currently, only one JDBC data source is supported per JDBC data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name db-user – Directory Proxy Server configuration property

Description _S

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the database user of the JDBC data source.

The default behavior for this property is as follows: No user.

This property is used to configure the following features:

jdbc-data-source

A JDBC data source is defined for each relational database to which you want LDAP clients to have access. Currently, only one JDBC data source is supported per JDBC data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name default-log-level – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	info
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property sets the default log level for all categories of log message.

This property can take the following values in addition to the default.

error

Error logging

warning

Warning logging

info

Informational logging

all

All logging levels

none

All logging disabled

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name delete-weight - Directory Proxy Server configuration property

Description S

Syntax	integer
Default value	disabled
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the proportion of delete requests that are sent to the attached data source.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

disabled

Do not forward any delete requests to the data source

This property is used to configure the following features:

attached-ldap-data-source

A data source can be attached to one or more data source pools for load balancing and failover. When attached to a data source pool, a data source is called an attached data source.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name description – Directory Proxy Server configuration property

Description

Syntax	string
Default value	Default behavior is not defined.
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property enables you to attach a description to the feature.

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

jdbc-data-source

A JDBC data source is defined for each relational database to which you want LDAP clients to have access. Currently, only one JDBC data source is supported per JDBC data view.

jdbc-data-source-pool

Requests from clients are distributed to a JDBC data source pool. A JDBC data source pool is defined for each JDBC data source.

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-source

The common name of the LDAP data source

ldap-data-source-pool

One or more data sources are attached to a data source pool for load balancing and failover.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

request-filtering-policy Request filtering policies control what data can be accessed by clients.

resource-limits-policy

Resource limit policies define the maximum resources that Directory Proxy Server can process for a given connection handler.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name distribution-algorithm – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the built-in algorithm used to distribute operations to data views that have the same base DN.

This property can take the following values in addition to the default.

pattern-matching

Requests are distributed to data views based on the match between the parameters of the requests and one or more patterns.

lexicographic

Requests are distributed to data views based on the lexicographic value of the RDN specified in the request. Lexicographic bounds are taken from the value of the first RDN beneath the base DN of the data view.

numeric

Requests are distributed to data views based on the numeric value of the RDN specified in the request. The numeric value is taken from the value of the first RDN beneath the base DN of the data view.

replication

Requests are distributed to data views based on the role of the data view in replication. The algorithm forces all write operations to be sent to all data sources in the data source pool, and all read operations to be sent to a single data source.

The default behavior for this property is as follows: No distribution algorithm is enabled

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	string
	Default value	none
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name dn-join-rule – Directory Proxy Server configuration property

This property determines how the DN of entries in the secondary data view are constructed.

To be taken in account by the server, this property must be set on join data view if the join-rule-control-enabled property for join data view is set to true; otherwise it must be set on secondary data views. Only one DN join rule can be defined.

The default behavior for this property is as follows: No DN join rule is enabled

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name dn-mapping-attrs - Directory Proxy Server configuration property

Description S

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property defines a list of attributes that contain DNs of entries.

When a DN is renamed by setting the dn-mapping-source-base-dn property, attributes in the portion of the DIT affected by renaming must also be renamed if those attributes contain DNs.

The default behavior for this property is as follows: No DN valued attributes to be mapped

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name dn-mapping-source-base-dn – Directory Proxy Server configuration property

Description S

Syntax	dn
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property defines a DN mapping.

When a client makes a request, the DN is rewritten to match that on the server side. When the result is returned to the client, the DN is changed back to match the client side.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: No source suffix - do not perform DN mapping

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Stability Level	Evolving

Name dn-pattern – Directory Proxy Server configuration property

Description

Syntax	string
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies a DN pattern that controls how DNs are constructed in the data view.

This property is used to configure the following features:

jdbc-object-class

A JDBC object class maps an LDAP object class to one or more relational database tables. A JDBC object class can obtain its information from more than one table. However, one table must be defined as the primary table, and additional tables are defined as secondary tables.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name domain-name-filters – Directory Proxy Server configuration property

Description

Syntax	string
Default value	any
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies a set of domain name suffixes. A client's network domain must match at least one of the suffixes in order for the connection to be accepted by the connection handler.

The domain name can be in one of the following formats:

- Full name. For example, box.eng.sun.com.
- Suffix name. For example, .eng.sun.com.
- Fully qualified name of the local host.

The default behavior for this property is as follows: All domains are accepted

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name driver-class – Directory Proxy Server configuration property

Description

Syntax	string
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the JDBC driver class of the JDBC data source.

This property is used to configure the following features:

jdbc-data-source

A JDBC data source is defined for each relational database to which you want LDAP clients to have access. Currently, only one JDBC data source is supported per JDBC data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name driver-url – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	Yes
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the JDBC driver jar of the JDBC data source.

The default behavior for this property is as follows: The proxy will not use any password to connect to the JDBC data source.

This property is used to configure the following features:

jdbc-data-source

A JDBC data source is defined for each relational database to which you want LDAP clients to have access. Currently, only one JDBC data source is supported per JDBC data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name email-alerts-enabled – Directory Proxy Server configuration property

Description

Syntax	boolean
Default value	false
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not Directory Proxy Server should use email based alert notification.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name email-alerts-message-from-address – Directory Proxy Server configuration property

Description [

Syntax	string
Default value	local
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the from-address that alert messages should use.

The syntax of this string is EMAIL ADDRESS.

A valid email address

The value of this property must match the pattern ^.+@.+\$.

The default behavior for this property is as follows: The default sender is dps@localhost

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name email-alerts-message-subject – Directory Proxy Server configuration property

Description

Syntax	string
Default value	Proxy Server Administrative Alert
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the subject line that alert messages should use.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name email-alerts-message-subject-includes-alert-code – Directory Proxy Server configuration property

Description

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not Directory Proxy Server should add the alert code to the subject line for alert messages.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name email-alerts-message-to-address – Directory Proxy Server configuration property

Description S

Syntax	string
Default value	root@localhost
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the to-address that alert messages should use.

The syntax of this string is EMAIL_ADDRESS.

A valid email address

The value of this property must match the pattern ^.+@.+\$.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name email-alerts-smtp-host - Directory Proxy Server configuration property

Description _{Sv}

Syntax	ipAddress
Default value	localhost
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the host name of the SMTP server to which alert messages should be sent.

This property takes an IP address or host name.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name email-alerts-smtp-port – Directory Proxy Server configuration property

Description S

Syntax	integer
Default value	smtp
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the port number of the SMTP server to which alert messages should be sent.

This property takes an integer.

The value of this property must be at least 1.

The value of this property must be no greater than 65535.

This property can also take the following values:

smtp

Standard smtp port

smtps

Standard smtp over SSL port

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name enable-client-affinity – Directory Proxy Server configuration property

Description

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag that indicates whether or not consecutive requests from the same client should be directed to the same LDAP data source.

This property is true or false.

This property is used to configure the following features:

ldap-data-source-pool

One or more data sources are attached to a data source pool for load balancing and failover.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name enabled-admin-alerts – Directory Proxy Server configuration property

Description _S

Syntax	enumeration
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the list of enabled administration alerts.

This property can take the following values in addition to the default.

```
info-server-startup
  Server startup
info-server-shutdown-clean
  Clean server shutdown
error-server-shutdown-abrupt
  Abrupt server shutdown
info-configuration-reload
  Configuration reloaded
warning-configuration-reload-failure-no-impact
  Configuration reload failure due to bad configuration - run-time configuration not
  impacted
error-configuration-reload-failure-with-impact
  Configuration reload failure due to bad configuration - run-time configuration possibly
  impacted
warning-data-source-unavailable
  Data source is currently unavailable
info-data-source-available
  Data source is available again
warning-listener-unavailable
   Unable to listen for incoming connections or requests
warning-data-sources-inconsistent
  Inconsistency detected between data sources
```

The default behavior for this property is as follows: No administration alerts are enabled

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 Description
 Syntax
 boolean

 Default value
 false

 Must be set
 No

 Is modifiable
 Yes

 Is multivalued
 No

 Requires restart
 No

Name enable-data-view-affinity – Directory Proxy Server configuration property

This property is a flag indicating whether or not consecutive requests from the same client should be directed exclusively to the same data view.

This property is true or false.

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

[ATTRIBUTE TYPE	ATTRIBUTE VALUE
	Availability	SUNWldap-proxy
	Stability Level	Evolving

Name enabled-ssl-cipher-suites – Directory Proxy Server configuration property

Description

Syntax	selectionEnumeration
Default value	JRE
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the list of enabled SSL cipher suites.

This property takes its possible values from an external component.

The default behavior for this property is as follows: All SSL cipher suites enabled by the Java Run Time running the proxy.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name enabled-ssl-protocols – Directory Proxy Server configuration property

Description

Syntax	selectionEnumeration
Default value	JRE
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the list of enabled SSL protocols.

This property takes its possible values from an external component.

The default behavior for this property is as follows: All SSL protocols enabled by the Java Run Time running the proxy.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name enable-log-rotation – Directory Proxy Server configuration property

Description S

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies whether log files are rotated or not.

This property is true or false.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name enable-remote-user-mapping – Directory Proxy Server configuration property

Description _S

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not Directory Proxy Server should map the bind DN of a user to an alternate bind DN. The identity mapping is configured in the user entry in a remote LDAP server.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name enable-user-mapping – Directory Proxy Server configuration property

Description _S

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not Directory Proxy Server should map the user identity to the identity of an alternate user. The identity mapping is configured in the Directory Proxy Server.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name encrypt-configuration – Directory Proxy Server configuration property

Description S

boolean
true
No
Yes
No
No

This property is a flag indicating whether or not Directory Proxy Server should encrypt passwords that are stored in the configuration.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name excluded-subtrees – Directory Proxy Server configuration property

Description

Syntax	dn
Default value	Default behavior is not defined.
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the DNs of subtrees which are excluded by a data view.

When a subordinate data view is created, Directory Proxy Server automatically excludes the subordinate subtree from the superior data view. However, the automatic configuration can be disabled and the feature can be configured manually.

This property takes a Distinguished Name (DN) value.

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description Syntax string

Name extension-jar-file-url – Directory Proxy Server configuration property

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the jar file that contains custom plugins, such as custom distribution plugins.

The default behavior for this property is as follows: Proxy uses no extension jar file.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name filter-join-rule - Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property defines the relationship between the primary and secondary data views.

A filter join rule indicates how an entry should be retrieved from the secondary data view based on something in the primary data view.

For example, uid=\\${primary-view-name.uid} is a valid property value.

To be taken in account by the server, this property must be set on join data view if the join-rule-control-enabled property for join data view is set to true; otherwise it must be set on secondary data views.

A filter join rule takes the form of an LDAP filter that is used to construct an attribute from one or more attributes from the primary data view.

The default behavior for this property is as follows: No filter join rule is applied

This property is used to configure the following features:

```
jdbc-data-view
```

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

jdbc-table

A JDBC table is created for each relational database table that will be used in the JDBC data view. When you create a JDBC table you specify the name of the table in the relational database, and the name you want to assign to this table in the JDBC data view.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name internal-value – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property defines the physical value of the attribute.

The default behavior for this property is as follows: For some transformations, this property is required for the proxy to apply the transformation.

This property is used to configure the following features:

virtual-transformation

Virtual data transformations create a virtual data view from a physical data view. Practically, you never define a virtual data view. Instead, you specify the transformations that you require and define these on an existing physical data view. A transformation performs a specific action in a certain direction. The direction of a transformation determines the transformation model. When you define a virtual data transformation, you create a virtual attribute that exists only in the context of the virtual data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	ipAddressMask
	Default value	any
	Must be set	No
	Is modifiable	Yes
	Is multivalued	Yes
	Requires restart	No

Name ip-address-filters – Directory Proxy Server configuration property

This property specifies a set of IPv4 or IPv6 address masks. The IP address of a client connection must match at least one of the masks in order for the connection to be accepted by the connection handler. The IP address can be in one of the following formats:

- IP address in dotted decimal form.
- IP address and bits, in the form of network number/mask bits.
- IP address and quad, in the form of a pair of dotted-decimal quads.
- All addresses, a catch-all for clients that are not placed into other, higher priority, groups.
- 0.0.0.0. This address is for groups to which initial membership is not considered. For example, for groups that clients switch to after their initial bind.
- IP address of the local host.

This property takes an IP address such as 168.192.0.*.

The default behavior for this property is as follows: All IP addresses are accepted

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name is-enabled - Directory Proxy Server configuration property

Description _S

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not the data view is accepting requests.

This property is true or false.

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

jdbc-data-source

A JDBC data source is defined for each relational database to which you want LDAP clients to have access. Currently, only one JDBC data source is supported per JDBC data view.

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-source

The common name of the LDAP data source

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldap-listener

The LDAP listener represents the network interface of Directory Proxy Server.

ldaps-listener

The LDAP listener represents the network interface of Directory Proxy Server.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name is-read-only - Directory Proxy Server configuration property

Description S

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not the data view should accept read operations only.

This property is true or false.

This property is used to configure the following features:

jdbc-data-source

A JDBC data source is defined for each relational database to which you want LDAP clients to have access. Currently, only one JDBC data source is supported per JDBC data view.

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-source

The common name of the LDAP data source

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

[ATTRIBUTE TYPE	ATTRIBUTE VALUE
	Availability	SUNWldap-proxy
	Stability Level	Evolving

Name is-restart-required – Directory Proxy Server configuration property

Description _S

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	No
Is multivalued	No
Requires restart	No

This property is a flag indicating whether Directory Proxy Server must be restarted in order for configuration changes to take effect.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name is-routable – Directory Proxy Server configuration property

Description

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not the data view can be accessed by a connection handler if the data-view-routing-policy(5dpconf) property of the connection handler is all-routable.

This property is true or false.

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name is-single-row-table – Directory Proxy Server configuration property

Description

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies that an LDAP entry has only one matching row in the relational database table.

This property is true or false.

This property is used to configure the following features:

jdbc-table

A JDBC table is created for each relational database table that will be used in the JDBC data view. When you create a JDBC table you specify the name of the table in the relational database, and the name you want to assign to this table in the JDBC data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name	is-ssl-mandatory	- Directory	Proxy Server	configuration proper	ty
------	------------------	-------------	--------------	----------------------	----

Description _S

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not client connections must use SSL in order for them to be accepted by the connection handler.

This property is true or false.

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name jdbc-data-source-pool – Directory Proxy Server configuration property

Description

Syntax	dnReference
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the JDBC data source pool that should be used by the JDBC data view.

This property has as its value the name of a jdbc-data-source-pool configuration entity.

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name join-rule-control-enabled – Directory Proxy Server configuration property

Description

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies whether Server uses "filter-join-rule" and "dn-join-rule" property values stored on join views.

This property is true or false.

This property is used to configure the following features:

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

Attributes See attributes(5) for descriptions of the following attributes:

[ATTRIBUTE TYPE	ATTRIBUTE VALUE
	Availability	SUNWldap-proxy
	Stability Level	Evolving

Name ldap-address – Directory Proxy Server configuration property

Description

Syntax	ipAddress
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the address of the LDAP data source.

This property takes an IP address or host name.

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name	ldap-data-source-p	ool - Directory	y Proxy Serve	r configuration property

Description

Syntax	dnReference
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the name of the LDAP data source pool to be used by the LDAP data view.

This property has as its value the name of a ldap-data-source-pool configuration entity.

This property is used to configure the following features:

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name ldap-port – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	ldap
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the LDAP port of the LDAP data source.

This property takes an integer.

The value of this property must be at least 1.

The value of this property must be no greater than 65535.

This property can also take the following values:

ldap

Standard ldap port

ldaps

Standard ldaps port

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name ldaps-port – Directory Proxy Server configuration property

Description Sv

Syntax	integer
Default value	ldaps
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the LDAPS port of the LDAP data source.

This property takes an integer.

The value of this property must be at least 1.

The value of this property must be no greater than 65535.

This property can also take the following values:

ldap

Standard ldap port

ldaps Standard ldaps port

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name ldap-syntax – Directory Proxy Server configuration property

Description _S

Syntax	string
Default value	cis
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property defines the syntax used to construct the LDAP attribute from an entry in the relational database table.

This property is used to configure the following features:

jdbc-attr

JDBC attributes map LDAP attributes to entries in relational database tables. The definition of a JDBC attribute includes the name of the LDAP attribute, and the relational database table and column in which the corresponding information is located.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name ldif-data-source – Directory Proxy Server configuration property

Description

Syntax	string
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the name of a file on the Directory Proxy Server filesystem where the LDIF data is contained.

This property is used to configure the following features:

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name lexicographic-attrs – Directory Proxy Server configuration property

Description

Syntax	string
Default value	all
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the set of attributes that are examined by the distribution algorithm when distribution-algorithm(5dpconf) is lexicographic.

The default behavior for this property is as follows: All attributes

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	string
	Default value	none
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name lexicographic-lower-bound – Directory Proxy Server configuration property

This property specifies the lower bound of the distribution when distribution-algorithm(5dpconf) is lexicographic.

For example, consider a configuration with a first data view that handles [A-M] inclusive, and a second data view that handles [N-Z] inclusive. For the first data view, you set the lower bound to A, and the upper bound to M. For the second data view, you set the lower bound to N, and the upper bound to Z.

The default behavior for this property is as follows: No lower limit

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

[ATTRIBUTE TYPE	ATTRIBUTE VALUE
	Availability	SUNWldap-proxy

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Stability Level	Evolving

 Syntax
 string

 Default value
 none

 Must be set
 No

 Is modifiable
 Yes

 Is multivalued
 No

 Requires restart
 No

Name lexicographic-upper-bound – Directory Proxy Server configuration property

Description

This property specifies the upper bound of the distribution when distribution-algorithm(5dpconf) is lexicographic.

For example, consider a configuration with a first data view that handles [A-M] inclusive, and a second data view that handles [N-Z] inclusive. For the first data view, you set the lower bound to A, and the upper bound to M. For the second data view, you set the lower bound to N, and the upper bound to Z.

The default behavior for this property is as follows: No upper limit

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

[ATTRIBUTE TYPE	ATTRIBUTE VALUE
	Availability	SUNWldap-proxy

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Stability Level	Evolving

Name listen-address – Directory Proxy Server configuration property

Description

Syntax	ipAddress
Default value	0.0.0
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the IP address that Directory Proxy Server should listen on.

This property takes an IP address or host name.

This property is used to configure the following features:

ldap-listener

The LDAP listener represents the network interface of Directory Proxy Server.

ldaps-listener

The LDAP listener represents the network interface of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name listen-port – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the IP port that Directory Proxy Server should listen on.

This property takes an integer.

The value of this property must be at least 1.

The value of this property must be no greater than 65535.

This property can also take the following values:

ldap

Standard ldap port

ldaps

Standard ldaps port

This property is used to configure the following features:

ldap-listener

The LDAP listener represents the network interface of Directory Proxy Server.

ldaps-listener

The LDAP listener represents the network interface of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	enumeration
	Default value	proportional
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	Yes

Name load-balancing-algorithm – Directory Proxy Server configuration property

This property specifies the algorithm that determines how operations are distributed to the data sources attached to a data source pool.

This property can take the following values in addition to the default.

failover

Requests are distributed exclusively to the data source with the highest weight. If that data source fails, requests are distributed exclusively to the data source with the next highest weight.

saturation

Requests are distributed to the data source with the highest weight until the data source approaches its saturation level. Requests are then sent to the data source with the next highest weight .

When the data source with the highest weight drops below its saturation level, Directory Proxy Server resumes sending requests to that data source.

proportional

Requests are distributed to data sources in proportion to the weight of a data source and its cumulative load.

operational-affinity

Requests are allocated a hash value according to the type of the request and the properties of the request. Hash values are allocated to data sources in proportion to the weight of a data source and its cumulative load.

This property is used to configure the following features:

ldap-data-source-pool

One or more data sources are attached to a data source pool for load balancing and failover.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name	log-buffer-size - Directo	ry Proxy Server	r configuration property
nume	10g-Dunci-size - Directo	I Y I IOAY SCIVE	configuration property

Description

Syntax	dataSize
Default value	0b
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the size of the error log buffer. When the buffer is full, it is flushed to disk.

This property is expressed in bytes.

The value of this property must be at least 0b.

The value of this property must be no greater than 100k.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-file-name – Directory Proxy Server configuration property

Description

Syntax	string
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the path name to the log file.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-file-perm – Directory Proxy Server configuration property

Description S

Syntax	string
Default value	600
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the permissions on the log file.

The syntax of this string is OCTAL MODE.

A unix style octal permission, for example, 600.

The value of this property must match the pattern ^[0-7][0-7]\$.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-level-client-connections – Directory Proxy Server configuration property

Description [

Syntax	accessLogLevel
Default value	inherited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the log level for events related to client connections.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.
info	Errors, warnings and informational messages are included in the log file.
inherited	The log level is inherited from the value of the default-log-level property.
none	No messages are included in the log file.
This property is used to configure the following features:	
_	

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	accessLogLevel
	Default value	inherited
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name log-level-client-disconnections – Directory Proxy Server configuration property

This property specifies the log level for events related to client disconnections.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.
info	Errors, warnings and informational messages are included in the log file.
inherited	The log level is inherited from the value of the default-log-level property.
none	No messages are included in the log file.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-level-client-operations – Directory Proxy Server configuration property

Description

Syntax	accessLogLevel
Default value	inherited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the log level for events related to client operations.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.	
info	Errors, warnings and informational messages are included in the log file.	
inherited	The log level is inherited from the value of the default-log-level property.	
none	No messages are included in the log file.	
This property is used to configure the following features:		

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	logLevel
	Default value	inherited
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name log-level-configuration – Directory Proxy Server configuration property

This property specifies the logging level for events related to configuration.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.	
error	Only error messages are included in the log file.	
info	Errors, warnings and informational messages are included in the log file.	
inherited	The log level is inherited from the value of the default-log-level property.	
none	No messages are included in the log file.	
warning	Error messages and warning messages are included in the log file.	
This property is used to configure the following features:		
_		

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-level-connection-handlers – Directory Proxy Server configuration property

Description [

Syntax	accessLogLevel
Default value	inherited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the log level for events related to connection handlers.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.	
info	Errors, warnings and informational messages are included in the log file.	
inherited	The log level is inherited from the value of the default-log-level property.	
none	No messages are included in the log file.	
This property is used to configure the following features:		

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	logLevel
	Default value	inherited
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name log-level-data-source – Directory Proxy Server configuration property

This property specifies the logging level for events related to data sources.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.	
error	Only error messages are included in the log file.	
info	Errors, warnings and informational messages are included in the log file.	
inherited	The log level is inherited from the value of the default-log-level property.	
none	No messages are included in the log file.	
warning	Error messages and warning messages are included in the log file.	
This property is used to configure the following features:		
_		

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-level-data-sources – Directory Proxy Server configuration property

Description

Syntax	accessLogLevel
Default value	inherited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the log level for events related to data sources.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.	
info	Errors, warnings and informational messages are included in the log file.	
inherited	The log level is inherited from the value of the default-log-level property.	
none	No messages are included in the log file.	
This property is used to configure the following features:		
_		

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	accessLogLevel
	Default value	none
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name log-level-data-sources-detailed – Directory Proxy Server configuration property

This property specifies the log level for detailed events related to data sources.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.
info	Errors, warnings and informational messages are included in the log file.
inherited	The log level is inherited from the value of the default-log-level property.
none	No messages are included in the log file.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-level-internal – Directory Proxy Server configuration property

Description _{Sy}

Syntax	logLevel
Default value	inherited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

The logging level for events related to problems with the internal server.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.
error	Only error messages are included in the log file.
info	Errors, warnings and informational messages are included in the log file.
inherited	The log level is inherited from the value of the default-log-level property.
none	No messages are included in the log file.
warning	Error messages and warning messages are included in the log file.
This property is used to configure the following features:	
error-log The error logs contain information about the health of the Directory Proxy Server.	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	logLevel
	Default value	inherited
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name log-level-operation-decode – Directory Proxy Server configuration property

This property specifies the logging level for events related to client operation decoding.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.	
error	Only error messages are included in the log file.	
info	Errors, warnings and informational messages are included in the log file.	
inherited	The log level is inherited from the value of the default-log-level property.	
none	No messages are included in the log file.	
warning	Error messages and warning messages are included in the log file.	
This property is used to configure the following features:		
_		

error-log The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-level-operation-processing – Directory Proxy Server configuration property

Description S

Syntax	logLevel
Default value	inherited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the logging level for events related to client operation processing.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.
error	Only error messages are included in the log file.
info	Errors, warnings and informational messages are included in the log file.
inherited	The log level is inherited from the value of the default-log-level property.
none	No messages are included in the log file.
warning	Error messages and warning messages are included in the log file.
This property is used to configure the following features:	
error-log The error logs contain information about the health of the Directory Proxy Server.	

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	logLevel
	Default value	inherited
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name log-level-plugin – Directory Proxy Server configuration property

This property specifies the logging level for events related to plugins.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.	
error	Only error messages are included in the log file.	
info	Errors, warnings and informational messages are included in the log file.	
inherited	The log level is inherited from the value of the default-log-level property.	
none	No messages are included in the log file.	
warning	Error messages and warning messages are included in the log file.	
This property is used to configure the following features:		
error-log		

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-level-shutdown – Directory Proxy Server configuration property

Description Svi

Syntax	logLevel
Default value	inherited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the logging level for events related to server shutdown.

This property can take the following values.

all	All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.	
error	Only error messages are included in the log file.	
info	Errors, warnings and informational messages are included in the log file.	
inherited	The log level is inherited from the value of the default-log-level property.	
none	No messages are included in the log file.	
warning Error messages and warning messages are included in the log file.		
This property is used to configure the following features:		
error-log The error logs contain information about the health of the Directory Proxy Server.		

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	logLevel
	Default value	inherited
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name log-level-startup – Directory Proxy Server configuration property

This property specifies the logging level for events related to server startup.

This property can take the following values.

All messages are included in the log file. In most cases, this setting produces the same results as the info setting. In certain situations, this setting enables additional debugging messages to be logged.		
Only error messages are included in the log file.		
Errors, warnings and informational messages are included in the log file.		
The log level is inherited from the value of the default-log-level property.		
none No messages are included in the log file.		
warning Error messages and warning messages are included in the log file.		
This property is used to configure the following features:		
•		

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-min-size - Directory Proxy Server configuration property

Description

Syntax	dataSize
Default value	0b
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

If the log-rotation-policy(5dpconf) is periodic, this property specifies a minimum file size. The log files are rotated at the specified interval if the file size is bigger than the specified size.

This property is expressed in bytes.

The value of this property must be at least 0b.

The value of this property must be no greater than 2g.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	string
	Default value	1h
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name log-rotation-frequency – Directory Proxy Server configuration property

Requires restart No

This property specifies the interval at which log files are rotated when log-rotation-policy(5dpconf) is periodic.

This property is set in conjunction with the following properties: log-rotation-start-time(5dpconf) and log-rotation-start-day(5dpconf).

The syntax of this string is <count>[mwdh].

The value for log-rotation-frequency(5dpconf) is a time period of the form <count>[mwdh]. For example, a value of 2w means that the logs are rotated every 2 weeks.

The value of this property must match the pattern ^[0-9]+[mMwWdDhH]\$.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-rotation-policy – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the policy used to rotate log files.

This property can take the following values in addition to the default.

size

Rotate log files when they reach the size specified by the log-rotation-size(5dpconf) property.

periodic

Rotate log files at the time and interval specified by the following properties:

- log-rotation-start-time(5dpconf)
- log-rotation-start-day(5dpconf)
- log-rotation-frequency(5dpconf)

If the rotation policy is periodic and log-rotation-size(5dpconf) is set, the log file is rotated at the specified interval IF the file size is bigger than the specified size.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name	log-rotation-size - Director	y Proxy Server	configuration property	

Description

Syntax	dataSize
Default value	100m
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

If the log-rotation-policy(5dpconf) is size, this property specifies the file size at which log files are automatically rotated.

This property is expressed in bytes.

The value of this property must be at least 1m.

The value of this property must be no greater than 2g.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-rotation-start-day – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	1
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the day-of-the-week or day-of-the-month that log files are rotated when log-rotation-policy(5dpconf) is periodic.

This property is set in conjunction with the following properties: log-rotation-start-time(5dpconf) and log-rotation-frequency(5dpconf).

This property takes an integer.

The value of this property must be at least 1.

The value of this property must be no greater than 31.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	string
	Default value	0000
	Must be set	No

Yes

No No

Name log-rotation-start-time – Directory Proxy Server configuration property

This property specifies the time of day at which log files are rotated when the log-rotation-policy(5dpconf) is periodic.

This property is set in conjunction with the following properties: log-rotation-start-day(5dpconf) and log-rotation-frequency(5dpconf).

The syntax of this string is TIME.

The value for log-rotation-start-time is a time of day of the form hhmm.

The value of this property must match the pattern ((2[0-3])|([0-1][0-9]))[0-5][0-9]\$.

This property is used to configure the following features:

access-log

Is modifiable

Is multivalued

Requires restart

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name log-search-filters – Directory Proxy Server configuration property

Description Sv

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies whether or not search filters are included in log messages.

This property is true or false.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE

 Yes

 Is multivalued
 No

 Requires restart
 No

Name mapped-bind-dn – Directory Proxy Server configuration property

This property specifies the distinguished name of the user that the client is mapped to if enable-user-mapping(5dpconf) is true.

The distinguished name of the client is specified by user-bind-dn(5dpconf).

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: The proxy maps to the identity defined as the anonymous mapping.

This property is used to configure the following features:

user-mapping

In user mapping, a client identity is mapped to the identity of an alternate user. After a BIND operation, the Directory Proxy Server submits subsequent operations as the alternate user.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name mapped-bind-pwd – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	No
Is multivalued	No
Requires restart	No

This property specifies the password of the user that the client is mapped to if enable-user-mapping(5dpconf) is true.

The password of the client is specified by user-bind-pwd(5dpconf).

This property is read-only. To change the password, use the mapped-bind-pwd-file property.

The default behavior for this property is as follows: The proxy will not use any password associated to this mapping

This property is used to configure the following features:

user-mapping

In user mapping, a client identity is mapped to the identity of an alternate user. After a BIND operation, the Directory Proxy Server submits subsequent operations as the alternate user.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name mapped-bind-pwd-file – Directory Proxy Server configuration property

Description

Syntax	password
Default value	No default is defined.
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the file from which to read the password of the user that the client is mapped to if enable-user-mapping(5dpconf) is true.

The password of the client is specified by user-bind-pwd(5dpconf). The temporary file is read once, and the password is stored for future use.

This property takes a path to a file that contains the password value.

This property is used to configure the following features:

user-mapping

In user mapping, a client identity is mapped to the identity of an alternate user. After a BIND operation, the Directory Proxy Server submits subsequent operations as the alternate user.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name max-age – Directory Proxy Server configuration property

Description

Syntax	duration
Default value	unlimited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum age (in months, weeks or days) that a log file can reach before it is deleted.

The duration is expressed in seconds.

The value of this property must be at least 1d.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name max-client-connections – Directory Proxy Server configuration property

Description S

Syntax	integer
Default value	unlimited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum number of simultaneous connections from a single client permitted by associated connection handlers.

This property takes an integer.

The value of this property must be at least 1.

The default behavior for this property is as follows: No limit

This property is used to configure the following features:

resource-limits-policy

Resource limit policies define the maximum resources that Directory Proxy Server can process for a given connection handler.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name max-connection-queue-size – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	128
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum size of the listener's new connection queue. When the queue is full, new connections are rejected.

This property takes an integer.

The value of this property must be at least 1.

This property is used to configure the following features:

ldap-listener

The LDAP listener represents the network interface of Directory Proxy Server.

ldaps-listener

The LDAP listener represents the network interface of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name max-connections – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	unlimited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum number of simultaneous connections permitted by associated connection handlers.

This property takes an integer.

The value of this property must be at least 1.

The default behavior for this property is as follows: No limit

This property is used to configure the following features:

resource-limits-policy

Resource limit policies define the maximum resources that Directory Proxy Server can process for a given connection handler.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name max-ldap-message-size - Directory Proxy Server configuration property

Description

Syntax	dataSize
Default value	unlimited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum size of an LDAP message. Messages above the maximum size are not accepted by the listener.

This property is expressed in bytes.

The value of this property must be at least 4k.

The value of this property must be no greater than 2g.

This property is used to configure the following features:

ldap-listener

The LDAP listener represents the network interface of Directory Proxy Server.

ldaps-listener

The LDAP listener represents the network interface of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name max-log-files – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	10
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum number of log files that are preserved.

This property takes an integer.

The value of this property must be at least 0.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name max-simultaneous-operations-per-connection – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	unlimited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum number of simultaneous operations per connection that is allowed by the associated connection handlers.

This property takes an integer.

The value of this property must be at least 1.

The default behavior for this property is as follows: No limit

This property is used to configure the following features:

resource-limits-policy

Resource limit policies define the maximum resources that Directory Proxy Server can process for a given connection handler.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name max-size – Directory Proxy Server configuration property

Description

Syntax	dataSize
Default value	unlimited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum log size in bytes, kilobytes, Megabytes or Gigabytes.

This property is expressed in bytes.

The value of this property must be at least 1M.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name max-total-operations-per-connection – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	unlimited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum number of operations per connection that is allowed by the associated connection handlers.

This property takes an integer.

The value of this property must be at least 1.

The default behavior for this property is as follows: No limit

This property is used to configure the following features:

resource-limits-policy

Resource limit policies define the maximum resources that Directory Proxy Server can process for a given connection handler.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	dataSize
	Default value	1M
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name min-free-disk-space-size – Directory Proxy Server configuration property

This property specifies the minimum allowed free disk space for logs in bytes, kilobytes, Megabytes, or Gigabytes.

This property is expressed in bytes.

The value of this property must be at least 1M.

The value of this property cannot be unlimited.

This property is used to configure the following features:

access-log

The access log contains information about the requests being processed by the Directory Proxy Server.

error-log

The error logs contain information about the health of the Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name minimum-search-filter-substring-length – Directory Proxy Server configuration property

Description _S

Syntax	integer
Default value	unlimited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the minimum length of a substring in a search filter.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

unlimited No limit

prohibited Substring filters prohibited

This property is used to configure the following features:

```
resource-limits-policy
```

Resource limit policies define the maximum resources that Directory Proxy Server can process for a given connection handler.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name model – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property defines the transformation model. The transformation model is determined by the direction of a transformation, in other words, whether the transformation is applied during the request, during the response, or both.

This property can take the following values in addition to the default.

```
mapping
Mapping
write
```

Store and forget

read

Default virtual value

This property is used to configure the following features:

virtual-transformation

Virtual data transformations create a virtual data view from a physical data view. Practically, you never define a virtual data view. Instead, you specify the transformations that you require and define these on an existing physical data view. A transformation performs a specific action in a certain direction. The direction of a transformation determines the transformation model. When you define a virtual data transformation, you create a virtual attribute that exists only in the context of the virtual data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name modify-dn-weight – Directory Proxy Server configuration property

Description _S

Syntax	integer
Default value	disabled
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the proportion of modify DN requests that are sent to the attached data source.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

disabled

Do not forward any modify DN requests to the data source

This property is used to configure the following features:

attached-ldap-data-source

A data source can be attached to one or more data source pools for load balancing and failover. When attached to a data source pool, a data source is called an attached data source.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name modify-weight – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	disabled
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the proportion of modify requests that are sent to the attached data source.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

disabled

Do not forward any modify requests to the data source

This property is used to configure the following features:

attached-ldap-data-source

A data source can be attached to one or more data source pools for load balancing and failover. When attached to a data source pool, a data source is called an attached data source.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name monitoring-bind-dn – Directory Proxy Server configuration property

Description _S

Syntax	dn
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the DN used for binding to an LDAP data source to check the data source's availability.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: Proxy uses an anonymous access to access the LDAP data source.

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name monitoring-bind-pwd – Directory Proxy Server configuration property

Description S

Syntax	string
Default value	none
Must be set	No
Is modifiable	No
Is multivalued	No
Requires restart	No

This property specifies the password used for binding to an LDAP data source to check the data source's availability.

This property is read-only. To change the password, use the monitoring-bind-pwd-file property.

The default behavior for this property is as follows: Proxy uses an anonymous access to access the LDAP data source.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name monitoring-bind-pwd-file – Directory Proxy Server configuration property

Description

Syntax	password
Default value	No default is defined.
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the file from which to read the password used for binding to an LDAP data source to check the data source's availability. The DN used for binding to an LDAP data source to check the data source's availability is specified by monitoring-bind-pwd(5dpconf). The temporary file is read once, and the password stored for future use.

This property takes a path to a file that contains the password value.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 Description
 Syntax
 duration

 Default value
 5000

 Must be set
 No

 Is modifiable
 Yes

 Is multivalued
 No

 Requires restart
 No

Name monitoring-bind-timeout – Directory Proxy Server configuration property

This property specifies the maximum length of time that the availability monitor waits to establish a connection to the LDAP data source.

The duration is expressed in milliseconds.

The value of this property must be at least 1.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name monitoring-entry-dn – Directory Proxy Server configuration property

Description S

Syntax	dn
Default value	
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the DN of a target entry in a search operation. The availability monitor uses the search operation to test a connection to the data source.

This property takes a Distinguished Name (DN) value.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name monitoring-entry-timeout – Directory Proxy Server configuration property

Description Sv

Syntax	duration
Default value	5000
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum length of time that the availability monitor tries to retrieve the target entry in a search operation. The availability monitor uses the search operation to test a connection to the data source.

The duration is expressed in milliseconds.

The value of this property must be at least 1.

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name monitoring-inactivity-timeout – Directory Proxy Server configuration property

Description

Syntax	duration
Default value	120
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

The availability monitor polls inactive connections to keep them alive. This property specifies how long a connection can be inactive before the availability monitor performs a search on the idle connection to keep it alive.

The duration is expressed in seconds.

The value of this property must be at least 1.

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

SyntaxdurationDefault value30Must be setNoIs modifiableYesIs multivaluedNoRequires restartNo

Name monitoring-interval – Directory Proxy Server configuration property

This property specifies the polling interval. If a connection is found to be down, the availability monitor polls the connection at this interval to detect its recovery.

The duration is expressed in seconds.

The value of this property must be at least 1.

The value of this property cannot be unlimited.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name monitoring-mode – Directory Proxy Server configuration property

Description _S

Syntax	enumeration
Default value	proactive
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the monitoring mode of a data source.

This property can take the following values in addition to the default.

proactive

The availability monitor checks the availability of the data source continuously.

reactive

The availability monitor checks the availability of the data source only after a client request times out, or when an I/O error has been detected.

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name monitoring-search-filter – Directory Proxy Server configuration property

Description

Syntax	string
Default value	((objectClass=*)(objectClass=ldapSubEntry))
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the filter used in a search operation. The availability monitor uses the search operation to test a connection to the data source.

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name non-viewable-attr – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property provides a list of attributes that are not exposed by the data view.

The default behavior for this property is as follows: No restriction is applied on the list of viewable attributes.

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	string
	Default value	none
	Must be set	No
	Is modifiable	Yes
	Is multivalued	Yes
	Requires restart	No

Name non-writable-attr – Directory Proxy Server configuration property

This property provides a list of attributes that cannot be written through the data view.

The default behavior for this property is as follows: No restriction is applied on the list of writable attributes.

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name number-of-search-threads – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	20
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the number of connections that should be made to a data source so that search operations can be performed in parallel.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

unlimited No limit

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	integer
	Default value	2
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	Yes

Name number-of-threads – Directory Proxy Server configuration property

This property specifies the number of threads allocated to the listener to handle simultaneous client connections and requests.

This property takes an integer.

The value of this property must be at least 1.

The value of this property must be no greater than 64.

This property is used to configure the following features:

ldap-listener

The LDAP listener represents the network interface of Directory Proxy Server.

ldaps-listener

The LDAP listener represents the network interface of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name number-of-worker-threads – Directory Proxy Server configuration property

Description [

Syntax	integer
Default value	50
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the number of worker threads available for processing operations in the work queue.

This property takes an integer.

The value of this property must be at least 1.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name num-bind-incr – Directory Proxy Server configuration property

Description _S

Syntax	integer
Default value	10
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the number of new connections that are created when the server needs more connections for bind operations.

This property takes an integer.

The value of this property must be at least 1.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name num-bind-init – Directory Proxy Server configuration property

Description _S

Syntax	integer
Default value	10
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the initial number of connections that should be made to an LDAP data source to perform bind operations.

This property takes an integer.

The value of this property must be at least 0.

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name num-bind-limit – Directory Proxy Server configuration property

Description S

Syntax	integer
Default value	1024
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum number of connections that can be made to an LDAP data source to perform bind operations.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

unlimited

This value means no limit is set for this property.

This property is used to configure the following features:

```
ldap-data-source
The common name of the LDAP data source
```

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE

Stability Level	Evolving

Name numeric-attrs – Directory Proxy Server configuration property

Description

Syntax	string
Default value	all
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the set of attributes that are examined by the distribution algorithm when the distribution-algorithm(5dpconf) is numeric.

The default behavior for this property is as follows: All attributes

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

 No

 Is modifiable
 Yes

 Is multivalued
 No

 Requires restart
 No

Name numeric-default-data-view – Directory Proxy Server configuration property

This property is a flag indicating whether or not the associated data view should act as a default data view in the numeric distribution set and handle requests that contain non-numeric target RDNs.

This property is true or false.

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

	Stability Level	Evolving

Name numeric-lower-bound - Directory Proxy Server configuration property

Description

Syntax	integer
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the lower bound of distribution when the distribution-algorithm(5dpconf) is numeric.

This property takes an integer.

The default behavior for this property is as follows: No lower limit

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Availability	SUNWldap-proxy
Stability Level	Evolving

Name numeric-upper-bound – Directory Proxy Server configuration property

Description _S

Syntax	integer
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the upper bound of distribution when the distribution-algorithm(5dpconf) is numeric.

This property takes an integer.

The default behavior for this property is as follows: No upper limit

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name num-read-incr – Directory Proxy Server configuration property

Description [

Syntax	integer
Default value	10
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the number of new connections that are created when the server needs more connections for read operations.

This property takes an integer.

The value of this property must be at least 1.

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name num-read-init – Directory Proxy Server configuration property

Description S

Syntax	integer
Default value	10
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the initial number of connections that should be made to an LDAP data source to perform read operations.

This property takes an integer.

The value of this property must be at least 0.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name num-read-limit – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	1024
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum number of connections that can be made to an LDAP data source to perform read operations.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

unlimited

This value means no limit is set for this property.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name num-write-incr – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	10
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the number of new connections that are created when the server needs more connections for write operations.

This property takes an integer.

The value of this property must be at least 1.

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name num-write-init – Directory Proxy Server configuration property

Description _S

Syntax	integer
Default value	10
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies the initial number of connections that should be made to an LDAP data source to perform write operations.

This property takes an integer.

The value of this property must be at least 0.

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

No

Name num-write-limit – Directory Proxy Server configuration property

This property specifies the maximum number of connections that can be made to an LDAP data source to perform write operations.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

unlimited

Requires restart

This value means no limit is set for this property.

This property is used to configure the following features:

```
ldap-data-source
The common name of the LDAP data source
```

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name one-level-search-base-dn – Directory Proxy Server configuration property

Description

Syntax	dn
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the list of one-level search bases to which the search-size-limit property applies. Custom search limits are defined for a specific resource limits policy.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: The search-size-limit property does not apply to any one-level search.

This property is used to configure the following features:

custom-search-size-limit

Custom search limits are used to restrict the maximum size of a search result. Custom search limits are defined for a specific resource limits policy.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name pattern-matching-base-object-search-filter – Directory Proxy Server configuration property

Description

Syntax	string
Default value	all
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies a pattern for a search filter. The filter of a base-level search request must match the specified pattern for the request to be handled by the data view.

The default behavior for this property is as follows: Match all base-object search filters

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name pattern-matching-dn-regular-expression – Directory Proxy Server configuration property

Description

Syntax	string
Default value	all
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies a pattern for a regular expression. The target DN of a request must match this pattern in order for the data view to handle the request. The pattern is relative to the base DN of the data view.

The default behavior for this property is as follows: Match all operation target DNs

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name pattern-matching-one-level-search-filter – Directory Proxy Server configuration property

Description

Syntax	string
Default value	all
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies a pattern for a search filter. The filter of a one-level search request must match the specified pattern for the request to be handled by the data view.

The default behavior for this property is as follows: Match all one-level search filters

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name pattern-matching-subtree-search-filter – Directory Proxy Server configuration property

Description

Syntax	string
Default value	all
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies a pattern for a search filter. The filter of a subtree-level search request must match the specified pattern for the request to be handled by the data view.

The default behavior for this property is as follows: Match all subtree search filters

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name primary-table – Directory Proxy Server configuration property

Description

Syntax	string	
Default value	Default behavior is not defined.	
Must be set	Yes	
Is modifiable	Yes	
Is multivalued	No	
Requires restart	No	

This property specifies the primary JDBC table from which the object class obtains its list of entries.

This property is used to configure the following features:

jdbc-object-class

A JDBC object class maps an LDAP object class to one or more relational database tables. A JDBC object class can obtain its information from more than one table. However, one table must be defined as the primary table, and additional tables are defined as secondary tables.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name primary-view – Directory Proxy Server configuration property

Description

Syntax	dnReference	
Default value	Default behavior is not defined.	
Must be set	Yes	
Is modifiable	Yes	
Is multivalued	No	
Requires restart	No	

This property defines the primary data view that forms the source of a join data view.

The value of this property is the name of one of the following configuration entities: jdbc-data-view, join-data-view, ldap-data-view, ldif-data-view.

This property is used to configure the following features:

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Syntax	integer
Default value	99
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

Name priority – Directory Proxy Server configuration property

Description

This property specifies the priority of the connection handler. A connection is evaluated against connection handlers in order of the priority of the connection handler, as follows:

- Priority 1 is the highest priority connection handler.
- Priority 100 is the lowest priority connection handler. Priority 100 is reserved for the default connection handler.

This property takes an integer.

The value of this property must be at least 1.

The value of this property must be no greater than 99.

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name process-bind – Directory Proxy Server configuration property

Description

Syntax	boolean
Default value	No default is defined.
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies whether binds are permitted on a data view.

This property is true or false.

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name prohibited-comparable-attrs - Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies a set of LDAP attribute types that cannot be compared in an LDAP search filter or compare operation.

The default behavior for this property is as follows: None - all attribute types can be compared

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name prohibited-subtrees – Directory Proxy Server configuration property

Description _S

Syntax	dn
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies a set of subtrees that cannot be accessed by clients.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: No subtrees are prohibited

This property is used to configure the following features:

request-filtering-policy Request filtering policies control what data can be accessed by clients.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 Syntax
 duration

 Default value
 1800000

 Must be set
 No

 Is modifiable
 Yes

 Is multivalued
 No

 Requires restart
 No

Name proxied-auth-check-timeout – Directory Proxy Server configuration property

This property specifies a timeout used during proxy authorization.

When a client operation contains a proxy authorization control, Directory Proxy Server checks that the clientDN has the right to impersonate the clientPauthDN.

If client-cred-mode(5dpconf) is set to use-proxy-auth, Directory Proxy Server checks that the clientDN has the relevant ACIs in the LDAP server by using the getEffectiveRights command.

The result is cached in the Directory Proxy Server and renewed when proxied-auth-check-timeout expires.

The duration is expressed in milliseconds.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTI	ЕТҮРЕ	ATTRIBUTE VALUE
Availabi	lity	SUNWldap-proxy
Stability	Level	Evolving

Name proxied-auth-use-v1 – Directory Proxy Server configuration property

Description

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether Directory Proxy Server will use proxy authorization control version 1 or version 2, as follows:

- If the flag is true, Directory Proxy Server uses proxy authorization control v1.
- If the flag is false, Directory Proxy Server uses proxy authorization control v2.

This property is true or false.

This property is used to configure the following features:

ldap-data-source

The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name referral-bind-policy – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	default
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the bind policy that is applied when following referrals.

This property can take the following values in addition to the default.

user

Use credentials if available

anonymous

Always anonymous

The default behavior for this property is as follows: Use the settings specified in the default connection handler.

This property is used to configure the following features:

```
resource-limits-policy
```

Resource limit policies define the maximum resources that Directory Proxy Server can process for a given connection handler.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name referral-hop-limit – Directory Proxy Server configuration property

Description _S

Syntax	integer
Default value	default
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum number of hops that are allowed when following referrals.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

unlimited No limit

The default behavior for this property is as follows: Use the settings specified in the default connection handler.

This property is used to configure the following features:

resource-limits-policy

Resource limit policies define the maximum resources that Directory Proxy Server can process for a given connection handler.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name referral-policy – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	default
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the policy that is applied when a referral is returned by an LDAP server.

This property can take the following values in addition to the default.

follow Follow referrals

forward

Forward referrals to client

discard

Discard referrals

The default behavior for this property is as follows: Use the settings specified in the default connection handler

This property is used to configure the following features:

resource-limits-policy

Resource limit policies define the maximum resources that Directory Proxy Server can process for a given connection handler.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name remote-user-mapping-bind-dn-attr – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the name of the attribute that contains an alternate bind DN. The attribute is contained in a user entry on a remote LDAP server. The attribute is used to perform remote user mapping when enable-remote-user-mapping(5dpconf) is true.

The default behavior for this property is as follows: This property is required when proxy performs remote user mapping.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name replication-role – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	master
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the role that the data view plays in replication distribution.

This property can take the following values in addition to the default.

consumer

The data view simulates a replication consumer and handles read operations only.

master

The data view simulates a replication master and handles read and write operations.

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Stability Level	Evolving

Name request-filtering-policy – Directory Proxy Server configuration property

Description

Syntax	dnReference
Default value	no-filtering
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the name of a request filtering policy which is to be used by the connection handler.

This property has as its value the name of a request-filtering-policy configuration entity.

The default behavior for this property is as follows: No request filtering policy - all requests are permitted.

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name resource-limits-policy – Directory Proxy Server configuration property

Description S

Syntax	dnReference
Default value	no-limits
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the name of a resource limits policy which is to be used by the connection handler.

This property has as its value the name of a resource-limits-policy configuration entity.

The default behavior for this property is as follows: No resource limits policy - no resource limits apply.

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name rule-action – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	hide-entry
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies how the result of a search operation should be returned.

This property can take the following values in addition to the default.

hide-entry

Do not return target entries

hide-attrs

Return target entries, filtering out the attributes specified by the attrs property

show-attrs

Return target entries, filtering out the attributes not specified by the attrs property

This property is used to configure the following features:

search-data-hiding-rule

Search data hiding rules determine what parts of the result of a search operation are returned to a client. Search data hiding rules are defined for a given request filtering policy.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name schema-check-enabled – Directory Proxy Server configuration property

Description [

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not the connection handler should perform a schema check.

This property is true or false.

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name scriptable-alerts-command – Directory Proxy Server configuration property

Description

Syntax	string
Default value	No default is defined.
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the command to use for handling alert messages.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name scriptable-alerts-enabled – Directory Proxy Server configuration property

Description [

Syntax	boolean
Default value	false
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not Directory Proxy Server should use a customizable script for alert notification.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name search-mode – Directory Proxy Server configuration property

Description

Syntax	enumeration
Default value	parallel
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies how searches that span multiple data sources are performed.

This property can take the following values in addition to the default.

parallel

Perform searches in parallel

sequential

Perform searches sequentially

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name search-size-limit - Directory Proxy Server configuration property

Description S

Syntax	integer
Default value	unlimited
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum number of entries that can be returned by a search operation.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

unlimited

This value means no limit is set for this property.

This property is used to configure the following features:

```
custom-search-size-limit
```

Custom search limits are used to restrict the maximum size of a search result. Custom search limits are defined for a specific resource limits policy.

```
resource-limits-policy
```

Resource limit policies define the maximum resources that Directory Proxy Server can process for a given connection handler.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	duration
	Default value	unlimited

No

Yes

No No

Name search-time-limit – Directory Proxy Server configuration property

This property specifies the maximum duration of a search operation.

The duration is expressed in milliseconds.

The value of this property cannot be unlimited.

The default behavior for this property is as follows: No limit

This property is used to configure the following features:

resource-limits-policy

Must be set

Is modifiable

Is multivalued

Requires restart

Resource limit policies define the maximum resources that Directory Proxy Server can process for a given connection handler.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name search-wait-timeout – Directory Proxy Server configuration property

Description [

Syntax	duration
Default value	10000
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the maximum length of time that Directory Proxy Server waits for a search thread to become available.

The duration is expressed in milliseconds.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name search-weight – Directory Proxy Server configuration property

Description

Syntax	integer
Default value	disabled
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the proportion of search requests that are sent to the attached data source.

This property takes an integer.

The value of this property must be at least 1.

This property can also take the following values:

disabled

Do not forward any search requests to the data source

This property is used to configure the following features:

attached-ldap-data-source

A data source can be attached to one or more data source pools for load balancing and failover. When attached to a data source pool, a data source is called an attached data source.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name secondary-table – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies an optional additional JDBC table from which the object class obtains additional information about its entries.

The default behavior for this property is as follows: No additional JDBC table is considered.

This property is used to configure the following features:

jdbc-object-class

A JDBC object class maps an LDAP object class to one or more relational database tables. A JDBC object class can obtain its information from more than one table. However, one table must be defined as the primary table, and additional tables are defined as secondary tables.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name secondary-view – Directory Proxy Server configuration property

Description

Syntax	dnReference
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property defines the secondary data view that forms the source of a join data view.

The value of this property is the name of one of the following configuration entities: jdbc-data-view, join-data-view, ldap-data-view, ldif-data-view.

This property is used to configure the following features:

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name sql-column – Directory Proxy Server configuration property

Description

Syntax	string
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property provides the column in the relational database table from which the LDAP attribute is obtained.

This property is used to configure the following features:

jdbc-attr

JDBC attributes map LDAP attributes to entries in relational database tables. The definition of a JDBC attribute includes the name of the LDAP attribute, and the relational database table and column in which the corresponding information is located.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name	sql-syntax - Directory	Proxy Server config	guration property

Description

Syntax	string
Default value	VARCHAR
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property defines the syntax used to construct an entry in the relational database table from an LDAP entry.

This property is used to configure the following features:

jdbc-attr

JDBC attributes map LDAP attributes to entries in relational database tables. The definition of a JDBC attribute includes the name of the LDAP attribute, and the relational database table and column in which the corresponding information is located.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name sql-table – Directory Proxy Server configuration property

Description

Syntax	string
Default value	Default behavior is not defined.
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the name of the relational database table.

This property is used to configure the following features:

jdbc-table

A JDBC table is created for each relational database table that will be used in the JDBC data view. When you create a JDBC table you specify the name of the table in the relational database, and the name you want to assign to this table in the JDBC data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 Description
 Syntax
 string

 Default value
 none

 Must be set
 No

 Is modifiable
 Yes

 Is multivalued
 No

 Requires restart
 No

Name ssl-client-cert-alias – Directory Proxy Server configuration property

This property specifies the alias of the certificate used to negotiate SSL connections with data sources.

The default behavior for this property is as follows: Proxy applies chooses an alias based on the public key type and the list of certificate issuer authorities recognized by the peer (if any).

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name ssl-policy – Directory Proxy Server configuration property

Description [

Syntax	enumeration
Default value	never
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property specifies whether SSL should be used for connections between Directory Proxy Server and a data source.

This property can take the following values in addition to the default.

always Always use SSL

client Use SSL if the client is using SSL

never

Never use SSL

This property is used to configure the following features:

ldap-data-source The common name of the LDAP data source

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

 Description
 Syntax
 string

 Default value
 none

 Must be set
 No

 Is modifiable
 Yes

 Is multivalued
 No

 Requires restart
 No

Name ssl-server-cert-alias – Directory Proxy Server configuration property

This property specifies the alias of the certificate used to negotiate SSL connections with clients.

The default behavior for this property is as follows: Proxy applies chooses an alias based on the public key type and the list of certificate issuer authorities recognized by the peer (if any). After instance creation, the value of this property is defaultServerCert.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name subtree-search-base-dn – Directory Proxy Server configuration property

Description

Syntax	dn
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies the list of subtree search bases to which the search-size-limit property applies. Custom search limits are defined for a specific resource limits policy.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: The search-size-limit property does not apply to any subtree search.

This property is used to configure the following features:

custom-search-size-limit

Custom search limits are used to restrict the maximum size of a search result. Custom search limits are defined for a specific resource limits policy.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	string
	Default value	none
	Must be set	No
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name super-class – Directory Proxy Server configuration property

This property specifies a list of additional object classes to be returned as part of the object class attribute.

The default behavior for this property is as follows: No additional object class is returned.

This property is used to configure the following features:

jdbc-object-class

A JDBC object class maps an LDAP object class to one or more relational database tables. A JDBC object class can obtain its information from more than one table. However, one table must be defined as the primary table, and additional tables are defined as secondary tables.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name supported-ssl-cipher-suites – Directory Proxy Server configuration property

Description

Syntax	string
Default value	JRE
Must be set	No
Is modifiable	No
Is multivalued	Yes
Requires restart	No

This property specifies the list of SSL cipher suites that are supported by Directory Proxy Server.

The default behavior for this property is as follows: All SSL cipher suites supported by the Java Run Time running the proxy.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name supported-ssl-protocols – Directory Proxy Server configuration property

Description

Syntax	string
Default value	JRE
Must be set	No
Is modifiable	No
Is multivalued	Yes
Requires restart	No

This property specifies the list of SSL protocols that are supported by Directory Proxy Server.

The default behavior for this property is as follows: All SSL protocols supported by the Java Run Time running the proxy.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name syslog-alerts-enabled – Directory Proxy Server configuration property

Description _{Sv}

Syntax	boolean
Default value	false
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not Directory Proxy Server should use the system log for alert notification.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name syslog-alerts-facility – Directory Proxy Server configuration property

Description S

Syntax	string
Default value	USER
Must be set	No
Is modifiable	No
Is multivalued	No
Requires restart	No

This property specifies the syslog message category that alert messages should use.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name syslog-alerts-host – Directory Proxy Server configuration property

Description [

Syntax	ipAddress
Default value	localhost
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the host name of the syslogd daemon that alert messages should be sent to.

This property takes an IP address or host name.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	string
	Default value	none
	Must be set	No
	Is modifiable	Yes
	Is multivalued	Yes
	Requires restart	No

Name target-attr-value-assertions – Directory Proxy Server configuration property

This property specifies a list of attribute:value assertions in the form attrName:attrValue. The search data hiding rule applies to entries that match one or more of the specified assertions.

The syntax of this string is <attr>#<value>.

An attribute value assertion of the form <attribute>#<value>

The value of this property must match the pattern ^[a-zA-Z][-a-zA-Z0-9]+#.+\$.

The default behavior for this property is as follows: No assertion is defined.

This property is used to configure the following features:

search-data-hiding-rule

Search data hiding rules determine what parts of the result of a search operation are returned to a client. Search data hiding rules are defined for a given request filtering policy.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name target-dn-regular-expressions – Directory Proxy Server configuration property

Description _S

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies a list of name patterns. The search data hiding rule applies to entries whose name matches one or more of the specified patterns.

The default behavior for this property is as follows: No pattern is defined.

This property is used to configure the following features:

search-data-hiding-rule

Search data hiding rules determine what parts of the result of a search operation are returned to a client. Search data hiding rules are defined for a given request filtering policy.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name	target-dns - Director	y Proxy Server	configuration property	7
------	-----------------------	----------------	------------------------	---

Description

Syntax	dn
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property specifies a list of entry names. The search data hiding rule applies to all the listed entries.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: No DN is defined.

This property is used to configure the following features:

search-data-hiding-rule

Search data hiding rules determine what parts of the result of a search operation are returned to a client. Search data hiding rules are defined for a given request filtering policy.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name	time-resolution -	Directory P	roxy Server	configuration	property
------	-------------------	-------------	-------------	---------------	----------

Description

Syntax	duration
Default value	500
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the time interval between consecutive system calls that retrieve time from the OS. For details about operations that take less than 500 milliseconds, reduce the time-resolution period. If set to 0 milliseconds, the proxy systematically performs a system call to retrieve the current time, else the time is cached and retrieved only every time-resolution period. This time is displayed in the logs.

The duration is expressed in milliseconds.

The value of this property cannot be unlimited.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name use-cert-subject-as-bind-dn – Directory Proxy Server configuration property

Description

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not Directory Proxy Server should use a user certificate subject as the user DN.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name use-external-schema – Directory Proxy Server configuration property

Description

Syntax	boolean
Default value	false
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	Yes

This property is a flag indicating whether or not Directory Proxy Server should use an external LDAP schema.

This property is true or false.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name	user-bind-dn - Director	y Prox	y Server	configuration	property	
------	-------------------------	--------	----------	---------------	----------	--

Description Synta

Syntax	dn
Default value	none
Must be set	Yes
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the distinguished name of the client that is mapped if enable-user-mapping(5dpconf) is true.

Ι.

The distinguished name of the user that the client is mapped to is specified by mapped-bind-dn(5dpconf).

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: Proxy does no apply user mapping.

This property is used to configure the following features:

user-mapping

In user mapping, a client identity is mapped to the identity of an alternate user. After a BIND operation, the Directory Proxy Server submits subsequent operations as the alternate user.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name user-bind-pwd – Directory Proxy Server configuration property

Description S

Syntax	string
Default value	none
Must be set	No
Is modifiable	No
Is multivalued	No
Requires restart	No

This property specifies the password of the client that is mapped if enable-user-mapping(5dpconf) is true.

The password of the user to which the client is mapped is specified by mapped-bind-pwd(5dpconf).

This property is read-only. To change the password, use the user-bind-pwd-file property.

The default behavior for this property is as follows: The proxy will not associate any password to the mapped identity.

This property is used to configure the following features:

user-mapping

In user mapping, a client identity is mapped to the identity of an alternate user. After a BIND operation, the Directory Proxy Server submits subsequent operations as the alternate user.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Description	Syntax	password
	Default value	No default is defined.
	Must be set	Yes
	Is modifiable	Yes
	Is multivalued	No
	Requires restart	No

Name user-bind-pwd-file – Directory Proxy Server configuration property

This property specifies the file from which to read the password of the client that is mapped if enable-user-mapping(5dpconf) is true.

The password of the user that the client is mapped to is specified by mapped-bind-pwd(5dpconf). The temporary file is read once, and the password stored for future use.

This property takes a path to a file that contains the password value.

This property is used to configure the following features:

user-mapping

In user mapping, a client identity is mapped to the identity of an alternate user. After a BIND operation, the Directory Proxy Server submits subsequent operations as the alternate user.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name user-filter – Directory Proxy Server configuration property

Description

Syntax	string
Default value	any
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies an LDAP search filter. The entry of the bound client must match the LDAP search filter in order for the connection to be accepted by the connection handler.

For example, the following filter could be used as a criteria for a connection handler: "uid>=1000".

Bound clients with a uid that matches the filter can be allocated to the connection handler.

The default behavior for this property is as follows: All users are accepted

This property is used to configure the following features:

connection-handler

Connection handlers define the resource limits and filters that apply to a connection, and the data views that are exposed to the connection.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name user-mapping-anonymous-bind-dn – Directory Proxy Server configuration property

Description S

Syntax	dn
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the bind DN to which anonymous users are mapped if enable-user-mapping(5dpconf) is true.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: No mapping is applied to anonymous users.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name user-mapping-anonymous-bind-pwd – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	No
Is multivalued	No
Requires restart	No

This property specifies the authentication password for anonymous user mapping if enable-user-mapping(5dpconf) is true.

This property is read-only. To change the password, use the user-mapping-anonymous-bind-pwd-file property.

The default behavior for this property is as follows: No mapping is applied to anonymous users.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name user-mapping-anonymous-bind-pwd-file – Directory Proxy Server configuration property

Description

Syntax	password
Default value	No default is defined.
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the file from which to read the authentication password for anonymous user mapping if enable-user-mapping(5dpconf) is true. The temporary file is read once, and the password is stored for future use.

This property takes a path to a file that contains the password value.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name user-mapping-default-bind-dn – Directory Proxy Server configuration property

Description

Syntax	dn
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies a default bind DN to which a user identity is mapped if enable-user-mapping(5dpconf) is true but the mapping fails.

User mapping can fail when a client identity is mapped to a non-existent alternative identity or when there has been a configuration error.

This property takes a Distinguished Name (DN) value.

The default behavior for this property is as follows: No mapping is applied.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name user-mapping-default-bind-pwd – Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	No
Is multivalued	No
Requires restart	No

This property specifies the default bind password to use if enable-user-mapping(5dpconf) is true but the mapping fails.

User mapping can fail when a client identity is mapped to a non-existent alternative identity or when there has been a configuration error.

This property is read-only. To change the password, use the user-mapping-default-bind-pwd-file property.

The default behavior for this property is as follows: No mapping is applied to anonymous users.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy
Stability Level	Evolving

Name user-mapping-default-bind-pwd-file – Directory Proxy Server configuration property

Description

Syntax	password
Default value	No default is defined.
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property specifies the file from which to read the default bind password if enable-user-mapping(5dpconf) is true but the mapping fails. The temporary file is read once, and the password is stored for future use.

This property takes a path to a file that contains the password value.

This property is used to configure the following features:

server

The global configuration of Directory Proxy Server contains properties that affect the overall operation of Directory Proxy Server.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy

Name use-tcp-no-delay – Directory Proxy Server configuration property

Description _{Su}

Syntax	boolean
Default value	true
Must be set	No
Is modifiable	Yes
Is multivalued	No
Requires restart	No

This property is a flag indicating whether or not TCP NODELAY should be enabled for connections between clients and a listener.

Ι.

This property is true or false.

This property is used to configure the following features:

```
ldap-data-source
  The common name of the LDAP data source
```

```
ldap-listener
```

The LDAP listener represents the network interface of Directory Proxy Server.

```
ldaps-listener
```

The LDAP listener represents the network interface of Directory Proxy Server.

 $\textbf{See Also} \quad \texttt{dpconf}(1M)$

Name viewable-attr – Directory Proxy Server configuration property

Description

Syntax	string
Default value	all except non-viewable-attr
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property provides a list of attributes that are exposed by the data view.

The default behavior for this property is as follows: All attributes are viewable

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE		ATTRIBUTE VALUE
Availability		SUNWldap-proxy
Stability Leve	1	Evolving

Name view-value - Directory Proxy Server configuration property

Description

Syntax	string
Default value	none
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property defines the virtual value of the attribute.

The default behavior for this property is as follows: For some transformations, this property is required for the proxy to apply the transformation.

This property is used to configure the following features:

virtual-transformation

Virtual data transformations create a virtual data view from a physical data view. Practically, you never define a virtual data view. Instead, you specify the transformations that you require and define these on an existing physical data view. A transformation performs a specific action in a certain direction. The direction of a transformation determines the transformation model. When you define a virtual data transformation, you create a virtual attribute that exists only in the context of the virtual data view.

Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-proxy

Name writable-attr – Directory Proxy Server configuration property

Description

Syntax	string
Default value	all except non-writable-attr
Must be set	No
Is modifiable	Yes
Is multivalued	Yes
Requires restart	No

This property provides a list of attributes that can be written through the data view.

The default behavior for this property is as follows: All attributes are writable

This property is used to configure the following features:

jdbc-data-view

A JDBC data view enables you to make a relational database accessible to LDAP client applications.

join-data-view

A join data view is an aggregation of multiple data views. The current release of Directory Proxy Server supports the aggregation of two data views into one join data view.

ldap-data-view

An LDAP data view exposes data in an LDAP server to a client request and specifies the data source pool that responds to the request.

ldif-data-view

An LDIF data view allows data in an LDIF file to be present to LDAP applications as if it were LDAP data.

(**REFERENCE**) File Formats

- Name certmap.conf Map certificates to directory entries
- Synopsis Location: instance-path/alias/certmap.conf

```
# This is a comment.
certmap default default
[default:property1 [value1]]
[default:property2 [value2]]
[...]
[certmap name issuerDN
[name:property1 [value1]]
[name:property2 [value2]]
```

... 1

Description The certmap.conf file defines how Directory Server maps certificates to directory entries.

Comment lines are those starting with #.

CERTIFICATE The certmap.conf file consists of a series of certificate maps. It begins with a default certificate map, starting with the line:

certmap default default

Each subsequent certificate map starts with a line identifying the name of the map and the certificate authority issuer DN of the certificates to which the map applies.

The *issuerDN* string specified in the certificate map must correspond *exactly* to the issuer DN shown in the certificates. In particular, whitespace in the issuer DN is significant.

PROPERTIES AND A certificate map also optionally specifies values for the following properties.

VALUES		
	DNComps	Specifies a comma separated list of relative distinguished name components of the base DN for an LDAP search to find the user entry matching the certificate. The components are taken from the subject DN of the certificate.
		When the value of this property value is left empty, the base DN is the null suffix. In this particular case, searching against the null suffix in Directory Server searches every suffix in the directory. Thus leaving DNComps empty can have negative impact on performance.
		The default behavior, when this property is commented out or not specified, is to take as the base DN the subject DN of the certificate.
	FilterComps	Specifies a comma separated list of LDAP attributes to form a filter for an LDAP search to find the user entry matching the certificate. The values for the filter are taken from the certificate, which can hold the following attributes.

	С	Country
	cn	Common name
	e mail	Email address
	l	Location
	0	Organization
	ou	Organizational unit
	st	State
	uid	UNIX user ID
		nple, consider a certificate map named example containing the gFilterComps specification.
	example:	FilterComps e,uid
		urches for the user entry matching the certificate use the filter (mail= <i>email-addr-from-cert</i>) (<i>uid-from-cert</i>))".
		ult behavior, when this property is commented out or not , is to use the filter "(objectclass=*)".
verifycert	-	whether the client application certificate is checked to make sure and not revoked.
		perty can be usefully set to on if the directory stores client on certificates.
		ult behavior is the same as off, meaning client certificates are not to be valid and not revoked.
CmapLdapAttr		the name of the LDAP attribute in the directory containing the DN of the certificate.
	The imp attribute	lied default value is certSubjectDN, not a standard LDAP
	the subje	the LDAP attribute used is not of syntax DN, its value must match act DN provided <i>exactly</i> as the LDAP server does normalize DN at are not stored in attributes with DN syntax.
library	Specifies mapping	a shared plug-in library or DLL containing custom certificate g code.
	There is	no default.

InitFn Specifies the initialization function for the custom certificate mapping code in the library referenced by the value of the library property.

There is no default.

Examples The following certmap.conf file specifies both a default certificate map, and an additional certificate map for certificates from the US subsidiary of Example.com.

```
# Example certmap.conf
certmap default default
certmap examplecerts ou=Example.com, o=examplecerts, c=US
examplecerts:DNComps ou,o,c
examplecerts:FilterComps e
examplecerts:verifycert on
```

When the server gets a certificate issued by any certificate authority other than the US subsidiary of Example.com, it uses the default mapping. If the certificate however has been issued by the US subsidiary of Example.com, the server looks for entries under the branch for the organizational unit and searches for entries using the client email address. It also verifies that such certificates are valid and that they are not revoked.

Name dse.ldif – Directory Server configuration file

- Synopsis Location: *instance-path*/config/dse.ldif Location: *instance-path*/conf_bk/dse.ldif
- **Description** Directory Server stores its configuration as directory entries under cn=config. You can therefore change the server configuration by modifying configuration entries over LDAP, rather than by editing configuration files. Configuring Directory Server in this way allows you to reconfigure a remote server while it continues to serve other directory clients.

The dse.ldif file defines the configuration for a Directory Server instance. The dse.ldif file includes a set of entries under cn=config. These entries make up the modular parts of the Directory Server instance configuration.

Directory Server stores its schema under cn=schema, not as part of the rest of the server configuration. For an introduction to the schema available under cn=schema, see Intro(5DSSD).

Note – Neither the dse.ldif file nor the cn=config suffix constitute a public interface for configuring a Directory Server instance. Use dsconf(1M) instead.

The dse.ldif file has the following characteristics.

- The dse.ldif file is read only once at startup. Thereafter, the server configuration is based on the in-memory LDAP image of the configuration entries. Modifications to the dse.ldif file while the server is running are erased.
- Modification of the configuration with Directory Service Control Center or from the command line changes the LDAP image of the configuration. Some directory features read the current configuration when invoked and do not require the server to be restarted.
- Directory Server writes the dse.ldif file whenever the LDAP image of the configuration is changed. Some directory features read their configuration only when the server starts. Writing the file ensures the change is present.

The existing dse.ldif file is copied to dse.ldif.bak, and the existing dse.ldif.bak is overwritten. Therefore, any manual changes to the dse.ldif file are lost if the configuration is changed through LDAP before the server is restarted.

- After every successful startup of the directory, the dse.ldif file is copied to dse.ldif.startOK in the same location. If your server cannot start because of a faulty configuration, restore the dse.ldif file from the dse.ldif.startOK file.
- The following restrictions apply to modifications to the server configuration.
 - Rather than delete configuration entries and add them again, you modify their attributes.
 - Some modifications only take effect after the server is restarted. See ATTRIBUTES REQUIRING RESTART in the manual page for details.
 - The cn=monitor entry cannot be modified.

The server ignores invalid attribute values.

Extended Description		
	<pre>cn=encryption,cn=config</pre>	Configuration attributes related to encryption
	cn=features,cn=config	Access control for many server features, also configuration for internationalized matching and searching
	<pre>cn=mapping tree,cn=config</pre>	Configuration for suffixes and replica
	cn=Password Policy,cn=config	Default password policy configuration
	cn=plugins,cn=config	Plug-in configuration entries for plug-in based server functionality, databases, indexes
	<pre>cn=replication,cn=config</pre>	Default replication bind information for cn=Replication Manager, also formerly used for replication configuration
	cn= <i>suffixName</i> ,cn=config	Suffix configuration attributes
	cn=tasks,cn=config	Used by the server to manage online import, backup, and so forth
	cn=uniqueid generator,cn=config	Configuration attributes for providing unique IDs

About Configuration Attributes The dse.ldif file contains all configuration information including directory specific entries created by Directory Server at startup, and directory specific entries related to the database, also created by Directory Server at startup. The file includes the Root DSE, named by "", and the entire contents of cn=config. When the server generates the dse.ldif file, it lists the entries in hierarchical order. It does so in the order that the entries appear in the directory under cn=config.

Within a configuration entry, each attribute is represented as an attribute name. The value of the attribute corresponds to the attribute's configuration.

The following example shows part of the dse.ldif file for a Directory Server instance. The example indicates, among other things, that schema checking has been turned *on*. This is represented by the attribute nsslapd-schemacheck, which takes the value on.

```
dn: cn=config
objectclass: top
objectclass: extensibleObject
objectclass: nsslapdConfig
nsslapd-accesslog-logging-enabled: on
nsslapd-enquote-sup-oc: on
nsslapd-localhost: myServer.example.com
```

```
nsslapd-errorlog: /local/ds/logs/errors
nsslapd-schemacheck: on
nsslapd-port: 389
nsslapd-localuser: nobody
...
```

See *CONFIGURATION ATTRIBUTES* in this manual page for a list of configuration attribute manual pages.

Access Control For W Configuration Entries in

When Directory Server is installed, a default set of Access Control Instructions, ACIs, is implemented for all entries under cn=config. The following extract from the dse.ldif file shows an example of these default ACIs.

```
aci: (targetattr != "aci") (targetscope = "base") (version 3.0;
aci "Enable read access to rootdse for anonymous users";
allow(read,search,compare) userdn="ldap:///anyone"; )
aci: (targetattr = "*") (version 3.0; acl "Enable full access
for Administrators group"; allow (all)(groupdn = "
ldap:///cn=Administrators,cn=config"); )
aci: (targetattr = "userPassword") ( version 3.0;
acl "allow userpassword self modification";
allow (write) userdn = "ldap:///self";)
```

By default, both the cn=Directory Manager user and the cn=admin, cn=Administrators, cn=config user have access to modify configuration entries. ACI syntax is covered elsewhere in the Directory Server Enterprise Edition documentation.

ConfigurationThis section lists configuration attributes by their location in the configuration Directory
Information Tree.

Attributes of General configuration entries are stored under the cn=config entry. The cn=config entry is an instance of the nsslapdConfig object class, which inherits from the extensibleObject object class. For attributes to be taken into account by the server, the entry must contain the nsslapdConfig object class, the extensibleObject object class and the top object class.

See the following manual pages.

- nsslapd-schemacheck(5dsconf)
- nsslapd-securePort(5dsconf)
- nsslapd-securelistenhost(5dsconf)
- nsslapd-security(5dsconf)
- nsslapd-sizelimit(5dsconf)
- nsslapd-threadnumber(5dsconf)
- nsslapd-timelimit(5dsconf)
- nsslapd-versionstring(5dsconf)
- useAuthzIdForAuditAttrs(5dsconf)

Attributes of Encryption related attributes are stored under the cn=encryption, cn=config entry. This cn=encryption, cn=config entry is an instance of the nsEncryptionConfig object class. For encryption related attributes to be taken into account by the server, this object class, in addition to the top object class, must be present in the entry.

See the following manual pages.

- nsSSL2(5dsconf)
- nsSSL3(5dsconf)
- nsSSL3ciphers(5dsconf)

- nsSSLClientAuth(5dsconf)
- nsSSLServerAuth(5dsconf)
- nsSSLSessionTimeout(5dsconf)

Attributes of Configuration attributes for suffixes and replication are stored under the branch cn=mapping tree, cn=config.

Configuration attributes related to suffixes are found under the suffix subentry, which has a DN of the following form.

cn="suffixName",cn=mapping tree,cn=config

Suffix configuration entries therefore have CNs such as cn="dc=example,dc=com". Suffix configuration entries are instances of the nsMappingTree object class, which inherits from the extensibleObject object class. For suffix configuration attributes to be taken into account by the server, these object classes, in addition to the top object class, must be present in the entry. See the following man pages about suffix configuration entry attributes.

- nsslapd-backend(5dsconf)
- nsslapd-distribution-plugin(5dsconf)
- nsslapd-distribution-funct(5dsconf)
- nsslapd-referral(5dsconf)
- nsslapd-state(5dsconf)

Replication configuration attributes are stored under an entry with a DN of the following form.

cn=replica,cn="suffixName",cn=mapping tree,cn=config

Replication agreement attributes are stored under an entry with a DN of the following form.

See replication(5dsconf) for details.

Attributes of cn=Password Policy

 of The default password policy entry for a Directory Server instance has DN cn=Password
 Policy, cn=config. For help configuring password policy, see the *Directory Server* Administration Guide.

For details concerning password policy entries, see pwpolicy(5dssd). Entries having the object classes described in pwdPolicy(5dsoc), and in sunPwdPolicy(5dsoc) are used to configure password policy.

For instructions concerning legacy password policy functionality, see the *Directory Server Migration Guide*. Legacy password policy functionality is configured using entries of the object class described in passwordPolicy(5dsoc).

Plug-In Configuration Under cn=plugins Many of the features of Directory Server are designed as discrete modules that plug into the core server. The configuration for each part of Directory Server plug-in functionality has its own separate entry and set of attributes under the subtree cn=plugins, cn=config. The following example shows the configuration entry for the Telephone Syntax plug-in.

```
dn: cn=Telephone Syntax,cn=plugins,cn=config
objectclass: top
objectclass: nsSlapdPlugin
objectclass: ds-signedPlugin
objectclass: extensibleObject
cn: Telephone Syntax
nsslapd-pluginPath: /opt/SUNWdsee/ds6/lib/syntax-plugin.so
nsslapd-pluginInitfunc: tel_init
nsslapd-pluginType: syntax
nsslapd-pluginEnabled: on
...
```

Some of these attributes are common to all plug-ins and some may be particular to a specific plug-in.

Chained Suffix Plug-In Configuration

All plug-in configuration information used by the chained suffix instances is stored under the cn=chaining database, cn=plugins, cn=config entry.

The following global chained suffix configuration attributes common to all instances are stored under cn=config, cn=chaining database, cn=plugins, cn=config.

- nsActiveChainingComponents(5dsconf)
- nsMaxResponseDelay(5dsconf)
- nsMaxTestResponseDelay(5dsconf)
- nsTransmittedControls(5dsconf)

Default instance chained suffix attributes are stored under cn=default instance config, cn=chaining database, cn=plugins, cn=config.

- nsAbandonedSearchCheckInterval(5dsconf)
- nsBindConnectionsLimit(5dsconf)
- nsBindRetryLimit(5dsconf)
- nsBindTimeout(5dsconf)
- nsCheckLocalACI(5dsconf)
- nsConcurrentBindLimit(5dsconf)
- nsConcurrentOperationsLimit(5dsconf)
- nsConnectionLife(5dsconf)
- nsOperationConnectionsLimit(5dsconf)
- nsProxiedAuthorization(5dsconf)
- nsReferralOnScopedSearch(5dsconf)

- nsslapd-sizelimit(5dsconf)
- nsslapd-timelimit(5dsconf)

Instance-specific chained suffix attributes are stored under cn=*chainedSuffix*, cn=chaining database, cn=plugins, cn=config.

- nsFarmServerURL(5dsconf)
- nshoplimit(5dsconf)
- nsMultiplexorBindDN(5dsconf)
- nsMultiplexorCredentials(5dsconf)

The following list shows the chained suffix attributes used for monitoring activity on instances. These attributes are stored under cn=monitor, cn=dbName, cn=chaining database, cn=plugins, cn=config.

nsAddCount	Number of add operations received.
nsDeleteCount	Number of delete operations received.
nsModifyCount	Number of modify operations received.
nsRenameCount	Number of rename operations received.
nsSearchBaseCount	Number of base level searches received.
nsSearchOneLevelCount	Number of one-level searches received.
nsSearchSubtreeCount	Number of subtree searches received.
nsAbandonCount	Number of abandon operations received.
nsBindCount	Number of bind requests received.
nsUnbindCount	Number of unbinds received.
nsCompareCount	Number of compare operations received.
nsOperationConnectionCount	Number of open connections for normal operations.
nsBindConnectionCount	Number of open connections for bind operations.

Database Plug-In Configuration

Database plug-in configuration entries are stored under cn=ldbm database, cn=plugins, cn=config. That entry is a server plug-in configuration entry for databases, and therefore takes the same attributes as other plug-in entries.

Key entries beneath the plug-in configuration entry are listed as follows.

cn=*attr*, cn=default indexes, cn=config, cn=ldbm database, cn=plugins, cn=config Configuration entries for default indexes. Notice that each individual attribute type indexed has its own entry, and that the attribute type is identified by common name, CN. See the following man pages concerning attributes for such entries.

- cn(5dsat)
- description(5dsat)
- nsIndexType(5dsconf)
- nsMatchingRule(5dsconf)
- nsSystemIndex(5dsconf)

cn=attr,cn=index,cn=dbName,cn=ldbm database, cn=plugins,cn=config

Configuration entries for indexing for attributes of the suffix whose backend database has CN *dbName*. Such entries take the same configuration attributes as configuration entries for default indexes.

All indexes, except system-essential ones, can be removed, but care should be taken not to cause unnecessary disruptions.

cn=config,cn=ldbm database,cn=plugins,cn=config

Global configuration information for all databases. See the following man pages concerning attributes for such entries.

- nsLookthroughLimit(5dsconf)
- nsslapd-db-checkpoint-interval(5dsconf)
- nsslapd-db-circular-logging(5dsconf)
- nsslapd-db-durable-transactions(5dsconf)
- nsslapd-db-home-directory(5dsconf)
- nsslapd-db-idl-divisor(5dsconf)
- nsslapd-db-locks(5dsconf)
- nsslapd-db-logbuf-size(5dsconf)
- nsslapd-db-logdirectory(5dsconf)
- nsslapd-db-logfile-size(5dsconf)
- nsslapd-db-page-size(5dsconf)
- nsslapd-db-transaction-batch-val(5dsconf)
- nsslapd-db-tx-max(5dsconf)
- nsslapd-dbcachesize(5dsconf)
- nsslapd-dbncache(5dsconf)
- nsslapd-disk-full-threshold(5dsconf)
- nsslapd-disk-low-threshold(5dsconf)
- nsslapd-exclude-from-export(5dsconf)
- nsslapd-import-cachesize(5dsconf)
- nsslapd-mode(5dsconf)

cn=database,cn=monitor,cn=ldbm database, cn=plugins,cn=config

Entry for read-only database performance monitoring attributes. All of the values for these attributes are 32-bit integers.

nsslapd-db-abort-rate	Number of transactions that have been aborted.
nsslapd-db-active-txns	Number of transactions that are currently active (used by the database.)

nsslapd-db-cache-hit	Requested pages found in the cache.
nsslapd-db-cache-region-wait-rate	Number of times that a thread of control was forced to wait before obtaining the region lock.
nsslapd-db-cache-size-bytes	Total cache size in bytes.
nsslapd-db-cache-try	Total cache lookups.
nsslapd-db-clean-pages	Clean pages currently in the cache.
nsslapd-db-commit-rate	Number of transactions that have been committed.
nsslapd-db-configured-locks	Configured number of locks.
nsslapd-db-configured-txns	Configured number of transactions.
nsslapd-db-current-locks	Number of locks currently used by the database.
nsslapd-db-deadlock-rate	Number of deadlocks detected.
nsslapd-db-dirty-pages	Dirty pages currently in the cache.
nsslapd-db-hash-buckets	Number of hash buckets in buffer hash table.
nsslapd-db-hash-elements-examine-rate	Total number of hash elements traversed during hash table lookups.
nsslapd-db-hash-search-rate	Total number of buffer hash table lookups.
nsslapd-db-lock-conflicts	Total number of locks not immediately available due to conflicts.
nsslapd-db-lockers	Number of current lockers.
nsslapd-db-lock-region-wait-rate	Number of times that a thread of control was forced to wait before obtaining the region lock.
nsslapd-db-lock-request-rate	Total number of locks requested.
nsslapd-db-log-bytes-since-checkpoint	Number of bytes written to this log since the last checkpoint.
nsslapd-db-log-flush-commit	The number of log flushes that contained a transaction commit record.

nsslapd-db-log-flush-count	The number of times the log has been flushed to disk.
nsslapd-db-log-max-commit-per-flush	The maximum number of commits contained in a single log flush.
nsslapd-db-log-min-commit-per-flush	The minimum number of commits contained in a single log flush that contained a commit.
nsslapd-db-log-region-wait-rate	Number of times that a thread of control was forced to wait before obtaining the region lock.
nsslapd-db-log-write-count	The number of times the log has been written to disk.
nsslapd-db-log-write-count-fill	The number of times the log has been written to disk because the in-memory log record cache filled up.
nsslapd-db-log-write-rate	Number of bytes written to the log since the last checkpoint.
nsslapd-db-longest-chain-length	Longest chain ever encountered in buffer hash table lookups.
nsslapd-db-max-locks	Maximum number of locks used by the database since the last startup.
nsslapd-db-max-txns	Maximum number of transactions used since the last startup.
nsslapd-db-page-create-rate	Pages created in the cache.
nsslapd-db-page-read-rate	Pages read into the cache.
nsslapd-db-page-ro-evict-rate	Clean pages forced from the cache.
nsslapd-db-page-rw-evict-rate	Dirty pages forced from the cache.
nsslapd-db-pages-in-use	All pages, clean or dirty, currently in use.
nsslapd-db-page-trickle-rate	Dirty pages written using the memp_trickle interface.
nsslapd-db-page-write-rate	Pages read into the cache.
nsslapd-db-txn-region-wait-rate	Number of times that a thread of control was force to wait before obtaining the region lock.

cn=dbName,cn=ldbm database,cn=plugins,cn=config

Configuration information for databases backing suffixes you define. The *dbName* is by default a contraction of the common name for the suffix. For example, if the suffix has CN cd=example, dc=com, the *dbName* might be example. See the following man pages concerning attributes for such entries.

- nsslapd-cachesize(5dsconf)
- nsslapd-cachememsize(5dsconf)
- nsslapd-directory(5dsconf)
- nsslapd-readonly(5dsconf)
- nsslapd-require-index(5dsconf)
- nsslapd-suffix(5dsconf)

Virtual list view, VLV, index entries are found beneath this entry.

A VLV index provides fast searches against a known result set and sort ordering. To do this, the object class vlvSearch is needed to define the VLV search, and the object class vlvIndex is needed to order the search. See the following manual pages for details on the VLV configuration entry object classes and attributes.

- vlvBase(5dsat)
- vlvEnabled(5dsat)
- vlvFilter(5dsat)
- vlvScope(5dsat)
- vlvSort(5dsat)
- vlvUses(5dsat)
- vlvIndex(5dsoc)
- vlvSearch(5dsoc)

cn=default indexes, cn=config, cn=ldbm database, cn=plugins, cn=config Configuration entry for default indexing for all suffixes. Default indexes are configured per backend in order to optimize Directory Server functionality for the majority of deployments.

cn=monitor, cn=*dbName*, cn=ldbm database, cn=plugins, cn=config Entry for database monitoring attributes, listing database statistics for monitoring activity on the *dbName*database. These attributes are provided for each file that makes up your database.

dbentrycount	Total number of entries in the database, including entries created by replication.
dbfilename-number	This attribute indicates the name of the file and provides a sequential integer identifier, starting at 0, for the file. All associated statistics for the file are given the same numerical identifier.
dbfilecachehit	Number of times that a search requiring data from this file was performed and data successfully obtained from the cache.

dbfilecachemiss	Number of times that a search requiring data from this file was performed and that the data could not be obtained from the cache.
dbfilepagein	Number of pages brought to the cache from this file.
dbfilepageout	Number of pages for this file written from cache to disk.
entrycachehitratio	Ratio that indicates the number of entry cache tries to successful entry cache lookups.
entrycachehits	Total number of successful entry cache lookups.
ldapentrycount	Number of user entries in the database.
maxentrycachecount	Maximum number of directory entries that are allowed to be maintained in the entry cache.
maxentrycachesize	Maximum memory size allowed for entry cache, in bytes.

cn=monitor,cn=ldbm database,cn=plugins,cn=config

Entry for database monitoring attributes, listing database statistics for monitoring activity on databases.

dbcachehits	Requested pages found in the database.
dbcachetries	Total requested pages found in the database cache.
dbcachehitratio	Percentage of requested pages found in the database cache, hits/tries.
dbcachepagein	Pages read into the database cache.
dbcachepageout	Pages written from the database cache to the backing file.
dbcacheroevict	Clean pages forced from the cache.
dbcacherwevict	Dirty pages forced from the cache.

DSML Front End Plug-In Configuration Attributes

The front end plug-in enables you to access directory data by methods other than LDAP. Directory Server provides a DSML front end plug-in that enables access using DSMLv2 over HTTP/SOAP. Attributes for the DSML front end plug-in are stored under cn=DSMLv2-SOAP-HTTP, cn=frontends, cn=plugins, cn=config. See the following manual pages for details.

- ds-hdsml-clientauthmethod(5dsconf)
- ds-hdsml-dsmlschemalocation(5dsconf)
- ds-hdsml-iobuffersize(5dsconf)
- ds-hdsml-poolmaxsize(5dsconf)
- ds-hdsml-poolsize(5dsconf)

- ds-hdsml-port(5dsconf)
- ds-hdsml-requestmaxsize(5dsconf)
- ds-hdsml-responsemsgsize(5dsconf)
- ds-hdsml-rooturl(5dsconf)
- ds-hdsml-secureport(5dsconf)
- ds-hdsml-soapschemalocation(5dsconf)

Retro Changelog Plug-In Configuration

The following manual pages describe attributes used when configuring the retro changelog plug-in.

- nsslapd-changelogdir(5dsconf)
- nsslapd-changelogmaxage(5dsconf)
- nsslapd-changelogmaxentries(5dsconf)

Server Plug-In Configuration Entries

All plug-ins are instances of the nsSlapdPlugin object class, which in turn inherits from the extensibleObject object class. For plug-in configuration attributes to be taken into account by the server, both of these object classes, in addition to the top object class, must be present in the entry.

See nsslapd-plugin(5dsconf) for an overview of the plug-ins provided with Directory Server, including configurable options, configurable arguments, default setting, dependencies, general performance related information, and further reading.

Attributes of cn=uniqueid generator,cn=config Unique ID generator configuration attributes are stored under the entry with DN cn=uniqueid generator, cn=config. The cn=uniqueid generator, cn=config entry is an instance of the extensibleObject object class. For unique ID generator configuration attributes to be taken into account by the server, this object class, in addition to the top object class, must be present in the entry.

The principal unique ID generator attribute is nsState(5dsconf).

Attributes This section lists configuration elements whose modifications cannot take effect dynamically, while the server is still running. After modifying these parameters, you must restart the server. The following list shoiws the configuration attributes concerned, with their full DNs, and provides a brief description of their functions.

Any plug-in configuration attribute Changing plug-in settings.

cn=config:nsslapd-port
 Changing the port number.

cn=config:nsslapd-secureport
 Changing the secure port number.

cn=config:nsslapd-security Enabling or disabling use of SSL, TLS, and attribute encryption.
cn=config:nsslapd-changelogdir Modifying the change log database path.
<pre>cn=config:nsslapd-changelogsuffix Modifying the change log suffix.</pre>
<pre>cn=config:nsslapd-return-exact-case Modifying whether the server returns exact case matches for attribute names.</pre>
<pre>cn=config,cn=ldbm database,cn=plugins,cn=config:nsslapd-allidsthreshold Changing the all IDs threshold value.</pre>
<pre>cn=config,cn=ldbm database,cn=plugins,cn=config:nsslapd-dbcachesize Modifying the size of the database cache.</pre>
<pre>cn=config,cn=ldbm database,cn=plugins,cn=config:nsslapd-dbncache Modifying whether the database cache memory is split into equally sized pieces.</pre>
<pre>cn=config,cn=ldbm database,cn=plugins,cn=config:nsslapd-directory Changing the path to the database instance.</pre>
<pre>cn=config,cn=ldbm database,cn=plugins,cn=config:nsslapd-db-locks</pre>
<pre>cn=encryption,cn=config:nssslsessiontimeout Changing the lifetime of an SSL session.</pre>
<pre>cn=encryption,cn=config:nssslclientauth Enabling or disabling client authentication.</pre>
cn=encryption,cn=config:nssslserverauth Enabling or disabling server authentication.
<pre>cn=encryption,cn=config:nsssl2 Enabling or disabling SSL Version 2 for Directory Server.</pre>
<pre>cn=encryption,cn=config:nsssl3 Enabling or disabling SSL Version 3 for Directory Server.</pre>
<pre>cn=RSA, cn=encryption, cn=config:nsssltoken Changing the SSL token.</pre>
<pre>cn=RSA, cn=encryption, cn=config:nssslpersonalityssl Changing the SSL personality.</pre>
cn=RSA, cn=encryption, cn=config:nssslactivation Enabling or disabling the SSL encryption module.
<pre>cn=suffixName,cn=ldbm database,cn=plugins,cn=config:nsslapd-cachesize Modifying the number of entries held in the entry cache.</pre>

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal as a supported interface after this release

Name hosts_access - Format of host access control files for Directory Server Enterprise Edition

- **Synopsis** *instance-path/*config/hosts.allow *instance-path/*config/hosts.deny
- **Description** This manual page describes a simple access control language that is based on client (host name/address, user name), and server (process name, host name/address) patterns. Examples are given at the end. The impatient reader is encouraged to skip to the EXAMPLES section for a quick introduction.

In the following text, daemon is the the process name of a network daemon process, and client is the name and/or address of a host requesting service.

Note that the version of hosts_access supplied with Directory Server Enterprise Edition is different from the version delivered with Solaris. The Directory Server Enterprise Edition version of hosts_access has the following characteristics:

- Shell commands are not available on Microsoft Windows.
- hosts_options are not available on any OS.
- IPv6 is supported on all platforms except Windows.
- PARANOID mode is not available.
- You cannot replace the lib with your own lib, as it is statically linked to the server.
- There is no support of NIS Netgroups. Any '@' symbols in rules are ignored.
- The daemon_list process name is the port number of the server. For example, 3389:eng.example.com or 636:192.168.11.254. Port numbers are server properties: ldap-port, ldap-secure-port, dsml-port, dsml-secure-port. Use the dsconf command to view and modify these properties.
- Server instances can share files by pointing the instance name at the same file
 (*instance-path*/config/hosts.allow). Use the dsconf command to view and modify the
 server property host-access-dir-path. For example, to have all server instances pointing
 to /etc/hosts.{deny,allow}, run the following command on all servers: \$ dsconf
 set-server-prop -h host -p port host-access-dir-path: /etc
- You can make changes to the hosts_access or hosts_deny files without needing to restart the server. You can safely ignore the ds conf server restart message.
- Two conditions must be met in order for acess to be allowed. Firstly, the permissions of the file(s) must be owned by nsslapd-localuser or root and secondly write permission must be allowed for the owner, but not for group or other. Ensure that you use correct permissions, as incorrect permissons on shared files can cause problems. Note that these conditions are not checked on Windows platforms.

ACCESS CONTROL The access control software consults two files. The search stops at the first match:

 Access will be granted when a (daemon, client) pair matches an entry in the *instance-path*/config/hosts.allow file.

- Otherwise, access will be denied when a (daemon, client) pair matches an entry in the *instance-path*/config/hosts.deny file.
- Otherwise, access will be granted.

A non-existing access control file is treated as if it were an empty file. Thus, access control can be turned off by providing no access control files.

ACCESS CONTROL RULES Each access control file consists of zero or more lines of text. These lines are processed in order of appearance. The search terminates when a match is found.

- A newline character is ignored when it is preceded by a backslash character. This permits you to break up long lines so that they are easier to edit.
- Blank lines or lines that begin with a '#' character are ignored. This permits you to insert comments and whitespace so that the tables are easier to read.
- All other lines should satisfy the following format:

Hosts are identified by server port numbers. If there is no port number match or wildcard, the access control check skips that line of the file.

List elements should be separated by blanks and/or commas.

All access control checks are case insensitive.

PATTERNS The access control language implements the following patterns:

- A string that begins with a '.' character. A host name is matched if the last components of its name match the specified pattern. For example, the pattern '.tue.nl' matches the host name 'wzv.win.tue.nl'.
- A string that ends with a '.' character. A host address is matched if its first numeric fields match the given string. For example, the pattern '131.155.' matches the address of (almost) every host on the Eindhoven University network (131.155.x.x).
- An expression of the form 'n.n.n.n/m.m.m.' is interpreted as a 'net/mask' pair. A host address is matched if 'net' is equal to the bitwise AND of the address and the 'mask'. For example, the net/mask pattern '131.155.72.0/255.255.254.0' matches every address in the range '131.155.72.0' through '131.155.73.255'.
- When using IPv6 for matching, be aware that an expression of the form
 [n:n:n:n:n:n:n]/m is interpreted as a [net]/prefixlen pair. An IPv6 host address is
 matched if prefixlen bits of net is equal to the prefixlen bits of the address. For example, the
 [net]/prefixlen pattern [3ffe:505:2:1::]/64 matches every address in the range
 3ffe:505:2:1:: through 3ffe:505:2:1:ffff:ffff.
- WILDCARDS Wildcards '*' and '?' can be used to match hostnames or IP addresses. However, this method of matching cannot be used in conjunction with the following: net/mask matching, hostname matching beginning with '.', IP address matching ending with '.' or a IPv6 rule (begins with '[').

The access control language supports explicit wildcards:

	ALL	The universal wildcard, always matches.
	LOCAL	Matches any host whose name does not contain a dot character.
	UNKNOWN	Matches any user whose name is unknown, and matches any host whose name or address are unknown. This pattern should be used with care: host names may be unavailable due to temporary name server problems. A network address will be unavailable when the software cannot figure out what type of network it is talking to.
		Sun does not recommend that you use the UNKNOWN wildcard. Directory Server always fills in both host and address, so there is never a case when the host name is unknown. The user is unavailable because of no NIS netgroups support.
	KNOWN	Matches any user whose name is known, and matches any host whose name and address are known. This pattern should be used with care: host names may be unavailable due to temporary name server problems. A network address will be unavailable when the software cannot figure out what type of network it is talking to.
		In Directory Server the user is always marked as unknown and is unavailable because of the NIS Netgroup restriction.
OPERATORS		Intended use is of the form: 'list_1 EXCEPT list_2'; this construct matches anything that matches list_1 unless it matches list_2. The EXCEPT operator can be used in daemon_lists and in client_lists. The EXCEPT operator can be nested: if the control language would permit the use of parentheses, 'a EXCEPT b EXCEPT c' would parse as '(a EXCEPT (b EXCEPT c))'.
SHELL COMMANDS	Note that shell commands are not available on Microsoft Windows.	
	 If the first-matched access control rule contains a shell command, that command is subjected to %<i>letter</i> substitutions (see next section). The result is executed by a /bin/sh child process with standard input, output and error connected to /dev/null. Specify an '&' at the end of the command if you do not want to wait until it has completed. 	
	 Shell commands should not rely on the PATH setting of the inetd. Instead, they should absolute path names, or they should begin with an explicit PATH=whatever statement. 	
% EXPANSIONS	The following expansions are available within shell commands:	
	%a (%A)	The client (server) host address.
	%с	Client information: user@host, user@address, a host name, or just an address, depending on how much information is available.
	%d	The daemon process name (argv[0] value).
	%h (%H)	The client (server) host name or address, if the host name is unavailable.

%n (%N)	The client (serve	r) host name (or "unknown").
---------	-------------------	----------------	----------------

- %p The daemon process id.
- %s Server information: daemon@host, daemon@address, or just a daemon name, depending on how much information is available.
- %u The client user name (or "unknown").
- %% Expands to a single '%' character.

Characters in % expansions that may confuse the shell are replaced by underscores.

Examples The language is flexible enough that different types of access control policy can be expressed with a minimum of fuss. Although the language uses two access control tables, the most common policies can be implemented with one of the tables being trivial or even empty.

When reading the examples below it is important to realize that the allow table is scanned before the deny table, that the search terminates when a match is found, and that access is granted when no match is found at all.

The examples use host and domain names. They can be improved by including address and/or network/netmask information, to reduce the impact of temporary name server lookup failures.

MOSTLY CLOSED In this case, access is denied by default. Only explicitly authorized hosts are permitted access.

The default policy (no access) is implemented with a trivial deny file:

instance-path/config/hosts.deny: ALL: ALL

This denies all service to all hosts, unless they are permitted access by entries in the allow file.

The explicitly authorized hosts are listed in the allow file. For example:

instance-path/config/hosts.allow: ALL: LOCAL ALL: .foobar.edu EXCEPT terminalserver.foobar.edu

The first rule permits access from hosts in the local domain (no '.' in the host name). The second rule permits access from all hosts in the .foobar.edu domain (notice the leading period), with the exception of terminalserver.foobar.edu.

MOSTLY OPEN Here, access is granted by default; only explicitly specified hosts are refused service.

The default policy (access granted) makes the allow file redundant so that it can be omitted. The explicitly non-authorized hosts are listed in the deny file. For example:

instance-path/config/hosts.deny: ALL: some.host.name, .some.domain ALL EXCEPT 1389: other.host.name, .other.domain The first rule denies some hosts and domains all services; the second rule still permits connections to directory port 1389 from other hosts and domains.

BOOBYTRAPS The next example permits requests to Directory Server port 1389 from hosts in the local domain (notice the leading dot). Requests from any other hosts are denied. Instead of the requested file, a finger probe is sent to the offending host. The result is mailed to the superuser.

instance-path/config/hosts.allow: 1389: LOCAL, .my.domain instance-path/config/hosts.deny: ALL: (/usr/sfw/sbin/safe finger -l @%h | \

/usr/ucb/mail -s %d-%h root) &

The above example assumes that the safe_finger command is installed in /usr/sfw/sbin. For Solaris, the safe_finger command is in the SUNWtcpd package. The default location for the safe_finger command in the SUNWtcpd package is "/usr/sfw/sbin". For other operating systems the safe_finger command should be installed in a suitable place. The safe_finger command limits possible damage from data sent by the remote finger server, and gives better protection than the standard finger command. Shell commands for Windows is not supported, so Windows users should not use this rule.

The expansion of the %h (client host) and %d (service name) sequences is described in the section on shell commands.

Warning: do not booby-trap your finger daemon, unless you are prepared for infinite finger loops.

On network firewall systems this trick can be carried even further. The typical network firewall only provides a limited set of services to the outer world. All other services can be "bugged" just like the above tftp example. The result is an excellent early-warning system.

- **Diagnostics** An error is reported when a syntax error is found in a host access control rule; when the length of an access control rule exceeds the capacity of an internal buffer (2048); when an access control rule is not terminated by a newline character; when the result of *%letter* expansion would overflow an internal buffer; when a system call fails that should not. All problems are written to the Directory Server instance access log.
 - **Files** *instance-path/*config/hosts.allow, (daemon, client) pairs are granted access. *instance-path/*config/hosts.deny, (daemon, client) pairs are denied access.
 - **See Also** tcpd(1M) tcp/ip daemon wrapper program. tcpdchk(1M), tcpdmatch(1M), test programs.
 - **Bugs** If a name server lookup times out, the host name will not be available to the access control software, even though the host is registered.

Name objects – Schema definitions for Object Classes Description Directory Server supports many object classes you may use either directly or as the basis for your own object classes. An object class that inherits from another object class must appear after this object class in 99user.ldif, otherwise Directory Server will not start. Note - Schema provided with Directory Server differ from RFC 2256 with regard to the groupOfNames and groupOfUniqueNames object classes. In the schema provided, the member and uniquemember attribute types are optional, while RFC 2256 specifies that at least one value for these types must be present in the respective object class. Also, the LDAP RFCs (and X.500 standards) allow for an object class to have more than one superior. This behavior is not currently supported by Directory Server. **Object Classes** This collection includes the object classes documented in the following additional pages: RFC822localPart(5dsoc), account(5dsoc), alias(5dsoc), applicationEntity(5dsoc), bootableDevice(5dsoc), changeLogEntry(5dsoc), cosClassicDefinition(5dsoc), cosDefinition(5dsoc), cosIndirectDefinition(5dsoc), cosPointerDefinition(5dsoc), cosSuperDefinition(5dsoc), costemplate(5dsoc), country(5dsoc), dSA(5dsoc), dcObject(5dsoc), device(5dsoc), document(5dsoc), documentSeries(5dsoc), domain(5dsoc), domainRelatedObject(5dsoc), extensibleObject(5dsoc), friendlyCountry(5dsoc), groupOfCertificates(5dsoc), groupOfNames(5dsoc), groupOfURLs(5dsoc), groupOfUniqueNames(5dsoc), ieee802Device(5dsoc), inetOrgPerson(5dsoc), ipHost(5dsoc), ipNetwork(5dsoc), ipProtocol(5dsoc), ipService(5dsoc), javaContainer(5dsoc), javaMarshalledObject(5dsoc), javaNamingReference(5dsoc), javaObject(5dsoc), javaSerializedObject(5dsoc), labeledURIObject(5dsoc), ldapSubEntry(5dsoc), locality(5dsoc), newPilotPerson(5dsoc), nisMap(5dsoc), nisNetgroup(5dsoc), nisObject(5dsoc), nsComplexRoleDefinition(5dsoc), nsFilteredRoleDefinition(5dsoc), nsLicenseUser(5dsoc), nsManagedRoleDefinition(5dsoc), nsNestedRoleDefinition(5dsoc), nsRoleDefinition(5dsoc), nsSimpleRoleDefinition(5dsoc), oncRpc(5dsoc), organization(5dsoc), organizationalPerson(5dsoc), organizationalRole(5dsoc), organizationalUnit(5dsoc), passwordPolicy(5dsoc), person(5dsoc), pilotObject(5dsoc), pilotOrganization(5dsoc), posixAccount(5dsoc), posixGroup(5dsoc), pwdPolicy(5dsoc), referral(5dsoc), residentialPerson(5dsoc), room(5dsoc), shadowAccount(5dsoc), simpleSecurityObject(5dsoc), strongAuthenticationUser(5dsoc), subschema(5dsoc), sunPwdPolicy(5dsoc), top(5dsoc)

Name changeHasReplFixupOp - RetroChangelog attribute type

```
Synopsis ( 1.3.6.1.4.1.42.2.27.9.1.751
    NAME 'changeHasReplFixupOp'
    DESC 'RetroChangelog attribute type'
    SYNTAX 1.3.6.1.4.1.1466.115.121.1.5
    NO-USER-MODIFICATION
    USAGE directoryOperation
    X-ORIGIN 'Sun Directory Server' )
```

Description This attribute is used for the retro change log.

This attribute is created in an entry when the following conditions are satisfied:

- The retro change log is enabled
- The changeIsReplFixupOp attribute is configured to TRUE
- Directory Server has performed an operation to resolve a replication conflict

This attribute stores the following information about an operation performed to resolve a replication conflict:

- Target DN of the operation
- The type of update
- The change made

There is one value of this attribute for each operation performed to resolve a replication conflict.

The value of this attribute is base64 encoded.

- **Syntax** Binary, multi-valued.
- **Usage** Operational attribute used by the directory service; returned in ldapsearch only when specifically requested.

The value of this attribute may only be modified by the server.

ATTRIBUTE TYPE	ATTRIBUTE VALUE

 EQUALITY booleanMatch
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.7
 SINGLE-VALUE
 NO-USER-MODIFICATION
 USAGE directoryOperation
 X-ORIGIN 'Sun Directory Server')
- **Description** This attribute is used for the retro change log.

This attribute indicates whether Directory Server has performed an operation to resolve a replication conflict. The value of this attribute is as follows:

- TRUE A replication conflict has occured and Directory Server has performed an operation to resolve the conflict. The changeHasReplFixupOp attribute has been added to the entry to describe the operation.
- FALSE Directory Server has not performed an operation to resolve a replication conflict on this entry.
- Syntax Boolean, single-valued.
- **Usage** Operational attribute used by the directory service; returned in ldapsearch only when specifically requested.

The value of this attribute may only be modified by the server.

ATTRIBUTE TYPE	ATTRIBUTE VALUE

Name cosAttribute – Sun ONE defined attribute type

- Synopsis (2.16.840.1.113730.3.1.550
 NAME 'cosAttribute'
 DESC 'Sun ONE defined attribute type'
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
 X-DS-USE 'internal'
 X-ORIGIN 'Sun ONE Directory Server')
- **Description** Provides the name of the attribute for which you want to generate a value. You can specify more than one cosAttribute value. This attribute is used by all types of CoS definition entries.

The cosAttribute attribute allows two qualifiers following the name of the CoS attribute. The *override* qualifier has one of the following values:

- default (or no qualifier) Indicates that the server does not override a real attribute value stored in the entry when it has the same type as the virtual attribute.
- override Indicates that the server always returns the value generated by the CoS, even when there is a value stored with the entry.
- operational Indicates that the attribute will only be returned if it is explicitly requested in the search. Operational attributes do not need to pass a schema check in order to be returned. It also has the same behavior as the override qualifier.

The merge qualifier is either absent or given with the following value:

- merge-schemes Allows the virtual CoS attribute to be multivalued, either from multiple templates or multiple CoS definitions.
- Syntax Directory String, multi-valued.
- **Usage** Attribute specific to this Directory Server instance and version of the schema.
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE

Name cosIndirectSpecifier – Sun ONE defined attribute type

Synopsis (2.16.840.1.113730.3.1.577
 NAME 'cosIndirectSpecifier'
 DESC 'Sun ONE defined attribute type'
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
 SINGLE-VALUE
 X-DS-USE 'internal'
 X-ORIGIN 'Sun ONE Directory Server')

Description Specifies the attribute values used by an indirect CoS to identify the template entry.

Syntax Directory String, single-valued.

Usage Attribute specific to this Directory Server instance and version of the schema.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Evolving

Name cosPriority - Sun ONE defined attribute type
Synopsis (2.16.840.1.113730.3.1.569
NAME 'cosPriority'
DESC 'Sun ONE defined attribute type'
SYNTAX 1.3.6.1.4.1.1466.115.121.1.27
SINGLE-VALUE
X-DS-USE 'internal'
X-ORIGIN 'Sun ONE Directory Server')
Description Specifies which template provides the attribute value, when CoS templates compete to provide
an attribute value. This attribute represents the global priority of a particular template. A

- priority of zero is the highest priority.
 - Syntax Integer, single-valued.
 - **Usage** Attribute specific to this Directory Server instance and version of the schema.
- **Attributes** See attributes(5) for descriptions of the following attributes:

Syntax Directory String, multi-valued.

Examples givenName: Hecuba

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2256

Name homeDirectory – Standard LDAP attribute type

Synopsis (1.3.6.1.1.1.1.3
 NAME 'homeDirectory'
 DESC 'Standard LDAP attribute type'
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.26
 SINGLE-VALUE
 X-ORIGIN 'RFC 2307')

Description The home directory of the account.

Syntax IA5 String, single-valued.

Examples homeDirectory: /home/bsmith

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2307

Name	homePhone – Standard LDAP attribute type	
Synopsis	(0.9.2342.19200300.100.1.20 NAME 'homePhone' DESC 'Standard LDAP attribute type' SYNTAX 1.3.6.1.4.1.1466.115.121.1.50	
	X-ORIGIN 'RFC 1274')	
Description	Identifies the entry's home phone number.	

Syntax Telephone Number, multi-valued.

Examples homePhone: 415-555-1212

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 1274

Name homePostalAddress - Standard LDAP attribute type

- **Description** Identifies the home mailing address of an entry. This field is intended to include multiple lines, but each line within the entry should be separated by a dollar sign (\$). To represent an actual dollar sign (\$) or backslash (\) within this text, use the escaped hex values \24 and \5c respectively.

Syntax Directory String, multi-valued.

Examples To identify the home mailing address:

homePostalAddress: 1234 Ridgeway Drive\$Santa Clara, CA\$99555

Additionally, to represent the string:

The dollar (\$) value can be found in the c:\cost file.

provide the string:

The dollar ($\24$) value can be found\$in the c: $\5ccost$ file.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 1274

Name host - Standard LDAP attribute type
Synopsis (0.9.2342.19200300.100.1.9
NAME 'host'
DESC 'Standard LDAP attribute type'
SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
X-ORIGIN 'RFC 1274')
Description Defines the hostname of a computer.

Syntax Directory String, multi-valued.

Examples host: myServer

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 1274

Name houseIdentifier – Standard LDAP attribute type

Synopsis (2.5.4.51
 NAME 'houseIdentifier'
 DESC 'Standard LDAP attribute type'
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
 X-ORIGIN 'RFC 2256')

Description Identifies a building in a location.

Syntax Directory String, multi-valued.

Examples houseIdentifier: B105

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2256

Description Specifies any general information pertinent to an object. It is recommended that specific usage of this attribute type is avoided, and that specific requirements are met by other (possibly additional) attribute types.

Syntax Directory String, multi-valued.

Examples info: not valid

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 1274

Name initials – Standard LDAP attribute type

Synopsis (2.5.4.43
 NAME 'initials'
 DESC 'Standard LDAP attribute type'
 SUP name
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
 X-ORIGIN 'RFC 2256')

Description Identifies the entry's initials. Does not identify the entry's surname.

Syntax Directory String, multi-valued.

Examples initials: BFA

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2256

Name internationaliSDNNumber – Standard LDAP attribute type

Synopsis (2.5.4.25 NAME 'internationaliSDNNumber' DESC 'Standard LDAP attribute type' SYNTAX 1.3.6.1.4.1.1466.115.121.1.26 X-ORIGIN 'RFC 2256')

Description Contains the ISDN number of the entry. This is in the internationally agreed format for ISDN addresses given in CCITT Rec. E. 164.

Syntax IA5 String, multi-valued.

Examples internationaliSDNNumber: +S0 812467

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2256

Name ipHostNumber – Standard LDAP attribute type

Description IP address, expressed as a dotted decimal, omitting leading zeros.

Syntax Directory String, multi-valued.

Examples ipHostNumber: 10.0.0.1

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2307

Name ipNetmaskNumber – Standard LDAP attribute type

Synopsis (1.3.6.1.1.1.1.21

 DESC 'Standard LDAP attribute type'
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.27
 SINGLE-VALUE
 X-ORIGIN 'RFC 2307')

Description The IP service port number.

Syntax Integer, single-valued.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2307

Name ipServiceProtocol – Standard LDAP attribute type

Description The IP service protocol.

- **Syntax** Directory String, multi-valued.
- Examples ipServiceProtocol: tcp ipServiceProtocol: udp
- Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2307

Name	isMemberOf – LDAP attribute type
Synopsis	<pre>(1.3.6.1.4.1.42.2.27.9.1.792 NAME 'isMemberOf' DESC 'Sun defined attribute type' SYNTAX 1.3.6.1.4.1.1466.115.121.1.12 NO-USER-MODIFICATION USAGE directoryOperation X-DS-USE 'internal' X-ORIGIN 'Sun Directory Server')</pre>
Description	The values of this attribute are the DNs of static groups to which this entry belongs.
	This attribute values are calculated, thus cannot be indexed. Therefore this attribute should not be used in search filters.
Syntax	DN, multi-valued.
Usage	Attribute specific to this Directory Server instance and version of the schema.
	Operational attribute used by the directory service; returned in ldapsearch only when specifically requested.
	The value of this attribute may only be modified by the server.
Examples	isMemberOf: cn=bigGroup,ou=groups,dc=example,dc=com
Attributes	See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Evolving

Name janetMailbox – Standard LDAP attribute type

- **Description** Specifies an email address. This attribute is intended for the convenience of UK users unfamiliar with rfc822 mail addresses. Entries using this attribute must also include an rfc822Mailbox attribute.

Syntax Directory String, multi-valued.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 1274

Name javaClassName - Fully qualified name of distinguished Java class or interface

Synopsis (1.3.6.1.4.1.42.2.27.4.1.6
 NAME 'javaClassName'
 DESC 'Fully qualified name of distinguished Java class or interface'
 EQUALITY caseExactMatch
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
 SINGLE-VALUE
 X-ORIGIN 'RFC 2713')

Description Stores the fully qualified name of the Java object's distinguished class or interface.

Syntax Directory String, single-valued.

Examples javaClassName: java.lang.String

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2713

Name javaClassNames - Fully qualified Java class or interface name

Synopsis (1.3.6.1.4.1.42.2.27.4.1.13
 NAME 'javaClassNames'
 DESC 'Fully qualified Java class or interface name'
 EQUALITY caseExactMatch
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
 X-ORIGIN 'RFC 2713')

Description Stores the Java object's fully qualified class or interface names. It is a multivalued attribute. When more than one value is present, each is the name of a class or interface, or ancestor class or interface, of this object.

Syntax Directory String, multi-valued.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2713

Name javaCodebase – URL(s) specifying the location of class definition

Synopsis (1.3.6.1.4.1.42.2.27.4.1.7
NAME 'javaCodebase'
DESC 'URL(s) specifying the location of class definition'
EQUALITY caseExactIA5Match
SYNTAX 1.3.6.1.4.1.1466.115.121.1.26
X-ORIGIN 'RFC 2713')

- **Description** Stores the Java class definition's locations. It specifies the locations from which to load the class definition for the class specified by the javaClassName attribute. If this attribute contains more than one value, each value is an independent codebase.
 - Syntax IA5 String, multi-valued.
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory

Description	Used to indicate the attribute types to which a matching rule applies in a subschema.	
Syntax	Directory String, multi-valued.	
Attributes	See attributes(5) for descriptions of the following attributes:	

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2252

Name member – Standard LDAP attribute type

Description Identifies the distinguished names for each member of the group.

Syntax DN, multi-valued.

Examples member: cn=John Doe, dc=example, dc=com

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2256

Name memberCertificateDescription - Sun ONE defined attribute type

- Synopsis (2.16.840.1.113730.3.1.199
 NAME 'memberCertificateDescription'
 DESC 'Sun ONE defined attribute type'
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.26
 X-ORIGIN 'Sun ONE Directory Server')
- **Description** A multi-valued attribute, for which each value is a description, a pattern, or a filter matching the subject DN of a certificate (usually certificates used for SSL client authentication).

memberCertificateDescription matches any certificate that contains a subject DN with the same AVAs as the description. The description may contain multiple ou= AVAs. A matching DN must contain those same ou= AVAs, in the same order, although it may contain other AVAs (including other ou= AVAs) interspersed. For any other attribute type (not ou), there should be at most one AVA of that type in the description. If there are several, all but the last are ignored.

A matching DN must contain that same AVA, but no other AVA of the same type nearer the root (later, syntactically).

AVAs are considered the same if they contain the same attribute description (case-insensitive comparison) and the same attribute value (case-insensitive comparison, leading and trailing whitespace ignored, and consecutive whitespace characters treated as a single SP).

In order to be considered a member of a group with the following memberCertificateDescription, a certificate would need to include ou=x, ou=A, and o=example, but not o=company.

- Syntax IA5 String, multi-valued.
- Examples memberCertificateDescription: {ou=x, ou=A, o=company, o=example}

In order to match the group's requirements, a certificate's subject DNs must contain the same ou attribute types in the same order as defined in the memberCertificateDescription attribute.

Name namingContexts – Standard LDAP attribute type

- Synopsis (1.3.6.1.4.1.1466.101.120.5
 NAME 'namingContexts'
 DESC 'Standard LDAP attribute type'
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.12
 USAGE dsaOperation
 X-ORIGIN 'RFC 2252')
- **Description** Corresponds to a naming context the server is mastering or shadowing. When Directory Server does not master any information (for example, it is an LDAP gateway to a public X.500 directory), this attribute is absent. When Directory Server believes it contains the entire directory, the attribute has a single value, and that value is the empty string (indicating the null DN of the root). This attribute permits a client contacting a server to choose suitable base objects for searching.
 - Syntax DN, multi-valued.
 - **Usage** Operational attribute used by a Directory Server instance; returned in Ldapsearch only when specifically requested.
- Attributes See attributes(5) for descriptions of the following attributes:

SYNTAX 1.3.6.1.4.1.1466.115.121.1.27
SINGLE-VALUE
USAGE directoryOperation
X-DS-USE 'internal'
X-ORIGIN 'Sun ONE Directory Server')

Description This attribute specifies the maximum number of entries examined for a search operation.

- Syntax Integer, single-valued.
- **Usage** Attribute specific to this Directory Server instance and version of the schema. Operational attribute used by the directory service.
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Evolving

Name	nsRole – Sun ONE defined attribute type
Synopsis	<pre>(2.16.840.1.113730.3.1.574 NAME 'nsRole' DESC 'Sun ONE defined attribute type' SYNTAX 1.3.6.1.4.1.1466.115.121.1.12 NO-USER-MODIFICATION USAGE directoryOperation X-DS-USE 'internal' X-ORIGIN 'Sun ONE Directory Server')</pre>
Description	This attribute is a computed attribute that is not stored with the entry itself. It identifies which roles an entry belongs to.
Syntax	DN, multi-valued.
Usage	Attribute specific to this Directory Server instance and version of the schema.
	Operational attribute used by the directory service; returned in ldapsearch only when specifically requested.
	The value of this attribute may only be modified by the server.
Attributes	See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Evolving

Name	nsRoleDN – Sun ONE defined attribute type
Synopsis	<pre>(2.16.840.1.113730.3.1.575 NAME 'nsRoleDN' DESC 'Sun ONE defined attribute type' SYNTAX 1.3.6.1.4.1.1466.115.121.1.12 USAGE directoryOperation X-DS-USE 'internal' X-ORIGIN 'Sun ONE Directory Server')</pre>
Description	This attribute contains the distinguished name of each managed role to which the entry belongs. Membership of a managed role is conferred upon an entry by adding the role's DN to the entry's nsRoleDN attribute.
	This attribute is not to be confused with the generated nsRole attribute that contains the DN of <i>all</i> roles to which the entry belongs, as computed by Directory Server. Use nsRoleDN to set managed role membership, and use nsRole to evaluate role membership.
Syntax	DN, multi-valued.
Usage	Attribute specific to this Directory Server instance and version of the schema.
	Operational attribute used by the directory service; returned in ldapsearch only when specifically requested.
Examples	<pre>dn: cn=staff,ou=People,dc=example,dc=com objectclass: LDAPsubentry objectclass: nsRoleDefinition objectclass: nsSimpleRoleDefinition objectclass: nsManagedRoleDefinition</pre>

SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
X-DS-USE 'internal'
X-ORIGIN 'Sun ONE Directory Server')

Description Indicates whether user passwords will expire after a specified number of seconds. By default, passwords do not expire. When password expiration is enabled, you can set the number of seconds after which the password will expire with the passwordMaxAge attribute.

This attribute may be on or off. The default value is off.

Syntax Directory String, multi-valued.

- Usage Attribute specific to this Directory Server instance and version of the schema.
- Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name passwordExpirationTime – Sun ONE defined password policy attribute type

Description Indicates the exact time after which the user's password expires.

Syntax Generalized Time, single-valued.

Usage Attribute specific to this Directory Server instance and version of the schema.

Operational attribute used by the directory service; returned in ldapsearch only when specifically requested.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name passwordExpireWithoutWarning – Sun ONE defined password policy attribute type

Synopsis (1.3.6.1.4.1.42.2.27.9.1.86
 NAME 'passwordExpireWithoutWarning'
 DESC 'Sun ONE defined password policy attribute type'
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
 X-DS-USE 'internal'
 X-ORIGIN 'Sun ONE Directory Server')

Description Indicates whether a password can expire regardless of whether the user was warned about the expiration date.

This attribute may be on or off. The default value is off.

Syntax Directory String, multi-valued.

Usage Attribute specific to this Directory Server instance and version of the schema.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name passwordExpWarned - Sun ONE defined password policy attribute type

 SYNTAX 1.3.6.1.4.1.1466.115.121.1.5
 USAGE directoryOperation
 X-DS-USE 'internal'
 X-ORIGIN 'Sun ONE Directory Server')

Description Contains the history of the user's previous passwords.

Syntax Binary, multi-valued.

Usage Attribute specific to this Directory Server instance and version of the schema.

Operational attribute used by the directory service; returned in ldapsearch only when specifically requested.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Evolving

Name passwordInHistory - Sun ONE defined password policy attribute type

- Synopsis (2.16.840.1.113730.3.1.101
 NAME 'passwordInHistory'
 DESC 'Sun ONE defined password policy attribute type'
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
 X-DS-USE 'internal'
 X-ORIGIN 'Sun ONE Directory Server')
- **Description** Indicates the number of passwords Directory Server stores in history. The valid range of this attribute is 0 to 24. Passwords that are stored in history cannot be reused.

The password history is disabled by default. The default value of this attribute is 0. This implies that the server does not store any old passwords. By default, users can reuse old passwords.

Syntax Directory String, multi-valued.

Usage Attribute specific to this Directory Server instance and version of the schema.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name passwordLockout - Sun ONE defined password policy attribute type

Synopsis (2.16.840.1.113730.3.1.105
 NAME 'passwordLockout'
 DESC 'Sun ONE defined password policy attribute type'
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
 X-DS-USE 'internal'
 X-ORIGIN 'Sun ONE Directory Server')

Description Enables the account lockout mechanism. If this attribute is set to on, users are locked out of the directory once the maximum number of consecutive failed bind attempts has been reached. The maximum number of consecutive bind attempts is specified by the passwordMaxFailure attribute. Users remain locked out for the length of time specified by the passwordLockoutDuration attribute.

This attribute may be on or off. The default value is off.

- **Syntax** Directory String, multi-valued.
- **Usage** Attribute specific to this Directory Server instance and version of the schema.
- Attributes See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Obsolete: Scheduled for removal after this release

Name passwordRootdnMayBypassModsChecks - Sun ONE defined password policy attribute type

Synopsis (1.3.6.1.4.1.42.2.27.9.1.468
NAME 'passwordRootdnMayBypassModsChecks'
DESC 'Sun ONE defined password policy attribute type'
SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
SINGLE-VALUE
X-DS-USE 'internal'
X-ORIGIN 'Sun ONE Directory Server')

Description When set to on, this password policy attribute allows the root DN to modify passwords, even if the modification violates the password policy. This allows exceptions to the password policy. If the Directory Manager changes a password and the server detects that the new password violates the minimum length or the password history, a warning is logged, but the modification proceeds.

The default value is off, meaning the server rejects even changes to passwords by the Directory Manager if such changes violate the specified password policy.

- Syntax Directory String, single-valued.
- Usage Attribute specific to this Directory Server instance and version of the schema.
- Examples passwordRootdnMayBypassModsChecks: on
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE

 DESC 'Sun ONE defined password policy attribute type'
 SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
 X-DS-USE 'internal'
 X-ORIGIN 'Sun ONE Directory Server')

Description Specifies the algorithm used to hash Directory Server passwords. The default password storage scheme is the Salted Secure Hash Algorithm (SSHA).

The following hash types are supported:

- SSHA (Salted Secure Hash Algorithm) is the recommended method as it is the most secure.
- SHA (Secure Hash Algorithm) a version in use before SSHA.
- CRYPT is the UNIX crypt algorithm. It is provided for compatibility with UNIX passwords and supports MD5, Blowfish, and other strong algorithms. To specify the algorithm used, give the format of the salt in the nsslapd-plugingarg()() argument as follows:

nsslapd-pluginarg(): value()

The value is in the snprintf format corresponding to specific salt formats. For example, some of the formats supported include %.2s, \$1\$%.8s, \$2a\$04\$%.22s, and \$md5\$%.8s\$. If the string value maps to an algorithm that is not supported by the operating system, then a warning message is logged and the hash will be made using the default UNIX algorithm with a salt made of 31 random characters.

If this attribute is set to CLEAR, passwords are not encrypted and appear in plain text.

You can extend how password attributes are stored by writing your own password storage scheme plug-in.

- **Syntax** Directory String, multi-valued.
- **Usage** Attribute specific to this Directory Server instance and version of the schema.
- **Examples** passwordStorageScheme: CLEAR

 SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
 X-DS-USE 'internal'
 X-ORIGIN 'Sun ONE Directory Server')
- **Description** Specifies the number of seconds before a user password expires that the user will receive a password expiration warning on attempting to authenticate to the directory.

The server does not send a warning directly to the end user. Instead, the server returns the warning to the client application.

Note – End users *do not automatically receive email or other notification* as a result of the passwordWarning attribute being set to on. Make sure the warning received by the client application is appropriately delivered to the end user.

The valid range for this attribute is 1 to the maximum 32-bit integer value (2147483647) in seconds, with the default value set at 86400 seconds, meaning 1 day.

Syntax Directory String, multi-valued.

Usage Attribute specific to this Directory Server instance and version of the schema.

- **Description** Holds the name of the attribute to which the password policy is applied. Currently only userPassword can be used.
 - Syntax Object Identifier, multi-valued.
 - Examples pwdAttribute: userPassword
- **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	External: IETF, Password Policy Internet-Draft

Synopsis (1.3.6.1.4.1.42.2.27.8.1.16 NAME 'pwdChangedTime' DESC 'Directory Server defined password policy attribute type' SYNTAX 1.3.6.1.4.1.1466.115.121.1.24 SINGLE-VALUE NO-USER-MODIFICATION USAGE directoryOperation X-DS-USE 'internal' X-ORIGIN 'Password Policy for LDAP Directories Internet Draft') **Description** Specifies the last time the entry's password was changed. This is used by the password expiration policy. If this attribute is not present, the password will never expire. **Syntax** Generalized Time, single-valued. **Usage** Attribute specific to this Directory Server instance and version of the schema. Operational attribute used by the directory service; returned in ldapsearch only when specifically requested. The value of this attribute may only be modified by the server. Examples pwdChangedTime: 20050103121520Z **Attributes** See attributes(5) for descriptions of the following attributes:

Name pwdChangedTime – Directory Server defined password policy attribute type

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	External: IETF, Password Policy Internet-Draft

Name pwdCheckQuality – LDAP attribute type **Synopsis** (1.3.6.1.4.1.42.2.27.8.1.5 NAME 'pwdCheckQuality' DESC 'Level of required quality' SYNTAX 1.3.6.1.4.1.1466.115.121.1.27 X-DS-USE 'internal' X-ORIGIN 'Password Policy for LDAP Directories Internet Draft') **Description** Indicates how the password quality will be verified while being modified or added. This attribute can take the following values: 0 Default. Quality checking is not enforced. 1 Directory Server checks the quality of the password. If Directory Server cannot determine the quality of the password, because the password is hashed for example, it accepts the password and logs a warning message. 2 Directory Server checks the quality of the password. If Directory Server cannot determine the quality of the password, it returns LDAP CONSTRAINT VIOLATION and refuses the operation. If the password value is already hashed, and prefixed by a tag other than {CLEAR} setting this attribute to 1 means the server does not check quality and logs a warning. Setting this attribute to 2 in this case causes the server to reject the modification because it cannot check the password quality. **Syntax** Integer, single-valued. **Usage** Attribute specific to this Directory Server instance and version of the schema. Examples pwdCheckQuality: 1 **Attributes** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	External: IETF, Password Policy Internet-Draft

Name	pwdExpireWarning – Password Warning Expiration	
Synopsis	<pre>sis (1.3.6.1.4.1.42.2.27.8.1.7 NAME 'pwdExpireWarning' DESC 'Password Warning Expiration' SYNTAX 1.3.6.1.4.1.1466.115.121.1.27 X-DS-USE 'internal' X-ORIGIN 'Password Policy for LDAP Directories Internet Draft')</pre>	
Description	Specifies the maximum number of seconds before a password is due to expire that expiration warning messages will be returned to an authenticating user. If this attribute is not present, or if the value is 0 no warnings will be returned. If not 0, the	
	value must be smaller than the value of the pwdMaxAge attribute.	
Syntax Integer, single-valued.		
Usage Attribute specific to this Directory Server instance and version of the schema.		
Examples pwdExpireWarning: 604800		
Attributes	See attributes(5) for descriptions of the following attributes:	

ATTRIBUTE TYPE	ATTRIBUTE VALUE

Name replicationCSN – RetroChangelog attribute type

- Synopsis (1.3.6.1.4.1.42.2.27.9.1.725 NAME 'replicationCSN' DESC 'RetroChangelog attribute type' SYNTAX 1.3.6.1.4.1.1466.115.121.1.15 SINGLE-VALUE NO-USER-MODIFICATION USAGE directoryOperation X-ORIGIN 'Sun Directory Server')
- **Description** This attribute is used for the retro change log. When the retro change log is enabled, this attribute specifies a change sequence number (CSN) for each record in the retro change log corresponding to a replicated operation. The CSN uniquely identifies each change made to the replicated data.

The CSN contains a timestamp, sequence number, replica ID, and subsequence number.

- **Syntax** Directory String, single-valued.
- **Usage** Operational attribute used by the directory service; returned in ldapsearch only when specifically requested.

The value of this attribute may only be modified by the server.

Examples replicationCSN: 451d2c6d000200010000

In this example, the change sequence number is concatenated from the following values.

- 451d2c6d This represents time as the number of seconds since January 1, 1970.
- 0002 This is the sequence number, which is used to distinguish between operations that happened during the same second.
- 0001 This is the replica ID, which in this example is 1.
- 0000 This is the subsequence number, which is not always used, but helps the server to manage information about the state of replication.

Name	telephoneNumber – Standard LDAP attribute type
Synopsis	(2.5.4.20 NAME 'telephoneNumber' DESC 'Standard LDAP attribute type' SYNTAX 1.3.6.1.4.1.1466.115.121.1.50 X-ORIGIN 'RFC 2256')
Description	Identifies the entry's phone number.
Syntax	Telephone Number, multi-valued.

Examples telephoneNumber: 415-555-2233

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory
Stability Level	Standard: IETF, RFC 2256

Name teletexTerminalIdentifier – Standard LDAP attribute type

Synopsis (2.5.4.22
NAME 'teletexTerminalIdentifier'
DESC 'Standard LDAP attribute type'
SYNTAX 1.3.6.1.4.1.1466.115.121.1.15
X-ORIGIN 'RFC 2256')

Description Identifies the entry's teletex terminal identifier. The format of the attribute is as follows:

```
teletex-id = ttx-term 0*("$" ttx-param)
ttx-term = printablestring
ttx-param = ttx-key ":" ttx-value
ttx-key = "graphic" / "control" / "misc" / "page" / "private"
ttx-value = octetstring
```

The first printable string is the encoding of the first portion of the teletex terminal identifier to be encoded, and the subsequent 0 or more octet strings are subsequent portions of the teletex terminal identifier.

Syntax Directory String, multi-valued.

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWldap-directory

Description Used to represent Internet Domains (for example, example.com). The domainComponent attribute should be used for naming entries of this object class.

The domain object class can only be used with an entry that does not correspond to an organization, organizational unit, or other type of object for which an object class has been defined. The domain object class requires that the domainComponent attribute be present, and allows several other attributes to be present in the entry. These allowed attributes are used to describe the object represented by the domain, and may also be useful when searching.

Name	e extensibleObject – LDAPv3 extensible object	
Synopsis	<pre>(1.3.6.1.4.1.1466.101.120.111 NAME 'extensibleObject' DESC 'LDAPv3 extensible object' SUP top AUXILIARY X-ORIGIN 'RFC 2252')</pre>	
Description	Auxiliary object class which, when present in an entry, permits the entry to optionally hold any attribute. The allowed attribute list of this class is implicitly the set of all attributes known to the server.	
	In general it is better to use a more restrictive object class when designing schema for your deployment, as the server can do very little checking for extensibleObject. In particular, a good practice for new applications is to add specific auxiliary object classes where specific new attribute sets are needed, rather than to leave everything wide open and undecided with extensibleObject.	
Origin	This object class is defined by RFC 2252.

Name	pwdPolicy – Password Policy objectclass
Synopsis	<pre>(1.3.6.1.4.1.42.2.27.8.2.1 NAME 'pwdPolicy' DESC 'Password Policy objectclass' SUP top AUXILIARY MUST (pwdAttribute) MAY (pwdMinAge \$ pwdMaxAge \$ pwdInHistory \$ pwdCheckQuality \$ pwdMaxFailure \$ pwdMaxFailure \$ pwdMustChange \$ pwdSafeModify) X-DS-USE 'internal' X-ORIGIN 'Password Policy for LDAP Directories Internet Draft')</pre>

Description Contains the attributes defining a password policy in effect for a set of users. A password policy is defined for a particular subtree of the DIT by adding to an LDAP subentry whose immediate superior is the root of the subtree, the pwdPolicy auxiliary object class. The scope of the password policy is defined by the SubtreeSpecification attribute of the LDAP subentry as specified in RFC 3672.

Each object that is controlled by password policy advertises the subentry that is being used to control its policy in its pwdPolicySubentry attribute. Clients wishing to examine or manage password policy for an object may interrogate the pwdPolicySubentry for that object in order to arrive at the proper pwdPolicy subentry.

- Origin This object class is defined by Password Policy Internet-Draft.
- **Type** Auxiliary object class
- Superior top(5dsoc)
- **Required** Entries of this object class require the following attribute types in addition to those inherited from the superior(s):

pwdAttribute(5dsat)

Allowed Attributes Entries of this object class may have the following optional attribute types in addition to those inherited from the superior(s):
