# *Preface*

---

## *OVERVIEW*

A man page is provided for both the naive user, and sophisticated user who is familiar with the SunOS operating system and is in need of on-line information. A man page is intended to answer concisely the question “What does it do?” The man pages in general comprise a reference manual. They are not intended to be a tutorial.

The following contains a brief description of each section in the man pages and the information it references:

- Section 1 describes, in alphabetical order, commands available with the operating system.
- Section 1M describes, in alphabetical order, commands that are used chiefly for system maintenance and administration purposes.
- Section 2 describes all of the system calls. Most of these calls have one or more error returns. An error condition is indicated by an otherwise impossible returned value.
- Section 3 describes functions found in various libraries, other than those functions that directly invoke UNIX system primitives, which are described in Section 2 of this volume.

- 
- Section 4 outlines the formats of various files. The C structure declarations for the file formats are given where applicable.
  - Section 5 contains miscellaneous documentation such as character set tables, etc.
  - Section 6 contains available games and demos.
  - Section 7 describes various special files that refer to specific hardware peripherals, and device drivers. STREAMS software drivers, modules and the STREAMS-generic set of system calls are also described.
  - Section 9 provides reference information needed to write device drivers in the kernel operating systems environment. It describes two device driver interface specifications: the Device Driver Interface (DDI) and the Driver–Kernel Interface (DKI).
  - Section 9E describes the DDI/DKI, DDI-only, and DKI-only entry-point routines a developer may include in a device driver.
  - Section 9F describes the kernel functions available for use by device drivers.
  - Section 9S describes the data structures used by drivers to share information between the driver and the kernel.

Below is a generic format for man pages. The man pages of each manual section generally follow this order, but include only needed headings. For example, if there are no bugs to report, there is no BUGS section. See the intro pages for more information and detail about each section, and **man(1)** for more information about man pages in general.

## *NAME*

This section gives the names of the commands or functions documented, followed by a brief description of what they do.

## *SYNOPSIS*

This section shows the syntax of commands or functions. When a command or file does not exist in the standard path, its full pathname is shown. Literal characters (commands and options) are in **bold** font and variables (arguments, parameters and substitution characters) are in *italic* font. Options and

---

arguments are alphabetized, with single letter arguments first, and options with arguments next, unless a different argument order is required.

The following special characters are used in this section:

- [ ] The option or argument enclosed in these brackets is optional. If the brackets are omitted, the argument *must* be specified.
- ... Ellipses. Several values may be provided for the previous argument, or the previous argument can be specified multiple times, for example, '*filename ...*'.
- | Separator. Only one of the arguments separated by this character can be specified at time.
- { } Braces. The options and/or arguments enclosed within braces are interdependent, such that everything enclosed must be treated as a unit.

## *PROTOCOL*

This section occurs only in subsection 3R to indicate the protocol description file. The protocol specification pathname is always listed in **bold** font.

## *DESCRIPTION*

This section defines the functionality and behavior of the service. Thus it describes concisely what the command does. It does not discuss **OPTIONS** or cite **EXAMPLES**. Interactive commands, subcommands, requests, macros, functions and such, are described under **USAGE**.

## *IOCTL*

This section appears on pages in Section 7 only. Only the device class which supplies appropriate parameters to the **ioctl(2)** system call is called **ioctl** and generates its own heading. **ioctl** calls for a specific device are listed alphabetically (on the man page for that specific device). **ioctl** calls are used for a particular class of devices all of which have an **io** ending, such as **mtio(7)**.

---

## *OPTIONS*

This lists the command options with a concise summary of what each option does. The options are listed literally and in the order they appear in the SYNOPSIS section. Possible arguments to options are discussed under the option, and where appropriate, default values are supplied.

## *OPERANDS*

This section lists the command operands and describes how they affect the actions of the command.

## *OUTPUT*

This section describes the output - standard output, standard error, or output files - generated by the command.

## *RETURN VALUES*

If the man page documents functions that return values, this section lists these values and describes the conditions under which they are returned. If a function can return only constant values, such as 0 or -1, these values are listed in tagged paragraphs. Otherwise, a single paragraph describes the return values of each function. Functions declared as **void** do not return values, so they are not discussed in RETURN VALUES.

## *ERRORS*

On failure, most functions place an error code in the global variable **errno** indicating why they failed. This section lists alphabetically all error codes a function can generate and describes the conditions that cause each error. When more than one condition can cause the same error, each condition is described in a separate paragraph under the error code.

---

## *USAGE*

This section is provided as a *guidance* on use. This section lists special rules, features and commands that require in-depth explanations. The subsections listed below are used to explain built-in functionality:

- Commands**
- Modifiers**
- Variables**
- Expressions**
- Input Grammar**

## *EXAMPLES*

This section provides examples of usage or of how to use a command or function. Wherever possible a complete example including command line entry and machine response is shown. Whenever an example is given, the prompt is shown as

**example%**

or if the user must be super-user,

**example#**

Examples are followed by explanations, variable substitution rules, or returned values. Most examples illustrate concepts from the SYNOPSIS, DESCRIPTION, OPTIONS and USAGE sections.

## *ENVIRONMENT*

This section lists any environment variables that the command or function affects, followed by a brief description of the effect.

## *EXIT STATUS*

This section lists the values the command returns to the calling program or shell and the conditions that cause these values to be returned. Usually, zero is returned for successful completion and values other than zero for various error conditions.

## *FILES*

---

This section lists all filenames referred to by the man page, files of interest, and files created or required by commands. Each is followed by a descriptive summary or explanation.

## *ATTRIBUTES*

This section lists characteristics of commands, utilities, and device drivers by defining the attribute type and its corresponding value. (See **attributes(5)** for more information.)

## *SEE ALSO*

This section lists references to other man pages, in-house documentation and outside publications.

## *DIAGNOSTICS*

This section lists diagnostic messages with a brief explanation of the condition causing the error. Messages appear in **bold** font with the exception of variables, which are in *italic* font.

## *WARNINGS*

This section lists warnings about special conditions which could seriously affect your working conditions — this is not a list of diagnostics.

## *NOTES*

This section lists additional information that does not belong anywhere else on the page. It takes the form of an *aside* to the user, covering points of special interest. Critical information is never covered here.

## *BUGS*

This section describes known bugs and wherever possible suggests workarounds.

**NAME**        ascii – map of ASCII character set

**SYNOPSIS**    cat /usr/pub/ascii

**DESCRIPTION** /usr/pub/ascii is a map of the ASCII character set, to be printed as needed. It contains octal and hexadecimal values for each character. While not included in that file, a chart of decimal values is also shown here.

Octal — Character

|         |         |         |         |         |         |         |         |

**FILES****/usr/pub/ascii**

On-line chart of octal and hexadecimal values for the ASCII character set.

**NAME** attributes, architecture, availability, CSI, stability, MT-Level – characteristics of commands, utilities, and device drivers

**DESCRIPTION** The **ATTRIBUTES** man page section contains a table (see below) defining attribute types and their corresponding values.

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Architecture        | SPARC           |
| Availability        | SUNcsu          |
| CSI                 | Enabled         |
| Interface Stability | Unstable        |
| MT-Level            | Safe            |

**Architecture** Architecture defines processor or specific hardware. (See **-p** option of **uname(1)**). In some cases, it may indicate required adapters or peripherals.

**Availability** This refers to the software package which contains the command or component being described on the man page. To be able to use the command, the indicated package must have been installed. For information on how to add a package see **pkgadd(1M)**.

**Code Set Independence (CSI)** OS utilities and libraries which are free of dependencies on the properties of any code sets are said to have Code Set Independence (CSI). They have the attribute of being CSI enabled. This is in contrast to many commands and utilities in Solaris, for example, that work only with Extended Unix Codesets (EUC), an encoding method that allows concurrent support for up to four code sets and is commonly used to represent Asian character sets.

However, for practical reasons, this independence is not absolute. Certain assumptions are still applied to the current CSI implementation:

- File code is a superset of ASCII.
- In order to support multi-byte characters and NULL-terminated UNIX file names, the NULL and / (slash) characters cannot be part of any multi-byte characters.
- Only "stateless" file code encodings are supported. Stateless encoding avoids shift, locking shift, designation, invocation, and so forth, although single shift is not excluded.
- Process code (**wchar\_t** values) is implementation dependent and can change over time or between implementations or between locales.

- Not every object in Solaris 2.x can have names composed of arbitrary characters. The names of the following objects must be composed of ASCII characters:
  - User names, group name, and passwords
  - System name
  - Names of printers and special devices
  - Names of terminals (`/dev/tty*`)
  - Process ID numbers
  - Message queues, semaphores, and shared memory labels.
- The following may be composed of ISO Latin-1 or EUC characters:
  - File names
  - Directory names
  - Command names
  - Shell variables and environmental variable names
  - Mount points for file systems
  - NIS key names and domain names
- The names of NFS shared files should be composed of ASCII characters. Although files and directories may have names and contents composed of characters from non-ASCII code sets, using only the ASCII codeset allows NFS mounting across any machine, regardless of localization.

For the commands and utilities that are CSI enabled, all can handle single-byte and multi-byte locales released in 2.6.

For applications to get full support of internationalization services, dynamic binding has to be applied. Statically bound programs will only get support for C and POSIX locales.

#### Interface Stability

Sun often provides developers with early access to new technologies, which allows developers to evaluate with them as soon as possible. Unfortunately, new technologies are prone to changes and standardization often results in interface incompatibility from previous versions.

To make reasonable risk assessments, developers need to know how likely an interface is to change in future releases. To aid developers in making these assessments, interface stability information is included on some manual pages for commands, entry-points, and file formats.

The more stable interfaces can safely be used by nearly all applications, because Sun will endeavor to ensure that these continue to work in future minor releases. Applications that depend only on Standard and Stable interfaces should reliably continue to function correctly on future minor releases (but not necessarily on earlier major releases).

The less stable interfaces allow experimentation and prototyping, but should be used only with the understanding that they might change incompatibly or even be dropped or replaced with alternatives in future minor releases.

“Interfaces” that Sun does not document (for example, most kernel data structures and some symbols in system header files) may be implementation artifacts. Such internal interfaces are not only subject to incompatible change or removal, but we are unlikely to

mention such a change in release notes.

*Release Levels*

Products are given release levels, as well as names, to aid compatibility discussions. Each release level may also include changes suitable for lower levels.

| <b>Release</b> | <b>Version</b> | <b>Significance</b>  |
|----------------|----------------|--|
| Major          | x.0            | Likely to contain major feature additions; adhere to different, possibly incompatible Standard revisions; and though unlikely, could change, drop, or replace Standard or Stable interfaces. Initial product releases are usually 1.0. |
| Minor          | x.y            | Compared to an x.0 or earlier release (y!=0), it's likely to contain: minor feature additions, compatible Standard and Stable interfaces, possibly incompatible Evolving interfaces, or likely incompatible Unstable interfaces.       |
| Micro          | x.y.z          | Intended to be interface compatible with the previous release (z!=0), but likely to add bug fixes, performance enhancements, and support for additional hardware.  |

*Classifications*

The following table summarizes how stability level classifications relate to release level. For a complete discussion of individual classifications, see the appropriate subsection below.

| <b>Stability Level</b> | <b>Release Level for Incompatible Changes</b> | <b>Other Comments</b>   |
|------------------------|---|---|
| Standard               | Major (x.0)                                   | Actual or <i>de facto</i> .   |
| Stable                 | Major (x.0)                                   | Incompatibilities are exceptional.                                    |
| Evolving               | Minor (x.y)                                   | Migration advice might accompany an incompatibility.                  |
| Unstable               | Minor (x.y)                                   | Experimental or transitional: incompatibilities are common.           |
| Obsolete               | Minor (x.y)                                   | Deprecated interface: likely to be removed in a future minor release. |

The interface stability levels described in this manual page apply to both source and binary interfaces unless otherwise stated. The stability level of each interface is unknown unless explicitly stated.

**Standard:** *organization\_name, standard\_name, version*

The documented command or function complies with the standard listed. Most of these interfaces are defined by a formal standard, and controlled by a standards organization. Changes will usually be made in accordance with approved changes to that standard. This stability level can also apply to interfaces that have been adopted (without a formal standard) by an "industry convention."

Support is provided for only the specified version(s) of a standard; support of later versions is not guaranteed. If the standards organization approves a non-upwards-compatible change to a Standard interface that Sun decides to support, we will announce a compatibility and migration strategy.

**Stable**

A Stable interface is a mature interface under Sun's control. Sun will try to avoid non-upwards-compatible changes to these interfaces, especially in minor or micro releases.

If support of a Stable interface must be discontinued, Sun will attempt to provide notification and the stability level changes to Obsolete.

**Evolving**

An Evolving interface may eventually become Standard or Stable but is still in transition.

Sun will make reasonable efforts to ensure compatibility with previous releases as it evolves. When non-upwards compatible changes become necessary, they will occur in minor and major releases; such changes will be avoided in micro releases whenever possible. If such a change is necessary, it will be documented in the release notes for the effected release, and when feasible, Sun will provide migration aids for binary compatibility and continued source development.

**Unstable**

An Unstable interface is provided to give developers early access to new or rapidly changing technology or as an interim solution to a problem for which a more stable solution is anticipated in the future.

For Unstable interfaces, Sun no claims about either source or binary compatibility from one minor release to another. Applications developed based on these interfaces may not work in future minor releases.

**Obsolete: Scheduled for removal after event**

An Obsolete interface is supported in the current release, but is scheduled to be removed in a future (minor) release. When support of an interface is to be discontinued, Sun will attempt to provide notification before discontinuing support. Use of an Obsolete interface may produce warning messages.

**MT-Level**

Libraries are classified into four categories which define their ability to support multiple threads. Manual pages containing routines that are of multiple or differing levels show this within their **NOTES** section.

**Safe** Safe is an attribute of code that can be called from a multithreaded application. The effect of calling into a Safe interface or a safe code segment is that the results are valid even when called by multiple threads. Often overlooked is the fact that the result of this Safe interface or safe code segment can have global consequences that affect all threads. For example, the action of opening or closing a file from one thread is visible by all the threads within a process. A multi-threaded application has the responsibility for using these interfaces in a safe manner, which is different from whether or not the interface is Safe. For example, a multi-threaded application that closes a file that is still in use by other threads within the application is not using the `close(2)` interface safely.

**Unsafe** An Unsafe library contains global and static data that is not protected. It is not safe to use unless the application arranges for only one thread at time to execute within the library. Unsafe libraries may contain routines that are Safe; however, most of the library's routines are unsafe to call.

The following table contains reentrant counterparts for Unsafe functions. This table is subject to change by Sun.

Reentrant functions for libc:

| <b>Unsafe Function</b> | <b>Reentrant counterpart</b> |
|------------------------|------------------------------|
| <b>ctime</b>           | <b>ctime_r</b>               |
| <b>localtime</b>       | <b>localtime_r</b>           |
| <b>asctime</b>         | <b>asctime_r</b>             |
| <b>gmtime</b>          | <b>gmtime_r</b>              |
| <b>ctermid</b>         | <b>ctermid_r</b>             |
| <b>getlogin</b>        | <b>getlogin_r</b>            |
| <b>rand</b>            | <b>rand_r</b>                |
| <b>readdir</b>         | <b>readdir_r</b>             |
| <b>strtok</b>          | <b>strtok_r</b>              |
| <b>tmpnam</b>          | <b>tmpnam_r</b>              |

**MT-Safe** An MT-Safe library is fully prepared for multithreaded access. It protects its global and static data with locks, and can provide a reasonable amount of concurrency. Note that a library can be safe to use, but not MT-Safe. For example, surrounding an entire library with a monitor makes the library Safe, but it supports no concurrency so it is not considered MT-Safe. An MT-Safe library must permit a reasonable amount of concurrency. (This definition's purpose is to give precision to what is meant when a library is described as Safe. The definition of a Safe library does not specify if the library supports concurrency. The MT-Safe definition makes it clear that the library is Safe, and supports some concurrency. This clarifies the Safe definition, which can mean anything from being single threaded to being any degree of multithreaded.)

**Async-Signal-Safe**

Async-Signal-Safe refers to particular library routines that can be safely called from a signal handler. A thread that is executing an Async-Signal-Safe routine will not deadlock with itself if interrupted by a signal. Signals are only a problem for MT-Safe routines that acquire locks.

Signals are disabled when locks are acquired in Async-Signal-Safe routines. This prevents a signal handler that might acquire the same lock from being called.

The list of Async-Signal-Safe functions includes:

|                         |                       |                      |
|-------------------------|-----------------------|----------------------|
| <b>_exit</b>            | <b>access</b>         | <b>aio_error</b>     |

**MT-Safe with Exceptions**

See the NOTES sections of these pages for a description of the exceptions.

**Safe with Exceptions**

See the NOTES sections of these pages for a description of the exceptions.

**Fork1-Safe**

A Fork1-Safe library releases the locks it had held whenever **fork1(2)** is called in a Solaris thread program, or **fork(2)** in a POSIX (see **standards(5)**) thread program. Calling **fork(2)** in a POSIX thread program has the same semantic as calling **fork1(2)** in a Solaris thread program. All system calls, **libpthread**, and **libthread** are **Fork1-Safe**. Otherwise, you should handle the locking clean-up yourself (see **pthread\_atfork(3T)**).

**Cancel-Safety**

If a multi-threaded application uses **pthread\_cancel(3T)** to cancel (that is, kill) a thread, it is possible that the target thread is killed while holding a resource, such as a lock or allocated memory. If the thread has not installed the appropriate cancellation cleanup handlers to release the resources appropriately (see **pthread\_cancel(3T)**), the application is "cancel-unsafe", that is, it is not safe with respect to cancellation. This unsafety could result in deadlocks due to locks not released by a thread that gets cancelled, or resource leaks; for example, memory not being freed on thread cancellation. All applications that use **pthread\_cancel(3T)** should ensure that they operate in a Cancel-Safe environment.

Libraries that have cancellation points and which acquire resources such as locks or allocate memory dynamically, also contribute to the cancel-unsafety of applications that are linked with these libraries. This introduces another level of safety for libraries in a multi-threaded program: Cancel-Safety.

There are two sub-categories of Cancel-Safety: Deferred-Cancel-Safety, and Asynchronous-Cancel-Safety.

An application is considered to be Deferred-Cancel-Safe when it is Cancel-Safe for threads whose cancellation type is **PTHREAD\_CANCEL\_DEFERRED**.

An application is considered to be Asynchronous-Cancel-Safe when it is Cancel-Safe for threads whose cancellation type is **PTHREAD\_CANCEL\_ASYNCHRONOUS**.

Deferred-Cancel-Safety is easier to achieve than Asynchronous-Cancel-Safety, since a thread with the deferred cancellation type can be cancelled only at well-defined cancellation points, whereas a thread with the asynchronous cancellation type can be cancelled anywhere. Since all threads are created by default to have the deferred cancellation type, it may never be necessary to worry about asynchronous cancel safety. Indeed, most applications and libraries are expected to always be Asynchronous-Cancel-Unsafe.

An application which is Asynchronous-Cancel-Safe is also, by definition, Deferred-Cancel-Safe.

| <b>NAME</b>           | charmap – character set description file   |       |       |       |       |       |       |       |       |       |      |      |       |      |       |       |      |       |       |       |       |       |       |      |       |      |       |       |       |      |      |       |      |      |       |      |      |
| <b>DESCRIPTION</b>    | <p>A character set description file or <i>charmap</i> defines characteristics for a coded character set. Other information about the coded character set may also be in the file. Coded character set character values are defined using symbolic character names followed by character encoding values.</p> <p>The character set description file provides:</p> <ul style="list-style-type: none"> <li>• The capability to describe character set attributes (such as collation order or character classes) independent of character set encoding, and using only the characters in the portable character set. This makes it possible to create generic <b>localedef(1)</b> source files for all codesets that share the portable character set.</li> <li>• Standardized symbolic names for all characters in the portable character set, making it possible to refer to any such character regardless of encoding.</li> </ul>   |       |       |       |       |       |       |       |       |       |      |      |       |      |       |       |      |       |       |       |       |       |       |      |       |      |       |       |       |      |      |       |      |      |       |      |      |
| <b>Symbolic Names</b> | <p>Each symbolic name is included in the file and is mapped to a unique encoding value (except for those symbolic names that are shown with identical glyphs). If the control characters commonly associated with the symbolic names in the following table are supported by the implementation, the symbolic names and their corresponding encoding values are included in the file. Some of the encodings associated with the symbolic names in this table may be the same as characters in the portable character set table.</p> <table border="1" style="margin-left: auto; margin-right: auto; border-collapse: collapse;"> <tr> <td>&lt;ACK&gt;</td> <td>&lt;DC2&gt;</td> <td>&lt;ENQ&gt;</td> <td>&lt;FS&gt;</td> <td>&lt;IS4&gt;</td> <td>&lt;SOH&gt;</td> </tr> <tr> <td>&lt;BEL&gt;</td> <td>&lt;DC3&gt;</td> <td>&lt;EOT&gt;</td> <td>&lt;GS&gt;</td> <td>&lt;LF&gt;</td> <td>&lt;STX&gt;</td> </tr> <tr> <td>&lt;BS&gt;</td> <td>&lt;DC4&gt;</td> <td>&lt;ESC&gt;</td> <td>&lt;HT&gt;</td> <td>&lt;NAK&gt;</td> <td>&lt;SUB&gt;</td> </tr> <tr> <td>&lt;CAN&gt;</td> <td>&lt;DEL&gt;</td> <td>&lt;ETB&gt;</td> <td>&lt;IS1&gt;</td> <td>&lt;RS&gt;</td> <td>&lt;SYN&gt;</td> </tr> <tr> <td>&lt;CR&gt;</td> <td>&lt;DLE&gt;</td> <td>&lt;ETX&gt;</td> <td>&lt;IS2&gt;</td> <td>&lt;SI&gt;</td> <td>&lt;US&gt;</td> </tr> <tr> <td>&lt;DC1&gt;</td> <td>&lt;EM&gt;</td> <td>&lt;FF&gt;</td> <td>&lt;IS3&gt;</td> <td>&lt;SO&gt;</td> <td>&lt;VT&gt;</td> </tr> </table> | <ACK> | <DC2> | <ENQ> | <FS>  | <IS4> | <SOH> | <BEL> | <DC3> | <EOT> | <GS> | <LF> | <STX> | <BS> | <DC4> | <ESC> | <HT> | <NAK> | <SUB> | <CAN> | <DEL> | <ETB> | <IS1> | <RS> | <SYN> | <CR> | <DLE> | <ETX> | <IS2> | <SI> | <US> | <DC1> | <EM> | <FF> | <IS3> | <SO> | <VT> |

| <DC1>                 | <EM>   | <FF>  | <IS3> | <SO>  | <VT>  |       |       |       |       |       |      |      |       |      |       |       |      |       |       |       |       |       |       |      |       |      |       |       |       |      |      |       |      |      |       |      |      |
| <b>Declarations</b>   | <p>The following declarations can precede the character definitions. Each must consist of the symbol shown in the following list, starting in column 1, including the surrounding brackets, followed by one or more blank characters, followed by the value to be assigned to the symbol.</p> <p>&lt;code_set_name&gt;      The name of the coded character set for which the character set description file is defined.</p> <p>&lt;mb_cur_max&gt;          The maximum number of bytes in a multi-byte character. This defaults to 1.</p> <p>&lt;mb_cur_min&gt;          An unsigned positive integer value that defines the minimum number of bytes in a character for the encoded character set.</p> <p>&lt;escape_char&gt;          The escape character used to indicate that the characters following will be interpreted in a special way, as defined later in this section. This defaults to backslash (\), which is the character glyph used</p>  |       |       |       |       |       |       |       |       |       |      |      |       |      |       |       |      |       |       |       |       |       |       |      |       |      |       |       |       |      |      |       |      |      |       |      |      |

in all the following text and examples, unless otherwise noted.

*<comment\_char>* The character that when placed in column 1 of a charmap line, is used to indicate that the line is to be ignored. The default character is the number sign (#).

**Format**

The character set mapping definitions will be all the lines immediately following an identifier line containing the string **CHARMAP** starting in column 1, and preceding a trailer line containing the string **END CHARMAP** starting in column 1. Empty lines and lines containing a *<comment\_char>* in the first column will be ignored. Each non-comment line of the character set mapping definition (that is, between the **CHARMAP** and **END CHARMAP** lines of the file) must be in either of two forms:

`"%s %s %s\n",<symbolic-name>,<encoding>,<comments>`

or

`"%s..%s %s %s\n",<symbolic-name>,<symbolic-name>,<encoding>,<comments>`

In the first format, the line in the character set mapping definition defines a single symbolic name and a corresponding encoding. A character following an escape character is interpreted as itself; for example, the sequence `<\\>` represents the symbolic name `>` enclosed between angle brackets.

In the second format, the line in the character set mapping definition defines a range of one or more symbolic names. In this form, the symbolic names must consist of zero or more non-numeric characters, followed by an integer formed by one or more decimal digits. The characters preceding the integer must be identical in the two symbolic names, and the integer formed by the digits in the second symbolic name must be equal to or greater than the integer formed by the digits in the first name. This is interpreted as a series of symbolic names formed from the common part and each of the integers between the first and the second integer, inclusive. As an example, `<j0101>...<j0104>` is interpreted as the symbolic names `<j0101>`, `<j0102>`, `<j0103>`, and `<j0104>`, in that order.

A character set mapping definition line must exist for all symbolic names and must define the coded character value that corresponds to the character glyph indicated in the table, or the coded character value that corresponds with the control character symbolic name. If the control characters commonly associated with the symbolic names are supported by the implementation, the symbolic name and the corresponding encoding value must be included in the file. Additional unique symbolic names may be included. A coded character value can be represented by more than one symbolic name.

The encoding part is expressed as one (for single-byte character values) or more concatenated decimal, octal or hexadecimal constants in the following formats:

`"%cd%d",<escape_char>,<decimal byte value>`  
`"%cx%x",<escape_char>,<hexadecimal byte value>`  
`"%c%o",<escape_char>,<octal byte value>`

**Decimal Constants**

Decimal constants must be represented by two or three decimal digits, preceded by the escape character and the lower-case letter **d**; for example, `\d05`, `\d97`, or `\d143`. Hexadecimal constants must be represented by two hexadecimal digits, preceded by the escape

character and the lower-case letter **x**; for example, `\x05`, `\x61`, or `\x8f`. Octal constants must be represented by two or three octal digits, preceded by the escape character; for example, `\05`, `\141`, or `\217`. In a portable charmap file, each constant must represent an 8-bit byte. Implementations supporting other byte sizes may allow constants to represent values larger than those that can be represented in 8-bit bytes, and to allow additional digits in constants. When constants are concatenated for multi-byte character values, they must be of the same type, and interpreted in byte order from first to last with the least significant byte of the multi-byte character specified by the last constant.

#### Ranges of Symbolic Names

In lines defining ranges of symbolic names, the encoded value is the value for the first symbolic name in the range (the symbolic name preceding the ellipsis). Subsequent symbolic names defined by the range will have encoding values in increasing order. For example, the line

```
<j0101>...<j0104>          \d129\d254
```

will be interpreted as:

```
<j0101>                    \d129\d254
<j0102>                    \d129\d255
<j0103>                    \d130\d0
<j0104>                    \d130\d1
```

Note that this line will be interpreted as the example even on systems with bytes larger than 8 bits. The comment is optional.

|                    |   |
|--------------------|---|
| <b>NAME</b>        | environ – user environment  |
| <b>DESCRIPTION</b> | <p>When a process begins execution, <b>exec</b> routines make available an array of strings called the environment; see <b>exec(2)</b>. By convention, these strings have the form <i>variable=value</i>, for example, <b>PATH=/sbin:/usr/sbin</b>. These environmental variables provide a way to make information about a program's environment available to programs.</p> <p>A name may be placed in the environment by the <b>export</b> command and <i>name=value</i> arguments in <b>sh(1)</b>, or by <b>exec(2)</b>. It is unwise to conflict with certain shell variables that are frequently exported by <b>.profile</b> files: <b>MAIL</b>, <b>PS1</b>, <b>PS2</b>, <b>IFS</b>; see <b>profile(4)</b>.</p> <p>The following environmental variables can be used by applications and are expected to be set in the target run-time environment.</p> <p><b>HOME</b>        The name of the user's login directory, set by <b>login(1)</b> from the password file; see <b>passwd(4)</b>.</p> <p><b>LANG</b>         The string used to specify internationalization information that allows users to work with different national conventions. The <b>setlocale(3C)</b> function checks the <b>LANG</b> environment variable when it is called with "" as the <i>locale</i> argument. <b>LANG</b> is used as the default locale if the corresponding environment variable for a particular category is unset or null. If, however, <b>LC_ALL</b> is set to a valid, non-empty value, its contents are used to override both the <b>LANG</b> and the other <b>LC_*</b> variables.</p> <p>For example, when <b>setlocale()</b> is invoked as</p> <p style="text-align: center;"><b>setlocale(LC_CTYPE, ""),</b></p> <p><b>setlocale()</b> will query the <b>LC_CTYPE</b> environment variable first to see if it is set and non-null. If <b>LC_CTYPE</b> is not set or null, then <b>setlocale()</b> will check the <b>LANG</b> environment variable to see if it is set and non-null. If both <b>LANG</b> and <b>LC_CTYPE</b> are unset or <b>NULL</b>, the default "C" locale will be used to set the <b>LC_CTYPE</b> category.</p> <p>Most commands will invoke</p> <p style="text-align: center;"><b>setlocale(LC_ALL, "")</b></p> <p>prior to any other processing. This allows the command to be used with different national conventions by setting the appropriate environment variables.</p> <p>The following environment variables correspond to each category of <b>setlocale(3C)</b>:</p> <p><b>LC_ALL</b>        If set to a valid, non-empty string value, override the values of <b>LANG</b> and all the other <b>LC_*</b> variables.</p> <p><b>LC_COLLATE</b>   This category specifies the character collation sequence being used. The information corresponding to this category is stored in a database created by the <b>localedef(1)</b> command. This environment variable affects <b>strcoll(3C)</b> and <b>strxfrm(3C)</b>.</p> |

|                    |  |
|--------------------|--|
| <b>LC_CTYPE</b>    | This category specifies character classification, character conversion, and widths of multibyte characters. When <b>LC_CTYPE</b> is set to a valid value, the calling utility can display and handle text and file names containing valid characters for that locale; Extended Unix Code (EUC) characters where any individual character can be 1, 2, or 3 bytes wide; and EUC characters of 1, 2, or 3 column widths. The default "C" locale corresponds to the 7-bit ASCII character set; only characters from ISO 8859-1 are valid. The information corresponding to this category is stored in a database created by the <b>localedef(1)</b> command. This environment variable is used by <b>ctype(3C)</b> , <b>mblen(3C)</b> , and many commands, such as <b>cat(1)</b> , <b>ed(1)</b> , <b>ls(1)</b> , and <b>vi(1)</b> . |
| <b>LC_MESSAGES</b> | This category specifies the language of the message database being used. For example, an application may have one message database with French messages, and another database with German messages. Message databases are created by the <b>mkmsgs(1)</b> command. This environment variable is used by <b>exstr(1)</b> , <b>gettext(1)</b> , <b>srchtxt(1)</b> , <b>gettext(3C)</b> , and <b>gettext(3C)</b> .  |
| <b>LC_MONETARY</b> | This category specifies the monetary symbols and delimiters used for a particular locale. The information corresponding to this category is stored in a database created by the <b>localedef(1)</b> command. This environment variable is used by <b>localeconv(3C)</b> .  |
| <b>LC_NUMERIC</b>  | This category specifies the decimal and thousands delimiters. The information corresponding to this category is stored in a database created by the <b>localedef(1)</b> command. The default C locale corresponds to "." as the decimal delimiter and no thousands delimiter. This environment variable is used by <b>localeconv(3C)</b> , <b>printf(3S)</b> , and <b>strtod(3C)</b> .   |
| <b>LC_TIME</b>     | This category specifies date and time formats. The information corresponding to this category is stored in a database specified in <b>localdef(1)</b> . The default C locale corresponds to U.S. date and time formats. This environment variable is used by many commands and functions; for example: <b>at(1)</b> , <b>calendar(1)</b> , <b>date(1)</b> , <b>strftime(3C)</b> , and <b>getdate(3C)</b> .   |
| <b>MSGVERB</b>     | Controls which standard format message components <b>fmtmsg</b> selects when messages are displayed to <b>stderr</b> ; see <b>fmtmsg(1)</b> and <b>fmtmsg(3C)</b> .  |
| <b>NETPATH</b>     | A colon-separated list of network identifiers. A network identifier is a character string used by the Network Selection component of the system to   |

provide application-specific default network search paths. A network identifier must consist of non-NULL characters and must have a length of at least 1. No maximum length is specified. Network identifiers are normally chosen by the system administrator. A network identifier is also the first field in any `/etc/netconfig` file entry. `NETPATH` thus provides a link into the `/etc/netconfig` file and the information about a network contained in that network's entry. `/etc/netconfig` is maintained by the system administrator. The library routines described in `getnetpath(3N)` access the `NETPATH` environment variable.

**NLSPATH** Contains a sequence of templates which `catopen(3C)` and `gettext(3C)` use when attempting to locate message catalogs. Each template consists of an optional prefix, one or more substitution fields, a filename and an optional suffix.

For example:

```
NLSPATH="/system/nlslib/%N.cat"
```

defines that `catopen()` should look for all message catalogs in the directory `/system/nlslib`, where the catalog name should be constructed from the `name` parameter passed to `catopen()`, `%N`, with the suffix `.cat`.

Substitution fields consist of a `%` symbol, followed by a single-letter keyword. The following keywords are currently defined:

|                 |   |
|-----------------|---|
| <code>%N</code> | The value of the <code>name</code> parameter passed to <code>catopen()</code> . |
| <code>%L</code> | The value of <code>LANG</code> or <code>LC_MESSAGES</code> .                    |
| <code>%l</code> | The language element from <code>LANG</code> or <code>LC_MESSAGES</code> .       |
| <code>%t</code> | The territory element from <code>LANG</code> or <code>LC_MESSAGES</code> .      |
| <code>%c</code> | The codeset element from <code>LANG</code> or <code>LC_MESSAGES</code> .        |
| <code>%%</code> | A single <code>%</code> character.  |

An empty string is substituted if the specified value is not currently defined. The separators “`_`” and “`.`” are not included in `%t` and `%c` substitutions.

Templates defined in `NLSPATH` are separated by colons (`:`). A leading colon or two adjacent colons (`::`) is equivalent to specifying `%N`.

For example:

```
NLSPATH=":%N.cat:/nlslib/%L/%N.cat"
```

indicates to `catopen()` that it should look for the requested message catalog in `name`, `name.cat` and `/nlslib/$LANG/name.cat`. For `gettext()`, `%N` automatically maps to “`messages`”.

If `NLSPATH` is unset or `NULL`, `catopen()` and `gettext()` call `setlocale(3C)`, which checks `LANG` and the `LC_*` variables to locate the message catalogs.

`NLSPATH` will normally be set up on a system wide basis (in `/etc/profile`) and thus makes the location and naming conventions associated with message catalogs transparent to both programs and users.

|                  |  |
|------------------|--|
| <b>PATH</b>      | The sequence of directory prefixes that <b>sh</b> (1), <b>time</b> (1), <b>nice</b> (1), <b>nohup</b> (1), and other utilities apply in searching for a file known by an incomplete path name. The prefixes are separated by colons (:). <b>login</b> (1) sets <b>PATH=/usr/bin</b> . For more detail, see <b>sh</b> (1).  |
| <b>SEV_LEVEL</b> | Define severity levels and associate and print strings with them in standard format error messages; see <b>addseverity</b> (3C), <b>fmtmsg</b> (1), and <b>fmtmsg</b> (3C).  |
| <b>TERM</b>      | The kind of terminal for which output is to be prepared. This information is used by commands, such as <b>vi</b> (1), which may exploit special capabilities of that terminal.   |
| <b>TZ</b>        | <p>Timezone information. The contents of this environment variable are used by the functions <b>ctime</b>(3C), <b>localtime</b>(3C), <b>strftime</b>(3C), and <b>mktime</b>(3C) to override the default timezone. If <b>TZ</b> is not in the following form, it designates a path to a timezone database file relative to <b>/usr/share/lib/zoneinfo/</b>, ignoring the first character if it is a colon (:); otherwise, <b>TZ</b> has the form:</p> <p><i>std offset [ dst [ offset ], [ start [/time], end [/time] ] ]</i></p> <p><i>std</i> and <i>dst</i> Three or more bytes that are the designation for the standard (<i>std</i>) and daylight savings time (<i>dst</i>) timezones. Only <i>std</i> is required. If <i>dst</i> is missing, then daylight savings time does not apply in this locale. Upper- and lower-case letters are allowed. Any characters except a leading colon (:), digits, a comma (,), a minus (-) or a plus (+) are allowed.</p> <p><i>offset</i> Indicates the value one must add to the local time to arrive at Coordinated Universal Time. The offset has the form:</p> <p><i>hh[:mm[:ss]]</i></p> <p>The minutes (<i>mm</i>) and seconds (<i>ss</i>) are optional. The hour (<i>hh</i>) is required and may be a single digit. The <i>offset</i> following <i>std</i> is required. If no <i>offset</i> follows <i>dst</i>, daylight savings time is assumed to be one hour ahead of standard time. One or more digits may be used; the value is always interpreted as a decimal number. The hour must be between 0 and 24, and the minutes (and seconds) if present between 0 and 59. Out of range values may cause unpredictable behavior. If preceded by a “-”, the timezone is east of the Prime Meridian; otherwise it is west (which may be indicated by an optional preceding “+” sign).</p> <p><i>start/time, end/time</i> Indicate when to change to and back from daylight savings time, where <i>start/time</i> describes when the change from standard time to daylight savings time occurs, and <i>end/time</i> describes when the change back happens. Each <i>time</i> field describes when, in current local time, the change is made.</p> |

The formats of *start* and *end* are one of the following:

- Jn***        The Julian day  $n$  ( $1 \leq n \leq 365$ ). Leap days are not counted. That is, in all years, February 28 is day 59 and March 1 is day 60. It is impossible to refer to the occasional February 29.
- n***            The zero-based Julian day ( $0 \leq n \leq 365$ ). Leap days are counted, and it is possible to refer to February 29.
- Mm.n.d***    The  $d^{\text{th}}$  day, ( $0 \leq d \leq 6$ ) of week  $n$  of month  $m$  of the year ( $1 \leq n \leq 5$ ,  $1 \leq m \leq 12$ ), where week 5 means “the last  $d$ -day in month  $m$ ” which may occur in either the fourth or the fifth week). Week 1 is the first week in which the  $d^{\text{th}}$  day occurs. Day zero is Sunday.

Implementation specific defaults are used for *start* and *end* if these optional fields are not given.

The *time* has the same format as *offset* except that no leading sign (“-” or “+”) is allowed. The default, if *time* is not given is 02:00:00.

| <b>DESCRIPTION</b> | The <b>eqnchar</b> command contains <b>troff(1)</b> and <b>nroff(1)</b> character definitions for constructing characters that are not available on the Graphic Systems typesetter. These definitions are primarily intended for use with <b>eqn(1)</b> and <b>neqn</b> . It contains definitions for the following characters:  |                  |                   |                |                |               |           |                |           |               |           |               |         |            |        |               |           |             |                |             |           |             |         |               |           |                |         |            |           |             |          |                |         |                  |                   |              |             |             |          |                  |                   |               |       |             |     |              |          |              |          |                |     |              |         |            |        |             |           |            |          |            |        |               |        |             |         |             |             |                |          |             |          |               |           |             |              |            |              |               |           |             |           |                |               |                |             |             |           |                 |               |                |             |                 |              |               |            |  |  |

- F\_RDDNY** Deny other read access share reservations.
- F\_WRDNY** Deny other write access share reservations.
- F\_RWDNY** Deny other read or write access share reservations.
- F\_NODNY** Do not deny other read or write access share reservations.

The following four sets of values for the **oflag** used by **open()** are bitwise distinct:

- O\_CREAT** Create file if it does not exist.
- O\_EXCL** Exclusive use flag.
- O\_NOCTTY** Do not assign controlling tty.
- O\_TRUNC** Truncate flag.

File status flags used for **open()** and **fcntl()**:

- O\_APPEND** Set append mode.
- O\_NDELAY** Non-blocking mode.
- O\_NONBLOCK** Non-blocking mode (POSIX; see **standards(5)**).
- O\_DSYNC** Write I/O operations on the file descriptor complete as defined by synchronized I/O data integrity completion.
- O\_RSYNC** Read I/O operations on the file descriptor complete at the same level of integrity as specified by the the **O\_DSYNC** and **O\_SYNC** flags. If both **O\_DSYNC** and **O\_RSYNC** are set in *oflag*, all I/O operations on the file descriptor complete as defined by synchronized I/O data integrity completion. If both **O\_SYNC** and **O\_RSYNC** are set in *oflag*, all I/O operations on the file descriptor complete as defined by synchronized I/O file integrity completion.
- O\_SYNC** When opening a regular file, this flag affects subsequent writes. If set, each **write(2)** will wait for both the file data and file status to be physically updated. Write I/O operations on the file descriptor complete as defined by synchronized I/O file integrity completion.

Mask for use with file access modes:

- O\_ACCMODE** Mask for file access modes.

File access modes used for **open()** and **fcntl()**:

- O\_RDONLY** Open for reading only.
- O\_RDWR** Open for reading and writing.
- O\_WRONLY** Open for writing only.

The **flock** structure describes a file lock. It includes the following members:

- short l\_type;** /\* Type of lock \*/
- short l\_whence;** /\* Flag for starting offset \*/
- off\_t l\_start;** /\* Relative offset in bytes \*/
- off\_t l\_len;** /\* Size; if 0 then until EOF \*/
- long l\_sysid;** /\* Returned with F\_GETLK \*/
- pid\_t l\_pid;** /\* Returned with F\_GETLK \*/

The structure **fshare** describes a file share reservation. It includes the following members:

```

short  f_access;      /* Type of reservation */
short  f_deny;       /* Type of reservations to deny */
long   f_id;         /* Process unique identifier */

```

**NOTES**

Data is successfully transferred for a write operation to a regular file when the system ensures that all data written is readable on any subsequent open of the file (even one that follows a system or power failure) in the absence of a failure of the physical storage medium.

Data is successfully transferred for a read operation when an image of the data on the physical storage medium is available to the requesting process.

Synchronized I/O data integrity completion (see [fdatasync\(3R\)](#)):

For reads, the operation has been completed or diagnosed if unsuccessful. The read is complete only when an image of the data has been successfully transferred to the requesting process. If there were any pending write requests affecting the data to be read at the time that the synchronized read operation was requested, these write requests will be successfully transferred prior to reading the data.

For writes, the operation has been completed or diagnosed if unsuccessful. The write is complete only when the data specified in the write request is successfully transferred, and all file system information required to retrieve the data is successfully transferred.

File attributes that are not necessary for data retrieval (access time, modification time, status change time) need not be successfully transferred prior to returning to the calling process.

Synchronized I/O file integrity completion (see [fsync\(3C\)](#)):

Identical to a synchronized I/O data integrity completion with the addition that all file attributes relative to the I/O operation (including access time, modification time, status change time) will be successfully transferred prior to returning to the calling process.

| <b>DESCRIPTION</b>      | <p>The file system tree is organized for administrative convenience. Distinct areas within the file system tree are provided for files that are private to one machine, files that can be shared by multiple machines of a common architecture, files that can be shared by all machines, and home directories. This organization allows sharable files to be stored on one machine but accessed by many machines using a remote file access mechanism such as NFS. Grouping together similar files makes the file system tree easier to upgrade and manage.</p> <p>The file system tree consists of a root file system and a collection of mountable file systems. The <b>mount(2)</b> program attaches mountable file systems to the file system tree at mount points (directory entries) in the root file system or other previously mounted file systems. Two file systems, / (the root) and /usr, must be mounted in order to have a completely functional system. The root file system is mounted automatically by the kernel at boot time; the /usr file system is mounted by the system start-up script, which is run as part of the booting process.</p>  |             |  |                 |                     |                 |                          |                   |                   |                 |                   |                 |   |                  |                   |             |  |                  |  |                    |   |                     |  |                 |  |
| <b>Root File System</b> | <p>The root file system contains files that are unique to each machine. It contains the following directories:</p> <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 20px;"><b>/dev</b></td> <td>Primary location for special files. Typically, device files are built to match the kernel and hardware configuration of the machine.</td> </tr> <tr> <td><b>/dev/dsk</b></td> <td>Block disk devices.</td> </tr> <tr> <td><b>/dev/pts</b></td> <td>Pseudo-terminal devices.</td> </tr> <tr> <td><b>/dev/rdisk</b></td> <td>Raw disk devices.</td> </tr> <tr> <td><b>/dev/rmt</b></td> <td>Raw tape devices.</td> </tr> <tr> <td><b>/dev/sad</b></td> <td>Entry points for the STREAMS Administrative driver.</td> </tr> <tr> <td><b>/dev/term</b></td> <td>Terminal devices.</td> </tr> <tr> <td><b>/etc</b></td> <td>Host-specific administrative configuration files and databases. /etc may be viewed as the directory that defines the machine's identity.</td> </tr> <tr> <td><b>/etc/acct</b></td> <td>Accounting system configuration information.</td> </tr> <tr> <td><b>/etc/cron.d</b></td> <td>Configuration information for <b>cron(1M)</b>.</td> </tr> <tr> <td><b>/etc/default</b></td> <td>Defaults information for various programs.</td> </tr> <tr> <td><b>/etc/dfs</b></td> <td>Configuration information for exported file systems.</td> </tr> </table> | <b>/dev</b> | Primary location for special files. Typically, device files are built to match the kernel and hardware configuration of the machine. | <b>/dev/dsk</b> | Block disk devices. | <b>/dev/pts</b> | Pseudo-terminal devices. | <b>/dev/rdisk</b> | Raw disk devices. | <b>/dev/rmt</b> | Raw tape devices. | <b>/dev/sad</b> | Entry points for the STREAMS Administrative driver. | <b>/dev/term</b> | Terminal devices. | <b>/etc</b> | Host-specific administrative configuration files and databases. /etc may be viewed as the directory that defines the machine's identity. | <b>/etc/acct</b> | Accounting system configuration information. | <b>/etc/cron.d</b> | Configuration information for <b>cron(1M)</b> . | <b>/etc/default</b> | Defaults information for various programs. | <b>/etc/dfs</b> | Configuration information for exported file systems. |
| <b>/dev</b>             | Primary location for special files. Typically, device files are built to match the kernel and hardware configuration of the machine.   |             |  |                 |                     |                 |                          |                   |                   |                 |                   |                 |   |                  |                   |             |  |                  |  |                    |   |                     |  |                 |  |

| <b>/dev/rdisk</b>       | Raw disk devices.  |             |  |                 |                     |                 |                          |                   |                   |                 |                   |                 |   |                  |                   |             |  |                  |  |                    |   |                     |  |                 |  |
| <b>/dev/rmt</b>         | Raw tape devices.  |             |  |                 |                     |                 |                          |                   |                   |                 |                   |                 |   |                  |                   |             |  |                  |  |                    |   |                     |  |                 |  |
| <b>/dev/sad</b>         | Entry points for the STREAMS Administrative driver.  |             |  |                 |                     |                 |                          |                   |                   |                 |                   |                 |   |                  |                   |             |  |                  |  |                    |   |                     |  |                 |  |
| <b>/dev/term</b>        | Terminal devices.  |             |  |                 |                     |                 |                          |                   |                   |                 |                   |                 |   |                  |                   |             |  |                  |  |                    |   |                     |  |                 |  |
| <b>/etc</b>             | Host-specific administrative configuration files and databases. /etc may be viewed as the directory that defines the machine's identity.   |             |  |                 |                     |                 |                          |                   |                   |                 |                   |                 |   |                  |                   |             |  |                  |  |                    |   |                     |  |                 |  |
| <b>/etc/acct</b>        | Accounting system configuration information.   |             |  |                 |                     |                 |                          |                   |                   |                 |                   |                 |   |                  |                   |             |  |                  |  |                    |   |                     |  |                 |  |
| <b>/etc/cron.d</b>      | Configuration information for <b>cron(1M)</b> .  |             |  |                 |                     |                 |                          |                   |                   |                 |                   |                 |   |                  |                   |             |  |                  |  |                    |   |                     |  |                 |  |
| <b>/etc/default</b>     | Defaults information for various programs.   |             |  |                 |                     |                 |                          |                   |                   |                 |                   |                 |   |                  |                   |             |  |                  |  |                    |   |                     |  |                 |  |
| <b>/etc/dfs</b>         | Configuration information for exported file systems.   |             |  |                 |                     |                 |                          |                   |                   |                 |                   |                 |   |                  |                   |             |  |                  |  |                    |   |                     |  |                 |  |

|                           |   |
|---------------------------|---|
| <b>/etc/fs</b>            | Binaries organized by file system types for operations required before <b>/usr</b> is mounted.  |
| <b>/etc/inet</b>          | Configuration files for Internet services.  |
| <b>/etc/init.d</b>        | Shell scripts for transitioning between run levels.   |
| <b>/etc/lib</b>           | Shared libraries needed during booting.   |
| <b>/etc/lp</b>            | Configuration information for the printer subsystem.  |
| <b>/etc/mail</b>          | Mail subsystem configuration.   |
| <b>/etc/net</b>           | Configuration information for transport independent network services.   |
| <b>/etc/opt</b>           | Configuration information for optional packages.  |
| <b>/etc/rc0.d</b>         | Scripts for entering or leaving run level 0. See <b>init(1M)</b> .  |
| <b>/etc/rc1.d</b>         | Scripts for entering or leaving run level 1. See <b>init(1M)</b> .  |
| <b>/etc/rc2.d</b>         | Scripts for entering or leaving run level 2. See <b>init(1M)</b> .  |
| <b>/etc/rc3.d</b>         | Scripts for entering or leaving run level 3. See <b>init(1M)</b> .  |
| <b>/etc/saf</b>           | Service Access Facility files.  |
| <b>/etc/skel</b>          | Default profile scripts for new user accounts. See <b>useradd(1M)</b> .   |
| <b>/etc/sm</b>            | Status monitor information.   |
| <b>/etc/sm.bak</b>        | Backup status monitor information.  |
| <b>/etc/tm</b>            | Trademark files; contents displayed at boot time.   |
| <b>/etc/uucp</b>          | UUCP configuration information. See <b>uucp(1C)</b> .   |
| <b>/export</b>            | Default root of the exported file system tree.  |
| <b>/home</b>              | Default root of a subtree for user directories.   |
| <b>/kernel</b>            | Subtree of Platform Independent loadable kernel modules required as part of the boot process. It includes the generic part of the core kernel that is platform-independent, <b>/kernel/genunix</b> . See <b>kernel(1M)</b> .    |
| <b>/mnt</b>               | Default temporary mount point for file systems. This is an empty directory on which file systems may be temporarily mounted.  |
| <b>/opt</b>               | Root of a subtree for add-on application packages.  |
| <b>/platform</b>          | Subtree of Platform Specific objects which need to reside on the root filesystem. It contains a series of directories, one per supported platform. The semantics of the series of directories is equivalent to <b>/</b> (root). |
| <b>/platform/*/kernel</b> | Platform Dependent objects with semantics equivalent to <b>/kernel</b> . It includes the file <b>unix</b> , the core kernel that is platform dependent. See <b>kernel(1M)</b> .   |

|                              |   |
|------------------------------|---|
| <b>/platform/*/lib</b>       | Platform Dependent objects with semantics equivalent to /lib.   |
| <b>/platform/*/sbin</b>      | Platform Dependent objects with semantics equivalent to /sbin.  |
| <b>/proc</b>                 | Root of a subtree for the process file system.  |
| <b>/sbin</b>                 | Essential executables used in the booting process and in manual system recovery. The full complement of utilities is available only after <b>/usr</b> is mounted.               |
| <b>/tmp</b>                  | Temporary files; cleared during the boot operation.   |
| <b>/var</b>                  | Root of a subtree for varying files. Varying files are files that are unique to a machine but that can grow to an arbitrary (that is, variable) size. An example is a log file. |
| <b>/var/adm</b>              | System logging and accounting files.  |
| <b>/var/cron</b>             | Log files for <b>cron</b> (1M).   |
| <b>/var/mail</b>             | Directory where users' mail is kept.  |
| <b>/var/news</b>             | Community service messages. Note: this is not the same as USENET-style news.  |
| <b>/var/nis</b>              | NIS+ databases.   |
| <b>/var/opt</b>              | Root of a subtree for varying files associated with optional software packages.   |
| <b>/var/preserve</b>         | Backup files for <b>vi</b> (1) and <b>ex</b> (1).   |
| <b>/var/sadm</b>             | Databases maintained by the software package management utilities.  |
| <b>/var/saf</b>              | Service access facility logging and accounting files.   |
| <b>/var/spool</b>            | Root directory for files used in printer spooling, mail delivery, <b>cron</b> (1M), <b>at</b> (1), etc.   |
| <b>/var/spool/cron</b>       | <b>cron</b> (1M) and <b>at</b> (1) spooling files.  |
| <b>/var/spool/locks</b>      | Spooling lock files.  |
| <b>/var/spool/lp</b>         | Line printer spool files. See <b>lp</b> (1).  |
| <b>/var/spool/mqueue</b>     | Mail queued for delivery.   |
| <b>/var/spool/pkg</b>        | Spooled packages.   |
| <b>/var/spool/uucp</b>       | Queued <b>uucp</b> (1C) jobs.   |
| <b>/var/spool/uucppublic</b> | Files deposited by <b>uucp</b> (1C).  |
| <b>/var/tmp</b>              | Transitory files; this directory is <i>not</i> cleared during the boot operation.   |
| <b>/var/uucp</b>             | <b>uucp</b> (1C) log and status files.  |
| <b>/var/yp</b>               | Databases needed for backwards compatibility with NIS and <b>ypbind</b> (1M); unnecessary after full transition to NIS+.  |

**/usr File System**

Because it is desirable to keep the root file system small and not volatile, on disk-based systems larger file systems are often mounted on **/home**, **/opt**, **/usr**, and **/var**.

The file system mounted on **/usr** contains architecture-dependent and architecture-independent sharable files. The subtree rooted at **/usr/share** contains architecture-independent sharable files; the rest of the **/usr** tree contains architecture-dependent files. By mounting a common remote file system, a group of machines with a common architecture may share a single **/usr** file system. A single **/usr/share** file system can be shared by machines of any architecture. A machine acting as a file server may export many different **/usr** file systems to support several different architectures and operating system releases. Clients usually mount **/usr** read-only so that they do not accidentally change any shared files.

The **/usr** file system contains the following subdirectories:

|                            |   |
|----------------------------|---|
| <b>/usr/4lib</b>           | <b>a.out</b> libraries for the Binary Compatibility Package. See <i>Binary Compatibility Guide</i> .  |
| <b>/usr/bin</b>            | Primary location for standard system utilities.   |
| <b>/usr/bin/sunview1</b>   | SunView executables. This directory is only present when the Binary Compatibility Package is installed.   |
| <b>/usr/ccs</b>            | C compilation system.   |
| <b>/usr/ccs/bin</b>        | C compilation commands and system utilities.  |
| <b>/usr/ccs/lib</b>        | Libraries and auxiliary files.  |
| <b>/usr/demo</b>           | Demo programs and data.   |
| <b>/usr/dt</b>             | root of a subtree for CDE Motif.  |
| <b>/usr/dt/bin</b>         | Primary location for CDE Motif system utilities.  |
| <b>/usr/dt/include</b>     | Header files for CDE Motif.   |
| <b>/usr/dt/lib</b>         | Libraries for CDE Motif.  |
| <b>/usr/dt/man</b>         | On-line reference manual pages for CDE Motif.   |
| <b>/usr/games</b>          | Game binaries and data.   |
| <b>/usr/include</b>        | Include headers (for C programs, etc).  |
| <b>/usr/kernel</b>         | Subtree of Platform Independent loadable kernel modules, not needed in the root filesystem.   |
| <b>/usr/platform</b>       | Subtree of Platform Specific objects which does not need to reside on the root filesystem. It contains a series of directories, one per supported platform. The semantics of the series of directories is equivalent to <b>/platform</b> , except for subdirectories which don't provide utility under one or the other (for example: <b>/platform/include</b> isn't needed). |
| <b>/platform/*/include</b> | Platform Dependent headers with semantics equivalent to <b>/usr/include</b> .   |
| <b>/platform/*/kernel</b>  | Platform Dependent objects with semantics equivalent to   |

|                         |   |
|-------------------------|---|
|                         | /usr/kernel.  |
| <b>/platform/*/lib</b>  | Platform Dependent objects with semantics equivalent to /usr/lib.   |
| <b>/platform/*/sbin</b> | Platform Dependent objects with semantics equivalent to /usr/sbin.  |
| <b>/usr/lib</b>         | Program libraries, various architecture-dependent databases, and executables not invoked directly by the user (system daemons, etc).      |
| <b>/usr/lib/acct</b>    | Accounting scripts and binaries. See <b>acct(1M)</b> .  |
| <b>/usr/lib/dict</b>    | Database files for <b>spell(1)</b> .  |
| <b>/usr/lib/class</b>   | Scheduling class-specific directories containing executables for <b>priocntl(1)</b> and <b>dispadmin(1M)</b> .                            |
| <b>/usr/lib/font</b>    | <b>troff(1)</b> font description files.   |
| <b>/usr/lib/fs</b>      | File system type dependent modules; generally not intended to be invoked directly by the user.  |
| <b>/usr/lib/iconv</b>   | Conversion tables for <b>iconv(1)</b> .   |
| <b>/usr/lib/libp</b>    | Profiled libraries.   |
| <b>/usr/lib/locale</b>  | Localization databases.   |
| <b>/usr/lib/lp</b>      | Line printer subsystem databases and back-end executables.  |
| <b>/usr/lib/mail</b>    | Auxiliary programs for the <b>mail(1)</b> subsystem.  |
| <b>/usr/lib/netsvc</b>  | Internet network services.  |
| <b>/usr/lib/nfs</b>     | Auxiliary NFS-related programs and daemons.   |
| <b>/usr/lib/pics</b>    | Position Independent Code (PIC) archives needed to rebuild the run-time linker.   |
| <b>/usr/lib/refer</b>   | Auxiliary programs for <b>refer(1)</b> .  |
| <b>/usr/lib/sa</b>      | Scripts and commands for the system activity report package. See <b>sar(1)</b> .  |
| <b>/usr/lib/saf</b>     | Auxiliary programs and daemons related to the service access facility.  |
| <b>/usr/lib/spell</b>   | Auxiliary programs and databases for <b>spell(1)</b> . This directory is only present when the Binary Compatibility Package is installed. |
| <b>/usr/lib/uucp</b>    | Auxiliary programs and daemons for <b>uucp(1C)</b> .  |
| <b>/usr/local</b>       | Commands local to a site.   |
| <b>/usr/net/servers</b> | Entry points for foreign name service requests relayed using the network listener. See <b>listen(1M)</b> .                                |
| <b>/usr/oasys</b>       | Commands and files related to the optional Framed Access Command Environment (FACE) package. See <b>face(1)</b> .                         |

|                                 |   |
|---------------------------------|---|
| <b>/usr/old</b>                 | Programs that are being phased out.   |
| <b>/usr/openwin</b>             | Installation or mount point for the OpenWindows software.   |
| <b>/usr/sadm</b>                | System administration files and directories.  |
| <b>/usr/sadm/bin</b>            | Binaries for the Form and Menu Language Interpreter (FMLI) scripts. See <b>fml</b> (1).   |
| <b>/usr/sadm/install</b>        | Executables and scripts for package management.   |
| <b>/usr/sbin</b>                | Executables for system administration.  |
| <b>/usr/sbin/static</b>         | Statically linked version of selected programs from <b>/usr/bin</b> and <b>/usr/sbin</b> . These are used to recover from broken dynamic linking and before all pieces necessary for dynamic linking are present. |
| <b>/usr/share</b>               | Architecture-independent sharable files.  |
| <b>/usr/share/man</b>           | On-line reference manual pages (if present).  |
| <b>/usr/share/lib</b>           | Architecture-independent databases.   |
| <b>/usr/share/lib/keytables</b> | Keyboard layout description tables.   |
| <b>/usr/share/lib/mailx</b>     | Help files for <b>mailx</b> (1).  |
| <b>/usr/share/lib/nterm</b>     | <b>nroff</b> (1) terminal tables.   |
| <b>/usr/share/lib/pub</b>       | Character set data files.   |
| <b>/usr/share/lib/spell</b>     | Auxiliary scripts and databases for <b>spell</b> (1).   |
| <b>/usr/share/lib/tabset</b>    | Tab setting escape sequences.   |
| <b>/usr/share/lib/terminfo</b>  | Terminal description files for <b>terminfo</b> (4).   |
| <b>/usr/share/lib/tmac</b>      | Macro packages and related files for text processing tools, for example, <b>nroff</b> (1) and <b>troff</b> (1).   |
| <b>/usr/share/lib/zoneinfo</b>  | Time zone information.  |
| <b>/usr/share/src</b>           | Source code for utilities and libraries.  |
| <b>/usr/snadm</b>               | SNAG files.   |
| <b>/usr/ucb</b>                 | Berkeley compatibility package binaries. See <i>Source Compatibility Guide</i> .  |
| <b>/usr/ucbinclude</b>          | Berkeley compatibility package headers.   |
| <b>/usr/ucblib</b>              | Berkeley compatibility package libraries.   |
| <b>/usr/vmsys</b>               | Commands and files related to the optional FACE package. See <b>face</b> (1). Berkeley compatibility package libraries.   |

**/export File System**

A machine with disks may export root file systems, swap files, and **/usr** file systems to diskless or partially-disked machines that mount them into the standard file system hierarchy. The standard directory tree for sharing these file systems from a server is:

|                                       |  |
|---------------------------------------|--|

| <b>NAME</b>        | floatingpoint – IEEE floating point definitions   |
| <b>SYNOPSIS</b>    | <b>#include &lt;floatingpoint.h&gt;</b>   |
| <b>DESCRIPTION</b> | <p>This file defines constants, types, and functions used to implement standard floating point according to ANSI/IEEE Std 754-1985. The functions are implemented in <b>libc</b>. The included header file <b>&lt;sys/ieeefp.h&gt;</b> defines certain types of interest to the kernel.</p> <p>IEEE Rounding Modes:</p> <p><b>fp_direction_type</b>    The type of the IEEE rounding direction mode. Note: the order of enumeration varies according to hardware.</p> <p><b>fp_precision_type</b>    The type of the IEEE rounding precision mode, which only applies on systems that support extended precision such as machines based on the Intel 80387 FPU or the 80486.</p> <p>SIGFPE handling:</p> <p><b>sigfpe_code_type</b>    The type of a SIGFPE code.</p> <p><b>sigfpe_handler_type</b> The type of a user-definable SIGFPE exception handler called to handle a particular SIGFPE code.</p> <p><b>SIGFPE_DEFAULT</b>    A macro indicating the default SIGFPE exception handling, namely to perform the exception handling specified by the user, if any, and otherwise to dump core using <b>abort(3C)</b>.</p> <p><b>SIGFPE_IGNORE</b>    A macro indicating an alternate SIGFPE exception handling, namely to ignore and continue execution.</p> <p><b>SIGFPE_ABORT</b>    A macro indicating an alternate SIGFPE exception handling, namely to abort with a core dump.</p> <p>IEEE Exception Handling:</p> <p><b>N_IEEE_EXCEPTION</b>    The number of distinct IEEE floating-point exceptions.</p> <p><b>fp_exception_type</b>    The type of the <b>N_IEEE_EXCEPTION</b> exceptions. Each exception is given a bit number.</p> <p><b>fp_exception_field_type</b><br/> The type intended to hold at least <b>N_IEEE_EXCEPTION</b> bits corresponding to the IEEE exceptions numbered by <b>fp_exception_type</b>. Thus <b>fp_inexact</b> corresponds to the least significant bit and <b>fp_invalid</b> to the fifth least significant bit. Note: some operations may set more than one exception.</p> <p>IEEE Formats and Classification:</p> <p><b>single; extended; quadruple</b><br/> Definitions of IEEE formats.</p> <p><b>fp_class_type</b>    An enumeration of the various classes of IEEE values and symbols.</p> |

**IEEE Base Conversion:**

The functions described under **floating\_to\_decimal(3)** and **decimal\_to\_floating(3)** satisfy not only the IEEE Standard, but also the stricter requirements of correct rounding for all arguments.

**DECIMAL\_STRING\_LENGTH**

The length of a **decimal\_string**.

**decimal\_string**

The digit buffer in a **decimal\_record**.

**decimal\_record**

The canonical form for representing an unpacked decimal floating-point number.

**decimal\_form**

The type used to specify fixed or floating binary to decimal conversion.

**decimal\_mode**

A struct that contains specifications for conversion between binary and decimal.

**decimal\_string\_form**

An enumeration of possible valid character strings representing floating-point numbers, infinities, or NaNs.

**FILES**

**/usr/include/sys/ieeefp.h**

|---|--|
| <b>NAME</b>                                 | fnmatch – file name pattern matching   |
| <b>DESCRIPTION</b>                          | The pattern matching notation described below is used to specify patterns for matching strings in the shell. Historically, pattern matching notation is related to, but slightly different from, the regular expression notation. For this reason, the description of the rules for this pattern matching notation is based on the description of regular expression notation described on the <b>regex(5)</b> manual page.  |
| <b>Patterns Matching a Single Character</b> | <p>The following <i>patterns matching a single character</i> match a single character: <i>ordinary characters, special pattern characters</i> and <i>pattern bracket expressions</i>. The pattern bracket expression will also match a single collating element.</p> <p>An ordinary character is a pattern that matches itself. It can be any character in the supported character set except for NUL, those special shell characters that require quoting, and the following three special pattern characters. Matching is based on the bit pattern used for encoding the character, not on the graphic representation of the character. If any character (ordinary, shell special, or pattern special) is quoted, that pattern will match the character itself. The shell special characters always require quoting.</p> <p>When unquoted and outside a bracket expression, the following three characters will have special meaning in the specification of patterns:</p> <ul style="list-style-type: none"> <li>? A question-mark is a pattern that will match any character.</li> <li>* An asterisk is a pattern that will match multiple characters, as described in <b>Patterns Matching Multiple Characters</b>, below.</li> <li>[ The open bracket will introduce a pattern bracket expression.</li> </ul> <p>The description of basic regular expression bracket expressions on the <b>regex(5)</b> manual page also applies to the pattern bracket expression, except that the exclamation-mark character (!) replaces the circumflex character (^) in its role in a <i>non-matching list</i> in the regular expression notation. A bracket expression starting with an unquoted circumflex character produces unspecified results.</p> <p>The restriction on a circumflex in a bracket expression is to allow implementations that support pattern matching using the circumflex as the negation character in addition to the exclamation-mark. A portable application must use something like [<b>^!</b>] to match either character.</p> <p>When pattern matching is used where shell quote removal is not performed (such as in the argument to the <b>find -name</b> primary when <b>find</b> is being called using one of the <b>exec</b> functions, or in the <i>pattern</i> argument to the <b>fnmatch(3C)</b> function, special characters can be escaped to remove their special meaning by preceding them with a backslash character. This escaping backslash will be discarded. The sequence <b>\\</b> represents one literal backslash. All of the requirements and effects of quoting on ordinary, shell special and special pattern characters will apply to escaping in this context.</p> <p>Both quoting and escaping are described here because pattern matching must work in three separate circumstances:</p> <ul style="list-style-type: none"> <li>• Calling directly upon the shell, such as in pathname expansion or in a <b>case</b></li> </ul> |

statement. All of the following will match the string or file **abc**:

```
abc      "abc"   a"b"c    a\bc    a[b]c
a["b"]c  a[\b]c  a["\b"]c a?c     a*c
```

The following will not:

```
"a?c"   a\*c   a\[b]c
```

- Calling a utility or function without going through a shell, as described for **find**(1) and the function **fnmatch**(3C).
- Calling utilities such as **find**, **cpio**, **tar** or **pax** through the shell command line. In this case, shell quote removal is performed before the utility sees the argument. For example, in:

```
find /bin -name e\c[\h]o -print
```

after quote removal, the backslashes are presented to **find** and it treats them as escape characters. Both precede ordinary characters, so the **c** and **h** represent themselves and **echo** would be found on many historical systems (that have it in **/bin**). To find a file name that contained shell special characters or pattern characters, both quoting and escaping are required, such as:

```
pax -r ... "*a\ (\?"
```

to extract a filename ending with **a(?**.

Conforming applications are required to quote or escape the shell special characters (sometimes called metacharacters). If used without this protection, syntax errors can result or implementation extensions can be triggered. For example, the KornShell supports a series of extensions based on parentheses in patterns; see **ksh**(1).

**Patterns Matching Multiple Characters**

The following rules are used to construct *patterns matching multiple characters* from *patterns matching a single character*:

- The asterisk (\*) is a pattern that will match any string, including the null string.
- The concatenation of *patterns matching a single character* is a valid pattern that will match the concatenation of the single characters or collating elements matched by each of the concatenated patterns.
- The concatenation of one or more *patterns matching a single character* with one or more asterisks is a valid pattern. In such patterns, each asterisk will match a string of zero or more characters, matching the greatest possible number of characters that still allows the remainder of the pattern to match the string.

Since each asterisk matches zero or more occurrences, the patterns **a\*b** and **a\*\*b** have identical functionality.

Examples:

```
a[bc]    matches the strings ab and ac.
a*d      matches the strings ad, abd and abcd, but not the string abc.
a*d*     matches the strings ad, abcd, abcdef, aaaad and adddd.
*a*d     matches the strings ad, abcd, efabcd, aaaad and adddd.
```

**Patterns Used for  
Filename Expansion**

The rules described so far in **Patterns Matching Multiple Characters** and **Patterns Matching a Single Character** are qualified by the following rules that apply when pattern matching notation is used for filename expansion.

1. The slash character in a pathname must be explicitly matched by using one or more slashes in the pattern; it cannot be matched by the asterisk or question-mark special characters or by a bracket expression. Slashes in the pattern are identified before bracket expressions; thus, a slash cannot be included in a pattern bracket expression used for filename expansion. For example, the pattern **a[b/c]d** will not match such pathnames as **abd** or **a/d**. It will only match a pathname of literally **a[b/c]d**.
2. If a filename begins with a period (**.**), the period must be explicitly matched by using a period as the first character of the pattern or immediately following a slash character. The leading period will not be matched by:

- the asterisk or question-mark special characters
- a bracket expression containing a non-matching list, such as :

**[!a]**

a range expression, such as:

**[%-0]**

or a character class expression, such as:

**[:punct:]**

It is unspecified whether an explicit period in a bracket expression matching list, such as:

**[.abc]**

can match a leading period in a filename.

3. Specified patterns are matched against existing filenames and pathnames, as appropriate. Each component that contains a pattern character requires read permission in the directory containing that component. Any component, except the last, that does not contain a pattern character requires search permission. For example, given the pattern:

**/foo/bar/x\*/bam**

search permission is needed for directories **/** and **foo**, search and read permissions are needed for directory **bar**, and search permission is needed for each **x\*** directory. If the pattern matches any existing filenames or pathnames, the pattern will be replaced with those filenames and pathnames, sorted according to the collating sequence in effect in the current locale. If the pattern contains an invalid bracket expression or does not match any existing filenames or pathnames, the pattern string is left unchanged.

|------------------------|---|
| <b>NAME</b>            | fns – overview of FNS   |
| <b>DESCRIPTION</b>     | <p>Federated Naming Service (FNS) provides a method for federating multiple naming services under a single, simple interface for the basic naming operations. The service supports resolution of <i>composite</i> names, names that span multiple naming systems, through the naming interface. In addition to the naming interface, FNS also specifies <i>policies</i> for composing names in the enterprise namespace. See <b>fns_policies(5)</b> and <b>fns_initial_context(5)</b>.</p> <p>Fundamental to the FNS model are the notions of composite names and <i>contexts</i>. A context provides operations for:</p> <ul style="list-style-type: none"> <li>• associating (binding) names to objects</li> <li>• resolving names to objects</li> <li>• removing bindings, listing names, renaming and so on.</li> </ul> <p>A context contains a set of names to reference bindings. A reference contains a list of communication end-points. Every naming operation in the FNS interface is performed on a context object.</p> <p>The federated naming system is formed by contexts from one naming system being bound in the contexts of another naming system. Resolution of a composite name proceeds from contexts within one naming system to those in the next, until the name is resolved.</p> |
| <b>XFN</b>             | <p>XFN is <i>X/Open Federated Naming</i>. The programming interface and policies that FNS supports are specified by XFN. See <b>xfn(3N)</b> and <b>fns_policies(5)</b>.</p>   |
| <b>Composite Names</b> | <p>A composite name is a name that spans multiple naming systems. It consists of an ordered list of components. Each component is a name from the namespace of a single naming system. FNS defines the syntax for constructing a composite name using names from component naming systems. Individual naming systems are responsible for the syntax of each component.</p> <p>The syntax for composite names is that components are composed left to right using the slash character ('/') as the component separator. For example, the composite name <b>.../Wiz.Com/site/Oceanview.East</b> consists of four components: <b>...</b>, <b>Wiz.COM</b>, <b>site</b>, and <b>Oceanview.East</b>. See <b>fns_policies(5)</b> and <b>fns_initial_context(5)</b> for more examples of composite names.</p>   |
| <b>Why FNS?</b>        | <p>FNS is useful for the following reasons:</p> <ul style="list-style-type: none"> <li>• A single uniform naming interface is provided to clients for accessing naming services. Consequently, the addition of new naming services does not require changes to applications or existing naming services. Furthermore, applications that use FNS will be portable across platforms because the interface exported by FNS is XFN, a public, open interface endorsed by other vendors and by the X/Open Company.</li> </ul>  |

- Names can be composed in a uniform way (that is, FNS supports a model in which composite names are constructed in a uniform syntactic way and can have any number of components).
- Coherent naming is encouraged through the use of shared contexts and shared names.

**FNS and Naming Systems**

FNS has support for NIS+, NIS, and files as enterprise-level naming services. This means that FNS implements the enterprise-level policies using NIS+, NIS, and files. FNS also supports DNS and X.500 (via DAP or LDAP) as global naming services, as well as support for federating NIS+ and NIS with DNS and X.500. See the corresponding individual man page for information about the implementation for a specific naming service.

|                    |   |
|--------------------|---|
| <b>NAME</b>        | fns_dns – overview of FNS over DNS implementation   |
| <b>DESCRIPTION</b> | <p>Federated Naming Service (FNS) provides a method for federating multiple naming services under a single, simple interface for the basic naming operations. One of the naming services supported by FNS is the Internet Domain Name System, or DNS (see <b>in.named(1M)</b>). DNS is a hierarchical collection of name servers that provide the Internet community with host and domain name resolution. FNS uses DNS to name entities globally. Names can be constructed for any enterprise that is accessible on the Internet; consequently, names can also be constructed for objects exported by these enterprises.</p> <p>FNS provides the XFN interface for performing naming resolution on DNS domains and hosts. In addition, enterprise namespaces such as those served by NIS+ and NIS can be federated with DNS by adding TXT records to DNS. To federate an NIS+ or NIS namespace under DNS, you first obtain the root reference for the NIS+ hierarchy or NIS domain. This reference is referred to as the <i>next naming system reference</i> because it refers to the <i>next</i> naming system beneath the DNS domain. This reference contains information about how to communicate with the NIS+ or NIS servers and has the following format:</p> <p style="text-align: center;"><i>&lt;domainname&gt; &lt;server name&gt; [ &lt;server address&gt; ]</i></p> <p>where <i>&lt;domainname&gt;</i> is the fully qualified domain name. Note that NIS+ and NIS have slightly different syntaxes for domain names. For NIS+, the fully qualified domain name is case-insensitive and terminated by a dot character (.). For NIS, the fully qualified domain name is case-sensitive and is <i>not</i> terminated by a dot character. For both NIS+ and NIS, <i>&lt;server address&gt;</i> is optional. If it is not supplied, a host name lookup will be performed to get the machine's address.</p> <p>For example, if the machine <b>wiz-nisplus-server</b> with address <b>133.33.33.33</b> serves the NIS+ domain <b>wiz.com.</b>, the reference would look like this:</p> <p style="text-align: center;"><b>wiz.com. wiz-nisplus-server 133.33.33.33</b></p> <p>For NIS, the reference information is of the form:</p> <p style="text-align: center;"><i>&lt;domainname&gt; &lt;server name&gt;</i></p> <p>For example, if the machine <b>woz-nis-server</b> serves the NIS domain <b>Woz.COM</b>, the reference would look like this:</p> <p style="text-align: center;"><b>Woz.COM woz-nis-server</b></p> <p>After obtaining this information, you then edit the DNS table (see <b>in.named(1M)</b>) and add a TXT record with this reference information. The TXT record must be associated with a DNS domain that includes an NIS record. For example, the reference information shown in the examples above would be entered as follows.</p> <p>For NIS+:</p> <p style="text-align: center;"><b>TXT "XFNNISPLUS wiz.com. wiz-nisplus-server 133.33.33.33"</b></p> <p>For NIS:</p> <p style="text-align: center;"><b>TXT "XFNNIS woz.com woz-nis-server"</b></p> |

Note the mandatory double quotes ( " ") delimiting the contents of the TXT record. After making any changes to the DNS table, you must notify the server by either restarting it or sending it a signal to reread the table:

```
#kill -HUP 'cat /etc/named.pid'
```

This update effectively adds the next naming system reference to DNS. You can look up this reference using **fnlookup**(1) to see if the information has been added properly. For example, the following command looks up the next naming system reference of the DNS domain **Wiz.COM**:

```
#fnlookup -v .../Wiz.COM/
```

Note the mandatory trailing slash (/).

After this administrative step has been taken, clients outside of the NIS+ hierarchy or NIS domain can access and perform operations on the contexts in the NIS+ hierarchy or NIS domain. Foreign NIS+ clients access the hierarchy as unauthenticated NIS+ clients. Continuing the example above, and assuming that NIS+ is federated underneath the DNS domain **Wiz.COM**, you can now list the root of the NIS+ enterprise using the command:

```
#fnlist .../Wiz.COM/
```

**SEE ALSO**

**fnlist**(1), **fnlookup**(1), **nis+**(1), **in.named**(1M), **ypserv**(1M), **xfn**(3N), **fns**(5), **fns\_nis**(5), **fns\_nis+**(5), **fns\_references**(5), **fns\_x500**(5)

|                                    |   |
|------------------------------------|---|
| <b>NAME</b>                        | fns_files – overview of FNS over files implementation   |
| <b>DESCRIPTION</b>                 | <p>The Federated Naming Service (FNS) provides a method for federating multiple naming services under a single, simple interface for the basic naming operations. One of the naming services supported by FNS is <code>/etc</code> files. FNS provides the XFN interface for performing naming and attribute operations on FNS enterprise objects (organization, site, user, host, and service objects), using files as the naming service. FNS stores bindings for these objects in files and uses them in conjunction with existing <code>/etc</code> files objects.</p>  |
| <b>FNS Policies and /etc Files</b> | <p>FNS defines policies for naming objects in the federated namespace (see <code>fns_policies(5)</code>). At the enterprise level, FNS policies specify naming for organizations, hosts, users, sites, and services. The enterprise-level naming service provides contexts to allow other objects to be named relative to these objects.</p> <p>The organizational unit namespace provides a hierarchical namespace for naming subunits of an enterprise. In <code>/etc</code> files, there is no concept of an organization. Hence, with respect to <code>/etc</code> files as the naming service, there is a single organizational unit context that represents the entire system. Users in an FNS organizational unit correspond to the users in the <code>/etc/passwd</code> file. FNS provides a context for each user in the <code>/etc/passwd</code> file.</p> <p>Hosts in an FNS organizational unit correspond to the hosts in the <code>/etc/hosts</code> file. FNS provides a context for each host in the <code>/etc/hosts</code> file.</p>   |
| <b>Security Considerations</b>     | <p>Changes to the FNS information (using the commands <code>fncreate(1M)</code>, <code>fncreate_fs(1M)</code>, <code>fnbind(1)</code>, <code>fndestroy(1M)</code> and <code>fnunbind(1)</code>) can be performed only by the privileged users on the system that exports the <code>/var/fn</code> directory. Also, based on the UNIX user IDs, users are allowed to modify their own contexts, bindings, and attributes, from any machine that mounts the <code>/var/fn</code> directory.</p> <p>For example, the command <code>fncreate(1M)</code> creates FNS related files and directories in the system on which the command is executed. Hence, the invoker of the <code>fncreate(1M)</code> command must have super-user privileges in order to create the user, host, site, and service contexts. However, a user could use the <code>fnunbind(1)</code> command to create calendar bindings in the user's own context, as in this example:</p> <pre>fnbind -r thisuser/service/calendar onc_calendar onc_cal_str jsmith@beatrix</pre> <p>The files object name that corresponds to an FNS composite name can be obtained using <code>fnlookup(1)</code> and <code>fnlist(1)</code>.</p> |
| <b>USAGE</b>                       | <p>The files used for storing FNS information are placed in the directory <code>/var/fn</code>. The machine on which <code>/var/fn</code> is located has access to the FNS file. The FNS information can be made accessible to other machines by exporting <code>/var/fn</code>. Client machines that NFS mount the <code>/var/fn</code> directory would then be able to access the FNS information.</p>  |
| <b>SEE ALSO</b>                    | <p><code>fnbind(1)</code>, <code>fnlist(1)</code>, <code>fnlookup(1)</code>, <code>fnunbind(1)</code>, <code>fncreate(1M)</code>, <code>fncreate_fs(1M)</code>, <code>fndestroy(1M)</code>, <code>xfn(3N)</code>, <code>fns(5)</code>, <code>fns_initial_context(5)</code>, <code>fns_nis(5)</code>, <code>fns_nis+(5)</code>, <code>fns_policies(5)</code>, <code>fns_references(5)</code></p>   |

|                    |  |                    |                 |                    |                |               |                  |              |                |             |             |             |  |     |  |                 |   |                |  |                    |   |               |  |              |  |                  |   |             |   |
|--------------------|--|--------------------|-----------------|--------------------|----------------|---------------|------------------|--------------|----------------|-------------|-------------|-------------|--|-----|--|-----------------|---|----------------|--|--------------------|---|---------------|--|--------------|--|------------------|---|-------------|---|
| <b>NAME</b>        | fns_initial_context – overview of the FNS Initial Context  |                    |                 |                    |                |               |                  |              |                |             |             |             |  |     |  |                 |   |                |  |                    |   |               |  |              |  |                  |   |             |   |
| <b>DESCRIPTION</b> | <p>Every FNS name is interpreted relative to some context, and every FNS naming operation is performed on a context object. The FNS programming interface (.) provides a function that allows the client to obtain an <i>Initial Context</i> object. The Initial Context provides the initial pathway to other FNS contexts. FNS defines a set of bindings that the client can expect to find in this context,</p> <p>FNS assumes that for every process:</p> <ol style="list-style-type: none"> <li>1. There is a user associated with the process when <code>fn_ctx_handle_from_initial()</code> is invoked. This association is based on the effective uid of the process. In the following discussion this user is denoted by <i>U</i>. The association of user to process may change during the life of a process but does not affect the context handle originally returned by <code>fn_ctx_handle_from_initial()</code>.</li> <li>2. The process is running on a host when <code>fn_ctx_handle_from_initial()</code> is invoked. In the following discussion this host is denoted by <i>H</i>.</li> </ol> <p>The following atomic names can appear in the Initial Context:</p> <table border="0" style="margin-left: 40px;"> <tr> <td>...</td> <td><b>thishost</b></td> <td><b>thisorgunit</b></td> </tr> <tr> <td><b>thisens</b></td> <td><b>myself</b></td> <td><b>myorgunit</b></td> </tr> <tr> <td><b>myens</b></td> <td><b>orgunit</b></td> <td><b>site</b></td> </tr> <tr> <td><b>user</b></td> <td><b>host</b></td> <td></td> </tr> </table> <p>Except for ..., these names with an added underscore ('_') prefix are also in the Initial Context and have the same binding as their counterpart (for example, <b>thishost</b> and <b>_thishost</b> have the same binding). In addition, <b>org</b> has the same binding as <b>orgunit</b>, and <b>thisuser</b> has the same binding as <b>myself</b>. The bindings for these names are summarized in the following table.</p> <p>Some of these names may not necessarily appear in all Initial Contexts. For example, a process owned by the super-user of a machine does not have any of the user-related bindings. Or, for another example, an installation that has not set up a site namespace will not have the site-related bindings.</p> <table border="0" style="margin-left: 40px;"> <tr> <td>...</td> <td>global context for resolving DNS or X.500 names. | ...                | global context for resolving DNS or X.500 names. Synonym: /...   |                    |                 |                    |                |               |                  |              |                |             |             |             |  |     |  |                 |   |                |  |                    |   |               |  |              |  |                  |   |             |   |
| <b>thishost</b>    | <i>H</i> 's host context. Synonym: <b>_thishost</b>  |                    |                 |                    |                |               |                  |              |                |             |             |             |  |     |  |                 |   |                |  |                    |   |               |  |              |  |                  |   |             |   |
| <b>thisens</b>     | the enterprise root of <i>H</i> . Synonym: <b>_thisens</b>   |                    |                 |                    |                |               |                  |              |                |             |             |             |  |     |  |                 |   |                |  |                    |   |               |  |              |  |                  |   |             |   |
| <b>thisorgunit</b> | <i>H</i> 's distinguished organizational unit context. In Solaris, this is <i>H</i> 's NIS+ home domain. Synonym: <b>_thisorgunit</b>  |                    |                 |                    |                |               |                  |              |                |             |             |             |  |     |  |                 |   |                |  |                    |   |               |  |              |  |                  |   |             |   |
| <b>myself</b>      | <i>U</i> 's user context. Synonyms: <b>_myself</b> , <b>thisuser</b>   |                    |                 |                    |                |               |                  |              |                |             |             |             |  |     |  |                 |   |                |  |                    |   |               |  |              |  |                  |   |             |   |
| <b>myens</b>       | the enterprise root of <i>U</i> . Synonym: <b>_myens</b>   |                    |                 |                    |                |               |                  |              |                |             |             |             |  |     |  |                 |   |                |  |                    |   |               |  |              |  |                  |   |             |   |
| <b>myorgunit</b>   | <i>U</i> 's distinguished organizational unit context. In Solaris, this is <i>U</i> 's NIS+ home domain. Synonym: <b>_myorgunit</b>  |                    |                 |                    |                |               |                  |              |                |             |             |             |  |     |  |                 |   |                |  |                    |   |               |  |              |  |                  |   |             |   |
| <b>user</b>        | the context in which users in the same organizational unit as <i>H</i> are named. Synonym: <b>_user</b>  |                    |                 |                    |                |               |                  |              |                |             |             |             |  |     |  |                 |   |                |  |                    |   |               |  |              |  |                  |   |             |   |

|             |   |
|-------------|---|
| <b>host</b> | the context in which hosts in the same organizational unit as <i>H</i> are named. Synonym: <b>_host</b>   |
| <b>org</b>  | the root context of the organizational unit namespace in <i>H</i> 's enterprise. In Solaris, this corresponds to the NIS+ root domain. Synonyms: <b>orgunit, _orgunit</b> |
| <b>site</b> | the root context of the site namespace in <i>H</i> 's enterprise, if the site namespace has been configured. Synonym: <b>_site</b>  |

**EXAMPLES**

The types of objects that may be named relative to the enterprise root are user, host, service, organizational unit, file, and site. Here are some examples of names that begin with the enterprise root:

**thisens/orgunit/multimedia.servers.engineering**  
names an organizational unit **multimedia.servers.engineering** in *H*'s enterprise.

**thisens/site/northwing.floor3.admin**  
names the north wing site, on the third floor of the administrations building in *H*'s enterprise.

**myens/user/hdiffie**  
names the user **hdiffie** in *U*'s enterprise.

**myens/service/teletax**  
names the **teletax** service of *U*'s enterprise.

The types of objects that may be named relative to an organizational unit name are: user, host, service, file, and site. Here are some examples of names that begin with organizational unit names (either explicitly via **org**, or implicitly via **thisorgunit** or **myorgunit**), and name objects relative to organizational unit names when resolved in the Initial Context:

**org/accounts\_payable.finance/site/videoconference.northwing**  
names a conference room **videoconference** located in the north wing of the site associated with the organizational unit **accounts\_payable.finance**.

**org/finance/user/mjones**  
names a user **mjones** in the organizational unit **finance**.

**org/finance/host/inmail**  
names a machine **inmail** belonging to the organizational unit **finance**.

**org/accounts\_payable.finance/fs/pub/blue-and-whites/FY92-124**  
names a file **pub/blue-and-whites/FY92-124** belonging to the organizational unit **accounts\_payable.finance**.

**org/accounts\_payable.finance/service/calendar**  
names the **calendar** service of the organizational unit **accounts\_payable.finance**. This might manage the meeting schedules of the organizational unit.

**thisorgunit/user/cmead**

names the user **cmead** in *H*'s organizational unit.

**myorgunit/fs/pub/project\_plans/widget.ps**

names the file **pub/project\_plans/widget.ps** exported by *U*'s organizational unit's file system.

The types of objects that may be named relative to a site name are users, hosts, services, and files. Here are some examples of names that begin with site names via **site**, and name objects relative to sites when resolved in the Initial Context;

**site/b5.mtv/service/printer/speedy**

names a printer **speedy** in the **b5.mtv** site.

**site/admin/fs/usr/dist**

names a file directory **usr/dist** available in the site **admin**.

The types of objects that may be named relative to a user name are services and files. Here are some examples of names that begin with user names (explicitly via **user** or implicitly via **thisuser**), and name objects relative to users when resolved in the Initial Context:

**user/jsmith/service/calendar**

names the **calendar** service of the user **jsmith**.

**user/jsmith/fs/bin/games/riddles**

names the file **bin/games/riddles** of the user **jsmith**.

**thisuser/service/printer**

names the **printer** service of *U*.

The types of objects that may be named relative to a host name are services and files. Here are some examples of names that begin with host names (explicitly via **host** or implicitly via **thishost**), and name objects relative to hosts when resolved in the Initial Context:

**host/mailhop/service/mailbox**

names the **mailbox** service associated with the machine **mailhop**.

**host/mailhop/fs/pub/saf/archives.91**

names the directory **pub/saf/archives.91** found under the root directory of the machine **mailhop**.

**thishost/service/printer**

names the **printer** service of *H*.

| <b>NAME</b>                              | fns_nis+ – overview of FNS over NIS+ implementation   |
| <b>DESCRIPTION</b>                       | <p>Federated Naming Service (FNS) provides a method for federating multiple naming services under a single, simple interface for the basic naming operations. One of the naming services supported by FNS is NIS+, the enterprise-wide information service in Solaris (see <b>nis+(1)</b>). FNS provides the XFN interface for performing naming and attribute operations on FNS enterprise objects (organization, site, user, host, and service objects) using NIS+. FNS stores bindings for these objects in NIS+ and uses them in conjunction with existing NIS+ objects.</p>  |
| <b>FNS Policies and NIS+</b>             | <p>FNS defines policies for naming objects in the federated namespace (see <b>fns_policies(5)</b>). At the enterprise level, FNS policies specify naming for organizations, hosts, users, sites, and services. The enterprise-level naming service provides contexts to allow other objects to be named relative to these objects.</p> <p>The organizational unit namespace provides a hierarchical namespace for naming subunits of an enterprise. An organizational unit maps to an NIS+ domain. Organizational unit names can be either fully qualified NIS+ domain names or relatively NIS+ domain names. If a terminal dot is present in the name, it is treated as a fully qualified name. Otherwise, the name is resolved relative to the root NIS+ domain.</p> <p>Users in the NIS+ namespace are found in the <b>passwd.org_dir</b> table of an NIS+ domain. Users in an FNS organizational unit correspond to the users in the <b>passwd.org_dir</b> table of the corresponding NIS+ domain. FNS provides a context for each user in the <b>passwd.org_dir</b> table.</p> <p>Hosts in the NIS+ namespace are found in the <b>hosts.org_dir</b> table of an NIS+ domain. Hosts in an FNS organizational unit correspond to the hosts in the <b>hosts.org_dir</b> table of the corresponding NIS+ domain. FNS provides a context for each host in the <b>hosts.org_dir</b> table.</p> <p>In NIS+, users and hosts have a notion of a <i>home domain</i>. It is the primary NIS+ domain that maintains information associated with them. A user or host's home domain can be determined directly using its NIS+ principal name, which is composed of the atomic user (login) name or the atomic host name, and the name of the NIS+ home domain. For example, user <b>jsmith</b> with home domain <b>wiz.com</b> has an NIS+ principal name, <b>jsmith.wiz.com</b>.</p> <p>A user's NIS+ home domain corresponds to the user's FNS organizational unit and determines the binding for <b>myens</b> and <b>myorgunit</b>.</p> <p>A host's NIS+ home domain corresponds to the host's FNS organizational unit and determines the binding for <b>thisens</b>, <b>thisorgunit</b>, <b>user</b>, and <b>host</b>.</p> |
| <b>Federating NIS+ with DNS or X.500</b> | <p>Federating NIS+ with the global naming systems DNS or X.500 makes NIS+ contexts accessible outside of an NIS+ hierarchy. To enable the federation, the administrator must first</p>  |

add address information in either DNS or X.500 (see **fns\_dns(5)** and **fns\_x500(5)**). After this administrative step has been taken, clients outside of the NIS+ hierarchy can access contexts and perform operations from outside the hierarchy as an unauthenticated NIS+ client.

**NIS+ Security**

The command **fncreate(1M)** creates NIS+ tables and directories in the NIS+ hierarchy associated with the domain of the host on which it executes. The invoker of **fncreate(1M)** and other FNS commands is expected to have the necessary NIS+ credentials. (See **nis+(1)** and **nisdefaults(1)**). The environment variable **NIS\_GROUP** of the process specifies the group owner for the NIS+ objects thus created. In order to facilitate administration of the NIS+ objects, **NIS\_GROUP** should be set to the name of the NIS+ administration group for the domain prior to executing **fncreate(1M)** and other FNS commands. Changes to NIS+-related properties, including default access control rights, could be effected using NIS+ administration tools and interfaces after the context has been created. The NIS+ object name that corresponds to an FNS composite name can be obtained using **fnlookup(1)** and **fnlist(1)**.

| <b>NAME</b>                             | fns_nis – overview of FNS over NIS (YP) implementation  |
| <b>DESCRIPTION</b>                      | <p>Federated Naming Service (FNS) provides a method for federating multiple naming services under a single, simple interface for the basic naming operations. One of the naming services supported by FNS is NIS (YP), the enterprise-wide information services in Solaris (see <b>ypcat(1)</b>, <b>ypmatch(1)</b>, <b>ypfiles(4)</b>). FNS provides the XFN interface for performing naming and attribute operations on FNS enterprise objects (organization, site, user, host and service objects) using NIS. FNS stores bindings for these objects in NIS and uses them in conjunction with existing NIS objects.</p>  |
| <b>FNS Policies and NIS</b>             | <p>FNS defines policies for naming objects in the federated namespace (see <b>fns_policies(5)</b>). At the enterprise level, FNS policies specify naming for organizations, hosts, users, sites, and services. The enterprise-level naming service provides contexts to allow other objects to be named relative to these objects.</p> <p>The FNS organizational unit namespace provides a hierarchical namespace for naming subunits of an enterprise. However, NIS does not support a hierarchical organizational structure. Therefore, a NIS domain maps to a single organizational unit in the FNS namespace.</p> <p>Users in an FNS organizational unit correspond to the users in the <b>passwd.byname</b> map of the corresponding NIS domain. FNS provides a context for each user in the <b>passwd.byname</b> map.</p> <p>Hosts in an FNS organizational unit correspond to the hosts in the <b>hosts.byname</b> map of the corresponding NIS domain. FNS provides a context for each host in the <b>hosts.byname</b> map.</p> |
| <b>Federating NIS with DNS or X.500</b> | <p>Federating NIS with the global naming systems DNS or X.500 makes NIS contexts accessible outside of an NIS domain. To enable the federation, the administrator must first add address information in either DNS or X.500 (see <b>fns_dns(5)</b> and <b>fns_x500(5)</b>). After this administrative step has been taken, clients outside of the NIS domain can access contexts and perform operations.</p>  |
| <b>Security Considerations</b>          | <p>Changes to the FNS information (using the commands <b>fncreate(1M)</b>, <b>fncreate_fs(1M)</b>, <b>fncreate_printer(1M)</b>, <b>fnbind(1)</b>, <b>fndestroy(1M)</b>, <b>fncheck(1M)</b>, and <b>fnunbind(1)</b>) can be performed only by the privileged users on the NIS master server that maintains the FNS information.</p> <p>For example, the command <b>fncreate(1M)</b> creates the NIS map for the associated NIS domain in the system on which it is executed. Hence, the command must be run by a privileged user either on the NIS master server or on a system that will serve as a NIS master server for FNS.</p> <p>The NIS object name that corresponds to an FNS composite name can be obtained using <b>fnlookup(1)</b> and <b>fnlist(1)</b>.</p>  |

|--------------------|---|
| <b>NAME</b>        | fns_policies – overview of the FNS Policies   |
| <b>DESCRIPTION</b> | <p>FNS defines policies for naming objects in the federated namespace. The goal of these policies is to allow easy and uniform composition of names. The policies use the basic rule that objects with narrower scopes are named relative to objects with wider scopes. FNS policies are described in terms of the following three categories: global, enterprise, and application.</p> <p><i>Global naming service</i></p> <p>A global naming service is a naming service that has world-wide scope. Internet DNS and X.500 are examples of global naming services. The types of objects named at this global level are typically countries, states, provinces, cities, companies, universities, institutions, and government departments and ministries. These entities are referred to as <i>enterprises</i>.</p> <p><i>Enterprise-level naming service</i></p> <p>Enterprise-level naming services are used to name objects within an enterprise. Within an enterprise, there are naming services that provide contexts for naming common entities such as organizational units, physical sites, human users, and computers. Enterprise-level naming services are bound below the global naming services. Global naming services provide contexts in which the root contexts of enterprise-level naming services can be bound.</p> <p><i>Application-level naming service</i></p> <p>Application-level naming services are incorporated in applications offering services such as file service, mail service, print service, and so on. Application-level naming services are bound below enterprise naming services. The enterprise-level naming services provide contexts in which contexts of application-level naming services can be bound.</p> <p>FNS has policies for global and enterprise naming. Naming within applications is left to individual applications or groups of related applications and not specified by FNS. FNS policy specifies that DNS and X.500 are global naming services that are used to name enterprises. The global namespace is named using the name .... A DNS name or an X.500 name can appear after the .... Support for federating global naming services is planned for a future release of FNS.</p> <p>Within an enterprise, there are namespaces for organizational units, sites, hosts, users, files and services, referred to by the names <b>orgunit</b>, <b>site</b>, <b>host</b>, <b>user</b>, <b>fs</b>, and <b>service</b>. In addition, these namespaces can be named using these names with an added underscore ('_') prefix (for example, <b>host</b> and <b>_host</b> have the same binding). The following table summarizes the FNS policies.</p> |

| Context Type | Subordinate Context                            | Parent Context                                      |
|--------------|--|---|
| org unit     | site<br>user<br>host<br>file system<br>service | enterprise root                                     |
| site         | user<br>host<br>file system<br>service         | enterprise root<br>org unit                         |
| user         | service<br>file system                         | enterprise root<br>org unit                         |
| host         | service<br>file system                         | enterprise root<br>org unit                         |
| service      | not specified                                  | enterprise root<br>org unit<br>site<br>user<br>host |
| file system  | none   | enterprise root<br>org unit<br>site<br>user<br>host |

In Solaris, an organizational unit name corresponds to an NIS+ domain name and is identified using either the fully-qualified form of its NIS+ domain name, or its NIS+ domain name relative to the NIS+ root. Fully-qualified NIS+ domain names have a terminal dot ('.'). For example, assume that the NIS+ root domain is "Wiz.COM." and "sales" is a subdomain of that. Then, the names **org/sales.Wiz.COM.** and **org/sales** both refer to the organizational unit corresponding to the same NIS+ domain **sales.Wiz.COM.**

User names correspond to names in the corresponding NIS+ *passwd.org\_dir* table. The file system context associated with a user is obtained from his entry in the NIS+ *passwd.org\_dir* table.

Host names correspond to names in the corresponding NIS+ *hosts.org\_dir* table. The file system context associated with a host corresponds to the files systems exported by the host.

**EXAMPLES**

The types of objects that may be named relative to an organizational unit name are: user, host, service, file, and site. Here are some examples of names name objects relative to organizational unit names:

**org/accounts\_payable.finance/site/videoconference.northwing**

names a conference room **videoconference** located in the north wing of the site associated with the organizational unit **accounts\_payable.finance**.

**org/finance/user/mjones**

names a user **mjones** in the organizational unit **finance**.

**org/finance/host/inmail**

names a machine **inmail** belonging to the organizational unit **finance**.

**org/accounts\_payable.finance/fs/pub/blue-and-whites/FY92-124**

names a file **pub/blue-and-whites/FY92-124** belonging to the organizational unit **accounts\_payable.finance**.

**org/accounts\_payable.finance/service/calendar**

names the **calendar** service of the organizational unit **accounts\_payable.finance**. This might manage the meeting schedules of the organizational unit.

The types of objects that may be named relative to a site name are services and files. Here are some examples of names that name objects relative to sites:

**site/b5.mtv/service/printer/speedy**

names a printer **speedy** in the **b5.mtv** site.

**site/admin/fs/usr/dist**

names a file directory **usr/dist** available in the site **admin**.

The types of objects that may be named relative to a user name are services and files. Here are some examples of names that name objects relative to users:

**user/jsmith/service/calendar**

names the **calendar** service of the user **jsmith**.

**user/jsmith/fs/bin/games/riddles**

names the file **bin/games/riddles** of the user **jsmith**.

The types of objects that may be named relative to a host name are services and files. Here are some examples of names that name objects relative to hosts:

**host/mailhop/service/mailbox**

names the **mailbox** service associated with the machine **mailhop**.

**host/mailhop/fs/pub/saf/archives.91**

names the directory **pub/saf/archives.91** found under the root directory of the machine **mailhop**.

|------------------------|--|
| <b>NAME</b>            | fns_references – overview of FNS References  |
| <b>DESCRIPTION</b>     | <p>Every composite name in FNS is bound to a <i>reference</i>. A reference consists of a type and a list of addresses. The reference type is used to identify the type of object.</p> <p>An address is something that can be used with some communication mechanism to invoke operations on an object or service. Multiple addresses are intended to identify multiple communication endpoints for a single conceptual object or service. Each address in a reference consists of an address type and an opaque buffer. The address type determines the format and interpretation of the address data. Together, the address's type and data specify how to reach the object. Many communication mechanisms are possible; FNS does not place any restrictions on them.</p> <p>The following summarizes the reference and address types that are currently defined. New types should be registered with the Federated Naming Group at SunSoft.</p>        |
| <b>Reference Types</b> | <p>All reference types use the <code>FN_ID_STRING</code> identifier format unless otherwise qualified.</p> <p><b>onc_fn_enterprise</b><br/>Enterprise root context.</p> <p><b>onc_fn_organization</b><br/>A context for naming objects related to an organizational unit.</p> <p><b>onc_fn_hostname</b><br/>A context for naming hosts.</p> <p><b>onc_fn_username</b><br/>A context for naming users.</p> <p><b>onc_fn_user</b><br/>A context for naming objects related to a user.</p> <p><b>onc_fn_host</b><br/>A context for naming objects related to a computer.</p> <p><b>onc_fn_site</b><br/>A context for naming sites.</p> <p><b>onc_fn_service</b><br/>A context for naming services.</p> <p><b>onc_fn_nsid</b><br/>A context for naming namespace identifiers.</p> <p><b>onc_fn_generic</b><br/>A context for naming application-specific objects.</p> <p><b>onc_fn_fs</b><br/>A context for naming files, directories, and file systems.</p> |

**Address Types****onc\_fn\_printrname**

A context for naming printers.

**onc\_printers**

A printer object. When implemented on top of NIS+, this could also be a context for naming printers.

**fn\_link\_ref**

An XFN link.

**inet\_domain**

An Internet domain.

All address types use the **FN\_ID\_STRING** identifier format unless otherwise qualified. The format of address contents is determined by the corresponding address type.

**onc\_fn\_nisplus**

For an FNS enterprise-level object implemented on top of NIS+. The address contains the context type, context representation type (either normal or merged), version number of the reference, and the NIS+ name of the object. The only intended use of this reference is that it be passed to **fn\_ctx\_handle\_from\_ref(3N)**.

**onc\_fn\_nis**

For an FNS enterprise-level object implemented on top of NIS. The address contains the context type and version number of the reference, and the NIS name of the object. The only intended use of this reference is that it be passed to **fn\_ctx\_handle\_from\_ref(3N)**.

**onc\_fn\_files**

For an FNS enterprise-level object implemented on top of **/etc** files. The address contains the context type and version number of the reference, and the location of the object in the **/etc** file system. The only intended use of this reference is that it be passed to **fn\_ctx\_handle\_from\_ref(3N)**.

**onc\_fn\_fs\_user**

For a user's home directory. The address contains the user's name and the name of the naming service password table where the user's home directory is stored.

**onc\_fn\_fs\_user\_nisplus**

For a user's home directory. The address contains the user's name and the name of the NIS+ password table where the user's home directory is stored.

**onc\_fn\_fs\_host**

For all file systems exported by a host. The address contains the host's name.

**onc\_fn\_fs\_mount**

For a single mount point. The address contains the mount options, the name of the servers and the exported path. See **mount(1M)**.

**onc\_fn\_printer\_files**

For a printer's address in the files naming service.

**onc\_fn\_printer\_nis**

For a printer's address in the NIS naming service.

**onc\_fn\_printer\_nisplus**

For a printer's address in the NIS+ naming service.

**fn\_link\_addr**

For an XFN link address. The contents is the string form of the composite name.

**inet\_domain**

For an Internet domain. The address contains the fully-qualified domain name (for example, "Wiz.COM.")

**inet\_ipaddr\_string**

For an object with an Internet address. The address contains an internet IP address in dotted string form (for example, "192.144.2.3").

**x500** For an X.500 object. The address contains an X.500 Distinguished Name, in the syntax specified in the **X/Open DCE: Directory Services**.

**osi\_paddr**

For an object with an OSI presentation address. The address contains the string encoding of an OSI Presentation Address as defined in *A string encoding of Presentation Address* (RFC 1278).

**onc\_printers\_bsaddr**

For a printer that understands the BSD print protocol. The address contains the machine name and printer name used by the protocol.

**onc\_printers\_use**

For a printer alias. The address contains a printer name.

**onc\_printers\_all**

For a list of printers that are enumerated using the "all" option. The address contains a list of printer names.

**onc\_printers\_location**

For a printer's location. The address format is unspecified.

**onc\_printers\_type**

For a printer's type. The address format is unspecified.

**onc\_printers\_speed**

For a printer's speed. The address format is unspecified.

|                    |   |
|--------------------|---|
| <b>NAME</b>        | fns_x500 – overview of FNS over X.500 implementation  |
| <b>DESCRIPTION</b> | <p>Federated Naming Service (FNS) provides a method for federating multiple naming services under a single, simple interface for the basic naming operations. One of the naming services supported by FNS is the X.500 Directory Service (see ITU-T X.500 or ISO/IEC 9594). X.500 is a global directory service. Its components cooperate to manage information about a hierarchy of objects on a worldwide scope. Such objects include countries, organizations, people, services, and machines. FNS uses X.500 to name entities globally. FNS provides the XFN interface for retrieval and modification of information stored in X.500. In addition, enterprise namespaces such as those served by NIS+ and NIS can be federated with X.500 by adding reference information to X.500 describing how to reach the desired next naming service. To federate a NIS+ or NIS namespace under X.500, perform the following steps:</p> <ol style="list-style-type: none"> <li>1. Obtain the root reference for the NIS+ hierarchy or NIS domain.</li> <li>2. Enhance the X.500 schema to support the addition of XFN references.</li> <li>3. Create an X.500 entry to store the XFN reference.</li> <li>4. Add the XFN reference.</li> </ol> <p>The root reference is referred to as the <i>next naming system reference</i> because it refers to the <i>next</i> naming system beneath X.500. This reference contains information about how to communicate with the NIS+ or NIS servers and has the following format:</p> <pre style="margin-left: 40px;">&lt;domainname&gt; &lt;server name&gt; [ &lt;server address&gt; ]</pre> <p>where &lt;domainname&gt; is the fully qualified domain name. Note that NIS+ and NIS have slightly different syntaxes for domain names. For NIS+, the fully qualified domain name is case-insensitive and terminated by a dot character ('.'). For NIS, the fully qualified domain name is case-sensitive and <i>not</i> terminated by a dot character. For both NIS+ and NIS, &lt;server address&gt; is optional. If it is not supplied, a host name lookup will be performed to get the machine's address.</p> <p>For example, if the machine <b>wiz-nisplus-server</b> with address <b>133.33.33.33</b> serves the NIS+ domain <b>wiz.com.</b>, the reference would look like this:</p> <pre style="margin-left: 40px;"><b>wiz.com. wiz-nisplus-server 133.33.33.33</b></pre> <p>For another example, if the machine <b>woz-nis-server</b> serves the NIS domain <b>Woz.COM</b>, the reference would look like this:</p> <pre style="margin-left: 40px;"><b>Woz.COM woz-nis-server</b></pre> <p>Before the next naming system reference can be added to X.500, the X.500 schema must be altered to include the following object class and associated attributes (defined in ASN.1 notation).</p> <pre style="margin-left: 40px;">xFNSupplement OBJECT-CLASS ::= {     SUBCLASS OF { top }     KIND      auxiliary     MAY CONTAIN { objectReferenceString   nNSReferenceString }</pre> |

```
ID      id-oc-xFNSupplement }
```

```
id-oc-xFNSupplement OBJECT IDENTIFIER ::= {  
iso member-body(2) ansi(840) sun(113536) 25 }
```

```
objectReferenceString ATTRIBUTE ::= {  
WITH SYNTAX      OCTET STRING  
EQUALITY MATCHING RULE octetStringMatch  
SINGLE VALUE      TRUE  
ID                id-at-objectReferenceString }
```

```
id-at-objectReferenceString OBJECT IDENTIFIER ::= {  
iso member-body(2) ansi(840) sun(113536) 30 }
```

```
nNSReferenceString ATTRIBUTE ::= {  
WITH SYNTAX      OCTET STRING  
EQUALITY MATCHING RULE octetStringMatch  
SINGLE VALUE      TRUE  
ID                id-at-nNSReferenceString }
```

```
id-at-nNSReferenceString OBJECT IDENTIFIER ::= {  
iso member-body(2) ansi(840) sun(113536) 31 }
```

The procedures for altering the X.500 schema will vary from implementation to implementation. Consult *Solstice X.500 Directory Management* or the schema administration guide for your X.500 product.

Once X.500 supports XFN references, the next naming system reference can be added by first creating an X.500 object and then adding the new reference to it. For example, the following commands create entries for the **Wiz** and **Woz** organizations in the U.S.A. and add the reference information shown in the examples above to them.

For NIS+:

```
example% fnattr .../c=us/o=wiz -a objectclass \  
top organization xfnsupplement  
example% fmbind -r .../c=us/o=wiz/ onc_fn_enterprise \  
onc_fn_nisplus_root "wiz.com. wiz-nisplus-server"
```

For NIS:

```
example% fnattr .../c=us/o=woz -a objectclass \  
top organization xfnsupplement  
example% fmbind -r .../c=us/o=woz/ onc_fn_enterprise \  
onc_fn_nis_root "Woz.COM woz-nis-server"
```

Note the mandatory trailing slash (/) in the name argument to **fmbind(1)**.

This modification effectively adds the next naming system reference to X.500. The reference may be retrieved using **fnlookup(1)** to see if the information has been added properly. For example, the following command looks up the next naming system reference of the **Wiz** organization:

```
example% fnlookup -v .../c=us/o=wiz/
```

Note the mandatory trailing slash.

After this administrative step has been taken, clients outside of the NIS+ hierarchy or NIS domain can access and perform operations on the contexts in the NIS+ hierarchy or NIS domain. Foreign NIS+ clients access the hierarchy as unauthenticated NIS+ clients. Continuing the example above, and assuming that NIS+ is federated underneath the **Wiz** organization, the root of the NIS+ enterprise may be listed using the command:

```
example% fnlist .../c=us/o=wiz/
```

Note the mandatory trailing slash.

The next naming system reference may be removed using the command:

```
example% fnunbind .../c=us/o=wiz/
```

Note the mandatory trailing slash.

| <b>NAME</b>             | formats – file format notation  |  |                      |                 |    |           |       |    |       |   |    |           |  |    |           |  |    |         |  |    |                 |   |
|-------------------------|---|--|----------------------|-----------------|----|-----------|-------|----|-------|---|----|-----------|--|----|-----------|--|----|---------|--|----|-----------------|---|
| <b>DESCRIPTION</b>      | Utility descriptions use a syntax to describe the data organization within files—stdin, stdout, stderr, input files, and output files—when that organization is not otherwise obvious. The syntax is similar to that used by the <b>printf(3S)</b> function. When used for stdin or input file descriptions, this syntax describes the format that could have been used to write the text to be read, not a format that could be used by the <b>scanf(3S)</b> function to read the input file.  |  |                      |                 |    |           |       |    |       |   |    |           |  |    |           |  |    |         |  |    |                 |   |
| <b>Format</b>           | <p>The description of an individual record is as follows:</p> <p style="text-align: center;">"&lt;format&gt;", [&lt;arg1&gt;, &lt;arg2&gt;, . . . , &lt;argn&gt;]</p> <p>The <i>format</i> is a character string that contains three types of objects defined below:</p> <p><i>characters</i>            Characters that are not <i>escape sequences</i> or <i>conversion specifications</i>, as described below, are copied to the output.</p> <p><i>escape sequences</i>    Represent non-graphic characters.</p> <p><i>conversion specifications</i></p> <p style="text-align: center;">                             Specifies the output format of each argument. (See below.)</p> <p>The following characters have the following special meaning in the format string:</p> <p>" "                        (An empty character position.) One or more blank characters</p> <p>Δ                            Exactly one space character.</p> <p>The notation for spaces allows some flexibility for application output. Note that an empty character position in <i>format</i> represents one or more blank characters on the output (not <i>white space</i>, which can include newline characters). Therefore, another utility that reads that output as its input must be prepared to parse the data using <b>scanf(3S)</b>, <b>awk(1)</b>, and so forth. The Δ character is used when exactly one space character is output.</p> |  |                      |                 |    |           |       |    |       |   |    |           |  |    |           |  |    |         |  |    |                 |   |
| <b>Escape Sequences</b> | <p>The following table lists escape sequences and associated actions on display devices capable of the action.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: left;">Escape Sequence</th> <th style="text-align: left;">Represents Character</th> <th style="text-align: left;">Terminal Action</th> </tr> </thead> <tbody> <tr> <td>\\</td> <td>backslash</td> <td>None.</td> </tr> <tr> <td>\a</td> <td>alert</td> <td>Attempts to alert the user through audible or visible notification.</td> </tr> <tr> <td>\b</td> <td>backspace</td> <td>Moves the printing position to one column before the current position, unless the current position is the start of a line.</td> </tr> <tr> <td>\f</td> <td>form-feed</td> <td>Moves the printing position to the initial printing position of the next logical page.</td> </tr> <tr> <td>\n</td> <td>newline</td> <td>Moves the printing position to the start of the next line.</td> </tr> <tr> <td>\r</td> <td>carriage-return</td> <td>Moves the printing position to the start of the current line.</td> </tr> </tbody> </table>  | Escape Sequence  | Represents Character | Terminal Action | \\ | backslash | None. | \a | alert | Attempts to alert the user through audible or visible notification. | \b | backspace | Moves the printing position to one column before the current position, unless the current position is the start of a line. | \f | form-feed | Moves the printing position to the initial printing position of the next logical page. | \n | newline | Moves the printing position to the start of the next line. | \r | carriage-return | Moves the printing position to the start of the current line. |
| Escape Sequence         | Represents Character  | Terminal Action  |                      |                 |    |           |       |    |       |   |    |           |  |    |           |  |    |         |  |    |                 |   |
| \\                      | backslash   | None.  |                      |                 |    |           |       |    |       |   |    |           |  |    |           |  |    |         |  |    |                 |   |
| \a                      | alert   | Attempts to alert the user through audible or visible notification.  |                      |                 |    |           |       |    |       |   |    |           |  |    |           |  |    |         |  |    |                 |   |
| \b                      | backspace   | Moves the printing position to one column before the current position, unless the current position is the start of a line. |                      |                 |    |           |       |    |       |   |    |           |  |    |           |  |    |         |  |    |                 |   |
| \f                      | form-feed   | Moves the printing position to the initial printing position of the next logical page.                                     |                      |                 |    |           |       |    |       |   |    |           |  |    |           |  |    |         |  |    |                 |   |
| \n                      | newline   | Moves the printing position to the start of the next line.   |                      |                 |    |           |       |    |       |   |    |           |  |    |           |  |    |         |  |    |                 |   |
| \r                      | carriage-return   | Moves the printing position to the start of the current line.  |                      |                 |    |           |       |    |       |   |    |           |  |    |           |  |    |         |  |    |                 |   |

- `\t`    `tab`                      Moves the printing position to the next tab position on the current line. If there are no more tab positions left on the line, the behaviour is undefined.
- `\v`    `vertical-tab`                      Moves the printing position to the start of the next vertical tab position. If there are no more vertical tab positions left on the page, the behaviour is undefined.

**Conversion Specifications**

Each conversion specification is introduced by the percent-sign character (%). After the character %, the following appear in sequence:

- flags*                      Zero or more *flags*, in any order, that modify the meaning of the conversion specification.
- field width*              An optional string of decimal digits to specify a minimum *field width*. For an output field, if the converted value has fewer bytes than the field width, it is padded on the left (or right, if the left-adjustment flag (-), described below, has been given to the field width).
- precision*                Gives the minimum number of digits to appear for the d, o, i, u, x or X conversions (the field is padded with leading zeros), the number of digits to appear after the radix character for the e and f conversions, the maximum number of significant digits for the g conversion; or the maximum number of bytes to be written from a string in s conversion. The precision takes the form of a period (.) followed by a decimal digit string; a null digit string is treated as zero.
- conversion characters*              A conversion character (see below) that indicates the type of conversion to be applied.

*flags*

The *flags* and their meanings are:

- The result of the conversion is left-justified within the field.
- +                              The result of a signed conversion always begins with a sign (+ or -).
- <space>                      If the first character of a signed conversion is not a sign, a space character is prefixed to the result. This means that if the space character and + flags both appear, the space character flag is ignored.
- #                              The value is to be converted to an alternative form. For c, d, i, u, and s conversions, the behaviour is undefined. For o conversion, it increases the precision to force the first digit of the result to be a zero. For x or X conversion, a non-zero result has 0x or 0X prefixed to it, respectively. For e, E, f, g, and G conversions, the result always contains a radix character, even if no digits follow the radix character. For g and G conversions, trailing zeros are not removed from the result as they usually are.
- 0                              For d, i, o, u, x, X, e, E, f, g, and G conversions, leading zeros (following any indication of sign or base) are used to pad to the field width; no space padding is performed. If the 0 and - flags both appear, the 0 flag is ignored. For d, i, o, u, x and X conversions, if a precision is specified, the 0 flag is

**Conversion Characters**

ignored. For other conversions, the behaviour is undefined.

Each conversion character results in fetching zero or more arguments. The results are undefined if there are insufficient arguments for the format. If the format is exhausted while arguments remain, the excess arguments are ignored.

The *conversion characters* and their meanings are:

*d,i,o,u,x,X* The integer argument is written as signed decimal (d or i), unsigned octal (o), unsigned decimal (u), or unsigned hexadecimal notation (x and X). The d and i specifiers convert to signed decimal in the style `[-]dddd`. The x conversion uses the numbers and letters 0123456789abcdef and the X conversion uses the numbers and letters 0123456789ABCDEF. The *precision* component of the argument specifies the minimum number of digits to appear. If the value being converted can be represented in fewer digits than the specified minimum, it is expanded with leading zeros. The default precision is 1. The result of converting a zero value with a precision of 0 is no characters. If both the field width and precision are omitted, the implementation may precede, follow or precede and follow numeric arguments of types d, i and u with blank characters; arguments of type o (octal) may be preceded with leading zeros.

The treatment of integers and spaces is different from the `printf(3S)` function in that they can be surrounded with blank characters. This was done so that, given a format such as:

```
"%d\n",<foo>
```

the implementation could use a `printf()` call such as:

```
printf("%6d\n", foo);
```

and still conform. This notation is thus somewhat like `scanf()` in addition to `printf()`.

*f* The floating point number argument is written in decimal notation in the style `[-]ddd.ddd`, where the number of digits after the radix character (shown here as a decimal point) is equal to the *precision* specification. The `LC_NUMERIC` locale category determines the radix character to use in this format. If the *precision* is omitted from the argument, six digits are written after the radix character; if the *precision* is explicitly 0, no radix character appears.

*e,E* The floating point number argument is written in the style `[-]d.ddde±dd` (the symbol  $\pm$  indicates either a plus or minus sign), where there is one digit before the radix character (shown here as a decimal point) and the number of digits after it is equal to the precision. The `LC_NUMERIC` locale category determines the radix character to use in this format. When the precision is missing, six digits are written after the radix character; if the precision is 0, no radix character appears. The E conversion character produces a number with E instead of e introducing the exponent. The exponent always contains at least two digits. However, if the value to be written requires an

- exponent greater than two digits, additional exponent digits are written as necessary.
- g,G*      The floating point number argument is written in style *f* or *e* (or in style *E* in the case of a *G* conversion character), with the precision specifying the number of significant digits. The style used depends on the value converted: style *g* is used only if the exponent resulting from the conversion is less than  $-4$  or greater than or equal to the precision. Trailing zeros are removed from the result. A radix character appears only if it is followed by a digit.
- c*          The integer argument is converted to an **unsigned char** and the resulting byte is written.
- s*          The argument is taken to be a string and bytes from the string are written until the end of the string or the number of bytes indicated by the *precision* specification of the argument is reached. If the precision is omitted from the argument, it is taken to be infinite, so all bytes up to the end of the string are written.
- %*          Write a *%* character; no argument is converted.

In no case does a non-existent or insufficient *field width* cause truncation of a field; if the result of a conversion is wider than the field width, the field is simply expanded to contain the conversion result. The term *field width* should not be confused with the term *precision* used in the description of *%s*.

One difference from the C function **printf()** is that the *l* and *h* conversion characters are not used. There is no differentiation between decimal values for type **int**, type **long**, or type **short**. The specifications *%d* or *%i* should be interpreted as an arbitrary length sequence of digits. Also, no distinction is made between single precision and double precision numbers (**float** or **double** in C). These are simply referred to as floating point numbers.

Many of the output descriptions use the term *line*, such as:

*"%s", <input line>*

Since the definition of *line* includes the trailing newline character already, there is no need to include a *\n* in the format; a double newline character would otherwise result.

**EXAMPLES**

To represent the output of a program that prints a date and time in the form Sunday, July 3, 10:02, where *<weekday>* and *<month>* are strings:

*"%s,%d%S%d,%d:%.2d\n",<weekday>,<month>,<day>,<hour>,<min>*

To show  $\pi$  written to 5 decimal places:

*"pi=%f\n",<value of  $\pi$ >*

To show an input file format consisting of five colon-separated fields:

*"%s:%s:%s:%s:%s\n",<arg1>,<arg2>,<arg3>,<arg4>,<arg5>*

| ISO 646sv                             | 646sv         | ISO 8859-1         | 8859          | Swedish              |

**CONVERSIONS** The conversions are performed according to the following tables. All values in the tables are given in octal.

**ISO 646 (US ASCII) to ISO 8859-1** For the conversion of ISO 646 to ISO 8859-1, all characters in ISO 646 can be mapped unchanged to ISO 8859-1

**ISO 646de (GERMAN) to ISO 8859-1** For the conversion of ISO 646de to ISO 8859-1, all characters not in the following table are mapped unchanged.

| <b>Conversions Performed</b> |                   |                  |                   |

**EXAMPLES**

In the conversion library, `/usr/lib/iconv` (see `iconv(3)`), the library module file name is composed of two symbolic elements separated by the percent sign (%). The first symbol specifies the code set that is being converted; the second symbol specifies the *target code*, that is, the code set to which the first one is being converted.

In the conversion table above, the first symbol is termed the "FROM Filename Element". The second symbol, representing the target code set, is the "TO Filename Element".

For example, the library module filename to convert from the *Korean EUC* code set to the *Korean UTF-8* code set is

**ko\_KR-euc%ko\_KR-UTF-8**

**FILES**

`/usr/lib/iconv/*.so` conversion modules

**NOTES**

ISO 8859 character sets using Latin alphabetic characters are distinguished as follows:

**ISO 8859-1 (Latin 1)**

For most West European languages, including:

|          |           |            |
|----------|-----------|------------|
| Albanian | Finnish   | Italian    |
| Catalan  | French    | Norwegian  |
| Danish   | German    | Portuguese |
| Dutch    | Galician  | Spanish    |
| English  | Irish     | Swedish    |
| Faeroese | Icelandic |            |

**ISO 8859-2 (Latin 2)**

For most Latin-written Slavic and Central European languages:

|           |          |         |
|-----------|----------|---------|
| Czech     | Polish   | Slovak  |
| German    | Rumanian | Slovene |
| Hungarian | Croatian |         |

**ISO 8859-3 (Latin 3)**

Popularly used for Esperanto, Galician, Maltese, and Turkish.

**ISO 8859-4 (Latin 4)**

Introduces letters for Estonian, Latvian, and Lithuanian. It is an incomplete predecessor of ISO 8859-10 (Latin 6).

**ISO 8859-9 (Latin 5)**

Replaces the rarely needed Icelandic letters in ISO 8859-1 (Latin 1) with the Turkish ones.

**ISO 8859-10 (Latin 6)**

Adds the last Inuit (Greenlandic) and Sami (Lappish) letters that were not included in ISO 8859-4 (Latin 4) to complete coverage of the Nordic area.

|                            |   |
|----------------------------|---|
| <b>NAME</b>                | in – Internet Protocol family   |
| <b>SYNOPSIS</b>            | <b>#include</b> <netinet/in.h>  |
| <b>DESCRIPTION</b>         | <p>The &lt;netinet/in.h&gt; header defines the following types through <b>typedef</b>:</p> <p><b>in_port_t</b>        An unsigned integral type of exactly 16 bits.<br/> <b>in_addr_t</b>        An unsigned integral type of exactly 32 bits.</p> <p>The &lt;netinet/in.h&gt; header defines the <b>in_addr</b> structure that includes the following member:</p> <p><b>in_addr_t</b>        <b>s_addr</b></p> <p>The &lt;netinet/in.h&gt; header defines the type <b>sa_family_t</b> as described in <b>socket(5)</b>.<br/> The &lt;netinet/in.h&gt; header defines the following macros for use as values of the <i>level</i> argument of <b>getsockopt()</b> and <b>setsockopt()</b>:</p> <p><b>IPPROTO_IP</b>            Dummy for IP<br/> <b>IPPROTO_ICMP</b>        Control message protocol<br/> <b>IPPROTO_TCP</b>        TCP<br/> <b>IPPROTO_UDP</b>        User datagram protocol</p> <p>The &lt;netinet/in.h&gt; header defines the following macros for use as destination addresses for <b>connect()</b>, <b>sendmsg()</b>, and <b>sendto()</b>:</p> <p><b>INADDR_ANY</b>            Local host address<br/> <b>INADDR_BROADCAST</b>    Broadcast address</p> |
| <b>Default</b>             | <p>For applications that do not require standard-conforming behavior (those that use the socket interfaces described in section 3N of the reference manual; see <b>Intro(3)</b> and <b>standards(5)</b>), the &lt;netinet/in.h&gt; header defines the <b>sockaddr_in</b> structure that includes the following members:</p> <p><b>sa_family_t</b>        <b>sin_family</b><br/> <b>in_port_t</b>        <b>sin_port</b><br/> <b>struct in_addr</b>    <b>sin_addr</b><br/> <b>char</b>            <b>sin_zero[8]</b></p>  |
| <b>Standard-conforming</b> | <p>For applications that require standard-conforming behavior (those that use the socket interfaces described in section 3XN of the reference manual; see <b>Intro(3)</b> and <b>standards(5)</b>), the &lt;netinet/in.h&gt; header defines the <b>sockaddr_in</b> structure that includes the following members:</p> <p><b>sa_family_t</b>        <b>sin_family</b><br/> <b>in_port_t</b>        <b>sin_port</b><br/> <b>struct in_addr</b>    <b>sin_addr</b><br/> <b>unsigned char</b>    <b>sin_zero[8]</b></p>   |

The **sockaddr\_in** structure is used to store addresses for the Internet protocol family. Values of this type must be cast to **struct sockaddr** for use with the socket interfaces.

|----------------------------|--|
| <b>NAME</b>                | inet – definitions for internet operations   |
| <b>SYNOPSIS</b>            | <b>#include &lt;arpa/inet.h&gt;</b>  |
| <b>DESCRIPTION</b>         | <p>The &lt;arpa/inet.h&gt; header defines the type <b>in_port_t</b>, the type <b>in_addr_t</b>, and the <b>in_addr</b> structure, as described in <b>in(5)</b>.</p> <p>Inclusion of the &lt;arpa/inet.h&gt; header may also make visible all symbols from <b>in(5)</b>.</p> <p>The following are declared as functions, and may also be defined as macros:</p> <pre> <b>in_addr_t</b>      <b>inet_addr(const char *cp);</b> <b>in_addr_t</b>      <b>inet_lnaof(struct in_addr in);</b> <b>struct in_addr</b> <b>inet_makeaddr(in_addr_t net, in_addr_t lna);</b> <b>in_addr_t</b>      <b>inet_netof(struct in_addr in);</b> <b>in_addr_t</b>      <b>inet_network(const char *cp);</b> <b>char</b>           <b>*inet_ntoa(struct in_addr in);</b> </pre> |
| <b>Default</b>             | <p>For applications that do not require standard-conforming behavior (those that use the socket interfaces described in section 3N of the reference manual; see <b>Intro(3)</b> and <b>standards(5)</b>), the following may be declared as functions, or defined as macros, or both:</p> <pre> <b>uint32_t</b>      <b>htonl(uint32_t hostlong);</b> <b>uint16_t</b>      <b>htons(uint16_t hostshort);</b> <b>uint32_t</b>      <b>ntohl(uint32_t netlong);</b> <b>uint16_t</b>      <b>ntohs(uint16_t netshort);</b> </pre>  |
| <b>Standard-conforming</b> | <p>For applications that require standard-conforming behavior (those that use the socket interfaces described in section 3XN of the reference manual; see <b>Intro(3)</b> and <b>standards(5)</b>), the following may be declared as functions, or defined as macros, or both:</p> <pre> <b>in_addr_t</b>      <b>htonl(in_addr_t hostlong);</b> <b>in_port_t</b>      <b>htons(in_port_t hostshort);</b> <b>in_addr_t</b>      <b>ntohl(in_addr_t netlong);</b> <b>in_port_t</b>      <b>ntohs(in_port_t netshort);</b> </pre>  |
| <b>SEE ALSO</b>            | <b>Intro(3)</b> , <b>htonl(3N)</b> , <b>htonl(3XN)</b> , <b>inet_addr(3N)</b> , <b>inet_addr(3XN)</b> , <b>in(5)</b> , <b>standards(5)</b>   |

**NAME** interface64 – 64-bit transitional interfaces

**DESCRIPTION** The interfaces, macros, and data types described on this page section are explicit 64-bit instances of the standard API. They are accessible through the transitional compilation environment described on the **lfcompile64(5)** manual page. The function prototype and semantics of a transitional interface are equivalent to those of the standard version of the call, except that relevant data types are 64-bit entities.

**Data Types** The following table shows the standard data or struct types and their corresponding 64-bit types. The absence of an entry in the **Standard Definition** column indicates that there is no existing 32-bit type that corresponds to the type listed in the **64-bit Definition** column.

| Standard Definition   | 64-bit Definition   | Header           |
|---|---|------------------|
| struct <b>aiocb</b><br><b>off_t</b> aio_offset;   | struct <b>aiocb64</b><br><b>off64_t</b> aio_offset;   | <aio.h>          |
| struct <b>dirent</b><br><b>ino_t</b> d_ino;<br><b>off_t</b> d_off;  | struct <b>dirent64</b><br><b>ino64_t</b> d_ino;<br><b>off64_t</b> d_off;  | <sys/dirent.h>   |
| struct <b>flock</b><br><b>off_t</b> l_start;<br><b>off_t</b> l_len;<br><b>F_SETLK</b><br><b>F_SETLKW</b><br><b>F_GETLK</b><br><b>F_FREESP</b>                         | struct <b>flock64</b><br><b>off64_t</b> l_start;<br><b>off64_t</b> l_len;<br><b>F_SETLK64</b><br><b>F_SETLKW64</b><br><b>F_GETLK64</b><br><b>F_FREESP64</b><br><b>O_LARGEFILE</b>   | <sys/fcntl.h>    |
| <b>fpos_t</b>   | <b>fpos64_t</b>   | <sys/stdio.h>    |
| <b>rlim_t</b><br>struct <b>rlimit</b><br><b>rlim_t</b> rlim_cur;<br><b>rlim_t</b> rlim_max;<br><b>RLIM_INFINITY</b><br><b>RLIM_SAVED_MAX</b><br><b>RLIM_SAVED_CUR</b> | <b>rlim64_t</b><br>struct <b>rlimit64</b><br><b>rlim64_t</b> rlim_cur;<br><b>rlim64_t</b> rlim_max;<br><b>RLIM64_INFINITY</b><br><b>RLIM64_SAVED_MAX</b><br><b>RLIM64_SAVED_CUR</b> | <sys/resource.h> |
| struct <b>stat</b><br><b>ino_t</b> st_ino;<br><b>off_t</b> st_size;<br><b>blkcnt_t</b> st_blocks;   | struct <b>stat64</b><br><b>ino64_t</b> st_ino;<br><b>off64_t</b> st_size;<br><b>blkcnt64_t</b> st_blocks;   | <sys/stat.h>     |

| Standard Definition  | 64-bit Definition  | Header          |
|--|--|-----------------|
| <b>struct statvfs</b><br><b>fsblkcnt_t</b> f_blocks;<br><b>fsblkcnt_t</b> f_bfree;<br><b>fsblkcnt_t</b> f_bavail;<br><b>fsfilcnt_t</b> f_files;<br><b>fsfilcnt_t</b> f_ffree;<br><b>fsfilcnt_t</b> f_favail; | <b>struct statvfs64</b><br><b>fsblkcnt64_t</b> f_blocks;<br><b>fsblkcnt64_t</b> f_bfree;<br><b>fsblkcnt64_t</b> f_bavail;<br><b>fsfilcnt64_t</b> f_files;<br><b>fsfilcnt64_t</b> f_ffree;<br><b>fsfilcnt64_t</b> f_favail; | <sys/statvfs.h> |
| <b>off_t</b> ;<br><b>ino_t</b> ;<br><b>blkcnt_t</b> ;<br><b>fsblkcnt_t</b> ;<br><b>fsfilcnt_t</b> ;  | <b>off64_t</b> ;<br><b>ino64_t</b> ;<br><b>blkcnt64_t</b> ;<br><b>fsblkcnt64_t</b> ;<br><b>fsfilcnt64_t</b> ;  | <sys/types.h>   |

|------------------------|---|
| <b>NAME</b>            | isalist – the native instruction sets known to Solaris software   |
| <b>DESCRIPTION</b>     | <p>The possible instruction set names returned by <b>isalist</b>(1) and the <b>SI_ISALIST</b> command of <b>sysinfo</b>(2) are listed here.</p> <p>The list is ordered within an instruction set family in the sense that later names are generally faster than earlier names; note that this is in the reverse order than listed by <b>isalist</b>(1) and <b>sysinfo</b>(2). In the following list of values, numbered entries generally represent increasing performance; lettered entries are either mutually exclusive or cannot be ordered.</p>  |
| <b>SPARC Platforms</b> | <p>Where appropriate, correspondence with a given value of the <code>-xarch</code> option of Sun's C 4.0 compiler is indicated. Other compilers may have similar options.</p> <p>1a. sparc<br/>         Indicates the SPARC V8 instruction set, as defined in <i>The SPARC Architecture Manual, Version 8</i>, Prentice-Hall, Inc., 1992. Some instructions (such as integer multiply and divide, FSMULD, and all floating point operations on quad operands) may be emulated by the kernel on certain systems.</p> <p>1b. sparcv7<br/>         Same as sparc. This corresponds to code produced with the <code>-xarch=v7</code> option of Sun's C 4.0 compiler.</p> <p>2. sparcv8-fsmuld<br/>         Like sparc, except that integer multiply and divide must be executed in hardware. This corresponds to code produced with the <code>-xarch=v8a</code> option of Sun's C 4.0 compiler.</p> <p>3. sparcv8<br/>         Like sparcv8-fsmuld, except that FSMULD must also be executed in hardware. This corresponds to code produced with the <code>-xarch=v8</code> option of Sun's C 4.0 compiler.</p> <p>4. sparcv8plus<br/>         Indicates the SPARC V8 instruction set plus those instructions in the SPARC V9 instruction set, as defined in <i>The SPARC Architecture Manual, Version 9</i>, Prentice-Hall, 1994, that can be used according to <i>The V8+ Technical Specification</i>. This corresponds to code produced with the <code>-xarch=v8plus</code> option of Sun's C 4.0 compiler.</p> <p>5a. sparcv8plus+vis<br/>         Like sparcv8plus, with the addition of those UltraSPARC I Visualization Instructions that can be used according to <i>The V8+ Technical Specification</i>. This corresponds to code produced with the <code>-xarch=v8plusa</code> option of Sun's C 4.0 compiler.</p> <p>5b. sparcv8plus+fmuladd<br/>         Like sparcv8plus, with the addition of the Hal SPARC64 floating multiply-add and multiply-subtract instructions.</p> |

## 6. sparcv9

Indicates the SPARC V9 instruction set, as defined in *The SPARC Architecture Manual, Version 9*, Prentice-Hall, 1994.

## 7a. sparcv9+vis

Like sparcv9, with the addition of the UltraSPARC I Visualization Instructions.

## 7b. sparcv9+fmuladd

Like sparcv9, with the addition of the Hal SPARC64 floating multiply-add and multiply-subtract instructions.

**Intel Platforms**

1. i386 The Intel 80386 instruction set, as described in *The i386 Microprocessor Programmer's Reference Manual*.

2. i486 The Intel 80486 instruction set, as described in *The i486 Microprocessor Programmer's Reference Manual*. (This is effectively i386, plus the CMPXCHG, BSWAP, and XADD instructions.)

## 3. pentium

The Intel Pentium instruction set, as described in *The Pentium Processor User's Manual*. (This is effectively i486, plus the CPU\_ID instruction, and any features that the CPU\_ID instruction indicates are present.)

## 4. pentium+mmx

Like pentium, with the MMX instructions guaranteed present.

## 5. pentium\_pro

The Intel PentiumPro instruction set, as described in *The PentiumPro Family Developer's Manual*. (This is effectively pentium, with the CMOVcc, FCMOVcc, FCOMI, and RDPMC instructions guaranteed present.)

## 6. pentium\_pro+mmx

Like pentium\_pro, with the MMX instructions guaranteed present.

|                    | <b>ABMON_11</b> Locale's equivalent of 'nov'   |
|                    | <b>ABMON_12</b> Locale's equivalent of 'dec'   |

|                  |   |
|------------------|---|
| <b>RADIXCHAR</b> | Locale's equivalent of '.'                |
| <b>THOUSEP</b>   | Locale's equivalent of ','                |
| <b>YESSTR</b>    | Locale's equivalent of 'yes'              |
| <b>NOSTR</b>     | Locale's equivalent of 'no'               |
| <b>CRNCYSTR</b>  | Locale's currency symbol                  |
| <b>D_T_FMT</b>   | Locale's default format for date and time |
| <b>D_FMT</b>     | Locale's default format for the date      |
| <b>T_FMT</b>     | Locale's default format for the time      |
| <b>AM_STR</b>    | Locale's equivalent of 'AM'               |
| <b>PM_STR</b>    | Locale's equivalent of 'PM'               |

This information is retrieved by **nl\_langinfo**.

The items **CRNCYSTR**, **RADIXCHAR** and **THOUSEP** are extracted from the fields **currency\_symbol**, **decimal\_point** and **thousands\_sep** in the structure returned by **localeconv**.

The items **T\_FMT**, **D\_FMT**, **D\_T\_FMT**, **YESSTR** and **NOSTR** are retrieved from a special message catalog named **Xopen\_info** which should be generated for each locale supported and installed in the appropriate directory [see **gettext(3C)** and **mkmsgs(1)**]. This catalog should have the messages in the order **T\_FMT**, **D\_FMT**, **D\_T\_FMT**, **YESSTR** and **NOSTR**.

All other items are as returned by **strftime**.

| <b>NAME</b>                       | largefile – large file status of utilities  |                 |              |                 |            |              |              |              |              |            |                 |           |               |            |           |  |               |           |              |              |             |             |            |                |             |             |             |            |            |           |           |              |               |             |           |             |             |              |                |           |            |              |             |           |              |            |            |           |             |              |            |             |            |             |              |           |                   |                 |                 |           |             |
| <b>DESCRIPTION</b>                | On a 32-bit system, a <i>large file</i> is a regular file whose size is greater than or equal to 2 Gbyte ( $2^{31}$ bytes). A <i>small file</i> is a regular file whose size is less than 2 Gbyte.  |                 |              |                 |            |              |              |              |              |            |                 |           |               |            |           |  |               |           |              |              |             |             |            |                |             |             |             |            |            |           |           |              |               |             |           |             |             |              |                |           |            |              |             |           |              |            |            |           |             |              |            |             |            |             |              |           |                   |                 |                 |           |             |
| <b>Large file aware utilities</b> | <p>A utility is called <i>large file aware</i> if it can process large files in the same manner as it does small files. A utility that is large file aware is able to handle large files as input and generate large files as output.</p> <p>The following <b>/usr/bin</b> utilities are large file aware:</p> <table border="0"> <tr> <td><b>adb</b></td> <td><b>awk</b></td> <td><b>bdiff</b></td> <td><b>cat</b></td> <td><b>chgrp</b></td> </tr> <tr> <td><b>chmod</b></td> <td><b>chown</b></td> <td><b>cksum</b></td> <td><b>cmp</b></td> <td><b>compress</b></td> </tr> <tr> <td><b>cp</b></td> <td><b>csplit</b></td> <td><b>cut</b></td> <td><b>dd</b></td> <td></td> </tr> <tr> <td><b>dircmp</b></td> <td><b>du</b></td> <td><b>egrep</b></td> <td><b>fgrep</b></td> <td><b>file</b></td> </tr> <tr> <td><b>find</b></td> <td><b>ftp</b></td> <td><b>getconf</b></td> <td><b>grep</b></td> <td><b>head</b></td> </tr> <tr> <td><b>join</b></td> <td><b>jsh</b></td> <td><b>ksh</b></td> <td><b>ln</b></td> <td><b>ls</b></td> </tr> <tr> <td><b>mkdir</b></td> <td><b>mkfifo</b></td> <td><b>more</b></td> <td><b>mv</b></td> <td><b>nawk</b></td> </tr> <tr> <td><b>page</b></td> <td><b>paste</b></td> <td><b>pathchk</b></td> <td><b>pg</b></td> <td><b>rcp</b></td> </tr> <tr> <td><b>remsh</b></td> <td><b>rksh</b></td> <td><b>rm</b></td> <td><b>rmdir</b></td> <td><b>rsh</b></td> </tr> <tr> <td><b>sed</b></td> <td><b>sh</b></td> <td><b>sort</b></td> <td><b>split</b></td> <td><b>sum</b></td> </tr> <tr> <td><b>tail</b></td> <td><b>tee</b></td> <td><b>test</b></td> <td><b>touch</b></td> <td><b>tr</b></td> </tr> <tr> <td><b>uncompress</b></td> <td><b>uudecode</b></td> <td><b>uuencode</b></td> <td><b>wc</b></td> <td><b>zcat</b></td> </tr> </table> <p>The following <b>/usr/sbin</b> utilities are large file aware:</p> <p><b>install mkfile mknod mmdir</b></p> <p>The following <b>/usr/ucb</b> utilities are large file aware:</p> <p><b>Mail chown from ln lpr</b><br/> <b>ls sed sum touch</b></p> <p>The <b>/usr/bin/cpio</b>, <b>/usr/bin/pax</b>, and <b>/usr/bin/tar</b> utilities are large file aware, but cannot archive a file whose size exceeds 8 Gbyte – 1 byte.</p> <p>The <b>/usr/sbin/crash</b> and <b>/usr/bin/truss</b> utilities have been modified to read a dump file and display information relevant to large files, such as offsets.</p> | <b>adb</b>      | <b>awk</b>   | <b>bdiff</b>    | <b>cat</b> | <b>chgrp</b> | <b>chmod</b> | <b>chown</b> | <b>cksum</b> | <b>cmp</b> | <b>compress</b> | <b>cp</b> | <b>csplit</b> | <b>cut</b> | <b>dd</b> |  | <b>dircmp</b> | <b>du</b> | <b>egrep</b> | <b>fgrep</b> | <b>file</b> | <b>find</b> | <b>ftp</b> | <b>getconf</b> | <b>grep</b> | <b>head</b> | <b>join</b> | <b>jsh</b> | <b>ksh</b> | <b>ln</b> | <b>ls</b> | <b>mkdir</b> | <b>mkfifo</b> | <b>more</b> | <b>mv</b> | <b>nawk</b> | <b>page</b> | <b>paste</b> | <b>pathchk</b> | <b>pg</b> | <b>rcp</b> | <b>remsh</b> | <b>rksh</b> | <b>rm</b> | <b>rmdir</b> | <b>rsh</b> | <b>sed</b> | <b>sh</b> | <b>sort</b> | <b>split</b> | <b>sum</b> | <b>tail</b> | <b>tee</b> | <b>test</b> | <b>touch</b> | <b>tr</b> | <b>uncompress</b> | <b>uudecode</b> | <b>uuencode</b> | <b>wc</b> | <b>zcat</b> |

**lfcompile(5)**, **lfcompile64(5)**, **interface64(5)**

**NAME** lfcompile – large file compilation environment

**DESCRIPTION** In the large file compilation environment, source interfaces are bound to appropriate 64-bit functions, structures, and types. Compiling in this environment allows applications to access files whose size is greater than or equal to 2 Gbyte ( $2^{31}$  bytes). Each interface named `xxx()` that needs to access 64-bit entities to access large files maps to a `xxx64()` call in the resulting binary. All relevant data types are defined to be of correct size (for example, `off_t` has a typedef definition for a 64-bit entity). An application compiled in this environment is able to use the `xxx()` source interfaces to access both large and small files, rather than having to explicitly utilize the transitional `xxx64()` interface calls to access large files. See the `lfcompile64(5)` manual page for information regarding the transitional compilation environment. Applications can be compiled in the large file compilation environment by using the following methods:

- Use the `getconf(1)` utility with one or more of the arguments listed in the table below. This method is recommended for portable applications.

| argument                   | purpose   |
|----------------------------|---|
| <code>LFS_CFLAGS</code>    | obtain compilation flags necessary to enable the large file compilation environment |
| <code>LFS_LDFLAGS</code>   | obtain link editor options  |
| <code>LFS_LIBS</code>      | obtain link library names   |
| <code>LFS_LINTFLAGS</code> | obtain lint options   |

- Set the compile-time flag `_FILE_OFFSET_BITS` to 64 before including any headers.

Applications may combine objects produced in the large file compilation environment with objects produced in the transitional compilation environment, but must be careful with respect to interoperability between those objects. Applications should not declare global variables of types whose sizes change between compilation environments.

**Access to Additional Large File Interfaces**

The `fseek()` and `ftell()` functions *do not* map to functions named `fseek64()` and `ftell64()`; rather, the large file additions `fseeko()` and `ftello()`, have functionality identical to `fseek()` and `ftell()` and *do* map to the 64-bit functions `fseeko64()` and `ftello64()`. Applications wishing to access large files should use `fseeko()` and `ftello()` in place of `fseek()` and `ftell()`. See the `fseek(3S)` and `ftell(3S)` manual pages for information about `fseeko()` and `ftello()`.

Applications wishing to access `fseeko()` and `ftello()` as well as the POSIX and X/Open specification-conforming interfaces should define the macro `_LARGEFILE_SOURCE` to be 1 and set whichever feature test macros are appropriate to obtain the desired environment (see `standards(5)`).

**EXAMPLES**

In the following examples, the large file compilation environment is accessed by invoking the **getconf** utility with one of the arguments listed in the table above. The additional large file interfaces are accessed by specifying **-D\_LARGEFILE\_SOURCE**.

The examples that use the form of command substitution specifying the command within parentheses preceded by a dollar sign can be executed only in a POSIX-conforming shell such as the Korn Shell (see **ksh(1)**). In a shell that is not POSIX-conforming, such as the Bourne Shell (see **sh(1)**) and the C Shell (see **csh(1)**), the **getconf** calls must be enclosed within grave accent marks, as shown in the second example.

1. An example of compiling a program with a “large” **off\_t**, and that uses **fseeko()**, **ftello()**, and **yacc(1)**:

```
$ c89 -D_LARGEFILE_SOURCE      \
-D_FILE_OFFSET_BITS=64 -o foo  \
$(getconf LFS_CFLAGS) y.tab.c b.o \
$(getconf LFS_LDFLAGS)        \
-ly $(getconf LFS_LIBS)
```

2. An example of compiling a program with a “large” **off\_t** that does not use **fseeko()** and **ftello()** and has no application specific libraries:

```
% c89 -D_FILE_OFFSET_BITS=64  \
`getconf LFS_CFLAGS` a.c      \
`getconf LFS_LDFLAGS`        \
`getconf LFS_LIBS`
```

3. An example of compiling a program with a “default” **off\_t** and that uses **fseeko()** and **ftello()**:

```
$ c89 -D_LARGEFILE_SOURCE a.c
```

4. An example of running **lint** on a program with a “large” **off\_t**:

```
$ lint -D_LARGEFILE_SOURCE    \
-D_FILE_OFFSET_BITS=64       \
$(getconf LFS_LINTFLAGS) ...  \
$(getconf LFS_LIBS)
```

**csh(1)**, **getconf(1)**, **ksh(1)**, **sh(1)**, **fseek(3S)**, **ftell(3S)**, **interface64(5)**, **lfcompile64(5)**, **standards(5)**

**NAME** lfcompile64 – transitional compilation environment

**DESCRIPTION** In the transitional compilation environment, 64-bit functions, structures, and types are added to the API. Compiling in this environment allows applications to access files whose size is greater than or equal to 2 Gbyte ( $2^{31}$  bytes).

The transitional compilation environment exports all the explicit 64-bit functions (**xxx64()**) and types in addition to all the regular 32-bit functions (**xxx()**) and types. Both **xxx()** and **xxx64()** functions are available to the program source. An application must use the **xxx64()** functions in order to access large files. See the **interface64(5)** manual page for a complete listing of the 64-bit transitional interfaces.

The transitional compilation environment differs from the large file compilation environment, wherein the underlying interfaces are bound to 64-bit functions, structures, and types. An application compiled in the large file compilation environment is able to use the **xxx()** source interfaces to access both large and small files, rather than having to explicitly utilize the transitional **xxx64()** interface calls to access large files. See the **lfcompile(5)** manual page for more information regarding the large file compilation environment.

Applications may combine objects produced in the large file compilation environment with objects produced in the transitional compilation environment, but must be careful with respect to interoperability between those objects. Applications should not declare global variables of types whose sizes change between compilation environments.

For applications that do not wish to conform to the POSIX or X/Open specifications, the 64-bit transitional interfaces are available by default. No compile-time flags need to be set.

**Access to Additional Large File Interfaces**

Applications that wish to access the transitional interfaces as well as the POSIX or X/Open specification-conforming interfaces should use the following compilation methods and set whichever feature test macros are appropriate to obtain the desired environment (see **standards(5)**).

- Set the compile-time flag `_LARGEFILE64_SOURCE` to 1 before including any headers.
- Use the `getconf(1)` command with one or more of the following arguments:

| argument               | purpose   |
|------------------------|---|
| <b>LFS64_CFLAGS</b>    | obtain compilation flags necessary to enable the transitional compilation environment |
| <b>LFS64_LDFLAGS</b>   | obtain link editor options  |
| <b>LFS64_LIBS</b>      | obtain link library names   |
| <b>LFS64_LINTFLAGS</b> | obtain lint options   |

**EXAMPLES** In the following examples, the transitional compilation environment is accessed by invoking the `getconf` utility with one of the arguments listed in the table above. The additional large file interfaces are accessed either by specifying

`-D_LARGEFILE64_SOURCE` or by invoking the **getconf** utility with the arguments listed above.

The example that uses the form of command substitution specifying the command within parentheses preceded by a dollar sign can be executed only in a POSIX-conforming shell such as the Korn Shell (see **ksh**(1)). In a shell that is not POSIX-conforming, such as the Bourne Shell (see **sh**(1)) and the C Shell (see **csh**(1)), the command must be enclosed within grave accent marks.

1. An example of compiling a program using transitional interfaces such as **lseek64()** and **fopen64()**:

```
$ c89 -D_LARGEFILE64_SOURCE \
$(getconf LFS64_CFLAGS) a.c \
$(getconf LFS64_LDFLAGS) \
$(getconf LFS64_LIBS)
```

2. An example of running lint on a program using transitional interfaces:

```
% lint -D_LARGEFILE64_SOURCE \
`getconf LFS64_LINTFLAGS` ... \
`getconf LFS64_LIBS`
```

|                          |   |
|--------------------------|---|
| <b>NAME</b>              | locale – subset of a user’s environment that depends on language and cultural conventions   |
| <b>DESCRIPTION</b>       | <p>A <i>locale</i> is the definition of the subset of a user’s environment that depends on language and cultural conventions. It is made up from one or more categories. Each category is identified by its name and controls specific aspects of the behavior of components of the system. Category names correspond to the following environment variable names:</p> <p><b>LC_CTYPE</b> Character classification and case conversion.<br/> <b>LC_COLLATE</b> Collation order.<br/> <b>LC_TIME</b> Date and time formats.<br/> <b>LC_NUMERIC</b> Numeric formatting.<br/> <b>LC_MONETARY</b> Monetary formatting.<br/> <b>LC_MESSAGES</b> Formats of informative and diagnostic messages and interactive responses.</p> <p>The standard utilities base their behavior on the current locale, as defined in the <b>ENVIRONMENT</b> section for each utility. The behavior of some of the C-language functions will also be modified based on the current locale, as defined by the last call to <b>setlocale(3C)</b>.</p> <p>Locales other than those supplied by the implementation can be created by the application via the <b>localedef(1)</b> utility. The value that is used to specify a locale when using environment variables will be the string specified as the <i>name</i> operand to <b>localedef</b> when the locale was created. The strings "C" and "POSIX" are reserved as identifiers for the POSIX locale.</p> <p>Applications can select the desired locale by invoking the <b>setlocale()</b> function with the appropriate value. If the function is invoked with an empty string, such as:</p> <pre style="text-align: center;"><b>setlocale(LC_ALL, "");</b></pre> <p>the value of the corresponding environment variable is used. If the environment variable is unset or is set to the empty string, the <b>setlocale()</b> function sets the appropriate environment.</p> |
| <b>Locale Definition</b> | <p>Locales can be described with the file format accepted by the <b>localedef</b> utility. The locale definition file must contain one or more locale category source definitions, and must not contain more than one definition for the same locale category.</p> <p>A category source definition consists of a category header, a category body and a category trailer. A category header consists of the character string naming of the category, beginning with the characters <b>LC_</b>. The category trailer consists of the string <b>END</b>, followed by one or more blank characters and the string used in the corresponding category header.</p> <p>The category body consists of one or more lines of text. Each line contains an identifier, optionally followed by one or more operands. Identifiers are either keywords, identifying a particular locale element, or collating elements. Each keyword within a locale must</p>   |

have a unique name (that is, two categories cannot have a commonly-named keyword); no keyword can start with the characters LC\_. Identifiers must be separated from the operands by one or more blank characters.

Operands must be characters, collating elements or strings of characters. Strings must be enclosed in double-quotes. Literal double-quotes within strings must be preceded by the *<escape character>*, described below. When a keyword is followed by more than one operand, the operands must be separated by semicolons; blank characters are allowed both before and after a semicolon.

The first category header in the file can be preceded by a line modifying the comment character. It has the following format, starting in column 1:

```
"comment_char %c\n",<comment character>
```

The comment character defaults to the number sign (#). Blank lines and lines containing the *<comment character>* in the first position are ignored.

The first category header in the file can be preceded by a line modifying the escape character to be used in the file. It has the following format, starting in column 1:

```
"escape_char %c\n",<escape character>
```

The escape character defaults to backslash.

A line can be continued by placing an escape character as the last character on the line; this continuation character will be discarded from the input. Although the implementation need not accept any one portion of a continued line with a length exceeding {LINE\_MAX} bytes, it places no limits on the accumulated length of the continued line. Comment lines cannot be continued on a subsequent line using an escaped newline character.

Individual characters, characters in strings, and collating elements must be represented using symbolic names, as defined below. In addition, characters can be represented using the characters themselves or as octal, hexadecimal or decimal constants. When non-symbolic notation is used, the resultant locale definitions will in many cases not be portable between systems. The left angle bracket (<) is a reserved symbol, denoting the start of a symbolic name; when used to represent itself it must be preceded by the escape character. The following rules apply to character representation:

1. A character can be represented via a symbolic name, enclosed within angle brackets < and >. The symbolic name, including the angle brackets, must exactly match a symbolic name defined in the charmap file specified via the **localedef -f** option, and will be replaced by a character value determined from the value associated with the symbolic name in the charmap file. The use of a symbolic name not found in the charmap file constitutes an error, unless the category is LC\_CTYPE or LC\_COLLATE, in which case it constitutes a warning condition (see **localedef(1)** for a description of action resulting from errors and warnings). The specification of a symbolic name in a **collating-element** or **collating-symbol** section that duplicates a symbolic name in the charmap file (if present) is an error. Use of the escape character or a right angle bracket within a symbolic name is invalid unless the character is preceded by the escape character.

**Example:**

```
<c>;<c-cedilla> "<M><a><y>"
```

2. A character can be represented by the character itself, in which case the value of the character is implementation-dependent. Within a string, the double-quote character, the escape character and the right angle bracket character must be escaped (preceded by the escape character) to be interpreted as the character itself. Outside strings, the characters

```
, ; < > escape_char
```

must be escaped to be interpreted as the character itself.

**Example:**

```
c β "May"
```

3. A character can be represented as an octal constant. An octal constant is specified as the escape character followed by two or more octal digits. Each constant represents a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

**Example:**

```
\143;\347;\143\150 "\115\141\171"
```

4. A character can be represented as a hexadecimal constant. A hexadecimal constant is specified as the escape character followed by an **x** followed by two or more hexadecimal digits. Each constant represents a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

**Example:**

```
\x63;\xe7;\x63\x68 "\x4d\x61\x79"
```

5. A character can be represented as a decimal constant. A decimal constant is specified as the escape character followed by a **d** followed by two or more decimal digits. Each constant represents a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

**Example:**

```
\d99;\d231;\d99\d104 "\d77\d97\d121"
```

Only characters existing in the character set for which the locale definition is created can be specified, whether using symbolic names, the characters themselves, or octal, decimal or hexadecimal constants. If a charmap file is present, only characters defined in the charmap can be specified using octal, decimal or hexadecimal constants. Symbolic names not present in the charmap file can be specified and will be ignored, as specified under item 1 above.

**LC\_CTYPE**

The **LC\_CTYPE** category defines character classification, case conversion and other character attributes. In addition, a series of characters can be represented by three adjacent periods representing an ellipsis symbol (. . .). The ellipsis specification is interpreted as meaning that all values between the values preceding and following it represent valid characters. The ellipsis specification is valid only within a single encoded character set; that is, within a group of characters of the same size. An ellipsis is interpreted as including in the list all characters with an encoded value higher than the encoded value of the character preceding the ellipsis and lower than the encoded value of the character following the ellipsis.

**Example:**

```
\x30;...;\x39;
```

includes in the character class all characters with encoded values between the endpoints.

The following keywords are recognized. In the descriptions, the term “automatically included” means that it is not an error either to include or omit any of the referenced characters.

The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included characters. These only need to be specified if the character values (that is, encoding) differ from the implementation default values.

**cswidth** Moved to **extensions** file (see **extensions(5)**).

**upper** Define characters to be classified as upper-case letters.

In the POSIX locale, the 26 upper-case letters are included:

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
```

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** can be specified. The upper-case letters **A** to **Z** are automatically included in this class.

**lower** Define characters to be classified as lower-case letters.

In the POSIX locale, the 26 lower-case letters are included:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
```

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** can be specified. The lower-case letters **a** to **z** of the portable character set are automatically included in this class.

**alpha** Define characters to be classified as letters.

In the POSIX locale, all characters in the classes **upper** and **lower** are included. In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** can be specified. Characters classified as either **upper** or **lower** are automatically included in this class.

**digit** Define the characters to be classified as numeric digits.

In the POSIX locale, only

0 1 2 3 4 5 6 7 8 9

are included.

In a locale definition file, only the digits **0**, **1**, **2**, **3**, **4**, **5**, **6**, **7**, **8**, and **9** can be specified, and in contiguous ascending sequence by numerical value. The digits **0** to **9** of the portable character set are automatically included in this class.

The definition of character class **digit** requires that only ten characters; the ones defining digits can be specified; alternative digits (for example, Hindi or Kanji) cannot be specified here.

**space**

Define characters to be classified as white-space characters.

In the POSIX locale, at a minimum, the characters SPACE, FORMFEED, NEWLINE, CARRIAGE RETURN, TAB, and VERTICAL TAB are included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **graph**, or **xdigit** can be specified. The characters SPACE, FORMFEED, NEWLINE, CARRIAGE RETURN, TAB, and VERTICAL TAB of the portable character set, and any characters included in the class **blank** are automatically included in this class.

**cntrl**

Define characters to be classified as control characters.

In the POSIX locale, no characters in classes **alpha** or **print** are included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **punct**, **graph**, **print**, or **xdigit** can be specified.

**punct**

Define characters to be classified as punctuation characters.

In the POSIX locale, neither the space character nor any characters in classes **alpha**, **digit**, or **cntrl** are included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **cntrl**, **xdigit** or as the space character can be specified.

**graph**

Define characters to be classified as printable characters, not including the space character.

In the POSIX locale, all characters in classes **alpha**, **digit**, and **punct** are included; no characters in class **cntrl** are included.

In a locale definition file, characters specified for the keywords **upper**, **lower**, **alpha**, **digit**, **xdigit**, and **punct** are automatically included in this class. No character specified for the keyword **cntrl** can be specified.

**print**

Define characters to be classified as printable characters, including the space character.

In the POSIX locale, all characters in class **graph** are included; no characters in class **cntrl** are included.

In a locale definition file, characters specified for the keywords **upper**, **lower**, **alpha**, **digit**, **xdigit**, **punct**, and the space character are automatically included in this class. No character specified for the keyword **cntrl** can be specified.

- xdigit** Define the characters to be classified as hexadecimal digits.  
 In the POSIX locale, only:  
 0 1 2 3 4 5 6 7 8 9 A B C D E F a b c d e f  
 are included.  
 In a locale definition file, only the characters defined for the class **digit** can be specified, in contiguous ascending sequence by numerical value, followed by one or more sets of six characters representing the hexadecimal digits 10 to 15 inclusive, with each set in ascending order (for example **A, B, C, D, E, F, a, b, c, d, e, f**). The digits **0** to **9**, the upper-case letters **A** to **F** and the lower-case letters **a** to **f** of the portable character set are automatically included in this class.  
 The definition of character class **xdigit** requires that the characters included in character class **digit** be included here also.
- blank** Define characters to be classified as blank characters.  
 In the POSIX locale, only the space and tab characters are included.  
 In a locale definition file, the characters space and tab are automatically included in this class.
- charclass** Define one or more locale-specific character class names as strings separated by semi-colons. Each named character class can then be defined subsequently in the **LC\_CTYPE** definition. A character class name consists of at least one and at most **{CHARCLASS\_NAME\_MAX}** bytes of alphanumeric characters from the portable filename character set. The first character of a character class name cannot be a digit. The name cannot match any of the **LC\_CTYPE** keywords defined in this document.
- charclass-name**  
 Define characters to be classified as belonging to the named locale-specific character class. In the POSIX locale, the locale-specific named character classes need not exist.  
 If a class name is defined by a **charclass** keyword, but no characters are subsequently assigned to it, this is not an error; it represents a class without any characters belonging to it.  
 The **charclass-name** can be used as the *property* argument to the **wctype(3C)** function, in regular expression and shell pattern-matching bracket expressions, and by the **tr(1)** command.
- toupper** Define the mapping of lower-case letters to upper-case letters.  
 In the POSIX locale, at a minimum, the 26 lower-case characters:  
 a b c d e f g h i j k l m n o p q r s t u v w x y z  
 are mapped to the corresponding 26 upper-case characters:

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

In a locale definition file, the operand consists of character pairs, separated by semicolons. The characters in each character pair are separated by a comma and the pair enclosed by parentheses. The first character in each pair is the lower-case letter, the second the corresponding upper-case letter. Only characters specified for the keywords **lower** and **upper** can be specified. The lower-case letters **a** to **z**, and their corresponding upper-case letters **A** to **Z**, of the portable character set are automatically included in this mapping, but only when the **toupper** keyword is omitted from the locale definition.

**tolower** Define the mapping of upper-case letters to lower-case letters. In the POSIX locale, at a minimum, the 26 upper-case characters

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

are mapped to the corresponding 26 lower-case characters:

a b c d e f g h i j k l m n o p q r s t u v w x y z

In a locale definition file, the operand consists of character pairs, separated by semicolons. The characters in each character pair are separated by a comma and the pair enclosed by parentheses. The first character in each pair is the upper-case letter, the second the corresponding lower-case letter. Only characters specified for the keywords **lower** and **upper** can be specified. If the **tolower** keyword is omitted from the locale definition, the mapping will be the reverse mapping of the one specified for **toupper**.

**LC\_COLLATE**

The **LC\_COLLATE** category provides a collation sequence definition for numerous utilities (such as **sort(1)**, **uniq(1)**, and so forth), regular expression matching (see **regex(5)**), and the **strcoll(3C)**, **strxfrm(3C)**, **wcscoll(3C)**, and **wcsxfrm(3C)** functions.

A collation sequence definition defines the relative order between collating elements (characters and multi-character collating elements) in the locale. This order is expressed in terms of collation values; that is, by assigning each element one or more collation values (also known as collation weights). At least the following capabilities are provided:

1. **Multi-character collating elements.** Specification of multi-character collating elements (that is, sequences of two or more characters to be collated as an entity).
2. **User-defined ordering of collating elements.** Each collating element is assigned a collation value defining its order in the character (or basic) collation sequence. This ordering is used by regular expressions and pattern matching and, unless collation weights are explicitly specified, also as the collation weight to be used in sorting.
3. **Multiple weights and equivalence classes.** Collating elements can be assigned one or more (up to the limit {**COLL\_WEIGHTS\_MAX**}) collating weights for use in sorting. The first weight is hereafter referred to as the primary weight.
4. **One-to-Many mapping.** A single character is mapped into a string of collating elements.
5. **Equivalence class definition.** Two or more collating elements have the same

collation value (primary weight).

6. **Ordering by weights.** When two strings are compared to determine their relative order, the two strings are first broken up into a series of collating elements; the elements in each successive pair of elements are then compared according to the relative primary weights for the elements. If equal, and more than one weight has been assigned, then the pairs of collating elements are recompared according to the relative subsequent weights, until either a pair of collating elements compare unequal or the weights are exhausted.

The following keywords are recognized in a collation sequence definition. They are described in detail in the following sections.

|                          |   |
|--------------------------|---|
| <b>collating-element</b> | Define a collating-element symbol representing a multi-character collating element. This keyword is optional.   |
| <b>collating-symbol</b>  | Define a collating symbol for use in collation order statements. This keyword is optional.  |
| <b>order_start</b>       | Define collation rules. This statement is followed by one or more collation order statements, assigning character collation values and collation weights to collating elements. |
| <b>order_end</b>         | Specify the end of the collation-order statements.  |

**collating-element**  
keyword

In addition to the collating elements in the character set, the **collating-element** keyword is used to define multi-character collating elements. The syntax is:

```
"collating-element %s from \"%s\"\\n", <collating-symbol>, <string>
```

The *<collating-symbol>* operand is a symbolic name, enclosed between angle brackets (< and >), and must not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. The string operand is a string of two or more characters that collates as an entity. A *<collating-element>* defined via this keyword is only recognized with the LC\_COLLATE category.

**Example:**

```
collating-element <ch> from "<c><h>"
collating-element <e-acute> from "<acute><e>"
collating-element <ll> from "ll"
```

**collating-symbol**  
keyword

This keyword will be used to define symbols for use in collation sequence statements; that is, between the **order\_start** and the **order\_end** keywords. The syntax is:

```
"collating-symbol %s\\n", <collating-symbol>
```

The *<collating-symbol>* is a symbolic name, enclosed between angle brackets (< and >), and must not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition.

A **collating-symbol** defined via this keyword is only recognized with the LC\_COLLATE category.

**order\_start** keyword

**Example:**

```
collating-symbol <UPPER_CASE>
collating-symbol <HIGH>
```

The **collating-symbol** keyword defines a symbolic name that can be associated with a relative position in the character order sequence. While such a symbolic name does not represent any collating element, it can be used as a weight.

The **order\_start** keyword must precede collation order entries and also defines the number of weights for this collation sequence definition and other collation rules.

The syntax of the **order\_start** keyword is:

```
"order_start %s;%s;..;%s\n", <sort-rules>, <sort-rules>
```

The operands to the **order\_start** keyword are optional. If present, the operands define rules to be applied when strings are compared. The number of operands define how many weights each element is assigned; if no operands are present, one **forward** operand is assumed. If present, the first operand defines rules to be applied when comparing strings using the first (primary) weight; the second when comparing strings using the second weight, and so on. Operands are separated by semicolons (;). Each operand consists of one or more collation directives, separated by commas (,). If the number of operands exceeds the {COLL\_WEIGHTS\_MAX} limit, the utility will issue a warning message. The following directives will be supported:

- forward** Specifies that comparison operations for the weight level proceed from start of string towards the end of string.
- backward** Specifies that comparison operations for the weight level proceed from end of string towards the beginning of string.
- position** Specifies that comparison operations for the weight level will consider the relative position of elements in the strings not subject to **IGNORE**. The string containing an element not subject to **IGNORE** after the fewest collating elements subject to **IGNORE** from the start of the compare will collate first. If both strings contain a character not subject to **IGNORE** in the same relative position, the collating values assigned to the elements will determine the ordering. In case of equality, subsequent characters not subject to **IGNORE** are considered in the same manner.

The directives **forward** and **backward** are mutually exclusive.

**Example:**

```
order_start forward;backward
```

If no operands are specified, a single **forward** operand is assumed.

The character (and collating element) order is defined by the order in which characters and elements are specified between the **order\_start** and **order\_end** keywords. This character order is used in range expressions in regular expressions (see **regex(5)**). Weights assigned to the characters and elements define the collation sequence; in the absence of

weights, the character order is also the collation sequence.

The **position** keyword provides the capability to consider, in a compare, the relative position of characters not subject to **IGNORE**. As an example, consider the two strings “o-ring” and “or-ing”. Assuming the hyphen is subject to **IGNORE** on the first pass, the two strings will compare equal, and the position of the hyphen is immaterial. On second pass, all characters except the hyphen are subject to **IGNORE**, and in the normal case the two strings would again compare equal. By taking position into account, the first collates before the second.

#### Collation Order

The **order\_start** keyword is followed by collating identifier entries. The syntax for the collating element entries is

```
"%s %s;%s;...;%s\n"<collating-identifier>,<weight>,<weight>,...
```

Each *collating-identifier* consists of either a character described in **Locale Definition** above, a *collating-element*, a *collating-symbol*, an ellipsis, or the special symbol **UNDEFINED**. The order in which collating elements are specified determines the character order sequence, such that each collating element compares less than the elements following it. The NUL character compares lower than any other character.

A *collating-element* is used to specify multi-character collating elements, and indicates that the character sequence specified via the *collating-element* is to be collated as a unit and in the relative order specified by its place.

A *collating-symbol* is used to define a position in the relative order for use in weights. No weights are specified with a *collating-symbol*.

The ellipsis symbol specifies that a sequence of characters will collate according to their encoded character values. It is interpreted as indicating that all characters with a coded character set value higher than the value of the character in the preceding line, and lower than the coded character set value for the character in the following line, in the current coded character set, will be placed in the character collation order between the previous and the following character in ascending order according to their coded character set values. An initial ellipsis is interpreted as if the preceding line specified the NUL character, and a trailing ellipsis as if the following line specified the highest coded character set value in the current coded character set. An ellipsis is treated as invalid if the preceding or following lines do not specify characters in the current coded character set.

The symbol **UNDEFINED** is interpreted as including all coded character set values not specified explicitly or via the ellipsis symbol. Such characters are inserted in the character collation order at the point indicated by the symbol, and in ascending order according to their coded character set values. If no **UNDEFINED** symbol is specified, and the current coded character set contains characters not specified in this section, the utility will issue a warning message and place such characters at the end of the character collation order.

The optional operands for each collation-element are used to define the primary, secondary, or subsequent weights for the collating element. The first operand specifies the relative primary weight, the second the relative secondary weight, and so on. Two or more collation-elements can be assigned the same weight; they belong to the same

*equivalence class* if they have the same primary weight. Collation behaves as if, for each weight level, elements subject to **IGNORE** are removed, unless the **position** collation directive is specified for the corresponding level with the **order\_start** keyword. Then each successive pair of elements is compared according to the relative weights for the elements. If the two strings compare equal, the process is repeated for the next weight level, up to the limit {**COLL\_WEIGHTS\_MAX**}.

Weights are expressed as characters described in **Locale Definition** above, *<collating-symbol>*s, *<collating-element>*s, an ellipsis, or the special symbol **IGNORE**. A single character, a *<collating-symbol>* or a *<collating-element>* represent the relative position in the character collating sequence of the character or symbol, rather than the character or characters themselves. Thus, rather than assigning absolute values to weights, a particular weight is expressed using the relative order value assigned to a collating element based on its order in the character collation sequence.

One-to-many mapping is indicated by specifying two or more concatenated characters or symbolic names. For example, if the character **<eszet>** is given the string "**<s><s>**" as a weight, comparisons are performed as if all occurrences of the character **<eszet>** are replaced by **<s><s>** (assuming that **<s>** has the collating weight **<s>**). If it is necessary to define **<eszet>** and **<s><s>** as an equivalence class, then a collating element must be defined for the string **ss**.

All characters specified via an ellipsis will by default be assigned unique weights, equal to the relative order of characters. Characters specified via an explicit or implicit **UNDEFINED** special symbol will by default be assigned the same primary weight (that is, belong to the same equivalence class). An ellipsis symbol as a weight is interpreted to mean that each character in the sequence has unique weights, equal to the relative order of their character in the character collation sequence. The use of the ellipsis as a weight is treated as an error if the collating element is neither an ellipsis nor the special symbol **UNDEFINED**.

The special keyword **IGNORE** as a weight indicates that when strings are compared using the weights at the level where **IGNORE** is specified, the collating element is ignored; that is, as if the string did not contain the collating element. In regular expressions and pattern matching, all characters that are subject to **IGNORE** in their primary weight form an equivalence class.

An empty operand is interpreted as the collating element itself.

For example, the order statement:

**<a>**    **<a>;<a>**

is equal to:

**<a>**

An ellipsis can be used as an operand if the collating element was an ellipsis, and is interpreted as the value of each character defined by the ellipsis.

The collation order as defined in this section defines the interpretation of bracket expressions in regular expressions.

**Example:**

```

order_start    forward;backward
UNDEFINED    IGNORE;IGNORE
<LOW>
<space>        <LOW>;<space>
...            <LOW>;...
<a>            <a>;<a>
<a-acute>      <a>;<a-acute>
<a-grave>      <a>;<a-grave>
<A>            <a>;<A>
<A-acute>      <a>;<A-acute>
<A-grave>      <a>;<A-grave>
<ch>           <ch>;<ch>
<Ch>           <ch>;<Ch>
<s>            <s>;<s>
<eszet>       "<s><s>";"<eszet><eszet>"
order_end

```

This example is interpreted as follows:

1. The **UNDEFINED** means that all characters not specified in this definition (explicitly or via the ellipsis) are ignored for collation purposes; for regular expression purposes they are ordered first.
2. All characters between **<space>** and **<a>** have the same primary equivalence class and individual secondary weights based on their ordinal encoded values.
3. All characters based on the upper- or lower-case character **a** belong to the same primary equivalence class.
4. The multi-character collating element **<ch>** is represented by the collating symbol **<ch>** and belongs to the same primary equivalence class as the multi-character collating element **<Ch>**.

**order\_end** keyword

The collating order entries must be terminated with an **order\_end** keyword.

**LC\_MONETARY**

The **LC\_MONETARY** category defines the rules and symbols that are used to format monetary numeric information. This information is available through the **localeconv(3C)** function

The following items are defined in this category of the locale. The item names are the keywords recognized by the **localedef(1)** utility when defining a locale. They are also similar to the member names of the **lconv** structure defined in **<locale.h>**. The **localeconv** function returns **{CHAR\_MAX}** for unspecified integer items and the empty string ("") for unspecified or size zero string items.

In a locale definition file the operands are strings. For some keywords, the strings can contain only integers. Keywords that are not provided, string values set to the empty string (""), or integer keywords set to **-1**, are used to indicate that the value is not available in the locale.

|                          |   |
|--------------------------|---|
| <b>int_curr_symbol</b>   | The international currency symbol. The operand is a four-character string, with the first three characters containing the alphabetic international currency symbol in accordance with those specified in the ISO 4217:1987 standard. The fourth character is the character used to separate the international currency symbol from the monetary quantity.   |
| <b>currency_symbol</b>   | The string used as the local currency symbol.   |
| <b>mon_decimal_point</b> | The operand is a string containing the symbol that is used as the decimal delimiter (radix character) in monetary formatted quantities. In contexts where standards (such as the ISO C standard) limit the <b>mon_decimal_point</b> to a single byte, the result of specifying a multi-byte operand is unspecified.   |
| <b>mon_thousands_sep</b> | The operand is a string containing the symbol that is used as a separator for groups of digits to the left of the decimal delimiter in formatted monetary quantities. In contexts where standards limit the <b>mon_thousands_sep</b> to a single byte, the result of specifying a multi-byte operand is unspecified.  |
| <b>mon_grouping</b>      | <p>Define the size of each group of digits in formatted monetary quantities. The operand is a sequence of integers separated by semicolons. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not -1, then the size of the previous group (if any) will be repeatedly used for the remainder of the digits. If the last integer is -1, then no further grouping will be performed.</p> <p>The following is an example of the interpretation of the <b>mon_grouping</b> keyword. Assuming that the value to be formatted is <b>123456789</b> and the <b>mon_thousands_sep</b> is <b>'</b>, then the following table shows the result. The third column shows the equivalent string in the ISO C standard that would be used by the <b>localeconv</b> function to accommodate this grouping.</p> |

| <b>mon_grouping</b> | <b>Formatted Value</b> | <b>ISO C String</b> |
|---------------------|------------------------|---------------------|
| 3;-1                | 123456'789             | "\3\177"            |
| 3                   | 123'456'789            | "\3"                |
| 3;2;-1              | 1234'56'789            | "\3\2\177"          |
| 3;2                 | 12'34'56'789           | "\3\2"              |
| -1                  | 123456789              | "\177"              |

In these examples, the octal value of `{CHAR_MAX}` is 177.

|                        |  |
|------------------------|--|
| <b>positive_sign</b>   | A string used to indicate a non-negative-valued formatted monetary quantity.   |
| <b>negative_sign</b>   | A string used to indicate a negative-valued formatted monetary quantity.   |
| <b>int_frac_digits</b> | An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using <b>int_curr_symbol</b> .  |
| <b>frac_digits</b>     | An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using <b>currency_symbol</b> .  |
| <b>p_cs_precedes</b>   | An integer set to 1 if the <b>currency_symbol</b> or <b>int_curr_symbol</b> precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.   |
| <b>p_sep_by_space</b>  | An integer set to 0 if no space separates the <b>currency_symbol</b> or <b>int_curr_symbol</b> from the value for a monetary quantity with a non-negative value, set to 1 if a space separates the symbol from the value, and set to 2 if a space separates the symbol and the sign string, if adjacent.   |
| <b>n_cs_precedes</b>   | An integer set to 1 if the <b>currency_symbol</b> or <b>int_curr_symbol</b> precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.   |
| <b>n_sep_by_space</b>  | An integer set to 0 if no space separates the <b>currency_symbol</b> or <b>int_curr_symbol</b> from the value for a monetary quantity with a negative value, set to 1 if a space separates the symbol from the value, and set to 2 if a space separates the symbol and the sign string, if adjacent.   |
| <b>p_sign_posn</b>     | An integer set to a value indicating the positioning of the <b>positive_sign</b> for a monetary quantity with a non-negative value. The following integer values are recognized for both <b>p_sign_posn</b> and <b>n_sign_posn</b> : <ul style="list-style-type: none"> <li><b>0</b> Parentheses enclose the quantity and the <b>currency_symbol</b> or <b>int_curr_symbol</b>.</li> <li><b>1</b> The sign string precedes the quantity and the <b>currency_symbol</b> or <b>int_curr_symbol</b>.</li> </ul> |

- 2 The sign string succeeds the quantity and the **currency\_symbol** or **int\_curr\_symbol**.
- 3 The sign string precedes the **currency\_symbol** or **int\_curr\_symbol**.
- 4 The sign string succeeds the **currency\_symbol** or **int\_curr\_symbol**.

**n\_sign\_posn** An integer set to a value indicating the positioning of the **negative\_sign** for a negative formatted monetary quantity.

The following table shows the result of various combinations:

|                          |                        | <b>p_sep_by_space</b> |           |          |
|--------------------------|------------------------|-----------------------|-----------|----------|
|                          |                        | 2                     | 1         | 0        |
| <b>p_cs_precedes = 1</b> | <b>p_sign_posn = 0</b> | (\$1.25)              | (\$ 1.25) | (\$1.25) |
|                          | <b>p_sign_posn = 1</b> | +\$1.25               | +\$ 1.25  | +\$1.25  |
|                          | <b>p_sign_posn = 2</b> | \$1.25 +              | \$ 1.25+  | \$1.25+  |
|                          | <b>p_sign_posn = 3</b> | +\$1.25               | +\$ 1.25  | +\$1.25  |
|                          | <b>p_sign_posn = 4</b> | \$ +1.25              | \$+ 1.25  | \$+1.25  |
| <b>p_cs_precedes = 0</b> | <b>p_sign_posn = 0</b> | (1.25 \$)             | (1.25 \$) | (1.25\$) |

```

```

n_sign_posn      -1
#
END LC_MONETARY

```

The entry **n/a** indicates that the value is not available in the POSIX locale.

## LC\_NUMERIC

The **LC\_NUMERIC** category defines the rules and symbols that will be used to format non-monetary numeric information. This information is available through the **localeconv(3C)** function.

The following items are defined in this category of the locale. The item names are the keywords recognized by the **localedef** utility when defining a locale. They are also similar to the member names of the *lconv* structure defined in `<locale.h>`. The **localeconv()** function returns `{CHAR_MAX}` for unspecified integer items and the empty string (`""`) for unspecified or size zero string items.

In a locale definition file the operands are strings. For some keywords, the strings only can contain integers. Keywords that are not provided, string values set to the empty string (`""`), or integer keywords set to `-1`, will be used to indicate that the value is not available in the locale. The following keywords are recognized:

|                      |  |
|----------------------|--|
| <b>decimal_point</b> | The operand is a string containing the symbol that is used as the decimal delimiter (radix character) in numeric, non-monetary formatted quantities. This keyword cannot be omitted and cannot be set to the empty string. In contexts where standards limit the <b>decimal_point</b> to a single byte, the result of specifying a multi-byte operand is unspecified.  |
| <b>thousands_sep</b> | The operand is a string containing the symbol that is used as a separator for groups of digits to the left of the decimal delimiter in numeric, non-monetary formatted monetary quantities. In contexts where standards limit the <b>thousands_sep</b> to a single byte, the result of specifying a multi-byte operand is unspecified.   |
| <b>grouping</b>      | Define the size of each group of digits in formatted non-monetary quantities. The operand is a sequence of integers separated by semicolons. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not <code>-1</code> , then the size of the previous group (if any) will be repeatedly used for the remainder of the digits. If the last integer is <code>-1</code> , then no further grouping will be performed. |

The non-monetary numeric formatting definitions for the POSIX locale follow; the code listing depicting the **localedef** input, the table representing the same information with the addition of **localeconv** values and **nl\_langinfo** constants.

```

LC_NUMERIC
# This is the POSIX locale definition for
# the LC_NUMERIC category.

```

```
#
decimal_point    "<period>"
thousands_sep   ""
grouping         -1
#
END LC_NUMERIC
```

| Item                 | POSIX locale Value | langinfo Constant | localeconv() Value | localedef Value |
|----------------------|--------------------|-------------------|--------------------|-----------------|
| <b>decimal_point</b> | ","                | <b>RADIXCHAR</b>  | ","                | .               |
| <b>thousands_sep</b> | n/a                | <b>THOUSEP</b>    | ""                 | ""              |
| <b>grouping</b>      | n/a                | -                 | ""                 | -1              |

The entry **n/a** indicates that the value is not available in the POSIX locale.

**LC\_TIME**

The **LC\_TIME** category defines the interpretation of the field descriptors supported by **date(1)** and affects the behavior of the **strftime(3C)**, **wcsftime(3C)**, **strptime(3C)**, and **nl\_langinfo(3C)** functions. Because the interfaces for C-language access and locale definition differ significantly, they are described separately.

For locale definition, the following mandatory keywords are recognized:

- abday** Define the abbreviated weekday names, corresponding to the **%a** field descriptor (conversion specification in the **strftime()**, **wcsftime()**, and **strptime()** functions). The operand consists of seven semicolon-separated strings, each surrounded by double-quotes. The first string is the abbreviated name of the day corresponding to Sunday, the second the abbreviated name of the day corresponding to Monday, and so on.
- day** Define the full weekday names, corresponding to the **%A** field descriptor. The operand consists of seven semicolon-separated strings, each surrounded by double-quotes. The first string is the full name of the day corresponding to Sunday, the second the full name of the day corresponding to Monday, and so on.
- abmon** Define the abbreviated month names, corresponding to the **%b** field descriptor. The operand consists of twelve semicolon-separated strings, each surrounded by double-quotes. The first string is the abbreviated name of the first month of the year (January), the second the abbreviated name of the second month, and so on.
- mon** Define the full month names, corresponding to the **%B** field descriptor. The operand consists of twelve semicolon-separated strings, each surrounded by double-quotes. The first string is the full name of the first month of the year (January), the second the full name of the second month, and so on.
- d\_t\_fmt** Define the appropriate date and time representation, corresponding to the **%c** field descriptor. The operand consists of a string, and can contain any combination of characters and field descriptors. In addition, the

|                   |   |
|-------------------|---|
|                   | string can contain the escape sequences <code>\\</code> , <code>\a</code> , <code>\b</code> , <code>\f</code> , <code>\n</code> , <code>\r</code> , <code>\t</code> , <code>\v</code> .   |
| <b>date_fmt</b>   | Define the appropriate date and time representation, corresponding to the <code>%C</code> field descriptor. The operand consists of a string, and can contain any combination of characters and field descriptors. In addition, the string can contain the escape sequences <code>\\</code> , <code>\a</code> , <code>\b</code> , <code>\f</code> , <code>\n</code> , <code>\r</code> , <code>\t</code> , <code>\v</code> .   |
| <b>d_fmt</b>      | Define the appropriate date representation, corresponding to the <code>%x</code> field descriptor. The operand consists of a string, and can contain any combination of characters and field descriptors. In addition, the string can contain the escape sequences <code>\\</code> , <code>\a</code> , <code>\b</code> , <code>\f</code> , <code>\n</code> , <code>\r</code> , <code>\t</code> , <code>\v</code> .  |
| <b>t_fmt</b>      | Define the appropriate time representation, corresponding to the <code>%X</code> field descriptor. The operand consists of a string, and can contain any combination of characters and field descriptors. In addition, the string can contain the escape sequences <code>\\</code> , <code>\a</code> , <code>\b</code> , <code>\f</code> , <code>\n</code> , <code>\r</code> , <code>\t</code> , <code>\v</code> .  |
| <b>am_pm</b>      | Define the appropriate representation of the <i>ante meridiem</i> and <i>post meridiem</i> strings, corresponding to the <code>%p</code> field descriptor. The operand consists of two strings, separated by a semicolon, each surrounded by double-quotes. The first string represents the <i>ante meridiem</i> designation, the last string the <i>post meridiem</i> designation.   |
| <b>t_fmt_ampm</b> | Define the appropriate time representation in the 12-hour clock format with <b>am_pm</b> , corresponding to the <code>%r</code> field descriptor. The operand consists of a string and can contain any combination of characters and field descriptors. If the string is empty, the 12-hour format is not supported in the locale.  |
| <b>era</b>        | <p>Define how years are counted and displayed for each era in a locale. The operand consists of semicolon-separated strings. Each string is an era description segment with the format:</p> <p><i>direction:offset:start_date:end_date:era_name:era_format</i></p> <p>according to the definitions below. There can be as many era description segments as are necessary to describe the different eras.</p> <p>The start of an era might not be the earliest point. For example, the Christian era B.C. starts on the day before January 1, A.D. 1, and increases with earlier time.</p> <p><i>direction</i>      Either a + or a - character. The + character indicates that years closer to the <i>start_date</i> have lower numbers than those closer to the <i>end_date</i>. The - character indicates that years closer to the <i>start_date</i> have higher numbers than those closer to the <i>end_date</i>.</p> <p><i>offset</i>          The number of the year closest to the <i>start_date</i> in the era, corresponding to the <code>%Ey</code> field descriptor.</p> <p><i>start_date</i>      A date in the form <i>yyyy/mm/dd</i>, where <i>yyyy</i>, <i>mm</i>, and <i>dd</i> are the year, month and day numbers respectively of the start of the era. Years prior to A.D. 1 are represented as</p> |

|                    |                   |  |
|--------------------|-------------------|--|
|                    |                   | negative numbers.  |
|                    | <i>end_date</i>   | The ending date of the era, in the same format as the <i>start_date</i> , or one of the two special values <i>–*</i> or <i>+*</i> . The value <i>–*</i> indicates that the ending date is the beginning of time. The value <i>+*</i> indicates that the ending date is the end of time.  |
|                    | <i>era_name</i>   | A string representing the name of the era, corresponding to the <b>%EC</b> field descriptor.   |
|                    | <i>era_format</i> | A string for formatting the year in the era, corresponding to the <b>%EY</b> field descriptor.   |
| <b>era_d_fmt</b>   |                   | Define the format of the date in alternative era notation, corresponding to the <b>%Ex</b> field descriptor.   |
| <b>era_t_fmt</b>   |                   | Define the locale's appropriate alternative time format, corresponding to the <b>%EX</b> field descriptor.   |
| <b>era_d_t_fmt</b> |                   | Define the locale's appropriate alternative date and time format, corresponding to the <b>%Ec</b> field descriptor.  |
| <b>alt_digits</b>  |                   | Define alternative symbols for digits, corresponding to the <b>%O</b> field descriptor modifier. The operand consists of semicolon-separated strings, each surrounded by double-quotes. The first string is the alternative symbol corresponding with zero, the second string the symbol corresponding with one, and so on. Up to 100 alternative symbol strings can be specified. The <b>%O</b> modifier indicates that the string corresponding to the value specified via the field descriptor will be used instead of the value. |

**LC\_TIME** *C-language Access*

The following information can be accessed. These correspond to constants defined in **<langinfo.h>** and used as arguments to the **nl\_langinfo(3C)** function.

|                |  |
|----------------|--|
| <b>ABDAY_x</b> | The abbreviated weekday names (for example Sun), where <i>x</i> is a number from 1 to 7. |
| <b>DAY_x</b>   | The full weekday names (for example Sunday), where <i>x</i> is a number from 1 to 7.     |
| <b>ABMON_x</b> | The abbreviated month names (for example Jan), where <i>x</i> is a number from 1 to 12.  |
| <b>MON_x</b>   | The full month names (for example January), where <i>x</i> is a number from 1 to 12.     |
| <b>D_T_FMT</b> | The appropriate date and time representation.  |
| <b>D_FMT</b>   | The appropriate date representation.   |
| <b>T_FMT</b>   | The appropriate time representation.   |
| <b>AM_STR</b>  | The appropriate ante-meridiem affix.   |
| <b>PM_STR</b>  | The appropriate post-meridiem affix.   |

|                    |  |
|--------------------|--|
| <b>T_FMT_AMPM</b>  | The appropriate time representation in the 12-hour clock format with <b>AM_STR</b> and <b>PM_STR</b> .   |
| <b>ERA</b>         | <p>The era description segments, which describe how years are counted and displayed for each era in a locale. Each era description segment has the format:</p> <p><i>direction:offset:start_date:end_date:era_name:era_format</i></p> <p>according to the definitions below. There will be as many era description segments as are necessary to describe the different eras. Era description segments are separated by semicolons.</p> <p>The start of an era might not be the earliest point. For example, the Christian era B.C. starts on the day before January 1, A.D. 1, and increases with earlier time.</p> <p><i>direction</i>      Either a + or a – character. The + character indicates that years closer to the <i>start_date</i> have lower numbers than those closer to the <i>end_date</i>. The – character indicates that years closer to the <i>start_date</i> have higher numbers than those closer to the <i>end_date</i>.</p> <p><i>offset</i>          The number of the year closest to the <i>start_date</i> in the era.</p> <p><i>start_date</i>      A date in the form <i>yyyy/mm/dd</i>, where <i>yyyy</i>, <i>mm</i>, and <i>dd</i> are the year, month and day numbers respectively of the start of the era. Years prior to AD 1 are represented as negative numbers.</p> <p><i>end_date</i>        The ending date of the era, in the same format as the <i>start_date</i>, or one of the two special values <i>–*</i> or <i>+*</i>. The value <i>–*</i> indicates that the ending date is the beginning of time. The value <i>+*</i> indicates that the ending date is the end of time.</p> <p><i>era_name</i>        The era, corresponding to the <b>%EC</b> conversion specification.</p> <p><i>era_format</i>     The format of the year in the era, corresponding to the <b>%EY</b> conversion specification.</p> |
| <b>ERA_D_FMT</b>   | The era date format.   |
| <b>ERA_T_FMT</b>   | The locale's appropriate alternative time format, corresponding to the <b>%EX</b> field descriptor.  |
| <b>ERA_D_T_FMT</b> | The locale's appropriate alternative date and time format, corresponding to the <b>%Ec</b> field descriptor.   |
| <b>ALT_DIGITS</b>  | The alternative symbols for digits, corresponding to the <b>%O</b> conversion specification modifier. The value consists of semicolon-separated symbols. The first is the alternative symbol corresponding to zero, the second is the symbol corresponding to one, and so on. Up to 100 alternative symbols may be specified.  |

The following table displays the correspondence between the items described above and the conversion specifiers used by `date(1)` and the `strftime(3C)`, `wcsftime(3C)`, and `strptime(3C)` functions.

| localedef Keyword  | langinfo Constant | Conversion Specifier |
|--------------------|-------------------|----------------------|
| <b>abday</b>       | ABDAY_x           | %a                   |
| <b>day</b>         | DAY_x             | %A                   |
| <b>abmon</b>       | ABMON_x           | %b                   |
| <b>mon</b>         | MON               | %B                   |
| <b>d_t_fmt</b>     | D_T_FMT           | %c                   |
| <b>date_fmt</b>    | DATE_FMT          | %C                   |
| <b>d_fmt</b>       | D_FMT             | %x                   |
| <b>t_fmt</b>       | T_FMT             | %X                   |
| <b>am_pm</b>       | AM_STR            | %p                   |
| <b>am_pm</b>       | PM_STR            | %p                   |
| <b>t_fmt_ampm</b>  | T_FMT_AMPM        | %r                   |
| <b>era</b>         | ERA               | %EC, %Ey, %EY        |
| <b>era_d_fmt</b>   | ERA_D_FMT         | %Ex                  |
| <b>era_t_fmt</b>   | ERA_T_FMT         | %EX                  |
| <b>era_d_t_fmt</b> | ERA_D_T_FMT       | %Ec                  |
| <b>alt_digits</b>  | ALT_DIGITS        | %O                   |

**LC\_TIME** *General Information*

Although certain of the field descriptors in the POSIX locale (such as the name of the month) are shown with initial capital letters, this need not be the case in other locales. Programs using these fields may need to adjust the capitalization if the output is going to be used at the beginning of a sentence.

The **LC\_TIME** descriptions of **abday**, **day**, **mon**, and **abmon** imply a Gregorian style calendar (7-day weeks, 12-month years, leap years, and so forth). Formatting time strings for other types of calendars is outside the scope of this document set.

As specified under **date** in **Locale Definition** and `strftime(3C)`, the field descriptors corresponding to the optional keywords consist of a modifier followed by a traditional field descriptor (for instance %Ex). If the optional keywords are not supported by the implementation or are unspecified for the current locale, these field descriptors are treated as the traditional field descriptor. For instance, assume the following keywords:

```
alt_digits    "0th";"1st";"2nd";"3rd";"4th";"5th";\
              "6th";"7th";"8th";"9th";"10th"
d_fmt        "The %Od day of %B in %Y"
```

On 7/4/1776, the %x field descriptor would result in “The 4th day of July in 1776” while 7/14/1789 would come out as “The 14 day of July in 1789” It can be noted that the above example is for illustrative purposes only; the %O modifier is primarily intended to provide for Kanji or Hindi digits in **date** formats.

**LC\_MESSAGES**

The **LC\_MESSAGES** category defines the format and values for affirmative and negative responses.

The following keywords are recognized as part of the locale definition file. The **nl\_langinfo(3C)** function accepts upper-case versions of the first four keywords.

- yesexpr**     The operand consists of an extended regular expression (see **regex(5)**) that describes the acceptable affirmative response to a question expecting an affirmative or negative response.
- noexpr**     The operand consists of an extended regular expression that describes the acceptable negative response to a question expecting an affirmative or negative response.
- yesstr**     The operand consists of a fixed string (not a regular expression) that can be used by an application for composition of a message that lists an acceptable affirmative response, such as in a prompt.
- nostr**     The operand consists of a fixed string that can be used by an application for composition of a message that lists an acceptable negative response.

The format and values for affirmative and negative responses of the POSIX locale follow; the code listing depicting the **localedef** input, the table representing the same information with the addition of **nl\_langinfo()** constants.

```
LC_MESSAGES
# This is the POSIX locale definition for
# the LC_MESSAGES category.
#
yesexpr "<circumflex><left-square-bracket><y><Y><right-square-bracket>"
#
noexpr "<circumflex><left-square-bracket><n><N><right-square-bracket>"
#
yesstr        "yes"
nostr         "no"
END LC_MESSAGES
```

| localedef Keyword | langinfo Constant | POSIX Locale Value |
|-------------------|-------------------|--------------------|
| yesexpr           | YESEXPR           | "^[yY]"            |
| noexpr            | NOEXPR            | "^[nN]"            |
| yesstr            | YESSTR            | "yes"              |
| nostr             | NOSTR             | "no"               |

**NAME** man – macros to format Reference Manual pages

**SYNOPSIS** **nroff** –**man** *filename* . . .  
**troff** –**man** *filename* . . .

**DESCRIPTION** These macros are used to lay out the reference pages in this manual. Note: if *filename* contains format input for a preprocessor, the commands shown above must be piped through the appropriate preprocessor. This is handled automatically by the **man(1)** command. See the “Conventions” section.

Any text argument *t* may be zero to six words. Quotes may be used to include SPACE characters in a “word”. If *text* is empty, the special treatment is applied to the next input line with text to be printed. In this way **.I** may be used to italicize a whole line, or **.SB** may be used to make small bold letters.

A prevailing indent distance is remembered between successive indented paragraphs, and is reset to default value upon reaching a non-indented paragraph. Default units for indents *i* are ens.

Type font and size are reset to default values before each paragraph, and after processing font and size setting macros.

These strings are predefined by –**man**:

- \\*R ‘®’, ‘(Reg)’ in **nroff**.
- \\*S Change to default type size.

**Requests**

\* n.t.l. = next text line; p.i. = prevailing indent

| <i>Request</i>        | <i>Cause</i> | <i>If no</i>      | <i>Explanation</i>  |
|-----------------------|--------------|-------------------|---|
|                       | <i>Break</i> | <i>Argument</i>   |   |
| <b>.B</b> <i>t</i>    | no           | <i>t</i> =n.t.l.* | Text is in bold font.   |
| <b>.BI</b> <i>t</i>   | no           | <i>t</i> =n.t.l.  | Join words, alternating bold and italic.                                    |
| <b>.BR</b> <i>t</i>   | no           | <i>t</i> =n.t.l.  | Join words, alternating bold and roman.                                     |
| <b>.DT</b>            | no           | .5i 1i..          | Restore default tabs.   |
| <b>.HP</b> <i>i</i>   | yes          | <i>i</i> =p.i.*   | Begin paragraph with hanging indent.<br>Set prevailing indent to <i>i</i> . |
| <b>.I</b> <i>t</i>    | no           | <i>t</i> =n.t.l.  | Text is italic.   |
| <b>.IB</b> <i>t</i>   | no           | <i>t</i> =n.t.l.  | Join words, alternating italic and bold.                                    |
| <b>.IP</b> <i>x i</i> | yes          | <i>x</i> =""      | Same as <b>.TP</b> with tag <i>x</i> .                                      |
| <b>.IR</b> <i>t</i>   | no           | <i>t</i> =n.t.l.  | Join words, alternating italic and roman.                                   |
| <b>.IX</b> <i>t</i>   | no           | -                 | Index macro, for SunSoft internal use.                                      |
| <b>.LP</b>            | yes          | -                 | Begin left-aligned paragraph.<br>Set prevailing indent to .5i.              |

| <b>.TH</b> <i>n s d f m</i> | yes | -               | Begin reference page <i>n</i> , of of section <i>s</i> ; <i>d</i> is the date of the most recent change. If present, <i>f</i> is the left page footer; <i>m</i> is the main page (center) header. Sets prevailing indent and tabs to .5i. |
| <b>.TP</b> <i>i</i>         | yes | <i>i=p.i.</i>   | Begin indented paragraph, with the tag given on the next text line.<br>Set prevailing indent to <i>i</i> .  |
| <b>.TX</b> <i>t p</i>       | no  | -               | Resolve the title abbreviation <i>t</i> ; join to punctuation mark (or text) <i>p</i> .   |

**Conventions**

When formatting a manual page, **man** examines the first line to determine whether it requires special processing. For example a first line consisting of:

```
'\" t
```

indicates that the manual page must be run through the **tbl(1)** preprocessor.

A typical manual page for a command or function is laid out as follows:

**.TH** *title* [1-9]

The name of the command or function, which serves as the title of the manual page. This is followed by the number of the section in which it appears.

**.SH** NAME

The name, or list of names, by which the command is called, followed by a dash and then a one-line summary of the action performed. All in roman font, this section contains no **troff(1)** commands or escapes, and no macro requests. It is used to generate the **windex** database, which is used by the **whatis(1)** command.

**.SH** SYNOPSIS

Commands:

The syntax of the command and its arguments, as typed on the command line. When in boldface, a word must be typed exactly as printed. When in italics, a word can be replaced with an argument that you supply. References to bold or italicized items are not capitalized in other sections, even when they begin a sentence.

Syntactic symbols appear in roman face:

- [ ] An argument, when surrounded by brackets is optional.
- | Arguments separated by a vertical bar are exclusive. You can supply only one item from such a list.
- ... Arguments followed by an ellipsis can be repeated. When an ellipsis follows a bracketed set, the expression within the brackets can be repeated.

Functions:

If required, the data declaration, or **#include** directive, is shown first, followed by the function declaration. Otherwise, the function declaration is shown.

#### **.SH DESCRIPTION**

A narrative overview of the command or function's external behavior. This includes how it interacts with files or data, and how it handles the standard input, standard output and standard error. Internals and implementation details are normally omitted. This section attempts to provide a succinct overview in answer to the question, "what does it do?"

Literal text from the synopsis appears in constant width, as do literal filenames and references to items that appear elsewhere in the reference manuals. Arguments are italicized.

If a command interprets either subcommands or an input grammar, its command interface or input grammar is normally described in a USAGE section, which follows the OPTIONS section. The DESCRIPTION section only describes the behavior of the command itself, not that of subcommands.

#### **.SH OPTIONS**

The list of options along with a description of how each affects the command's operation.

#### **.SH RETURN VALUES**

A list of the values the library routine will return to the calling program and the conditions that cause these values to be returned.

#### **.SH EXIT STATUS**

A list of the values the utility will return to the calling program or shell, and the conditions that cause these values to be returned.

#### **.SH FILES**

A list of files associated with the command or function.

#### **.SH SEE ALSO**

A comma-separated list of related manual pages, followed by references to other published materials.

#### **.SH DIAGNOSTICS**

A list of diagnostic messages and an explanation of each.

**.SH BUGS**

A description of limitations, known defects, and possible problems associated with the command or function.

Dale Dougherty and Tim O'Reilly, *Unix Text Processing*

**NAME** mansun – macros to format Reference Manual pages

**SYNOPSIS** **nroff** –mansun *filename* . . .  
**troff** –mansun *filename* . . .

**DESCRIPTION** These macros are used to lay out the reference pages in this manual. Note: if *filename* contains format input for a preprocessor, the commands shown above must be piped through the appropriate preprocessor. This is handled automatically by **man(1)**. See the “Conventions” section.

Any text argument *t* may be zero to six words. Quotes may be used to include SPACE characters in a “word”. If *text* is empty, the special treatment is applied to the next input line with text to be printed. In this way **.I** may be used to italicize a whole line, or **.SB** may be used to make small bold letters.

A prevailing indent distance is remembered between successive indented paragraphs, and is reset to default value upon reaching a non-indented paragraph. Default units for indents *i* are ens.

Type font and size are reset to default values before each paragraph, and after processing font and size setting macros.

These strings are predefined by **–mansun**:

**\\*R** ‘@’, ‘(Reg)’ in **nroff**.  
**\\*S** Change to default type size.

**Requests**

\* n.t.l. = next text line; p.i. = prevailing indent

| <i>Request</i>        | <i>Cause</i> | <i>If no</i>      | <i>Explanation</i>  |
|-----------------------|--------------|-------------------|---|
|                       | <i>Break</i> | <i>Argument</i>   |   |

**NAME** mm – text formatting (memorandum) macros

**SYNOPSIS** **nroff** –mm [ options ] filename ...  
**troff** –mm [ options ] filename ...

**DESCRIPTION** This package of **nroff**(1) and **troff**(1) macro definitions provides a formatting facility for various styles of articles, theses, and books. When producing 2-column output on a terminal or lineprinter, or when reverse line motions are needed, filter the output through **col**(1). All external –mm macros are defined below.

Note: this –mm macro package is an extended version written at Berkeley and is a superset of the standard –mm macro packages as supplied by Bell Labs. Some of the Bell Labs macros have been removed; for instance, it is assumed that the user has little interest in producing headers stating that the memo was generated at Whippy Labs.

Many **nroff** and **troff** requests are unsafe in conjunction with this package. However, the first four requests below may be used with impunity after initialization, and the last two may be used even before initialization:

- .bp** begin new page
- .br** break output line
- .sp n** insert n spacing lines
- .ce n** center next n lines
- .ls n** line spacing: *n=1* single, *n=2* double space
- .na** no alignment of right margin

Font and point size changes with **\f** and **\s** are also allowed; for example, **\flword****\fR** will italicize *word*. Output of the **tbl**(1), **eqn**(1) and **refer**(1) preprocessors for equations, tables, and references is acceptable as input.

| REQUESTS | Macro Name                   | Initial Value                                  | Break? Reset? | Explanation   |

**REGISTERS**

Formatting distances can be controlled in **-mm** by means of built-in number registers.  
For example, this sets the line length to 6.5 inches:

```
.nr LL 6.5i
```

Here is a table of number registers and their default values:

| Name      | Register Controls  | Takes Effect      | Default                                  |
|-----------|--------------------|-------------------|--|
| <b>Cl</b> | contents level     | table of contents | 2  |
| <b>De</b> | display eject      | display           | 0  |
| <b>Df</b> | display floating   | display           | 5  |
| <b>Ds</b> | display spacing    | display           | 1v                                       |
| <b>Hb</b> | heading break      | heading           | 2  |
| <b>Hc</b> | heading centering  | heading           | 0  |
| <b>Hi</b> | heading indent     | heading           | 1  |
| <b>Hi</b> | heading spacing    | heading           | 1  |
| <b>Hu</b> | heading unnumbered | heading           | 2  |
| <b>Li</b> | list indentation   | list              | 6 ( <b>nroff</b> )<br>5 ( <b>troff</b> ) |
| <b>Ls</b> | list spacing       | list              | 6  |
| <b>Pi</b> | paragraph indent   | paragraph         | 5  |
| <b>Pt</b> | paragraph type     | paragraph         | 1  |
| <b>Si</b> | static indent      | display           | 5 ( <b>nroff</b> )<br>3 ( <b>troff</b> ) |

When resetting these values, make sure to specify the appropriate units. Setting the line length to 7, for example, will result in output with one character per line. Setting **Pi** to 0 suppresses paragraph indentation

Here is a list of string registers available in **-mm**; they may be used anywhere in the text:

| Name         | String's Function                                |
|--------------|--|
| <b>\*Q</b>   | quote (" in <b>nroff</b> , " in <b>troff</b> )   |
| <b>\*U</b>   | unquote (" in <b>nroff</b> , " in <b>troff</b> ) |
| <b>\*-</b>   | dash (-- in <b>nroff</b> , — in <b>troff</b> )   |
| <b>\*(MO</b> | month (month of the year)                        |
| <b>\*(DY</b> | day (current date)                               |
| <b>\**</b>   | automatically numbered footnote                  |
| <b>\*' </b>  | acute accent (before letter)                     |
| <b>\*^ </b>  | grave accent (before letter)                     |
| <b>\*~ </b>  | circumflex (before letter)                       |
| <b>\*, </b>  | cedilla (before letter)                          |
| <b>\*: </b>  | umlaut (before letter)                           |
| <b>\*~ </b>  | tilde (before letter)                            |
| <b>\(BU</b>  | bullet item                                      |
| <b>\(DT</b>  | date ( <i>month day, yr</i> )                    |
| <b>\(EM</b>  | em dash  |
| <b>\(Lf</b>  | <b>LIST OF FIGURES</b> title                     |
| <b>\(Lt</b>  | <b>LIST OF TABLES</b> title                      |

| <b>NAME</b>        | ms – text formatting macros   |               |               |   |
| <b>SYNOPSIS</b>    | <b>nroff</b> –ms [ <i>options</i> ] <i>filename</i> . . .<br><b>troff</b> –ms [ <i>options</i> ] <i>filename</i> . . .  |               |               |   |
| <b>DESCRIPTION</b> | <p>This package of <b>nroff</b>(1) and <b>troff</b>(1) macro definitions provides a formatting facility for various styles of articles, theses, and books. When producing 2-column output on a terminal or lineprinter, or when reverse line motions are needed, filter the output through <b>col</b>(1). All external –ms macros are defined below.</p> <p>Note: this –ms macro package is an extended version written at Berkeley and is a superset of the standard –ms macro packages as supplied by Bell Labs. Some of the Bell Labs macros have been removed; for instance, it is assumed that the user has little interest in producing headers stating that the memo was generated at Whippy Labs.</p> <p>Many <b>nroff</b> and <b>troff</b> requests are unsafe in conjunction with this package. However, the first four requests below may be used with impunity after initialization, and the last two may be used even before initialization:</p> <ul style="list-style-type: none"> <li><b>.bp</b>    begin new page</li> <li><b>.br</b>    break output line</li> <li><b>.sp <i>n</i></b>    insert <i>n</i> spacing lines</li> <li><b>.ce <i>n</i></b>    center next <i>n</i> lines</li> <li><b>.ls <i>n</i></b>    line spacing: <i>n</i>=1 single, <i>n</i>=2 double space</li> <li><b>.na</b>    no alignment of right margin</li> </ul> <p>Font and point size changes with <b>\f</b> and <b>\s</b> are also allowed; for example, <b>\fIword\fR</b> will italicize <i>word</i>. Output of the <b>tbl</b>(1), <b>eqn</b>(1) and <b>refer</b>(1) preprocessors for equations, tables, and references is acceptable as input.</p> |               |               |   |
| <b>REQUESTS</b>    | Macro Name  | Initial Value | Break? Reset? | Explanation   |

**REGISTERS**

Formatting distances can be controlled in **–ms** by means of built-in number registers. For example, this sets the line length to 6.5 inches:

```
.nr LL 6.5i
```

Here is a table of number registers and their default values:

| Name      | Register Controls  | Takes Effect    | Default               |
|-----------|--------------------|-----------------|-----------------------|
| <b>PS</b> | point size         | paragraph       | 10                    |
| <b>VS</b> | vertical spacing   | paragraph       | 12                    |
| <b>LL</b> | line length        | paragraph       | 6i                    |
| <b>LT</b> | title length       | next page       | same as <b>LL</b>     |
| <b>FL</b> | footnote length    | next <b>.FS</b> | 5.5i                  |
| <b>PD</b> | paragraph distance | paragraph       | 1v (if n), .3v (if t) |
| <b>DD</b> | display distance   | displays        | 1v (if n), .5v (if t) |
| <b>PI</b> | paragraph indent   | paragraph       | 5n                    |
| <b>QI</b> | quote indent       | next <b>.QP</b> | 5n                    |
| <b>FI</b> | footnote indent    | next <b>.FS</b> | 2n                    |
| <b>PO</b> | page offset        | next page       | 0 (if n), ~1i (if t)  |
| <b>HM</b> | header margin      | next page       | 1i                    |
| <b>FM</b> | footer margin      | next page       | 1i                    |
| <b>FF</b> | footnote format    | next <b>.FS</b> | 0 (1, 2, 3 available) |

When resetting these values, make sure to specify the appropriate units. Setting the line length to 7, for example, will result in output with one character per line. Setting **FF** to 1 suppresses footnote superscripting; setting it to 2 also suppresses indentation of the first line; and setting it to 3 produces an **.IP**-like footnote paragraph.

Here is a list of string registers available in `-ms`; they may be used anywhere in the text:

| Name               | String's Function  |
|--------------------|--|
| <code>\*Q</code>   | quote (" in <code>nroff</code> , " in <code>troff</code> )   |
| <code>\*U</code>   | unquote (" in <code>nroff</code> , " in <code>troff</code> ) |
| <code>\*-</code>   | dash (-- in <code>nroff</code> , — in <code>troff</code> )   |
| <code>\*(MO</code> | month (month of the year)                                    |
| <code>\*(DY</code> | day (current date)   |
| <code>\**</code>   | automatically numbered footnote                              |
| <code>\*'</code>   | acute accent (before letter)                                 |
| <code>\*^</code>   | grave accent (before letter)                                 |
| <code>\*~</code>   | circumflex (before letter)                                   |
| <code>\*,</code>   | cedilla (before letter)                                      |
| <code>\*:</code>   | umlaut (before letter)                                       |
| <code>\*~</code>   | tilde (before letter)  |

When using the extended accent mark definitions available with `.AM`, these strings should come after, rather than before, the letter to be accented.

**FILES** `/usr/share/lib/tmac/s`  
`/usr/share/lib/tmac/ms.???`

**SEE ALSO** `col(1)`, `eqn(1)`, `nroff(1)`, `refer(1)`, `tbl(1)`, `troff(1)`

**BUGS** Floating keeps and regular keeps are diverted to the same space, so they cannot be mixed together with predictable results.

| <b>char</b>           | <b>**s_aliases</b>  | A pointer to an array of pointers to alternative service names, terminated by a null pointer.                              |                |                           |             |                    |  |            |                   |               |            |                 |                                       |             |                      |  |             |                |  |             |                    |   |            |                   |                                  |                  |              |   |             |                |                                |             |                    |  |            |                |                      |             |                |                               |             |                    |   |            |               |  |             |                 |  |                       |                |                    |                  |
| <b>int</b>            | <b>s_port</b>   | The port number at which the service resides, in network byte order.   |                |                           |             |                    |  |            |                   |               |            |                 |                                       |             |                      |  |             |                |  |             |                    |   |            |                   |                                  |                  |              |   |             |                |                                |             |                    |  |            |                |                      |             |                |                               |             |                    |   |            |               |  |             |                 |  |                       |                |                    |                  |
| <b>char</b>           | <b>*s_proto</b>   | The name of the protocol to use when contacting the service.   |                |                           |             |                    |  |            |                   |               |            |                 |                                       |             |                      |  |             |                |  |             |                    |   |            |                   |                                  |                  |              |   |             |                |                                |             |                    |  |            |                |                      |             |                |                               |             |                    |   |            |               |  |             |                 |  |                       |                |                    |                  |
| <b>HOST_NOT_FOUND</b> | <b>NO_DATA</b>  |  |                |                           |             |                    |  |            |                   |               |            |                 |                                       |             |                      |  |             |                |  |             |                    |   |            |                   |                                  |                  |              |   |             |                |                                |             |                    |  |            |                |                      |             |                |                               |             |                    |   |            |               |  |             |                 |  |                       |                |                    |                  |
| <b>NO_RECOVERY</b>    | <b>TRY_AGAIN</b>  |  |                |                           |             |                    |  |            |                   |               |            |                 |                                       |             |                      |  |             |                |  |             |                    |   |            |                   |                                  |                  |              |   |             |                |                                |             |                    |  |            |                |                      |             |                |                               |             |                    |   |            |               |  |             |                 |  |                       |                |                    |                  |

Inclusion of the <netdb.h> header may also make visible all symbols from **in(5)**.

**Default**

For applications that do not require standard-conforming behavior (those that use the socket interfaces described in section 3N of the reference manual; see **Intro(3)** and **standards(5)**), the following are declared as functions, and may also be defined as macros:

```

int          endhostent(void);
int          endnetent(void);
int          endprotoent(void);
int          endservent(void);
struct hostent *gethostbyaddr(const void *addr, int len, int type);
struct hostent *gethostbyname(const char *name);
struct hostent *gethostent(void);
struct netent *getnetbyaddr(long net, int type);
struct netent *getnetbyname(const char *name);
struct netent *getnetent(void);
struct protoent *getprotobyname(const char *name);
struct protoent *getprotobynumber(int proto);
struct protoent *getprotoent(void);
struct servent *getservbyname(const char *name, const char *proto);
struct servent *getservbyport(int port, const char *proto);
struct servent *getservent(void);
int          sethostent(int stayopen);
int          setnetent(int stayopen);
int          setprotoent(int stayopen);
int          setservent(int stayopen);
    
```

**Standard-conforming**

For applications that require standard-conforming behavior (those that use the socket interfaces described in section 3XN of the reference manual; see **Intro(3)** and **standards(5)**), the following are declared as functions, and may also be defined as macros:

```

void         endhostent(void);
void         endnetent(void);
void         endprotoent(void);
void         endservent(void);
struct hostent *gethostbyaddr(const void *addr, size_t len, int type);
struct hostent *gethostbyname(const char *name);
struct hostent *gethostent(void);
struct netent *getnetbyaddr(in_addr_t net, int type);
struct netent *getnetbyname(const char *name);
struct netent *getnetent(void);
struct protoent *getprotobyname(const char *name);
struct protoent *getprotobynumber(int proto);
struct protoent *getprotoent(void);
struct servent *getservbyname(const char *name, const char *proto);
struct servent *getservbyport(int port, const char *proto);
struct servent *getservent(void);
    
```

```
void      sethostent(int stayopen);  
void      setnetent(int stayopen);  
void      setprotoent(int stayopen);  
void      setservent(int stayopen);
```

|--------------------|---|
| <b>NAME</b>        | nfssec – overview of NFS security modes   |
| <b>DESCRIPTION</b> | <p>The <b>mount_nfs(1M)</b> and <b>share_nfs(1M)</b> commands each provide a way to specify the security mode to be used on an NFS file system through the <b>sec=mode</b> option. <i>mode</i> can be either <b>sys</b>, <b>dh</b>, <b>krb4</b>, or <b>none</b>. These security modes may also be added to the automount maps. Note that <b>mount_nfs(1M)</b> and <b>automount(1M)</b> do not support <b>sec=none</b> at this time.</p> <p>The <b>sec=mode</b> option on the <b>share_nfs(1M)</b> command line establishes the security mode of NFS servers. If the NFS connection uses the NFS Version 3 protocol, the NFS clients must query the server for the appropriate <i>mode</i> to use. If the NFS connection uses the NFS Version 2 protocol, then the NFS client will use the default security mode, which is currently <b>sys</b>. NFS clients may force the use of a specific security mode by specifying the <b>sec=mode</b> option on the command line. However, if the file system on the server is not shared with that security mode, the client may be denied access.</p> <p>If the NFS client wants to authenticate the NFS server using a particular (stronger) security mode, the client will want to specify the security mode to be used, even if the connection uses the NFS Version 3 protocol. This guarantees that an attacker masquerading as the server does not compromise the client.</p> <p>The NFS security modes are described as follows:</p> <p><b>sys</b>     Use <b>AUTH_SYS</b> authentication. The user's UNIX user-id and group-ids are passed in the clear on the network, unauthenticated by the NFS server. This is the simplest security method and requires no additional administration. It is the default used by Solaris NFS Version 2 clients and Solaris NFS servers.</p> <p><b>dh</b>       Use a Diffie-Hellman public key system (<b>AUTH_DES</b>, which is referred to as <b>AUTH_DH</b> in the forthcoming Internet RFC).</p> <p><b>krb4</b>     Use the Kerberos Version 4 authentication system (<b>AUTH_KERB</b>, which is referred to as <b>AUTH_KERB4</b> in a forthcoming Internet RFC).</p> <p><b>none</b>     Use null authentication (<b>AUTH_NONE</b>). NFS clients using <b>AUTH_NONE</b> have no identity and are mapped to the anonymous user <b>nobody</b> by NFS servers. A client using a security mode other than the one with which a Solaris NFS server shares the file system will have its security mode mapped to <b>AUTH_NONE</b>. In this case, if the file system is shared with <b>sec=none</b>, users from the client will be mapped to the anonymous user. The NFS security mode <b>none</b> is supported by <b>share_nfs(1M)</b>, but not by <b>mount_nfs(1M)</b> or <b>automount(1M)</b>.</p> |
| <b>FILES</b>       | <p><b>/etc/nfssec.conf</b>                    NFS security service configuration file.</p>  |

| <b>NAME</b>        | pam_dial_auth – authentication management PAM module for dialups  |                |                 |          |                         |
|--------------------|---|----------------|-----------------|----------|-------------------------|
| <b>SYNOPSIS</b>    | <code>/usr/lib/security/pam_dial_auth.so.1</code>   |                |                 |          |                         |
| <b>DESCRIPTION</b> | <p>The dialup PAM module, <code>/usr/lib/security/pam_dial_auth.so.1</code>, authenticates a user according to the <code>/etc/dialups</code> and <code>/etc/d_passwd</code> files. Only <code>pam_sm_authenticate()</code> is implemented within this module. <code>pam_sm_setcred()</code> is a null function. <code>/usr/lib/security/pam_dial_auth.so.1</code> is designed to be stacked immediately below the <code>/usr/lib/security/pam_unix.so.1</code> module for the login service.</p> <p><code>pam_sm_authenticate()</code> performs authentication only if both the <code>/etc/dialups</code> and <code>/etc/d_passwd</code> files exist. The user's terminal line is checked against entries in the <code>/etc/dialups</code> file. If there is a match, the user's shell is compared against entries in the <code>/etc/d_passwd</code> file. If there is a matching entry, the user is prompted for a password which is validated against the entry in the <code>/etc/d_passwd</code> file. If the passwords match, the user is authenticated. The following option may be passed in to this service module:</p> <p style="padding-left: 40px;"><b>debug</b>            <code>syslog(3)</code> debugging information at <code>LOG_DEBUG</code> level.</p> |                |                 |          |                         |
| <b>ATTRIBUTES</b>  | See <code>attributes(5)</code> for description of the following attributes:   |                |                 |          |                         |
|                    | <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: left;">ATTRIBUTE TYPE</th> <th style="text-align: left;">ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>MT Level</td> <td>MT-Safe with exceptions</td> </tr> </tbody> </table>   | ATTRIBUTE TYPE | ATTRIBUTE VALUE | MT Level | MT-Safe with exceptions |
| ATTRIBUTE TYPE     | ATTRIBUTE VALUE   |                |                 |          |                         |
| MT Level           | MT-Safe with exceptions   |                |                 |          |                         |
| <b>SEE ALSO</b>    | <code>pam(3)</code> , <code>pam_authenticate(3)</code> , <code>d_passwd(4)</code> , <code>dialups(4)</code> , <code>libpam(4)</code> , <code>pam.conf(4)</code> , <code>attributes(5)</code>  |                |                 |          |                         |
| <b>NOTES</b>       | The interfaces in <code>libpam()</code> are MT-Safe only if each thread within the multi-threaded application uses its own PAM handle.  |                |                 |          |                         |

**NAME** pam\_rhosts\_auth – authentication management PAM module using ruserok()

**SYNOPSIS** /usr/lib/security/pam\_rhosts\_auth.so.1

**DESCRIPTION** The rhosts PAM module, /usr/lib/security/pam\_rhosts\_auth.so.1, authenticates a user via the **rlogin** authentication protocol. Only **pam\_sm\_authenticate()** is implemented within this module. **pam\_sm\_authenticate()** uses the **ruserok(3)** library function to authenticate the **rlogin** or **rsh** user. **pam\_sm\_setcred()** is a null function.

/usr/lib/security/pam\_rhosts\_auth.so.1 is designed to be stacked on top of the /usr/lib/security/pam\_unix.so.1 module for both the **rlogin** and **rsh** services. This module is normally configured as *sufficient* so that subsequent authentication is performed only on failure of **pam\_sm\_authenticate()**. The following option may be passed in to this service module:

**debug**            **syslog(3)** debugging information at LOG\_DEBUG level.

**ATTRIBUTES** See **attributes(5)** for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE         |
|----------------|-------------------------|
| MT Level       | MT-Safe with exceptions |

**SEE ALSO** **pam(3)**, **pam\_authenticate(3)**, **ruserok(3N)**, **syslog(3)**, **libpam(4)**, **pam.conf(4)**, **attributes(5)**

**NOTES** The interfaces in **libpam()** are MT-Safe only if each thread within the multi-threaded application uses its own PAM handle.

|--|---|
| <b>NAME</b>                                | pam_sample – a sample PAM module  |
| <b>SYNOPSIS</b>                            | <code>/usr/lib/security/pam_sample.so.1</code>  |
| <b>DESCRIPTION</b>                         | The SAMPLE service module for PAM is divided into four components: authentication, account management, password management, and session management. The sample module is a shared object that is dynamically loaded to provide the necessary functionality.   |
| <b>SAMPLE Authentication Component</b>     | <p>The SAMPLE authentication module, typically <code>/usr/lib/security/pam_sample.so.1</code>, provides functions to test the PAM framework functionality using the <code>pam_sm_authenticate(3)</code> call. The SAMPLE module implementation of the <code>pam_sm_authenticate(3)</code> function compares the user entered password with the password set in the <code>pam.conf(4)</code> file, or the string "test" if a default test password has not been set. The following options may be passed in to the SAMPLE Authentication module:</p> <p><b>debug</b>                Syslog debugging information at the LOG_DEBUG level.</p> <p><b>passwd=newone</b>       Sets the password to be "newone."</p> <p><b>first_pass_good</b>     The first password is always good when used with the <code>use_first_pass</code> or <code>try_first_pass</code> option.</p> <p><b>first_pass_bad</b>      The first password is always bad when used with the <code>use_first_pass</code> or <code>try_first_pass</code> option.</p> <p><b>always_fail</b>         Always returns PAM_AUTH_ERR.</p> <p><b>always_succeed</b>     Always returns PAM_SUCCESS.</p> <p><b>always_ignore</b>      Always returns PAM_IGNORE.</p> <p><b>use_first_pass</b>      Use the user's initial password (entered when the user is authenticated to the first authentication module in the stack) to authenticate with the SAMPLE module. If the passwords do not match, or if this is the first authentication module in the stack, quit and do not prompt the user for a password. It is recommended that this option only be used if the SAMPLE authentication module is designated as <i>optional</i> in the <code>pam.conf</code> configuration file.</p> <p><b>try_first_pass</b>      Use the user's initial password (entered when the user is authenticated to the first authentication module in the stack) to authenticate with the SAMPLE module. If the passwords do not match, or if this is the first authentication module in the stack, prompt the user for a password.</p> <p>The SAMPLE module <code>pam_sm_setcred(3)</code> function always returns PAM_SUCCESS.</p> |
| <b>SAMPLE Account Management Component</b> | The SAMPLE Account Management Component, typically <code>pam_sample.so.1</code> , implements a simple access control scheme that limits machine access to a list of authorized users. The list of authorized users is supplied as option arguments to the entry for the SAMPLE account management PAM module in the <code>pam.conf</code> file. Note that the module  |

always permits access to the root super user.

The option field syntax to limit access is shown below:

```
allow= name[,name]
allow= name [allow=name]
```

The example **pam.conf** show below permits only larry to **login** directly. **rlogin** is allowed only for don and larry. Once a user is logged in, the user can use **su** if the user are sam or eric.

```
login    account  require  pam_sample.so.1  allow=larry
dtlogin  account  require  pam_sample.so.1  allow=larry
rlogin   account  require  pam_sample.so.1  allow=don allow=larry
su       account  require  pam_sample.so.1  allow=sam,eric
```

The debug and nowarn options are also supported.

**SAMPLE Password Management Component**

The SAMPLE Password Management Component function (**pam\_sm\_chauthtok(3)**), always returns **PAM\_SUCCESS**.

**SAMPLE Session Management Component**

The SAMPLE Session Management Component functions (**pam\_sm\_open\_session(3)**, **pam\_sm\_close\_session(3)**) always return **PAM\_SUCCESS**.

**ATTRIBUTES**

See **attributes(5)** for description of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE         |
|----------------|-------------------------|
| MT Level       | MT-Safe with exceptions |

**SEE ALSO**

**pam(3)**, **pam\_sm\_authenticate(3)**, **pam\_sm\_chauthtok(3)**, **pam\_sm\_close\_session(3)**, **pam\_sm\_open\_session(3)**, **pam\_sm\_setcred(3)**, **libpam(4)**, **pam.conf(4)**, **attributes(5)**

**NOTES**

The interfaces in **libpam()** are MT-Safe only if each thread within the multi-threaded application uses its own PAM handle.

|                                   |  |
|-----------------------------------|--|
| <b>NAME</b>                       | pam_unix – authentication, account, session, and password management PAM modules for UNIX  |
| <b>SYNOPSIS</b>                   | <code>/usr/lib/security/pam_unix.so.1</code>   |
| <b>DESCRIPTION</b>                | <p>The UNIX service module for PAM, <code>/usr/lib/security/pam_unix.so.1</code>, provides functionality for all four PAM modules: authentication, account management, session management and password management. The <code>pam_unix.so.1</code> module is a shared object that can be dynamically loaded to provide the necessary functionality upon demand. Its path is specified in the PAM configuration file.</p>  |
| <b>Unix Authentication Module</b> | <p>The UNIX authentication component provides functions to verify the identity of a user, (<code>pam_sm_authenticate()</code>) and to set user specific credentials (<code>pam_sm_setcred()</code>). <code>pam_sm_authenticate()</code> compares the user entered password with the password from the UNIX password database. If the passwords match, the user is authenticated. If the user also has secure RPC credentials and the secure RPC password is the same as the UNIX password, then the secure RPC credentials are also obtained.</p> <p>The following options may be passed to the UNIX service module:</p> <p><b>debug</b>            <code>syslog(3)</code> debugging information at <code>LOG_DEBUG</code> level.</p> <p><b>nowarn</b>            Turn off warning messages.</p> <p><b>use_first_pass</b>    It compares the password in the password database with the user's initial password (entered when the user authenticated to the first authentication module in the stack). If the passwords do not match, or if no password has been entered, it quits and does not prompt the user for a password. This option should only be used if the authentication service is designated as <i>optional</i> in the <code>pam.conf</code> configuration file.</p> <p><b>try_first_pass</b>    It compares the password in the password database with the user's initial password (entered when the user authenticated to the first authentication module in the stack). If the passwords do not match, or if no password has been entered, prompt the user for a password.</p> <p>When prompting for the current password, the UNIX authentication module will use the prompt, "password:" unless one of the following scenarios occur:</p> <ol style="list-style-type: none"> <li>1.    The option <b>try_first_pass</b> is specified and the password entered for the first module in the stack fails for the UNIX module.</li> <li>2.    The option <b>try_first_pass</b> is not specified, and the earlier authentication modules listed in the <code>pam.conf</code> file have prompted the user for the password.</li> </ol> <p>In these two cases, the UNIX authentication module will use the prompt "SYSTEM password:".</p> <p>The <code>pam_sm_setcred()</code> function sets user specific credentials. If the user had secure RPC credentials, but the secure RPC password was not the same as the UNIX password, then a warning message is printed. If the user wants to get secure RPC credentials, then</p> |

**keylogin(1)** needs to be run.

**Unix Account Management Module** The UNIX account management component provides a function to perform account management, **pam\_sm\_acct\_mgmt()**. The function retrieves the user's password entry from the UNIX password database and verifies that the user's account and password have not expired. The following options may be passed in to the UNIX service module:

**debug**           **syslog(3)** debugging information at LOG\_DEBUG level.  
**nowarn**           Turn off warning messages.

**Unix Session Management Module** The UNIX session management component provides functions to initiate **pam\_sm\_open\_session()** and terminate **pam\_sm\_close\_session()** UNIX sessions. For UNIX, **pam\_open\_session** updates the `/var/adm/lastlog` file. The account management module reads this file to determine the previous time the user logged in. The following options may be passed in to the UNIX service module:

**debug**           **syslog(3)** debugging information at LOG\_DEBUG level.  
**nowarn**           Turn off warning messages.  
**pam\_close\_session** is a null function.

**Unix Password Management Module** The UNIX password management component provides a function to change passwords **pam\_sm\_chauthtok()** in the UNIX password database. This module must be *required* in **pam.conf**. It cannot be *optional* or *sufficient*. The following options may be passed in to the UNIX service module:

**debug**           **syslog(3)** Debugging information at LOG\_DEBUG level.  
**nowarn**           Turn off warning messages.

**use\_first\_pass** It compares the password in the password database with the user's old password (entered to the first password module in the stack). If the passwords do not match, or if no password has been entered, it quits and does not prompt the user for the old password. It also attempts to use the new password (entered to the first password module in the stack) as the new password for this module. If the new password fails, it quits and does not prompt the user for a new password.

**try\_first\_pass** It compares the password in the password database with the user's old password (entered to the first password module in the stack). If the passwords do not match, or if no password has been entered, it prompts the user for the old password. It also attempts to use the new password (entered to the first password module in the stack) as the new password for this module. If the new password fails, it prompts the user for a new password.

If the user's password has expired, the UNIX account module saves this information in the authentication handle using **pam\_set\_data()**, with a unique name, **SUNW\_UNIX\_AUTHOK\_DATA**. The UNIX password module retrieves this information from the authentication handle using **pam\_get\_data()** to determine whether or not to force the user to update the user's password.

**ATTRIBUTES**

See **attributes(5)** for description of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE         |
|----------------|-------------------------|
| MT Level       | MT-Safe with exceptions |

**SEE ALSO**

**keylogin(1)**, **pam(3)**, **pam\_authenticate(3)**, **pam\_setcred(3)**, **syslog(3)**, **libpam(4)**, **pam.conf(4)**, **attributes(5)**

**NOTES**

The interfaces in **libpam()** are MT-Safe only if each thread within the multi-threaded application uses its own PAM handle.

|--------------------|---|
| <b>NAME</b>        | prof – profile within a function  |
| <b>SYNOPSIS</b>    | <pre>#define MARK #include &lt;prof.h&gt; void MARK( name);</pre>   |
| <b>DESCRIPTION</b> | <p><b>MARK</b> introduces a mark called <i>name</i> that is treated the same as a function entry point. Execution of the mark adds to a counter for that mark, and program-counter time spent is accounted to the immediately preceding mark or to the function if there are no preceding marks within the active function.</p> <p><i>name</i> may be any combination of letters, numbers, or underscores. Each <i>name</i> in a single compilation must be unique, but may be the same as any ordinary program symbol.</p> <p>For marks to be effective, the symbol <b>MARK</b> must be defined before the header <b>prof.h</b> is included, either by a preprocessor directive as in the synopsis, or by a command line argument:</p> <pre>cc -p -DMARK work.c</pre> <p>If <b>MARK</b> is not defined, the <b>MARK(name)</b> statements may be left in the source files containing them and are ignored. <b>prof-g</b> must be used to get information on all labels.</p> |
| <b>EXAMPLE</b>     | <p>In this example, marks can be used to determine how much time is spent in each loop. Unless this example is compiled with <b>MARK</b> defined on the command line, the marks are ignored.</p> <pre>#include &lt;prof.h&gt; work() {     int i, j;     ...     MARK(loop1);     for (i = 0; i &lt; 2000; i++) {         ...     }     MARK(loop2);     for (j = 0; j &lt; 2000; j++) {         ...     } }</pre>  |

|   |   |
|---|---|
| <b>NAME</b>   | regex – internationalized basic and extended regular expression matching  |
| <b>DESCRIPTION</b>  | <p>Regular Expressions (REs) provide a mechanism to select specific strings from a set of character strings. The Internationalized Regular Expressions described below differ from the Simple Regular Expressions described on the <b>regexp(5)</b> manual page in the following ways:</p> <ul style="list-style-type: none"> <li>• both Basic and Extended Regular Expressions are supported</li> <li>• the Internationalization features—character class, equivalence class, and multi-character collation—are supported.</li> </ul> <p>The Basic Regular Expression (BRE) notation and construction rules described in the <b>BASIC REGULAR EXPRESSIONS</b> section apply to most utilities supporting regular expressions. Some utilities, instead, support the Extended Regular Expressions (ERE) described in the <b>EXTENDED REGULAR EXPRESSIONS</b> section; any exceptions for both cases are noted in the descriptions of the specific utilities using regular expressions. Both BREs and EREs are supported by the Regular Expression Matching interfaces <b>regcomp(3C)</b> and <b>regex(3C)</b>.</p> |
| <b>BASIC REGULAR EXPRESSIONS</b><br><b>BREs Matching a Single Character</b> | <p>A BRE ordinary character, a special character preceded by a backslash, or a period matches a single character. A bracket expression matches a single character or a single collating element. See <b>RE Bracket Expression</b>, below.</p>   |
| <b>BRE Ordinary Characters</b>  | <p>An ordinary character is a BRE that matches itself: any character in the supported character set, except for the BRE special characters listed in <b>BRE Special Characters</b>, below.</p> <p>The interpretation of an ordinary character preceded by a backslash (\) is undefined, except for:</p> <ol style="list-style-type: none"> <li>1. the characters ), (, {, and }</li> <li>2. the digits 1 to 9 inclusive (see <b>BREs Matching Multiple Characters</b>, below)</li> <li>3. a character inside a bracket expression.</li> </ol>   |
| <b>BRE Special Characters</b>   | <p>A BRE <i>special character</i> has special properties in certain contexts. Outside those contexts, or when preceded by a backslash, such a character will be a BRE that matches the special character itself. The BRE special characters and the contexts in which they have their special meaning are:</p> <p>. [ \     The combination of period, left-bracket and backslash is special except when used in a bracket expression (see <b>RE Bracket Expression</b>, below). An expression containing a [ that is not preceded by a backslash and is not part of a bracket expression produces undefined results.</p>   |

|                              |   |
|------------------------------|---|
| *                            | <p>The asterisk is special except when used:</p> <ul style="list-style-type: none"> <li>• in a bracket expression</li> <li>• as the first character of an entire BRE (after an initial ^, if any)</li> <li>• as the first character of a subexpression (after an initial ^, if any); see <b>BREs Matching Multiple Characters</b>, below.</li> </ul>  |
| ^                            | <p>The circumflex is special when used:</p> <ul style="list-style-type: none"> <li>• as an anchor (see <b>BRE Expression Anchoring</b>, below).</li> <li>• as the first character of a bracket expression (see <b>RE Bracket Expression</b>, below).</li> </ul>   |
| \$                           | <p>The dollar sign is special when used as an anchor.</p>   |
| <b>Periods in BREs</b>       | <p>A period (.), when used outside a bracket expression, is a BRE that matches any character in the supported character set except NUL.</p>   |
| <b>RE Bracket Expression</b> | <p>A bracket expression (an expression enclosed in square brackets, [ ]) is an RE that matches a single collating element contained in the non-empty set of collating elements represented by the bracket expression.</p> <p>The following rules and definitions apply to bracket expressions:</p> <ol style="list-style-type: none"> <li>1. A <i>bracket expression</i> is either a matching list expression or a non-matching list expression. It consists of one or more expressions: collating elements, collating symbols, equivalence classes, character classes, or range expressions (see rule 7 below). Portable applications must not use range expressions, even though all implementations support them. The right-bracket (]) loses its special meaning and represents itself in a bracket expression if it occurs first in the list (after an initial circumflex (^), if any). Otherwise, it terminates the bracket expression, unless it appears in a collating symbol (such as [.]]) or is the ending right-bracket for a collating symbol, equivalence class, or character class. The special characters:             <div style="margin-left: 40px;"> <p style="text-align: center;">. * [ \</p> <p>(period, asterisk, left-bracket and backslash, respectively) lose their special meaning within a bracket expression.</p> <p>The character sequences:</p> <p style="text-align: center;">[. [= [:</p> <p>(left-bracket followed by a period, equals-sign, or colon) are special inside a bracket expression and are used to delimit collating symbols, equivalence class expressions, and character class expressions. These symbols must be followed by a valid expression and the matching terminating sequence .], =] or :], as described in the following items.</p> </div> </li> <li>2. A <i>matching list</i> expression specifies a list that matches any one of the expressions represented in the list. The first character in the list must not be the circumflex. For example, [abc] is an RE that matches any of the characters <b>a</b>, <b>b</b> or <b>c</b>.</li> </ol> |

3. A *non-matching list* expression begins with a circumflex (^), and specifies a list that matches any character or collating element except for the expressions represented in the list after the leading circumflex. For example, [^abc] is an RE that matches any character or collating element except the characters **a**, **b** or **c**. The circumflex will have this special meaning only when it occurs first in the list, immediately following the left-bracket.
4. A *collating symbol* is a collating element enclosed within bracket-period ([. .]) delimiters. Multi-character collating elements must be represented as collating symbols when it is necessary to distinguish them from a list of the individual characters that make up the multi-character collating element. For example, if the string **ch** is a collating element in the current collation sequence with the associated collating symbol <ch>, the expression [[.ch.]] will be treated as an RE matching the character sequence **ch**, while [ch] will be treated as an RE matching **c** or **h**. Collating symbols will be recognized only inside bracket expressions. This implies that the RE [[.ch.]]\***c** matches the first to fifth character in the string chchch. If the string is not a collating element in the current collating sequence definition, or if the collating element has no characters associated with it, the symbol will be treated as an invalid expression.
5. An *equivalence class expression* represents the set of collating elements belonging to an equivalence class. Only primary equivalence classes will be recognised. The class is expressed by enclosing any one of the collating elements in the equivalence class within bracket-equal ([= =]) delimiters. For example, if **a**, **à** and **â** belong to the same equivalence class, then [[=a=]b], [[=à=]b] and [[=â=]b] will each be equivalent to [aââb]. If the collating element does not belong to an equivalence class, the equivalence class expression will be treated as a *collating symbol*.
6. A *character class expression* represents the set of characters belonging to a character class, as defined in the LC\_CTYPE category in the current locale. All character classes specified in the current locale will be recognized. A character class expression is expressed as a character class name enclosed within bracket-colon ([: :]) delimiters.

The following character class expressions are supported in all locales:

|                  |                  |                  |                   |
|------------------|------------------|------------------|-------------------|
| <b>[:alnum:]</b> | <b>[:cntrl:]</b> | <b>[:lower:]</b> | <b>[:space:]</b>  |
| <b>[:alpha:]</b> | <b>[:digit:]</b> | <b>[:print:]</b> | <b>[:upper:]</b>  |
| <b>[:blank:]</b> | <b>[:graph:]</b> | <b>[:punct:]</b> | <b>[:xdigit:]</b> |

In addition, character class expressions of the form:

**[:name:]**

are recognized in those locales where the *name* keyword has been given a **character class** definition in the LC\_CTYPE category.

7. A *range expression* represents the set of collating elements that fall between two elements in the current collation sequence, inclusively. It is expressed as the starting point and the ending point separated by a hyphen (-).

Range expressions must not be used in portable applications because their behavior is dependent on the collating sequence. Ranges will be treated according to the current collating sequence, and include such characters that fall within the range based on that collating sequence, regardless of character values. This, however, means that the interpretation will differ depending on collating sequence. If, for instance, one collating sequence defines `ä` as a variant of `a`, while another defines it as a letter following `z`, then the expression `[ä-z]` is valid in the first language and invalid in the second.

In the following, all examples assume the collation sequence specified for the POSIX locale, unless another collation sequence is specifically defined.

The starting range point and the ending range point must be a collating element or collating symbol. An equivalence class expression used as a starting or ending point of a range expression produces unspecified results. An equivalence class can be used portably within a bracket expression, but only outside the range. For example, the unspecified expression `[=[e=]-f]` should be given as `[=[e=]e-f]`. The ending range point must collate equal to or higher than the starting range point; otherwise, the expression will be treated as invalid. The order used is the order in which the collating elements are specified in the current collation definition. One-to-many mappings (see `locale(5)`) will not be performed. For example, assuming that the character eszet (`ß`) is placed in the collation sequence after `r` and `s`, but before `t`, and that it maps to the sequence `ss` for collation purposes, then the expression `[r-s]` matches only `r` and `s`, but the expression `[s-t]` matches `s`, `ß` or `t`.

The interpretation of range expressions where the ending range point is also the starting range point of a subsequent range expression (for instance `[a-m-o]`) is undefined.

The hyphen character will be treated as itself if it occurs first (after an initial `^`, if any) or last in the list, or as an ending range point in a range expression. As examples, the expressions `[-ac]` and `[ac-]` are equivalent and match any of the characters `a`, `c`, or `-`; `[^ac]` and `[^ac-]` are equivalent and match any characters except `a`, `c`, or `-`; the expression `[%--]` matches any of the characters between `%` and `-` inclusive; the expression `[--@]` matches any of the characters between `-` and `@` inclusive; and the expression `[a--@]` is invalid, because the letter `a` follows the symbol `-` in the POSIX locale. To use a hyphen as the starting range point, it must either come first in the bracket expression or be specified as a collating symbol, for example: `[[[-.]0]`, which matches either a right bracket or any character or collating element that collates between hyphen and 0, inclusive.

If a bracket expression must specify both `-` and `]`, the `]` must be placed first (after the `^`, if any) and the `-` last within the bracket expression.

Note: Latin-1 characters such as `à` or `â` are not printable in some locales, for example, the `ja` locale.

**BREs Matching Multiple Characters**

The following rules can be used to construct BREs matching multiple characters from BREs matching a single character:

1. The concatenation of BREs matches the concatenation of the strings matched by each component of the BRE.
2. A *subexpression* can be defined within a BRE by enclosing it between the character pairs `\(` and `\)`. Such a subexpression matches whatever it would have matched without the `\(` and `\)`, except that anchoring within subexpressions is optional behavior; see **BRE Expression Anchoring**, below. Subexpressions can be arbitrarily nested.
3. The *back-reference* expression `\n` matches the same (possibly empty) string of characters as was matched by a subexpression enclosed between `\(` and `\)` preceding the `\n`. The character *n* must be a digit from 1 to 9 inclusive, *n*th subexpression (the one that begins with the *n*th `\(` and ends with the corresponding paired `\)`). The expression is invalid if less than *n* subexpressions precede the `\n`. For example, the expression `^(.*)\1$` matches a line consisting of two adjacent appearances of the same string, and the expression `\(a\) * \1` fails to match `a`. The limit of nine back-references to subexpressions in the RE is based on the use of a single digit identifier. This does not imply that only nine subexpressions are allowed in REs. The following is a valid BRE with ten subexpressions:

```
\(\(ab\) * c\) * d\) \(ef\) * \(gh\) \{2\) \(ij\) * \(kl\) * \(mn\) * \(op\) * \(qr\) *
```

4. When a BRE matching a single character, a subexpression or a back-reference is followed by the special character asterisk (`*`), together with that asterisk it matches what zero or more consecutive occurrences of the BRE would match. For example, `[ab]*` and `[ab][ab]` are equivalent when matching the string `ab`.
5. When a BRE matching a single character, a subexpression, or a back-reference is followed by an *interval expression* of the format `\{m\}`, `\{m,\}` or `\{m,n\}`, together with that interval expression it matches what repeated consecutive occurrences of the BRE would match. The values of *m* and *n* will be decimal integers in the range  $0 \leq m \leq n \leq \{\text{RE\_DUP\_MAX}\}$ , where *m* specifies the exact or minimum number of occurrences and *n* specifies the maximum number of occurrences. The expression `\{m\}` matches exactly *m* occurrences of the preceding BRE, `\{m,\}` matches at least *m* occurrences and `\{m,n\}` matches any number of occurrences between *m* and *n*, inclusive.  
  
For example, in the string `abababcccccd`, the BRE `c\{3\}` is matched by characters seven to nine, the BRE `\(ab\) \{4,\}` is not matched at all and the BRE `c\{1,3\}d` is matched by characters ten to thirteen.

The behavior of multiple adjacent duplication symbols (`*` and intervals) produces undefined results.

**BRE Precedence**

The order of precedence is as shown in the following table:

| BRE Precedence (from high to low) |                      |
|-----------------------------------|----------------------|
| collation-related bracket symbols | [= =] [: :] [. .]    |
| escaped characters                | \<special character> |
| bracket expression                | [ ]                  |
| subexpressions/back-references    | \( \) \n             |
| single-character-BRE duplication  | * \{m,n\}            |
| concatenation                     |                      |
| anchoring                         | ^ \$                 |

**BRE Expression Anchoring**

A BRE can be limited to matching strings that begin or end a line; this is called *anchoring*. The circumflex and dollar sign special characters will be considered BRE anchors in the following contexts:

1. A circumflex ( ^ ) is an anchor when used as the first character of an entire BRE. The implementation may treat circumflex as an anchor when used as the first character of a subexpression. The circumflex will anchor the expression to the beginning of a string; only sequences starting at the first character of a string will be matched by the BRE. For example, the BRE ^ab matches **ab** in the string **abcdef**, but fails to match in the string **cdefab**. A portable BRE must escape a leading circumflex in a subexpression to match a literal circumflex.
2. A dollar sign ( \$ ) is an anchor when used as the last character of an entire BRE. The implementation may treat a dollar sign as an anchor when used as the last character of a subexpression. The dollar sign will anchor the expression to the end of the string being matched; the dollar sign can be said to match the end-of-string following the last character.
3. A BRE anchored by both ^ and \$ matches only an entire string. For example, the BRE ^abcdef\$ matches strings consisting only of **abcdef**.
4. ^ and \$ are not special in subexpressions.

Note: The Solaris implementation does not support anchoring in BRE subexpressions.

**EXTENDED REGULAR EXPRESSIONS**

The rules specified for BREs apply to Extended Regular Expressions (EREs) with the following exceptions:

- The characters |, +, and ? have special meaning, as defined below.
- The { and } characters, when used as the duplication operator, are not preceded by backslashes. The constructs \{ and \} simply match the characters { and }, respectively.
- The back reference operator is not supported.
- Anchoring (^\$) is supported in subexpressions.

**EREs Matching a Single Character**

An ERE ordinary character, a special character preceded by a backslash, or a period matches a single character. A bracket expression matches a single character or a single collating element. An *ERE matching a single character* enclosed in parentheses matches the same as the ERE without parentheses would have matched.

**ERE Ordinary Characters**

An *ordinary character* is an ERE that matches itself. An ordinary character is any character in the supported character set, except for the ERE special characters listed in **ERE Special Characters** below. The interpretation of an ordinary character preceded by a backslash (\) is undefined.

**ERE Special Characters**

An *ERE special character* has special properties in certain contexts. Outside those contexts, or when preceded by a backslash, such a character is an ERE that matches the special character itself. The extended regular expression special characters and the contexts in which they have their special meaning are:

- . [ \ (     The period, left-bracket, backslash and left-parenthesis are special except when used in a bracket expression (see **RE Bracket Expression**, above). Outside a bracket expression, a left-parenthesis immediately followed by a right-parenthesis produces undefined results.
- )           The right-parenthesis is special when matched with a preceding left-parenthesis, both outside a bracket expression.
- \* + ? {     The asterisk, plus-sign, question-mark and left-brace are special except when used in a bracket expression (see **RE Bracket Expression**, above). Any of the following uses produce undefined results:
  - if these characters appear first in an ERE, or immediately following a vertical-line, circumflex or left-parenthesis
  - if a left-brace is not part of a valid interval expression.
- |            The vertical-line is special except when used in a bracket expression (see **RE Bracket Expression**, above). A vertical-line appearing first or last in an ERE, or immediately following a vertical-line or a left-parenthesis, or immediately preceding a right-parenthesis, produces undefined results.
- ^            The circumflex is special when used:
  - as an anchor (see **ERE Expression Anchoring**, below).
  - as the first character of a bracket expression (see **RE Bracket Expression**, above).
- \$            The dollar sign is special when used as an anchor.

**Periods in EREs**

A period (.), when used outside a bracket expression, is an ERE that matches any character in the supported character set except NUL.

**ERE Bracket Expression**

The rules for ERE Bracket Expressions are the same as for Basic Regular Expressions; see **RE Bracket Expression**, above).

**EREs Matching  
Multiple Characters**

The following rules will be used to construct EREs matching multiple characters from EREs matching a single character:

1. A *concatenation of EREs* matches the concatenation of the character sequences matched by each component of the ERE. A concatenation of EREs enclosed in parentheses matches whatever the concatenation without the parentheses matches. For example, both the ERE **cd** and the ERE **(cd)** are matched by the third and fourth character of the string **abcdefabcdef**.
2. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character plus-sign (+), together with that plus-sign it matches what one or more consecutive occurrences of the ERE would match. For example, the ERE **b+(bc)** matches the fourth to seventh characters in the string **acabbbbcde**; **[ab] +** and **[ab][ab]\*** are equivalent.
3. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character asterisk (\*), together with that asterisk it matches what zero or more consecutive occurrences of the ERE would match. For example, the ERE **b\*c** matches the first character in the string **cabbbbcde**, and the ERE **b\*cd** matches the third to seventh characters in the string **cabbbbcdebbbbbbcdcb**. And, **[ab]\*** and **[ab][ab]** are equivalent when matching the string **ab**.
4. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character question-mark (?), together with that question-mark it matches what zero or one consecutive occurrences of the ERE would match. For example, the ERE **b?c** matches the second character in the string **acabbbbcde**.
5. When an ERE matching a single character or an ERE enclosed in parentheses is followed by an *interval expression* of the format **{m}**, **{m,}** or **{m,n}**, together with that interval expression it matches what repeated consecutive occurrences of the ERE would match. The values of *m* and *n* will be decimal integers in the range  $0 \leq m \leq n \leq \{\text{RE\_DUP\_MAX}\}$ , where *m* specifies the exact or minimum number of occurrences and *n* specifies the maximum number of occurrences. The expression **{m}** matches exactly *m* occurrences of the preceding ERE, **{m,}** matches at least *m* occurrences and **{m,n}** matches any number of occurrences between *m* and *n*, inclusive.

For example, in the string **abababcccccd** the ERE **c{3}** is matched by characters seven to nine and the ERE **(ab){2,}** is matched by characters one to six.

The behavior of multiple adjacent duplication symbols (+, \*, ? and intervals) produces undefined results.

**ERE Alternation**

Two EREs separated by the special character vertical-line (|) match a string that is matched by either. For example, the ERE **a(bc|d)** matches the string **abc** and the string **ad**. Single characters, or expressions matching single characters, separated by the vertical bar and enclosed in parentheses, will be treated as an ERE matching a single character.

**ERE Precedence**

The order of precedence will be as shown in the following table:

| ERE Precedence (from high to low) |                      |
|-----------------------------------|----------------------|
| collation-related bracket symbols | [= =] [: :] [ . .]   |
| escaped characters                | \<special character> |
| bracket expression                | [ ]                  |
| grouping                          | ( )                  |
| single-character-ERE duplication  | * + ? {m,n}          |
| concatenation                     |                      |
| anchoring                         | ^ \$                 |
| alternation                       |                      |

For example, the ERE **abba | cde** matches either the string **abba** or the string **cde** (rather than the string **abbade** or **abbcde**, because concatenation has a higher order of precedence than alternation).

**ERE Expression Anchoring**

An ERE can be limited to matching strings that begin or end a line; this is called *anchoring*. The circumflex and dollar sign special characters are considered ERE anchors when used anywhere outside a bracket expression. This has the following effects:

1. A circumflex ( **^** ) outside a bracket expression anchors the expression or subexpression it begins to the beginning of a string; such an expression or subexpression can match only a sequence starting at the first character of a string. For example, the EREs **^ab** and **(^ab)** match **ab** in the string **abcdef**, but fail to match in the string **cdefab**, and the ERE **a^b** is valid, but can never match because the **a** prevents the expression **^b** from matching starting at the first character.
2. A dollar sign ( **\$** ) outside a bracket expression anchors the expression or subexpression it ends to the end of a string; such an expression or subexpression can match only a sequence ending at the last character of a string. For example, the EREs **ef\$** and **(ef\$)** match **ef** in the string **abcdef**, but fail to match in the string **cdefab**, and the ERE **e\$f** is valid, but can never match because the **f** prevents the expression **e\$** from matching ending at the last character.

|----------------------------------|--|
| <b>NAME</b>                      | regex, compile, step, advance – simple regular expression compile and match routines   |
| <b>SYNOPSIS</b>                  | <pre> <b>#define</b> INIT <i>declarations</i> <b>#define</b> GETC(<b>void</b>) <i>getc code</i> <b>#define</b> PEEKC(<b>void</b>) <i>peekc code</i> <b>#define</b> UNGETC(<b>void</b>) <i>ungetc code</i> <b>#define</b> RETURN(<i>ptr</i>) <i>return code</i> <b>#define</b> ERROR(<i>val</i>) <i>error code</i>  <b>#include</b> &lt;regex.h&gt;  <b>char</b> *compile(<b>char</b> *instring, <b>char</b> *expbuf, <b>const char</b> *endbuf, <b>int</b> eof); <b>int</b> step(<b>const char</b> *string, <b>const char</b> *expbuf); <b>int</b> advance(<b>const char</b> *string, <b>const char</b> *expbuf); <b>extern char</b> *loc1, *loc2, *locs;         </pre>   |
| <b>DESCRIPTION</b>               | <p>Regular Expressions (REs) provide a mechanism to select specific strings from a set of character strings. The Simple Regular Expressions described below differ from the Internationalized Regular Expressions described on the <b>regex(5)</b> manual page in the following ways:</p> <ul style="list-style-type: none"> <li>• only Basic Regular Expressions are supported</li> <li>• the Internationalization features—character class, equivalence class, and multi-character collation—are not supported.</li> </ul> <p>The functions <b>step()</b>, <b>advance()</b>, and <b>compile()</b> are general purpose regular expression matching routines to be used in programs that perform regular expression matching. These functions are defined by the <b>&lt;regex.h&gt;</b> header.</p> <p>The functions <b>step()</b> and <b>advance()</b> do pattern matching given a character string and a compiled regular expression as input.</p> <p>The function <b>compile()</b> takes as input a regular expression as defined below and produces a compiled expression that can be used with <b>step()</b> or <b>advance()</b>.</p> |
| <b>Basic Regular Expressions</b> | <p>A regular expression specifies a set of character strings. A member of this set of strings is said to be matched by the regular expression. Some characters have special meaning when used in a regular expression; other characters stand for themselves.</p> <p>The following <i>one-character REs</i> match a <i>single</i> character:</p> <ol style="list-style-type: none"> <li>1.1 An ordinary character (<i>not</i> one of those discussed in 1.2 below) is a one-character RE that matches itself.</li> <li>1.2 A backslash (\) followed by any special character is a one-character RE that matches the special character itself. The special characters are:             <ol style="list-style-type: none"> <li>a. ., *, [, and \ (period, asterisk, left square bracket, and backslash, respectively), which are always special, <i>except</i> when they appear within square brackets ([]; see 1.4 below).</li> </ol> </li> </ol>   |

- b. `^` (caret or circumflex), which is special at the *beginning* of an *entire* RE (see 4.1 and 4.3 below), or when it immediately follows the left of a pair of square brackets (`[]`) (see 1.4 below).
  - c. `$` (dollar sign), which is special at the **end** of an *entire* RE (see 4.2 below).
  - d. The character used to bound (that is, delimit) an entire RE, which is special for that RE (for example, see how slash (`/`) is used in the `g` command, below.)
- 1.3 A period (`.`) is a one-character RE that matches any character except new-line.
- 1.4 A non-empty string of characters enclosed in square brackets (`[]`) is a one-character RE that matches *any one* character in that string. If, however, the first character of the string is a circumflex (`^`), the one-character RE matches any character *except* new-line and the remaining characters in the string. The `^` has this special meaning *only* if it occurs first in the string. The minus (`-`) may be used to indicate a range of consecutive characters; for example, `[0-9]` is equivalent to `[0123456789]`. The `-` loses this special meaning if it occurs first (after an initial `^`, if any) or last in the string. The right square bracket (`]`) does not terminate such a string when it is the first character within it (after an initial `^`, if any); for example, `[]a-f]` matches either a right square bracket (`]`) or one of the ASCII letters `a` through `f` inclusive. The four characters listed in 1.2.a above stand for themselves within such a string of characters.

The following rules may be used to construct REs from one-character REs:

- 2.1 A one-character RE is a RE that matches whatever the one-character RE matches.
- 2.2 A one-character RE followed by an asterisk (`*`) is a RE that matches **0** or more occurrences of the one-character RE. If there is any choice, the longest leftmost string that permits a match is chosen.
- 2.3 A one-character RE followed by `\{m\}`, `\{m,\}`, or `\{m,n\}` is a RE that matches a *range* of occurrences of the one-character RE. The values of *m* and *n* must be non-negative integers less than 256; `\{m\}` matches *exactly* *m* occurrences; `\{m,\}` matches *at least* *m* occurrences; `\{m,n\}` matches *any number* of occurrences *between* *m* and *n* inclusive. Whenever a choice exists, the RE matches as many occurrences as possible.
- 2.4 The concatenation of REs is a RE that matches the concatenation of the strings matched by each component of the RE.
- 2.5 A RE enclosed between the character sequences `\(` (and `\)`) is a RE that matches whatever the unadorned RE matches.
- 2.6 The expression `\n` matches the same string of characters as was matched by an expression enclosed between `\(` (and `\)`) *earlier* in the same RE. Here *n* is a digit; the sub-expression specified is that beginning with the *n*-th occurrence of `\(` (counting from the left. For example, the expression `^\(.*\)\ 1$` matches a line consisting of two repeated appearances of the same string.

A RE may be constrained to match words.

- 3.1 \< constrains a RE to match the beginning of a string or to follow a character that is not a digit, underscore, or letter. The first character matching the RE must be a digit, underscore, or letter.
- 3.2 \> constrains a RE to match the end of a string or to precede a character that is not a digit, underscore, or letter.

An *entire RE* may be constrained to match only an initial segment or final segment of a line (or both).

- 4.1 A circumflex (^) at the beginning of an entire RE constrains that RE to match an *initial* segment of a line.
- 4.2 A dollar sign (\$) at the end of an entire RE constrains that RE to match a *final* segment of a line.
- 4.3 The construction *entire RE*\$ constrains the entire RE to match the entire line.

The null RE (for example, //) is equivalent to the last RE encountered.

### Addressing with REs

Addresses are constructed as follows:

- 1. The character "." addresses the current line.
- 2. The character "\$" addresses the last line of the buffer.
- 3. A decimal number *n* addresses the *n*-th line of the buffer.
- 4. 'x addresses the line marked with the mark name character *x*, which must be an ASCII lower-case letter (a-z). Lines are marked with the **k** command described below.
- 5. A RE enclosed by slashes (/) addresses the first line found by searching *forward* from the line *following* the current line toward the end of the buffer and stopping at the first line containing a string matching the RE. If necessary, the search wraps around to the beginning of the buffer and continues up to and including the current line, so that the entire buffer is searched.
- 6. A RE enclosed in question marks (?) addresses the first line found by searching *backward* from the line *preceding* the current line toward the beginning of the buffer and stopping at the first line containing a string matching the RE. If necessary, the search wraps around to the end of the buffer and continues up to and including the current line.
- 7. An address followed by a plus sign (+) or a minus sign (-) followed by a decimal number specifies that address plus (respectively minus) the indicated number of lines. A shorthand for .+5 is .5.
- 8. If an address begins with + or -, the addition or subtraction is taken with respect to the current line; for example, -5 is understood to mean .-5.
- 9. If an address ends with + or -, then 1 is added to or subtracted from the address, respectively. As a consequence of this rule and of Rule 8, immediately above, the address - refers to the line preceding the current line. (To maintain compatibility with earlier versions of the editor, the character ^ in addresses is entirely

- equivalent to `—`.) Moreover, trailing `+` and `-` characters have a cumulative effect, so `—` refers to the current line less 2.
10. For convenience, a comma (,) stands for the address pair `1,$`, while a semicolon (;) stands for the pair `.,$`.

**Characters With Special Meaning**

Characters that have special meaning except when they appear within square brackets ([]) or are preceded by `\` are: `.`, `*`, `[`, `\`. Other special characters, such as `$` have special meaning in more restricted contexts.

The character `^` at the beginning of an expression permits a successful match only immediately after a newline, and the character `$` at the end of an expression requires a trailing newline.

Two characters have special meaning only when used within square brackets. The character `-` denotes a range, `[c-c]`, unless it is just after the open bracket or before the closing bracket, `[-c]` or `[c-]` in which case it has no special meaning. When used within brackets, the character `^` has the meaning *complement of* if it immediately follows the open bracket (example: `[^c]`); elsewhere between brackets (example: `[c^]`) it stands for the ordinary character `^`.

The special meaning of the `\` operator can be escaped only by preceding it with another `\`, for example `\\`.

**Macros**

Programs must have the following five macros declared before the `#include <regex.h>` statement. These macros are used by the `compile()` routine. The macros `GETC`, `PEEKC`, and `UNGETC` operate on the regular expression given as input to `compile()`.

**GETC** This macro returns the value of the next character (byte) in the regular expression pattern. Successive calls to `GETC` should return successive characters of the regular expression.

**PEEKC** This macro returns the next character (byte) in the regular expression. Immediately successive calls to `PEEKC` should return the same character, which should also be the next character returned by `GETC`.

**UNGETC** This macro causes the argument `c` to be returned by the next call to `GETC` and `PEEKC`. No more than one character of pushback is ever needed and this character is guaranteed to be the last character read by `GETC`. The return value of the macro `UNGETC(c)` is always ignored.

**RETURN(ptr)** This macro is used on normal exit of the `compile()` routine. The value of the argument `ptr` is a pointer to the character after the last character of the compiled regular expression. This is useful to programs which have memory allocation to manage.

**ERROR(val)** This macro is the abnormal return from the `compile()` routine. The argument `val` is an error number (see ERRORS below for meanings). This call should never return.

|                          |   |
|--------------------------|---|
| <b>compile()</b>         | <p>The syntax of the <b>compile()</b> routine is as follows:</p> <p style="text-align: center;"><b>compile</b>(<i>instr</i>, <i>expbuf</i>, <i>endbuf</i>, <i>eof</i>)</p> <p>The first parameter, <i>instr</i>, is never used explicitly by the <b>compile()</b> routine but is useful for programs that pass down different pointers to input characters. It is sometimes used in the <b>INIT</b> declaration (see below). Programs which call functions to input characters or have characters in an external array can pass down a value of (<b>char *</b>)<b>0</b> for this parameter.</p> <p>The next parameter, <i>expbuf</i>, is a character pointer. It points to the place where the compiled regular expression will be placed.</p> <p>The parameter <i>endbuf</i> is one more than the highest address where the compiled regular expression may be placed. If the compiled expression cannot fit in (<b>endbuf-expbuf</b>) bytes, a call to <b>ERROR(50)</b> is made.</p> <p>The parameter <i>eof</i> is the character which marks the end of the regular expression. This character is usually a <b>/</b>.</p> <p>Each program that includes the <b>&lt;regex.h&gt;</b> header file must have a <b>#define</b> statement for <b>INIT</b>. It is used for dependent declarations and initializations. Most often it is used to set a register variable to point to the beginning of the regular expression so that this register variable can be used in the declarations for <b>GETC</b>, <b>PEEKC</b>, and <b>UNGETC</b>. Otherwise it can be used to declare external variables that might be used by <b>GETC</b>, <b>PEEKC</b> and <b>UNGETC</b>. (See <b>EXAMPLES</b> below.)</p>   |
| <b>step(), advance()</b> | <p>The first parameter to the <b>step()</b> and <b>advance()</b> functions is a pointer to a string of characters to be checked for a match. This string should be null terminated.</p> <p>The second parameter, <i>expbuf</i>, is the compiled regular expression which was obtained by a call to the function <b>compile()</b>.</p> <p>The function <b>step()</b> returns non-zero if some substring of <i>string</i> matches the regular expression in <i>expbuf</i> and <b>0</b> if there is no match. If there is a match, two external character pointers are set as a side effect to the call to <b>step()</b>. The variable <b>loc1</b> points to the first character that matched the regular expression; the variable <b>loc2</b> points to the character after the last character that matches the regular expression. Thus if the regular expression matches the entire input string, <b>loc1</b> will point to the first character of <i>string</i> and <b>loc2</b> will point to the null at the end of <i>string</i>.</p> <p>The function <b>advance()</b> returns non-zero if the initial substring of <i>string</i> matches the regular expression in <i>expbuf</i>. If there is a match, an external character pointer, <b>loc2</b>, is set as a side effect. The variable <b>loc2</b> points to the next character in <i>string</i> after the last character that matched.</p> <p>When <b>advance()</b> encounters a <b>*</b> or <b>\{ \}</b> sequence in the regular expression, it will advance its pointer to the string to be matched as far as possible and will recursively call itself trying to match the rest of the string to the rest of the regular expression. As long as there is no match, <b>advance()</b> will back up along the string until it finds a match or reaches the point in the string that initially matched the <b>*</b> or <b>\{ \}</b>. It is sometimes desirable to stop this backing up before the initial point in the string is reached. If the external</p> |

character pointer **locs** is equal to the point in the string at sometime during the backing up process, **advance()** will break out of the loop that backs up and will return zero.

The external variables **circf**, **sed**, and **nbra** are reserved.

**EXAMPLES**

The following is an example of how the regular expression macros and calls might be defined by an application program:

```
#define INIT      register char *sp = instring;
#define GETC      (*sp++)
#define PEEKC     (*sp)
#define UNGETC(c) (--sp)
#define RETURN(*c) return;
#define ERROR(c)  regerr

#include <regex.h>

...
(void) compile(*argv, expbuf, &expbuf[ESIZE], '\0');
...
if (step(linebuf, expbuf))
    succeed;
```

**DIAGNOSTICS**

The function **compile()** uses the macro **RETURN** on success and the macro **ERROR** on failure (see above). The functions **step()** and **advance()** return non-zero on a successful match and zero if there is no match. Errors are:

- 11 range endpoint too large.
- 16 bad number.
- 25 \ *digit* out of range.
- 36 illegal or missing delimiter.
- 41 no remembered search string.
- 42 \( \) imbalance.
- 43 too many \(.
- 44 more than 2 numbers given in \{ \}.
- 45 } expected after \.
- 46 first number exceeds second in \{ \}.
- 49 [ ] imbalance.
- 50 regular expression overflow.

| <b>SYNOPSIS</b>    | <b>#include &lt;siginfo.h&gt;</b>   |                |  |               |  |                 |  |                 |   |                   |  |                 |  |
| <b>DESCRIPTION</b> | <p>If a process is catching a signal, it may request information that tells why the system generated that signal (see <b>sigaction(2)</b>). If a process is monitoring its children, it may receive information that tells why a child changed state (see <b>waitid(2)</b>). In either case, the system returns the information in a structure of type <b>siginfo_t</b>, which includes the following information:</p> <pre> int          si_signo    /* signal number */ int          si_errno    /* error number */ int          si_code     /* signal code */ union signal si_value    /* signal value */     </pre> <p><b>si_signo</b> contains the system-generated signal number. For the <b>waitid(2)</b> function, <b>si_signo</b> is always <b>SIGCHLD</b>.</p> <p>If <b>si_errno</b> is non-zero, it contains an error number associated with this signal, as defined in <b>&lt;errno.h&gt;</b>.</p> <p><b>si_code</b> contains a code identifying the cause of the signal.</p> <p>If the value of the <b>si_code</b> member is <b>SI_NOINFO</b>, only the <b>si_signo</b> member of <b>siginfo_t</b> is meaningful, and the value of all other members is unspecified.</p> <p><b>User Signals</b></p> <p>If the value of <b>si_code</b> is less than or equal to 0, then the signal was generated by a user process (see <b>kill(2)</b>, <b>_lwp_kill(2)</b>, <b>sigqueue(3R)</b>, <b>sigsend(2)</b>, <b>abort(3C)</b>, and <b>raise(3C)</b>) and the <b>siginfo</b> structure contains the following additional information:</p> <pre> typedef long pid_t  si_pid    /* sending process ID */ typedef long uid_t  si_uid    /* sending user ID */     </pre> <p>If the signal was generated by a user process, the following values are defined for <b>si_code</b>:</p> <table border="0"> <tr> <td style="padding-right: 20px;"><b>SI_USER</b></td> <td>the implementation sets <b>si_code</b> to <b>SI_USER</b> if the signal was sent by <b>kill(2)</b>, <b>sigsend(2)</b>, <b>raise(3C)</b> or <b>abort(3C)</b>.</td> </tr> <tr> <td><b>SI_LWP</b></td> <td>the signal was sent by <b>_lwp_kill(2)</b>.</td> </tr> <tr> <td><b>SI_QUEUE</b></td> <td>the signal was sent by <b>sigqueue(3R)</b>.</td> </tr> <tr> <td><b>SI_TIMER</b></td> <td>the signal was generated by the expiration of a timer created by <b>timer_settime(3R)</b>.</td> </tr> <tr> <td><b>SI_ASYNCIO</b></td> <td>the signal was generated by the completion of an asynchronous I/O request.</td> </tr> <tr> <td><b>SI_MESGQ</b></td> <td>the signal was generated by the arrival of a message on an empty message queue. (see <b>mq_notify(3R)</b>).</td> </tr> </table> | <b>SI_USER</b> | the implementation sets <b>si_code</b> to <b>SI_USER</b> if the signal was sent by <b>kill(2)</b> , <b>sigsend(2)</b> , <b>raise(3C)</b> or <b>abort(3C)</b> . | <b>SI_LWP</b> | the signal was sent by <b>_lwp_kill(2)</b> . | <b>SI_QUEUE</b> | the signal was sent by <b>sigqueue(3R)</b> . | <b>SI_TIMER</b> | the signal was generated by the expiration of a timer created by <b>timer_settime(3R)</b> . | <b>SI_ASYNCIO</b> | the signal was generated by the completion of an asynchronous I/O request. | <b>SI_MESGQ</b> | the signal was generated by the arrival of a message on an empty message queue. (see <b>mq_notify(3R)</b> ). |
| <b>SI_USER</b>     | the implementation sets <b>si_code</b> to <b>SI_USER</b> if the signal was sent by <b>kill(2)</b> , <b>sigsend(2)</b> , <b>raise(3C)</b> or <b>abort(3C)</b> .  |                |  |               |  |                 |  |                 |   |                   |  |                 |  |
| <b>SI_LWP</b>      | the signal was sent by <b>_lwp_kill(2)</b> .  |                |  |               |  |                 |  |                 |   |                   |  |                 |  |
| <b>SI_QUEUE</b>    | the signal was sent by <b>sigqueue(3R)</b> .  |                |  |               |  |                 |  |                 |   |                   |  |                 |  |
| <b>SI_TIMER</b>    | the signal was generated by the expiration of a timer created by <b>timer_settime(3R)</b> .   |                |  |               |  |                 |  |                 |   |                   |  |                 |  |
| <b>SI_ASYNCIO</b>  | the signal was generated by the completion of an asynchronous I/O request.  |                |  |               |  |                 |  |                 |   |                   |  |                 |  |
| <b>SI_MESGQ</b>    | the signal was generated by the arrival of a message on an empty message queue. (see <b>mq_notify(3R)</b> ).  |                |  |               |  |                 |  |                 |   |                   |  |                 |  |

**si\_value** contains the application specified value, which is passed to the application's signal-catching function at the time of the signal delivery, if **si\_code** is any of **SI\_QUEUE**, **SI\_TIMER**, **SI\_ASYNCIO**, or **SI\_MESGQ**.

### System Signals

Otherwise, **si\_code** contains a positive value reflecting the reason why the system generated the signal:

| Signal         | Code                 | Reason                                |
|----------------|----------------------|---------------------------------------|
| <b>SIGILL</b>  | <b>ILL_ILLOPC</b>    | illegal opcode                        |
|                | <b>ILL_ILLOPN</b>    | illegal operand                       |
|                | <b>ILL_ILLADR</b>    | illegal addressing mode               |
|                | <b>ILL_ILLTRP</b>    | illegal trap                          |
|                | <b>ILL_PRVOPC</b>    | privileged opcode                     |
|                | <b>ILL_PRVREG</b>    | privileged register                   |
|                | <b>ILL_COPROC</b>    | co-processor error                    |
|                | <b>ILL_BADSTK</b>    | internal stack error                  |
| <b>SIGFPE</b>  | <b>FPE_INTDIV</b>    | integer divide by zero                |
|                | <b>FPE_INTOVF</b>    | integer overflow                      |
|                | <b>FPE_FLTDIV</b>    | floating point divide by zero         |
|                | <b>FPE_FLTOVF</b>    | floating point overflow               |
|                | <b>FPE_FLTUND</b>    | floating point underflow              |
|                | <b>FPE_FLTRES</b>    | floating point inexact result         |
|                | <b>FPE_FLTINV</b>    | invalid floating point operation      |
|                | <b>FPE_FLTSUB</b>    | subscript out of range                |
| <b>SIGSEGV</b> | <b>SEGV_MAPERR</b>   | address not mapped to object          |
|                | <b>SEGV_ACCERR</b>   | invalid permissions for mapped object |
| <b>SIGBUS</b>  | <b>BUS_ADRALN</b>    | invalid address alignment             |
|                | <b>BUS_ADRERR</b>    | non-existent physical address         |
|                | <b>BUS_OBJERR</b>    | object specific hardware error        |
| <b>SIGTRAP</b> | <b>TRAP_BRKPT</b>    | process breakpoint                    |
|                | <b>TRAP_TRACE</b>    | process trace trap                    |
| <b>SIGCHLD</b> | <b>CLD_EXITED</b>    | child has exited                      |
|                | <b>CLD_KILLED</b>    | child was killed                      |
|                | <b>CLD_DUMPED</b>    | child terminated abnormally           |
|                | <b>CLD_TRAPPED</b>   | traced child has trapped              |
|                | <b>CLD_STOPPED</b>   | child has stopped                     |
|                | <b>CLD_CONTINUED</b> | stopped child had continued           |
| <b>SIGPOLL</b> | <b>POLL_IN</b>       | data input available                  |
|                | <b>POLL_OUT</b>      | output buffers available              |
|                | <b>POLL_MSG</b>      | input message available               |
|                | <b>POLL_ERR</b>      | I/O error                             |
|                | <b>POLL_PRI</b>      | high priority input available         |
|                | <b>POLL_HUP</b>      | device disconnected                   |

In addition, the following signal-dependent information is available for kernel-generated signals:

| Signal                          | Field                                       | Value  |
|---------------------------------|---|--|
| <b>SIGILL</b><br><b>SIGFPE</b>  | <b>caddr_t si_addr</b>                      | address of faulting instruction                                      |
| <b>SIGSEGV</b><br><b>SIGBUS</b> | <b>caddr_t si_addr</b>                      | address of faulting memory reference                                 |
| <b>SIGCHLD</b>                  | <b>pid_t si_pid</b><br><b>int si_status</b> | child process ID<br>exit value or signal                             |
| <b>SIGPOLL</b>                  | <b>long si_band</b>                         | band event for <b>POLL_IN</b> , <b>POLL_OUT</b> , or <b>POLL_MSG</b> |

**SEE ALSO** [\\_lwp\\_kill\(2\)](#), [kill\(2\)](#), [sigaction\(2\)](#), [sigsend\(2\)](#), [waitid\(2\)](#), [abort\(3C\)](#), [raise\(3C\)](#), [aio\\_read\(3R\)](#), [mq\\_notify\(3R\)](#), [sigqueue\(3R\)](#), [timer\\_create\(3R\)](#), [timer\\_settime\(3R\)](#), [signal\(5\)](#)

**NOTES** For **SIGCHLD** signals, if **si\_code** is equal to **CLD\_EXITED**, then **si\_status** is equal to the exit value of the process; otherwise, it is equal to the signal that caused the process to change state. For some implementations, the exact value of **si\_addr** may not be available; in that case, **si\_addr** is guaranteed to be on the same page as the faulting instruction or memory reference.

|------------------------|--|
| <b>NAME</b>            | signal – base signals  |
| <b>SYNOPSIS</b>        | <b>#include &lt;signal.h&gt;</b>   |
| <b>DESCRIPTION</b>     | <p>A signal is an asynchronous notification of an event. A signal is said to be generated for (or sent to) a process when the event associated with that signal first occurs. Examples of such events include hardware faults, timer expiration and terminal activity, as well as the invocation of the <b>kill(2)</b> or <b>sigsend(2)</b> functions. In some circumstances, the same event generates signals for multiple processes. A process may request a detailed notification of the source of the signal and the reason why it was generated (see <b>siginfo(5)</b>).</p> <p>Signals can be generated synchronously or asynchronously. Events directly caused by the execution of code by a thread, such as a reference to an unmapped, protected, or bad memory can generate <b>SIGSEGV</b> or <b>SIGBUS</b>; a floating point exception can generate <b>SIGFPE</b>; and the execution of an illegal instruction can generate <b>SIGILL</b>. Such events are referred to as traps; signals generated by traps are said to be synchronously generated. Synchronously generated signals are initiated by a specific thread and are delivered to and handled by that thread.</p> <p>Signals may also be generated by calling <b>kill()</b>, <b>sigqueue()</b>, or <b>sigsend()</b>. Events such as keyboard interrupts generate signals, such as <b>SIGINT</b>, which are sent to the target process. Such events are referred to as interrupts; signals generated by interrupts are said to be asynchronously generated. Asynchronously generated signals are not directed to a particular thread but are handled by an arbitrary thread that meets either of the following conditions:</p> <ul style="list-style-type: none"> <li>• The thread is blocked in a call to <b>sigwait(2)</b> whose argument includes the type of signal generated.</li> <li>• The thread has a signal mask that does not include the type of signal generated.</li> </ul> <p>A process responds to signals in similar ways whether it is using threads (see <b>thr_create(3T)</b>) or it is using lightweight processes (LWPs). Each process may specify a system action to be taken in response to each signal sent to it, called the signal's disposition. All threads or LWPs in the process share the disposition. The set of system signal actions for a process is initialized from that of its parent. Once an action is installed for a specific signal, it usually remains installed until another disposition is explicitly requested by a call to either <b>sigaction()</b>, <b>signal()</b> or <b>sigset()</b>, or until the process <b>execs()</b> (see <b>sigaction(2)</b> and <b>signal(3C)</b>). When a process <b>execs</b>, all signals whose disposition has been set to catch the signal will be set to <b>SIG_DFL</b>. Alternatively, a process may request that the system automatically reset the disposition of a signal to <b>SIG_DFL</b> after it has been caught (see <b>sigaction(2)</b> and <b>signal(3C)</b>).</p> |
| <b>SIGNAL DELIVERY</b> | <p>A signal is said to be delivered to a process when a thread or LWP within the process takes the appropriate action for the disposition of the signal. Delivery of a signal can be blocked. There are two methods for handling delivery of a signal in a multithreaded application. The first method specifies a signal handler function to execute when the signal is received by the process (see <b>sigaction(2)</b>). The second method creates a thread to</p>  |

handle the receipt of the signal (see **sigwait(2)**). **sigaction()** can be used for both synchronously and asynchronously generated signals. **sigwait()** will only work for asynchronously generated signals, as synchronously generated signals are sent to the thread that caused the event. **sigwait()** is the recommended interface for use with a multithreaded application.

**SIGNAL MASK**

Each thread or LWP has a signal mask (see **thr\_sigsetmask(3T)** or **sigprocmask(2)**) that defines the set of signals currently blocked from delivery to it. The signal mask of the main thread or LWP is inherited from the signal mask of the thread or LWP that created it in the parent process. The selection of the thread or LWP within the process that is to take the appropriate action for the signal is based on the method of signal generation and the signal masks of the threads or LWPs in the receiving process. Signals that are generated by action of a particular thread or LWP such as hardware faults are delivered to the thread or LWP that caused the signal. Also, see **alarm(2)** for current semantics of delivery of **SIGALRM**. Signals that are directed to a particular thread or LWP (see **thr\_kill(3T)** or **\_lwp\_kill(2)**) are delivered to the targeted thread or LWP. If the selected thread or LWP has blocked the signal, it remains pending on the thread or LWP until it is unblocked. For all other types of signal generation (for example, **kill(2)**, **sigsend(2)**, terminal activity, and other external events not ascribable to a particular thread or LWP) one of the threads or LWPs that does not have the signal blocked is selected to process the signal. If all the threads or LWPs within the process block the signal, it remains pending on the process until a thread or LWP in the process unblocks it. If the action associated with a signal is set to ignore the signal then both currently pending and subsequently generated signals of this type are discarded immediately for this process.

The determination of which action is taken in response to a signal is made at the time the signal is delivered to a thread or LWP within the process, allowing for any changes since the time of generation. This determination is independent of the means by which the signal was originally generated.

The signals currently defined by **<signal.h>** are as follows:

| Name           | Value | Default | Event                              |
|----------------|-------|---------|------------------------------------|
| <b>SIGHUP</b>  | 1     | Exit    | Hangup (see <b>termio(7I)</b> )    |
| <b>SIGINT</b>  | 2     | Exit    | Interrupt (see <b>termio(7I)</b> ) |
| <b>SIGQUIT</b> | 3     | Core    | Quit (see <b>termio(7I)</b> )      |
| <b>SIGILL</b>  | 4     | Core    | Illegal Instruction                |
| <b>SIGTRAP</b> | 5     | Core    | Trace or Breakpoint Trap           |
| <b>SIGABRT</b> | 6     | Core    | Abort                              |
| <b>SIGEMT</b>  | 7     | Core    | Emulation Trap                     |
| <b>SIGFPE</b>  | 8     | Core    | Arithmetic Exception               |
| <b>SIGKILL</b> | 9     | Exit    | Killed                             |
| <b>SIGBUS</b>  | 10    | Core    | Bus Error                          |
| <b>SIGSEGV</b> | 11    | Core    | Segmentation Fault                 |
| <b>SIGSYS</b>  | 12    | Core    | Bad System Call                    |
| <b>SIGPIPE</b> | 13    | Exit    | Broken Pipe                        |
| <b>SIGALRM</b> | 14    | Exit    | Alarm Clock                        |
| <b>SIGTERM</b> | 15    | Exit    | Terminated                         |

|                     |    |        |   |
|---------------------|----|--------|---|
| <b>SIGUSR1</b>      | 16 | Exit   | User Signal 1                                       |
| <b>SIGUSR2</b>      | 17 | Exit   | User Signal 2                                       |
| <b>SIGCHLD</b>      | 18 | Ignore | Child Status Changed                                |
| <b>SIGPWR</b>       | 19 | Ignore | Power Fail or Restart                               |
| <b>SIGWINCH</b>     | 20 | Ignore | Window Size Change                                  |
| <b>SIGURG</b>       | 21 | Ignore | Urgent Socket Condition                             |
| <b>SIGPOLL</b>      | 22 | Exit   | Pollable Event (see <b>streamio(7I)</b> )           |
| <b>SIGSTOP</b>      | 23 | Stop   | Stopped (signal)                                    |
| <b>SIGTSTP</b>      | 24 | Stop   | Stopped (user) (see <b>termio(7I)</b> )             |
| <b>SIGCONT</b>      | 25 | Ignore | Continued   |
| <b>SIGTTIN</b>      | 26 | Stop   | Stopped (tty input) (see <b>termio(7I)</b> )        |
| <b>SIGTTOU</b>      | 27 | Stop   | Stopped (tty output) (see <b>termio(7I)</b> )       |
| <b>SIGVTALRM</b>    | 28 | Exit   | Virtual Timer Expired                               |
| <b>SIGPROF</b>      | 29 | Exit   | Profiling Timer Expired                             |
| <b>SIGXCPU</b>      | 30 | Core   | CPU time limit exceeded (see <b>getrlimit(2)</b> )  |
| <b>SIGXFSZ</b>      | 31 | Core   | File size limit exceeded (see <b>getrlimit(2)</b> ) |
| <b>SIGWAITING</b>   | 32 | Ignore | Concurrency signal reserved by threads library      |
| <b>SIGLWP</b>       | 33 | Ignore | Inter-LWP signal reserved by threads library        |
| <b>SIGFREEZE</b>    | 34 | Ignore | Check point Freeze                                  |
| <b>SIGTHAW</b>      | 35 | Ignore | Check point Thaw                                    |
| <b>SIGCANCEL</b>    | 36 | Ignore | Cancellation signal reserved by threads library     |
| <b>SIGRTMIN</b>     | *  | Exit   | First real time signal                              |
| <b>(SIGRTMIN+1)</b> | *  | Exit   | Second real time signal                             |
| ...                 |    |        |   |
| <b>(SIGRTMAX-1)</b> | *  | Exit   | Second-to-last real time signal                     |
| <b>SIGRTMAX</b>     | *  | Exit   | Last real time signal                               |

(The symbols **SIGRTMIN** through **SIGRTMAX** are evaluated dynamically in order to permit future configurability)

#### **SIGNAL DISPOSITION**

A process, using a **signal(3C)**, **sigset(3C)** or **sigaction(2)** system call, may specify one of three dispositions for a signal: take the default action for the signal, ignore the signal, or catch the signal.

#### **Default Action: SIG\_DFL**

A disposition of **SIG\_DFL** specifies the default action. The default action for each signal is listed in the table above and is selected from the following:

**Exit** When it gets the signal, the receiving process is to be terminated with all the consequences outlined in **exit(2)**.

**Core** When it gets the signal, the receiving process is to be terminated with all the consequences outlined in **exit(2)**. In addition, a "core image" of the process is

constructed in the current working directory.

Stop When it gets the signal, the receiving process is to stop. When a process is stopped, all the threads and LWPs within the process also stop executing.

Ignore When it gets the signal, the receiving process is to ignore it. This is identical to setting the disposition to SIG\_IGN.

**Ignore Signal:  
SIG\_IGN**

A disposition of SIG\_IGN specifies that the signal is to be ignored. Setting a signal action to SIG\_IGN for a signal that is pending causes the pending signal to be discarded, whether or not it is blocked. Any queued values pending are also discarded, and the resources used to queue them are released and made available to queue other signals.

**Catch Signal:  
function address**

A disposition that is a function address specifies that, when it gets the signal, the thread or LWP within the process that is selected to process the signal will execute the signal handler at the specified address. Normally, the signal handler is passed the signal number as its only argument; if the disposition was set with the **sigaction()** however, additional arguments may be requested (see **sigaction(2)**). When the signal handler returns, the receiving process resumes execution at the point it was interrupted, unless the signal handler makes other arrangements. If an invalid function address is specified, results are undefined.

If the disposition has been set with the **sigset()** or **sigaction()**, the signal is automatically blocked in the thread or LWP while it is executing the signal catcher. If a **longjmp()** (see **setjmp(3C)**) is used to leave the signal catcher, then the signal must be explicitly unblocked by the user (see **signal(3C)** and **sigprocmask(2)**).

If execution of the signal handler interrupts a blocked function call, the handler is executed and the interrupted function call returns -1 to the calling process with **errno** set to **EINTR**. However, if the **SA\_RESTART** flag is set, the function call will be transparently restarted.

Some signal-generating functions, such as high resolution timer expiration, asynchronous I/O completion, inter-process message arrival, and the **sigqueue(3R)** function, support the specification of an application defined value, either explicitly as a parameter to the function, or in a **sigevent** structure parameter.

The **sigevent** structure is defined by **<signal.h>** and contains at least the following members:

| Member Type  | Member Name  | Description       |
|--------------|--------------|-------------------|
| int          | sigev_notify | Notification type |
| int          | sigev_signo  | Signal number     |
| union signal | sigev_value  | Signal value      |

The **sigval** union is defined by **<signal.h>** and contains at least the following members:

| Member Type | Member Name | Description          |
|-------------|-------------|----------------------|
| int         | sival_int   | Integer signal value |
| void *      | sival_ptr   | Pointer signal value |

The **sigev\_notify** member specifies the notification mechanism to use when an asynchronous event occurs. The **sigev\_notify** member may be defined with the following values:

|                     |  |
|---------------------|--|
| <b>SIGEV_NONE</b>   | No asynchronous notification is delivered when the event of interest occurs.                         |
| <b>SIGEV_SIGNAL</b> | A queued signal, with its value application-defined, is generated when the event of interest occurs. |

Your implementation may define additional notification mechanisms.

The **sigev\_signo** member specifies the signal to be generated.

The **sigev\_value** member references the application defined value to be passed to the signal-catching function at the time of the signal delivery as the **si\_value** member of the **siginfo\_t** structure.

The **sival\_int** member is used when the application defined value is of type **int**, and the **sival\_ptr** member is used when the application defined value is a pointer.

When a signal is generated by **sigqueue(3R)** or any signal-generating function which supports the specification of an application defined value, the signal is marked pending and, if the **SA\_SIGINFO** flag is set for that signal, the signal is queued to the process along with the application specified signal value. Multiple occurrences of signals so generated are queued in FIFO order. If the **SA\_SIGINFO** flag is not set for that signal, later occurrences of that signal's generation, when a signal is already queued, are silently discarded.

#### NOTES

The dispositions of the **SIGKILL** and **SIGSTOP** signals cannot be altered from their default values. The system generates an error if this is attempted.

The **SIGKILL** and **SIGSTOP** signals cannot be blocked. The system silently enforces this restriction.

Whenever a process receives a **SIGSTOP**, **SIGTSTP**, **SIGTTIN**, or **SIGTTOU** signal, regardless of its disposition, any pending **SIGCONT** signal are discarded.

Whenever a process receives a **SIGCONT** signal, regardless of its disposition, any pending **SIGSTOP**, **SIGTSTP**, **SIGTTIN**, and **SIGTTOU** signals is discarded. In addition, if the process was stopped, it is continued.

**SIGPOLL** is issued when a file descriptor corresponding to a **STREAMS** (see **intro(2)**) file has a "selectable" event pending. A process must specifically request that this signal be sent using the **I\_SETSIG ioctl** call. Otherwise, the process will never receive **SIGPOLL**.

If the disposition of the **SIGCHLD** signal has been set with **signal** or **sigset**, or with **sigaction** and the **SA\_NOCLDSTOP** flag has been specified, it will only be sent to the calling process when its children exit; otherwise, it will also be sent when the calling process's children are stopped or continued due to job control.

The name **SIGCLD** is also defined in this header and identifies the same signal as **SIGCHLD**. **SIGCLD** is provided for backward compatibility, new applications should use **SIGCHLD**.

The disposition of signals that are inherited as **SIG\_IGN** should not be changed.

A signal directed by **kill(2)**, **sigqueue(3R)**, **sigsend(2)**, terminal activity, and other external events not ascribable to a particular thread or LWP, such as the **SIGXFSZ** or **SIGPIPE** signal, to a multithreaded process, that is, a process linked with **-lthread** or **-lpthread**, is routed to this process through a special, designated LWP within this process, called the *Asynchronous Signal LWP* (ASLWP). The ASLWP within the multi-threaded process receives notification of any signal directed to this process. Upon receiving this notification, the ASLWP forwards it to a thread within the process that has the signal unmasked. Actual signal delivery to the thread occurs only when the thread is running on an LWP. If no threads exist having that signal number unblocked, the signal remains pending. The ASLWP is usually blocked in a call to **\_signotifywait(2)**, waiting for such notifications. The eventual target thread receives the signal by way of a call to **\_lwp\_sigredirect(2)**, made either by the ASLWP or the thread itself, redirecting the signal to the LWP that the target thread is running on.

**NAME** socket – Internet Protocol family

**SYNOPSIS** `#include <sys/socket.h>`

**DESCRIPTION** The `<sys/socket.h>` header defines the unsigned integral type `sa_family_t` through `typedef`.

The `<sys/socket.h>` header defines the `sockaddr` structure that includes the following members:

```

    sa_family_t  sa_family      /* address family */
    char         sa_data[]      /* socket address (variable-length data) */

```

The `<sys/socket.h>` header defines the `msghdr` structure that includes the following members:

```

    void         *msg_name      /* optional address */
    size_t       msg_namelen    /* size of address */
    struct iovec *msg_iov       /* scatter/gather array */
    int          msg_iovlen     /* members in msg_iov */
    void         *msg_control    /* ancillary data, see below */
    size_t       msg_controllen /* ancillary data buffer len */
    int          msg_flags      /* flags on received message */

```

The `<sys/socket.h>` header defines the `cmsghdr` structure that includes the following members:

```

    size_t       cmsg_len       /* data byte count, including hdr */
    int          cmsg_level     /* originating protocol */
    int          cmsg_type      /* protocol-specific type */

```

Ancillary data consists of a sequence of pairs, each consisting of a `cmsghdr` structure followed by a data array. The data array contains the ancillary data message, and the `cmsghdr` structure contains descriptive information that allows an application to correctly parse the data.

The values for `cmsg_level` will be legal values for the level argument to the `getsockopt()` and `setsockopt()` functions. The `SCM_RIGHTS` type is supported for level `SOL_SOCKET`.

Ancillary data is also possible at the socket level. The `<sys/socket.h>` header defines the following macro for use as the `cmsg_type` value when `cmsg_level` is `SOL_SOCKET`:

```

    SCM_RIGHTS      Indicates that the data array contains the access rights to
                    be sent or received.

```

The `<sys/socket.h>` header defines the following macros to gain access to the data arrays in the ancillary data associated with a message header:

```

    CMSG_DATA(msg)  If the argument is a pointer to a cmsghdr structure, this
                    macro returns an unsigned character pointer to the data
                    array associated with the cmsghdr structure.

```

**MSG\_NXTHDR(*mhdr, cmsg*)**

If the first argument is a pointer to a **msg\_hdr** structure and the second argument is a pointer to a **cmsg\_hdr** structure in the ancillary data, pointed to by the **msg\_control** field of that **msg\_hdr** structure, this macro returns a pointer to the next **cmsg\_hdr** structure, or a null pointer if this structure is the last **cmsg\_hdr** in the ancillary data.

**MSG\_FIRSTHDR(*mhdr*)**

If the argument is a pointer to a **msg\_hdr** structure, this macro returns a pointer to the first **cmsg\_hdr** structure in the ancillary data associated with this **msg\_hdr** structure, or a null pointer if there is no ancillary data associated with the **msg\_hdr** structure.

The `<sys/socket.h>` header defines the **linger** structure that includes the following members:

```
int  l_onoff  /* indicates whether linger option is enabled */
int  l_linger /* linger time, in seconds */
```

The `<sys/socket.h>` header defines the following macros:

```
SOCK_DGRAM      Datagram socket
SOCK_STREAM     Byte-stream socket
SOCK_SEQPACKET  Sequenced-packet socket
```

The `<sys/socket.h>` header defines the following macro for use as the *level* argument of **setsockopt()** and **getsockopt()**.

```
SOL_SOCKET      Options to be accessed at socket level, not protocol level.
```

The `<sys/socket.h>` header defines the following macros: for use as the *option\_name* argument in **getsockopt()** or **setsockopt()** calls:

```
SO_DEBUG        Debugging information is being recorded.
SO_ACCEPTCONN   Socket is accepting connections.
SO_BROADCAST     Transmission of broadcast messages is supported.
SO_REUSEADDR    Reuse of local addresses is supported.
SO_KEEPAKIVE    Connections are kept alive with periodic messages.
SO_LINGER       Socket lingers on close.
SO_OOBINLINE    Out-of-band data is transmitted in line.
SO_SNDBUF       Send buffer size.
SO_RCVBUF       Receive buffer size.
SO_ERROR        Socket error status.
SO_TYPE         Socket type.
```

The `<sys/socket.h>` header defines the following macros for use as the valid values for the `msg_flags` field in the `msghdr` structure, or the `flags` parameter in `recvfrom()`, `recvmsg()`, `sendto()`, or `sendmsg()` calls:

|                          |   |
|--------------------------|---|
| <code>MSG_CTRUNC</code>  | Control data truncated.                             |
| <code>MSG_EOR</code>     | Terminates a record (if supported by the protocol). |
| <code>MSG_OOB</code>     | Out-of-band data.                                   |
| <code>MSG_PEEK</code>    | Leave received data in queue.                       |
| <code>MSG_TRUNC</code>   | Normal data truncated.                              |
| <code>MSG_WAITALL</code> | Wait for complete message.                          |

The `<sys/socket.h>` header defines the following macros:

|                      |                         |
|----------------------|-------------------------|
| <code>AF_UNIX</code> | UNIX domain sockets     |
| <code>AF_INET</code> | Internet domain sockets |

The `<sys/socket.h>` header defines the following macros:

|                        |   |
|------------------------|---|
| <code>SHUT_RD</code>   | Disables further receive operations.          |
| <code>SHUT_WR</code>   | Disables further send operations.             |
| <code>SHUT_RDWR</code> | Disables further send and receive operations. |

The following are declared as functions, and may also be defined as macros:

```

int accept(int socket, struct sockaddr *address, size_t *address_len);
int bind(int socket, const struct sockaddr *address, size_t address_len);
int connect(int socket, const struct sockaddr *address, size_t address_len);
int getpeername(int socket, struct sockaddr *address, size_t *address_len);
int getsockname(int socket, struct sockaddr *address, size_t *address_len);
int getsockopt(int socket, int level, int option_name, void *option_value,
               size_t *option_len);
int listen(int socket, int backlog);
ssize_t recv(int socket, void *buffer, size_t length, int flags);
ssize_t recvfrom(int socket, void *buffer, size_t length, int flags,
                  struct sockaddr *address, size_t *address_len);
ssize_t recvmsg(int socket, struct msghdr *message, int flags);
ssize_t send(int socket, const void *message, size_t length, int flags);
ssize_t sendmsg(int socket, const struct msghdr *message, int flags);
ssize_t sendto(int socket, const void *message, size_t length, int flags,
                const struct sockaddr *dest_addr, size_t dest_len);
int setsockopt(int socket, int level, int option_name, const void *option_value,
               size_t option_len);

```

```
int shutdown(int socket, int how);  
int socket(int domain, int type, int protocol);  
int socketpair(int domain, int type, int protocol, int socket_vector[2]);
```

**NAME** standards, posix, POSIX, posix.1, POSIX.1, posix.2, POSIX.2, xnet, XNET, xnet4, XNET4, xpg, XPG, xpg3, XPG3, xpg4, XPG4, xpg4v2, XPG4v2 – standards and specifications supported by Solaris

**DESCRIPTION** Solaris supports IEEE Std 1003.1 and IEEE Std 1003.2, commonly known as POSIX.1 and POSIX.2, respectively. The following table lists each version of these standards with a brief description and the SunOS or Solaris release that first conformed to it.

| POSIX Standard | Description                     | Release     |
|----------------|---------------------------------|-------------|
| POSIX.1-1988   | system interfaces and headers   | SunOS 4.1   |
| POSIX.1-1990   | POSIX.1-1988 update             | Solaris 2.0 |
| POSIX.1b-1993  | realtime extensions             | Solaris 2.4 |
| POSIX.1c-1996  | threads extensions              | Solaris 2.6 |
| POSIX.2-1992   | shell and utilities             | Solaris 2.5 |
| POSIX.2a-1992  | interactive shell and utilities | Solaris 2.5 |

Solaris also supports the X/Open Common Applications Environment (CAE) Portability Guide Issue 3 (XPG3), Issue 4 (XPG4), Issue 4 Version 2 (XPG4v2), and Networking Services Issue 4 (XNET4). The following table lists each X/Open specification with a brief description and the SunOS or Solaris release that first conformed to it.

| X/Open Specification | Description  | Release     |
|----------------------|--|-------------|
| XPG3                 | superset of POSIX.1-1988 containing utilities from SVID3   | SunOS 4.1   |
| XPG4                 | superset of POSIX.1-1990, POSIX.2-1992, and POSIX.2a-1992 containing extensions to POSIX standards from XPG3 | Solaris 2.4 |
| XPG4v2               | superset of XPG4 containing historical BSD interfaces widely used by common application packages             | Solaris 2.6 |
| XNET4                | sockets and XTI interfaces   | Solaris 2.6 |

**Utilities** If the behavior required by XPG4 conflicted with historical Solaris utility behavior, the original Solaris version of the utility was not changed; rather, a new version that was XPG4-compliant was provided in **/usr/xpg4/bin**. For applications wishing to take advantage of POSIX.2, POSIX.2a, XPG4, or XPG4v2 features, the **PATH** (**sh** or **ksh**) or **path** (**cs**) environment variables should be set with **/usr/xpg4/bin** preceding any other directories in which utilities specified by those specifications are found, such as **/bin**, **/usr/bin**, **/usr/ucb**, and **/usr/ccs/bin**.

| <b>NAME</b>        | stat – data returned by stat system call  |
| <b>SYNOPSIS</b>    | <b>#include</b> <sys/types.h><br><b>#include</b> <sys/stat.h>   |
| <b>DESCRIPTION</b> | <p>The system calls <b>stat</b>, <b>lstat</b> and <b>fstat</b> return data in a <b>stat</b> structure, which is defined in <b>stat.h</b>.</p> <p>The constants used in the <b>st_mode</b> field are also defined in this file:</p> <pre> <b>#define</b>  S_IFMT      /* type of file */ <b>#define</b>  S_IAMB      /* access mode bits */ <b>#define</b>  S_IFIFO     /* fifo */ <b>#define</b>  S_IFCHR     /* character special */ <b>#define</b>  S_IFDIR     /* directory */ <b>#define</b>  S_IFNAM     /* XENIX special named file */ <b>#define</b>  S_INSEM     /* XENIX semaphore subtype of IFNAM */ <b>#define</b>  S_INSHD     /* XENIX shared data subtype of IFNAM */ <b>#define</b>  S_IFBLK     /* block special */ <b>#define</b>  S_IFREG     /* regular */ <b>#define</b>  S_IFLNK     /* symbolic link */ <b>#define</b>  S_IFSOCK    /* socket */ <b>#define</b>  S_ISUID     /* set user id on execution */ <b>#define</b>  S_ISGID     /* set group id on execution */ <b>#define</b>  S_ISVTX     /* save swapped text even after use */ <b>#define</b>  S_IREAD     /* read permission, owner */ <b>#define</b>  S_IWRITE    /* write permission, owner */ <b>#define</b>  S_IEXEC     /* execute/search permission, owner */ <b>#define</b>  S_ENFMT     /* record locking enforcement flag */ <b>#define</b>  S_IRWXU     /* read, write, execute: owner */ <b>#define</b>  S_IRUSR     /* read permission: owner */ <b>#define</b>  S_IWUSR     /* write permission: owner */ <b>#define</b>  S_IXUSR     /* execute permission: owner */ <b>#define</b>  S_IRWXG     /* read, write, execute: group */ <b>#define</b>  S_IRGRP     /* read permission: group */ <b>#define</b>  S_IWGRP     /* write permission: group */ <b>#define</b>  S_IXGRP     /* execute permission: group */ <b>#define</b>  S_IRWXO     /* read, write, execute: other */ <b>#define</b>  S_IROTH     /* read permission: other */ <b>#define</b>  S_IWOTH     /* write permission: other */ <b>#define</b>  S_IXOTH     /* execute permission: other */ </pre> |

The following macros are for POSIX conformance (see **standards(5)**):

|                |                       |                        |
|----------------|-----------------------|------------------------|
| <b>#define</b> | <b>S_ISBLK(mode)</b>  | block special file     |
| <b>#define</b> | <b>S_ISCHR(mode)</b>  | character special file |
| <b>#define</b> | <b>S_ISDIR(mode)</b>  | directory file         |
| <b>#define</b> | <b>S_ISFIFO(mode)</b> | pipe or fifo file      |
| <b>#define</b> | <b>S_ISREG(mode)</b>  | regular file           |
| <b>#define</b> | <b>S_ISSOCK(mode)</b> | socket file            |

**SEE ALSO** stat(2), standards(5), types(5)

|                    |  |
|--------------------|--|
| <b>NAME</b>        | stdarg – handle variable argument list   |
| <b>SYNOPSIS</b>    | <pre>#include &lt;stdarg.h&gt; va_list pvar; void va_start(va_list pvar, void parmN); (type *) va_arg(va_list pvar, type); void va_copy(va_list dest, va_list src); void va_end(va_list pvar);</pre>   |
| <b>DESCRIPTION</b> | <p>This set of macros allows portable procedures that accept variable numbers of arguments of variable types to be written. Routines that have variable argument lists (such as <b>printf</b>) but do not use <i>stdarg</i> are inherently non-portable, as different machines use different argument-passing conventions.</p> <p><b>va_list</b> is a type defined for the variable used to traverse the list.</p> <p>The <b>va_start()</b> macro is invoked before any access to the unnamed arguments and initializes <b>pvar</b> for subsequent use by <b>va_arg()</b> and <b>va_end()</b>. The parameter <i>parmN</i> is the identifier of the rightmost parameter in the variable parameter list in the function definition (the one just before the <code>,</code> ...). If this parameter is declared with the <b>register</b> storage class or with a function or array type, or with a type that is not compatible with the type that results after application of the default argument promotions, the behavior is undefined.</p> <p>The parameter <i>parmN</i> is required under strict ANSI C compilation. In other compilation modes, <i>parmN</i> need not be supplied and the second parameter to the <b>va_start()</b> macro can be left empty (for example, <b>va_start(pvar, )</b>). This allows for routines that contain no parameters before the ... in the variable parameter list.</p> <p>The <b>va_arg()</b> macro expands to an expression that has the type and value of the next argument in the call. The parameter <b>pvar</b> should have been previously initialized by <b>va_start()</b>. Each invocation of <b>va_arg()</b> modifies <b>pvar</b> so that the values of successive arguments are returned in turn. The parameter <i>type</i> is the type name of the next argument to be returned. The type name must be specified in such a way so that the type of a pointer to an object that has the specified type can be obtained simply by postfixing a <code>*</code> to <i>type</i>. If there is no actual next argument, or if <i>type</i> is not compatible with the type of the actual next argument (as promoted according to the default argument promotions), the behavior is undefined.</p> <p>The <b>va_copy()</b> macro saves the state represented by the <b>va_list</b> <i>src</i> in the <b>va_list</b> <i>dest</i>. The <b>va_list</b> passed as <i>dest</i> should not be initialized by a previous call to <b>va_start()</b>, and must be passed to <b>va_end()</b> before being reused as a parameter to <b>va_start()</b> or as the <i>dest</i> parameter of a subsequent call to <b>va_copy()</b>. The behavior is undefined should any of these restrictions not be met.</p> |

The `va_end()` macro is used to clean up.

Multiple traversals, each bracketed by `va_start` and `va_end`, are possible.

#### EXAMPLES

This example gathers into an array a list of arguments that are pointers to strings (but not more than `MAXARGS` arguments) with function `f1`, then passes the array as a single argument to function `f2`. The number of pointers is specified by the first argument to `f1`.

```
#include <stdarg.h>
#define MAXARGS    31

void f1(int n_ptrs, ...)
{
    va_list ap;
    char *array[MAXARGS];
    int ptr_no = 0;

    if (n_ptrs > MAXARGS)
        n_ptrs = MAXARGS;
    va_start(ap, n_ptrs);
    while (ptr_no < n_ptrs)
        array[ptr_no++] = va_arg(ap, char*);
    va_end(ap);
    f2(n_ptrs, array);
}
```

Each call to `f1` shall have visible the definition of the function or a declaration such as

```
void f1(int, ...)
```

#### SEE ALSO

`vprintf(3S)`

#### NOTES

It is up to the calling routine to specify in some manner how many arguments there are, since it is not always possible to determine the number of arguments from the stack frame. For example, `execl` is passed a zero pointer to signal the end of the list. `printf` can tell how many arguments there are by the format. It is non-portable to specify a second argument of `char`, `short`, or `float` to `va_arg`, because arguments seen by the called function are not `char`, `short`, or `float`. C converts `char` and `short` arguments to `int` and converts `float` arguments to `double` before passing them to a function.

|--------------------|--|
| <b>NAME</b>        | sticky – mark files for special treatment  |
| <b>DESCRIPTION</b> | <p>The <i>sticky bit</i> (file mode bit <b>01000</b>, see <b>chmod(2)</b>) is used to indicate special treatment of certain files and directories. A directory for which the sticky bit is set restricts deletion of files it contains. A file in a sticky directory may only be removed or renamed by a user who has write permission on the directory, and either owns the file, owns the directory, or is the super-user. This is useful for directories such as <b>/tmp</b>, which must be publicly writable, but should deny users permission to arbitrarily delete or rename the files of others.</p> <p>If the sticky bit is set on a regular file and no execute bits are set, the system's page cache will not be used to hold the file's data. This bit is normally set on swap files of diskless clients so that accesses to these files do not flush more valuable data from the system's cache. Moreover, by default such files are treated as swap files, whose inode modification times may not necessarily be correctly recorded on permanent storage.</p> <p>Any user may create a sticky directory. See <b>chmod</b> for details about modifying file modes.</p> |
| <b>FILES</b>       | <b>/tmp</b>  |
| <b>SEE ALSO</b>    | <b>chmod(1)</b> , <b>chmod(2)</b> , <b>chown(2)</b> , <b>mkdir(2)</b>  |
| <b>BUGS</b>        | <b>mkdir(2)</b> will not create a directory with the sticky bit set.   |

| <b>NAME</b>        | term – conventional names for terminals   |                   |         |         |           |                                  |                  |            |                                      |                 |             |                           |                  |           |                               |               |            |                                     |                |            |                           |                |            |               |                   |
|--------------------|---|-------------------|---------|---------|-----------|----------------------------------|------------------|------------|--------------------------------------|-----------------|-------------|---------------------------|------------------|-----------|-------------------------------|---------------|------------|-------------------------------------|----------------|------------|---------------------------|----------------|------------|---------------|-------------------|
| <b>DESCRIPTION</b> | <p>Terminal names are maintained as part of the shell environment in the environment variable <b>TERM</b> (see <b>sh</b>(1), <b>profile</b>(4), and <b>environ</b>(5)). These names are used by certain commands (for example, <b>tabs</b>, <b>tput</b>, and <b>vi</b>) and certain functions (for example, see <b>curses</b>(3X)).</p> <p>Files under <b>/usr/share/lib/terminfo</b> are used to name terminals and describe their capabilities. These files are in the format described in <b>terminfo</b>(4). Entries in <b>terminfo</b> source files consist of a number of comma-separated fields. To print a description of a terminal <i>term</i>, use the command <b>infocmp -I term</b> (see <b>infocmp</b>(1M)). White space after each comma is ignored. The first line of each terminal description in the <b>terminfo</b> database gives the names by which <b>terminfo</b> knows the terminal, separated by bar ( ) characters. The first name given is the most common abbreviation for the terminal (this is the one to use to set the environment variable <b>TERMINFO</b> in <b>\$HOME/.profile</b>; see <b>profile</b>(4)), the last name given should be a long name fully identifying the terminal, and all others are understood as synonyms for the terminal name. All names but the last should contain no blanks and must be unique in the first 14 characters; the last name may contain blanks for readability.</p> <p>Terminal names (except for the last, verbose entry) should be chosen using the following conventions. The particular piece of hardware making up the terminal should have a root name chosen, for example, for the AT&amp;T 4425 terminal, <b>att4425</b>. This name should not contain hyphens, except that synonyms may be chosen that do not conflict with other names. Up to 8 characters, chosen from the set <b>a</b> through <b>z</b> and <b>0</b> through <b>9</b>, make up a basic terminal name. Names should generally be based on original vendors rather than local distributors. A terminal acquired from one vendor should not have more than one distinct basic name. Terminal sub-models, operational modes that the hardware can be in, or user preferences should be indicated by appending a hyphen and an indicator of the mode. Thus, an AT&amp;T 4425 terminal in 132 column mode is <b>att4425-w</b>. The following suffixes should be used where possible:</p> <table border="0" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th style="text-align: left;">Suffix</th> <th style="text-align: left;">Meaning</th> <th style="text-align: left;">Example</th> </tr> </thead> <tbody> <tr> <td><b>-w</b></td> <td>Wide mode (more than 80 columns)</td> <td><b>att4425-w</b></td> </tr> <tr> <td><b>-am</b></td> <td>With auto. margins (usually default)</td> <td><b>vt100-am</b></td> </tr> <tr> <td><b>-nam</b></td> <td>Without automatic margins</td> <td><b>vt100-nam</b></td> </tr> <tr> <td><b>-n</b></td> <td>Number of lines on the screen</td> <td><b>aaa-60</b></td> </tr> <tr> <td><b>-na</b></td> <td>No arrow keys (leave them in local)</td> <td><b>c100-na</b></td> </tr> <tr> <td><b>-np</b></td> <td>Number of pages of memory</td> <td><b>c100-4p</b></td> </tr> <tr> <td><b>-rv</b></td> <td>Reverse video</td> <td><b>att4415-rv</b></td> </tr> </tbody> </table> <p>To avoid conflicts with the naming conventions used in describing the different modes of a terminal (for example, <b>-w</b>), it is recommended that a terminal's root name not contain hyphens. Further, it is good practice to make all terminal names used in the <b>terminfo</b>(4) database unique. Terminal entries that are present only for inclusion in other entries via the <b>use=</b> facilities should have a '+' in their name, as in <b>4415+nl</b>.</p> | Suffix            | Meaning | Example | <b>-w</b> | Wide mode (more than 80 columns) | <b>att4425-w</b> | <b>-am</b> | With auto. margins (usually default) | <b>vt100-am</b> | <b>-nam</b> | Without automatic margins | <b>vt100-nam</b> | <b>-n</b> | Number of lines on the screen | <b>aaa-60</b> | <b>-na</b> | No arrow keys (leave them in local) | <b>c100-na</b> | <b>-np</b> | Number of pages of memory | <b>c100-4p</b> | <b>-rv</b> | Reverse video | <b>att4415-rv</b> |
| Suffix             | Meaning   | Example           |         |         |           |                                  |                  |            |                                      |                 |             |                           |                  |           |                               |               |            |                                     |                |            |                           |                |            |               |                   |
| <b>-w</b>          | Wide mode (more than 80 columns)  | <b>att4425-w</b>  |         |         |           |                                  |                  |            |                                      |                 |             |                           |                  |           |                               |               |            |                                     |                |            |                           |                |            |               |                   |
| <b>-am</b>         | With auto. margins (usually default)  | <b>vt100-am</b>   |         |         |           |                                  |                  |            |                                      |                 |             |                           |                  |           |                               |               |            |                                     |                |            |                           |                |            |               |                   |
| <b>-nam</b>        | Without automatic margins   | <b>vt100-nam</b>  |         |         |           |                                  |                  |            |                                      |                 |             |                           |                  |           |                               |               |            |                                     |                |            |                           |                |            |               |                   |
| <b>-n</b>          | Number of lines on the screen   | <b>aaa-60</b>     |         |         |           |                                  |                  |            |                                      |                 |             |                           |                  |           |                               |               |            |                                     |                |            |                           |                |            |               |                   |
| <b>-na</b>         | No arrow keys (leave them in local)   | <b>c100-na</b>    |         |         |           |                                  |                  |            |                                      |                 |             |                           |                  |           |                               |               |            |                                     |                |            |                           |                |            |               |                   |
| <b>-np</b>         | Number of pages of memory   | <b>c100-4p</b>    |         |         |           |                                  |                  |            |                                      |                 |             |                           |                  |           |                               |               |            |                                     |                |            |                           |                |            |               |                   |
| <b>-rv</b>         | Reverse video   | <b>att4415-rv</b> |         |         |           |                                  |                  |            |                                      |                 |             |                           |                  |           |                               |               |            |                                     |                |            |                           |                |            |               |                   |

Here are some of the known terminal names: (For a complete list, enter the command `ls -C /usr/share/lib/terminfo/?` ).

Commands whose behavior depends on the type of terminal should accept arguments of the form **-Tterm** where *term* is one of the names given above; if no such argument is present, such commands should obtain the terminal type from the environment variable **TERM**, which, in turn, should contain *term*.

**FILES** /usr/share/lib/terminfo/?/\*  
compiled terminal description database

|--------------------|--|
| <b>NAME</b>        | types – primitive system data types  |
| <b>SYNOPSIS</b>    | <b>#include</b> <sys/types.h>  |
| <b>DESCRIPTION</b> | <p>The data types defined in <b>types.h</b> are used in UNIX System code. Some data of these types are accessible to user code:</p> <pre> typedef struct { int r[1]; } *physadr; typedef long      clock_t; typedef long      daddr_t; typedef char *    caddr_t; typedef unsigned char  unchar; typedef unsigned short ushort; typedef unsigned int   uint; typedef unsigned long  ulong; typedef unsigned long  ino_t; typedef long          uid_t; typedef long          gid_t; typedef ulong         nlink_t; typedef ulong         mode_t; typedef short         cnt_t; typedef long          time_t; typedef int           label_t[10]; typedef ulong         dev_t; typedef long          off_t; typedef long          pid_t; typedef long          paddr_t; typedef int           key_t; typedef unsigned char use_t; typedef short         sysid_t; typedef short         index_t; typedef short         lock_t; typedef unsigned int  size_t; typedef long          clock_t; typedef long          pid_t; </pre> <p>The form <b>daddr_t</b> is used for disk addresses except in an inode on disk. Times are encoded in seconds since 00:00:00 UTC, January 1, 1970. The major and minor parts of a device code specify kind and unit number of a device and are installation-dependent. Offsets are measured in bytes from the beginning of a file. The <b>label_t</b> variables are used to save the processor state while another process is running.</p> |

|                    |  |
|--------------------|--|
| <b>NAME</b>        | <b>ucontext</b> – user context   |
| <b>SYNOPSIS</b>    | <b>#include &lt;ucontext.h&gt;</b>   |
| <b>DESCRIPTION</b> | <p>The <b>ucontext</b> structure defines the context of a thread of control within an executing process.</p> <p>This structure includes at least the following members:</p> <ul style="list-style-type: none"><li><b>ucontext_t uc_link</b></li><li><b>sigset_t uc_sigmask</b></li><li><b>stack_t uc_stack</b></li><li><b>mcontext_t uc_mcontext</b></li></ul> <p><b>uc_link</b> is a pointer to the context that to be resumed when this context returns. If <b>uc_link</b> is equal to 0, then this context is the main context, and the process exits when this context returns.</p> <p><b>uc_sigmask</b> defines the set of signals that are blocked when this context is active [see <b>sigprocmask(2)</b>].</p> <p><b>uc_stack</b> defines the stack used by this context [see <b>sigaltstack(2)</b>].</p> <p><b>uc_mcontext</b> contains the saved set of machine registers and any implementation specific context data. Portable applications should not modify or access <b>uc_mcontext</b>.</p> |

| <b>NAME</b>        | un – definitions for UNIX-domain sockets   |
| <b>SYNOPSIS</b>    | <b>#include</b> <sys/un.h>   |
| <b>DESCRIPTION</b> | <p>The &lt;sys/un.h&gt; header defines the <b>sockaddr_un</b> structure that includes the following members:</p> <pre>    sa_family_t  sun_family  /* address family */     char         sun_path[]  /* socket pathname */</pre> <p>The <b>sockaddr_un</b> structure is used to store addresses for UNIX domain sockets. Values of this type must be cast to <b>struct sockaddr</b> for use with the socket interfaces.</p> <p>The &lt;sys/un.h&gt; header defines the type <b>sa_family_t</b> as described in <b>socket(5)</b>.</p> |
| <b>SEE ALSO</b>    | <b>bind(3N)</b> , <b>bind(3XN)</b> , <b>socket(3N)</b> , <b>socket(3XN)</b> , <b>socketpair(3N)</b> , <b>socketpair(3XN)</b> , <b>socket(5)</b>  |

|                            |  |                       |                          |                          |                          |                    |                        |
|----------------------------|--|-----------------------|--------------------------|--------------------------|--------------------------|--------------------|------------------------|
| <b>NAME</b>                | unistd – standard symbolic constants and types   |                       |                          |                          |                          |                    |                        |
| <b>SYNOPSIS</b>            | <b>#include</b> <unistd.h>   |                       |                          |                          |                          |                    |                        |
| <b>DESCRIPTION</b>         | The <unistd.h> header defines miscellaneous symbolic constants and types, and declares miscellaneous functions. The contents of this header are shown below.   |                       |                          |                          |                          |                    |                        |
| <b>Version Test Macros</b> | <p>The following symbolic constants are defined:</p> <p><b>_POSIX_VERSION</b> Integer value indicating version of the ISO POSIX-1 standard (C language binding).</p> <p><b>_POSIX2_VERSION</b> Integer value indicating version of the ISO POSIX-2 standard (Shell and Utilities).</p> <p><b>_POSIX2_C_VERSION</b> Integer value indicating version of the ISO POSIX-2 standard (C language binding) and whether the X/Open POSIX2 C-language Binding Feature Group is supported.</p> <p><b>_XOPEN_VERSION</b> Integer value indicating version of the X/Open Portability Guide to which the implementation conforms.</p> <p><b>_POSIX_VERSION</b> is defined in the ISO POSIX-1 standard. It changes with each new version of the ISO POSIX-1 standard.</p> <p><b>_POSIX2_VERSION</b> is defined in the ISO POSIX-2 standard. It changes with each new version of the ISO POSIX-2 standard.</p> <p><b>_POSIX2_C_VERSION</b> is defined in the ISO POSIX-2 standard. It changes with each new version of the ISO POSIX-2 standard. When the C language binding option of the ISO POSIX-2 standard and therefore the X/Open POSIX2 C-language Binding Feature Group is not supported, <b>_POSIX2_C_VERSION</b> will be set to -1.</p> <p><b>_XOPEN_VERSION</b> is defined as an integer value greater than or equal to 3, indicating one of the issues of the X/Open Portability Guide to which the implementation conforms.</p> <p><b>_XOPEN_XCU_VERSION</b> is defined as an integer value indicating the version of the XCU specification to which the implementation conforms. If the value is -1, no commands and utilities are provided on the implementation. If the value is greater than or equal to 4, the functionality associated with the following symbols is also supported (see <b>Mandatory Symbolic Constants and Constants for Options and Feature Groups</b> below.)</p> <table border="0"> <tr> <td><b>_POSIX2_C_BIND</b></td> <td><b>_POSIX2_C_VERSION</b></td> </tr> <tr> <td><b>_POSIX2_CHAR_TERM</b></td> <td><b>_POSIX2_LOCALEDEF</b></td> </tr> <tr> <td><b>_POSIX2_UPE</b></td> <td><b>_POSIX2_VERSION</b></td> </tr> </table> <p>If the constants listed above are not defined, use the <b>sysconf(3C)</b> function to determine which features are supported.</p> | <b>_POSIX2_C_BIND</b> | <b>_POSIX2_C_VERSION</b> | <b>_POSIX2_CHAR_TERM</b> | <b>_POSIX2_LOCALEDEF</b> | <b>_POSIX2_UPE</b> | <b>_POSIX2_VERSION</b> |
| <b>_POSIX2_C_BIND</b>      | <b>_POSIX2_C_VERSION</b>   |                       |                          |                          |                          |                    |                        |
| <b>_POSIX2_CHAR_TERM</b>   | <b>_POSIX2_LOCALEDEF</b>   |                       |                          |                          |                          |                    |                        |
| <b>_POSIX2_UPE</b>         | <b>_POSIX2_VERSION</b>   |                       |                          |                          |                          |                    |                        |

Each of the following symbolic constants is defined only if the implementation supports the indicated revision of the X/Open Portability Guide:

- \_XOPEN\_XPG2** X/Open Portability Guide, Volume 2, January 1987, XVS System Calls and Libraries (ISBN: 0-444-70175-3).
- \_XOPEN\_XPG3** X/Open Specification, February 1992, System Interfaces and Headers, Issue 3 (ISBN: 1-872630-37-5, C212); this specification was formerly X/Open Portability Guide, Issue 3, Volume 2, January 1989, XSI System Interface and Headers (ISBN: 0-13-685843-0, XO/XPG/89/003).
- \_XOPEN\_XPG4** X/Open CAE Specification, July 1992, System Interfaces and Headers, Issue 4 (ISBN: 1-872630-47-2, C202) (XSH4).
- \_XOPEN\_UNIX** X/Open CAE Specification, August 1994, System Interfaces and Headers, Issue 4, Version 2 (ISBN: 1-85912-037-7, C435) (XSH4v2).

**Mandatory Symbolic Constants**

Although all implementations conforming to XSH4 or XSH4v2 support all of the FIPS features described below, there may be system-dependent or file-system-dependent configuration procedures that can remove or modify any or all of these features. Such configurations should not be made if strict FIPS compliance is required.

The following symbolic constants are either undefined or defined with a value other than -1. If a constant is undefined, an application should use the **sysconf(3C)**, **pathconf(2)**, or **fpathconf(2)** functions to determine which features are present on the system at that time or for the particular pathname in question.

**\_POSIX\_CHOWN\_RESTRICTED**

The use of **chown(2)** is restricted to a process with appropriate privileges, and to changing the group ID of a file only to the effective group ID of the process or to one of its supplementary group IDs.

**\_POSIX\_NO\_TRUNC** Pathname components longer than **NAME\_MAX** generate an error.

**\_POSIX\_VDISABLE** Terminal special characters defined in **<termios.h>** can be disabled using this character value.

**\_POSIX\_SAVED\_IDS** Each process has a saved set-user-ID and a saved set-group-ID.

**\_POSIX\_JOB\_CONTROL**

Implementation supports job control.

**\_POSIX\_CHOWN\_RESTRICTED**, **\_POSIX\_NO\_TRUNC**, and **\_POSIX\_VDISABLE** will have values other than -1 when **\_XOPEN\_VERSION** has a value greater than or equal to 4.

**Constants for Options and Feature Groups**

The following symbolic constants are defined to have the value -1 if the implementation will never provide the feature, and to have a value other than -1 if the implementation always provides the feature. If these are undefined, the **sysconf()** function can be used to determine whether the feature is provided for a particular invocation of the application.

**\_POSIX2\_C\_BIND** Implementation supports the C language binding option.

**\_POSIX2\_C\_DEV** Implementation supports the C language development utilities

|                          |   |
|--------------------------|---|
|                          | option.   |
| <b>_POSIX2_CHAR_TERM</b> | Implementation supports at least one terminal type.                                 |
| <b>_POSIX2_FORT_DEV</b>  | Implementation supports the FORTRAN Development Utilities Option.                   |
| <b>_POSIX2_FORT_RUN</b>  | Implementation supports the FORTRAN Run-time Utilities Option.                      |
| <b>_POSIX2_LOCALEDEF</b> | Implementation supports the creation of locales by the <b>localedef</b> utility.    |
| <b>_POSIX2_SW_DEV</b>    | Implementation supports the Software Development Utilities Option.                  |
| <b>_POSIX2_UPE</b>       | The implementation supports the User Portability Utilities Option.                  |
| <b>_XOPEN_CRYPT</b>      | The implementation supports the X/Open Encryption Feature Group.                    |
| <b>_XOPEN_ENH_I18N</b>   | The implementation supports the X/Open Enhanced Internationalisation Feature Group. |
| <b>_XOPEN_SHM</b>        | The implementation supports the X/Open Shared Memory Feature Group.                 |

#### Constants for Functions

The following symbolic constant is defined:

**NULL** Null pointer.

The following symbolic constants are defined for the *access()* function:

**R\_OK** Test for read permission.

**W\_OK** Test for write permission.

**X\_OK** Test for execute (search) permission.

**F\_OK** Test for existence of file.

The constants **F\_OK**, **R\_OK**, **W\_OK**, and **X\_OK** and the expressions **R\_OK | W\_OK**, **R\_OK | X\_OK**, and **R\_OK | W\_OK | X\_OK** all have distinct values.

The following symbolic constant is defined for the **confstr()** function:

**\_CS\_PATH** If the ISO POSIX-2 is supported, this is the value for the **PATH** environment variable that finds all standard utilities. Otherwise the meaning of this value is unspecified.

The following symbolic constants are defined for the **lseek(2)** and **fcntl(2)** functions (they have distinct values):

**SEEK\_SET** Set file offset to *offset*.

**SEEK\_CUR** Set file offset to current plus *offset*.

**SEEK\_END** Set file offset to EOF plus *offset*.

The following symbolic constants are defined for `sysconf(3C)`:

The two constants `_SC_PAGESIZE` and `_SC_PAGE_SIZE` may be defined to have the same value. All other values in this list are distinct.

The following symbolic constants are defined as possible values for the *function* argument to the `lockf(3C)` function:

`F_LOCK` Lock a section for exclusive use.

`F_ULOCK` Unlock locked sections.

`F_TEST` Test section for locks by other processes.

`F_TLOCK` Test and lock a section for exclusive use.

The following symbolic constants are defined for `pathconf(2)`:

`_PC_ASYNC_IO`      `_PC_CHOWN_RESTRICTED`

`_PC_FILESIZEBITS`   `_PC_LINK_MAX`

`_PC_MAX_CANON`      `_PC_MAX_INPUT`

`_PC_NAME_MAX`       `_PC_NO_TRUNC`

`_PC_PATH_MAX`       `_PC_PIPE_BUF`

`_PC_PRIO_IO`         `_PC_SYNC_IO`

`_PC_VDISABLE`

The following symbolic constants are defined for file streams:

`STDIN_FILENO`        File number of *stdin*. It is 0.

`STDOUT_FILENO`      File number of *stdout*. It is 1.

`STDERR_FILENO`      File number of *stderr*. It is 2.

#### Type Definitions

The `size_t`, `ssize_t`, `uid_t`, `gid_t`, `off_t`, `pid_t`, and `useconds_t` types are defined as described in `<sys/types.h>`.

#### Declarations

The following are declared as functions and may also be defined as macros:

```
int      access(const char *path, int amode);
unsigned int alarm(unsigned int seconds);
int      brk(void *addr);
int      chdir(const char *path);
int      chown(const char *path, uid_t owner, gid_t group);
int      chroot(const char *path);
int      close(int fildes);
size_t   confstr (int name, char *buf, size_t len);
char     *crypt(const char *key, const char *salt);
char     *ctermid(char *s);
char     *cuserid(char *s);
int      dup(int fildes);
int      dup2(int fildes, int fildes2);
void     encrypt(char block64, int edflag);
int      execl(const char *path, const char *arg0, ...);
int      execle(const char *file, const char *arg0, ...);
int      execlp(const char *file, const char *arg0, ...);
```

```

int      execv(const char *path, char *const argv[]);
int      execve(const char *path, char *const argv[], char *const envp[]);
int      execvp(const char *file, char *const argv[]);
void     _exit(int status);
int      fchown(int fildes, uid_t owner, gid_t group);
int      fchdir(int fildes);
pid_t    fork(void);
long int fpathconf(int fildes, int name);
int      fsync(int fildes);
int      ftruncate(int fildes, off_t length);
char     *getcwd(char *buf, size_t size);
int      getdtablesize(void);
gid_t    getegid(void);
uid_t    geteuid(void);
gid_t    getgid(void);
int      getgroups(int gidsetsize, gid_t grouplist[]);
long     gethostid(void);
int      gethostname(char *address, int address_len);
char     *getlogin(void);
int      getopt(int argc, char * const argv[], const char *optstring);
int      getpagesize(void);
char     *getpass(const char *prompt);
pid_t    getpgid(pid_t pid);
pid_t    getpgrp(void);
pid_t    getpid(void);
pid_t    getppid(void);
pid_t    getsid(pid_t pid);
uid_t    getuid(void);
char     *getwd(char *path_name);
int      isatty(int fildes);
int      lchown(const char *path, uid_t owner, gid_t group);
int      link(const char *path1, const char *path2);
int      lockf(int fildes, int function, off_t size);
off_t    lseek(int fildes, off_t offset, int whence);
int      nice(int incr);
long int pathconf(const char *path, int name);
int      pause(void);
int      pipe(int fildes2);
ssize_t  read(int fildes, void *buf, size_t nbyte);
int      readlink(const char *path, char *buf, size_t bufsiz);
int      rmdir(const char *path);
void     *sbrk(int incr);
int      setgid(gid_t gid);
int      setpgid(pid_t pid, pid_t pgid);
pid_t    setpgrp(void);

```

```

int          setregid(gid_t rgid, gid_t egid);
int          setreuid(uid_t ruid, uid_t euid);
pid_t       setsid(void);
int          setuid(uid_t uid);
unsigned int sleep(unsigned int seconds);
void        swab(const void *src, void *dest, ssize_t nbytes);
int         symlink(const char *path1, const char *path2);
void        sync(void);
long int    sysconf(int name);
pid_t       tcgetpgrp(int fildes);
int         tcsetpgrp(int fildes, pid_t pgrp_id);
int         truncate(const char *path, off_t length);
char        *ttyname(int fildes);
useconds_t  ualarm(useconds_t useconds, useconds_t interval);
int         unlink(const char *path);
int         usleep(useconds_t useconds);
pid_t       vfork(void);
ssize_t     write(int fildes, const void *buf, size_t nbytes);

```

The following external variables are declared:

```

extern char  *optarg;
extern int   optind, opterr, optopt;

```

|                    |   |
|--------------------|---|
| <b>NAME</b>        | varargs – handle variable argument list   |
| <b>SYNOPSIS</b>    | <pre>#include &lt;varargs.h&gt; va_alist va_dcl va_list pvar; void va_start(va_list pvar); type va_arg(va_list pvar, type); void va_end(va_list pvar);</pre>  |
| <b>DESCRIPTION</b> | <p>This set of macros allows portable procedures that accept variable argument lists to be written. Routines that have variable argument lists (such as <b>printf(3S)</b>) but do not use <b>varargs</b> are inherently non-portable, as different machines use different argument-passing conventions.</p> <p><b>va_alist</b> is used as the parameter list in a function header.</p> <p><b>va_dcl</b> is a declaration for <b>va_alist</b>. No semicolon should follow <b>va_dcl</b>.</p> <p><b>va_list</b> is a type defined for the variable used to traverse the list.</p> <p><b>va_start</b> is called to initialize <b>pvar</b> to the beginning of the list.</p> <p><b>va_arg</b> will return the next argument in the list pointed to by <b>pvar</b>. <i>type</i> is the type the argument is expected to be. Different types can be mixed, but it is up to the routine to know what type of argument is expected, as it cannot be determined at runtime.</p> <p><b>va_end</b> is used to clean up.</p> <p>Multiple traversals, each bracketed by <b>va_start</b> and <b>va_end</b>, are possible.</p> |
| <b>EXAMPLE</b>     | <p>This example is a possible implementation of <b>execl</b> (see <b>exec(2)</b> ).</p> <pre>#include &lt;unistd.h&gt; #include &lt;varargs.h&gt; #define MAXARGS    100  /*      execl is called by           execl(file, arg1, arg2, ..., (char *)0); */ execl(va_alist) va_dcl {     va_list ap;     char *file;     char *args[MAXARGS];           /* assumed big enough*/     int argno = 0;      va_start(ap);</pre>  |

```
    file = va_arg(ap, char *);
    while ((args[argno++] = va_arg(ap, char *)) != 0)
        ;
    va_end(ap);
    return execv(file, args);
}
```

**SEE ALSO** `exec(2)`, `printf(3S)`, `vprintf(3S)`, `stdarg(5)`

**NOTES** It is up to the calling routine to specify in some manner how many arguments there are, since it is not always possible to determine the number of arguments from the stack frame. For example, `execl` is passed a zero pointer to signal the end of the list. `printf` can tell how many arguments are there by the format.

It is non-portable to specify a second argument of `char`, `short`, or `float` to `va_arg`, since arguments seen by the called function are not `char`, `short`, or `float`. C converts `char` and `short` arguments to `int` and converts `float` arguments to `double` before passing them to a function.

`stdarg` is the preferred interface.

| <b>NAME</b>                | vgrindefs – vgrind's language definition data base   |  |                   |             |                         |           |   |           |   |   |   |     |   |           |     |   |           |     |   |           |     |   |           |     |  |           |     |  |           |     |  |           |     |  |           |      |   |           |     |   |           |      |  |           |     |  |           |     |  |           |     |  |           |     |   |           |      |  |

| <b>SYNOPSIS</b>            | <code>/usr/lib/vgrindefs</code>  |  |                   |             |                         |           |   |           |   |   |   |     |   |           |     |   |           |     |   |           |     |   |           |     |  |           |     |  |           |     |  |           |     |  |           |      |   |           |     |   |           |      |  |           |     |  |           |     |  |           |     |  |           |     |   |           |      |  |
| <b>DESCRIPTION</b>         | <b>vgrindefs</b> contains all language definitions for <b>vgrind</b> (1). Capabilities in <b>vgrindefs</b> are of two types: Boolean capabilities which indicate that the language has some particular feature and string capabilities which give a regular expression or keyword list. Entries may continue onto multiple lines by giving a <code>\</code> as the last character of a line. Lines starting with <code>#</code> are comments.  |  |                   |             |                         |           |   |           |   |   |   |     |   |           |     |   |           |     |   |           |     |   |           |     |  |           |     |  |           |     |  |           |     |  |           |      |   |           |     |   |           |      |  |           |     |  |           |     |  |           |     |  |           |     |   |           |      |  |
| <b>Capabilities</b>        | <p>The following table names and describes each capability.</p> <table border="0"> <thead> <tr> <th style="text-align: left;">Name</th> <th style="text-align: left;">Type</th> <th style="text-align: left;">Description</th> </tr> </thead> <tbody> <tr> <td><b>ab</b></td> <td>str</td> <td>Regular expression for the start of an alternate form comment</td> </tr> <tr> <td><b>ae</b></td> <td>str</td> <td>Regular expression for the end of an alternate form comment</td> </tr> <tr> <td><b>bb</b></td> <td>str</td> <td>Regular expression for the start of a block</td> </tr> <tr> <td><b>be</b></td> <td>str</td> <td>Regular expression for the end of a lexical block</td> </tr> <tr> <td><b>cb</b></td> <td>str</td> <td>Regular expression for the start of a comment</td> </tr> <tr> <td><b>ce</b></td> <td>str</td> <td>Regular expression for the end of a comment</td> </tr> <tr> <td><b>id</b></td> <td>str</td> <td>String giving characters other than letters and digits that may legally occur in identifiers (default <code>'_'</code>)</td> </tr> <tr> <td><b>kw</b></td> <td>str</td> <td>A list of keywords separated by spaces</td> </tr> <tr> <td><b>lb</b></td> <td>str</td> <td>Regular expression for the start of a character constant</td> </tr> <tr> <td><b>le</b></td> <td>str</td> <td>Regular expression for the end of a character constant</td> </tr> <tr> <td><b>oc</b></td> <td>bool</td> <td>Present means upper and lower case are equivalent</td> </tr> <tr> <td><b>pb</b></td> <td>str</td> <td>Regular expression for start of a procedure</td> </tr> <tr> <td><b>pl</b></td> <td>bool</td> <td>Procedure definitions are constrained to the lexical level matched by the <code>'px'</code> capability</td> </tr> <tr> <td><b>px</b></td> <td>str</td> <td>A match for this regular expression indicates that procedure definitions may occur at the next lexical level. | <b>Regular Expressions</b> | <p><b>vgrindefs</b> uses regular expressions similar to those of <b>ex</b>(1) and <b>lex</b>(1). The characters <code>''</code>, <code>'\$'</code>, <code>':'</code>, and <code>'\'</code> are reserved characters and must be 'quoted' with a preceding <code>\</code> if they are to be included as normal characters. The metasympols and their meanings are:</p> <table border="0"> <tr> <td><b>\$</b></td> <td>The end of a line</td> </tr> <tr> <td><b>^</b></td> <td>The beginning of a line</td> </tr> <tr> <td><b>\d</b></td> <td>A delimiter (space, tab, newline, start of line)</td> </tr> <tr> <td><b>\a</b></td> <td>Matches any string of symbols (like <code>'.*'</code> in <b>lex</b>)</td> </tr> <tr> <td><b>\p</b></td> <td>Matches any identifier. In a procedure definition (the <code>'pb'</code> capability) the string</td> </tr> </table>   | <b>\$</b>  | The end of a line | <b>^</b>    | The beginning of a line | <b>\d</b> | A delimiter (space, tab, newline, start of line)              | <b>\a</b> | Matches any string of symbols (like <code>'.*'</code> in <b>lex</b> ) | <b>\p</b>   | Matches any identifier. In a procedure definition (the <code>'pb'</code> capability) the string |     |   |           |     |   |           |     |   |           |     |   |           |     |  |           |     |  |           |     |  |           |     |  |           |      |   |           |     |   |           |      |  |           |     |  |           |     |  |           |     |  |           |     |   |           |      |  |
| <b>\$</b>                  | The end of a line  |  |                   |             |                         |           |   |           |   |   |   |     |   |           |     |   |           |     |   |           |     |   |           |     |  |           |     |  |           |     |  |           |     |  |           |      |   |           |     |   |           |      |  |           |     |  |           |     |  |           |     |  |           |     |   |           |      |  |
| <b>^</b>                   | The beginning of a line  |  |                   |             |                         |           |   |           |   |   |   |     |   |           |     |   |           |     |   |           |     |   |           |     |  |           |     |  |           |     |  |           |     |  |           |      |   |           |     |   |           |      |  |           |     |  |           |     |  |           |     |  |           |     |   |           |      |  |
| <b>\d</b>                  | A delimiter (space, tab, newline, start of line)   |  |                   |             |                         |           |   |           |   |   |   |     |   |           |     |   |           |     |   |           |     |   |           |     |  |           |     |  |           |     |  |           |     |  |           |      |   |           |     |   |           |      |  |           |     |  |           |     |  |           |     |  |           |     |   |           |      |  |
| <b>\a</b>                  | Matches any string of symbols (like <code>'.*'</code> in <b>lex</b> )  |  |                   |             |                         |           |   |           |   |   |   |     |   |           |     |   |           |     |   |           |     |   |           |     |  |           |     |  |           |     |  |           |     |  |           |      |   |           |     |   |           |      |  |           |     |  |           |     |  |           |     |  |           |     |   |           |      |  |
| <b>\p</b>                  | Matches any identifier. In a procedure definition (the <code>'pb'</code> capability) the string  |  |                   |             |                         |           |   |           |   |   |   |     |   |           |     |   |           |     |   |           |     |   |           |     |  |           |     |  |           |     |  |           |     |  |           |      |   |           |     |   |           |      |  |           |     |  |           |     |  |           |     |  |           |     |   |           |      |  |

that matches this symbol is used as the procedure name.

- () Grouping
- | Alternation
- ? Last item is optional
- \e Preceding any string means that the string will not match an input string if the input string is preceded by an escape character (\). This is typically used for languages (like C) that can include the string delimiter in a string by escaping it.

Unlike other regular expressions in the system, these match words and not characters. Hence something like '(tramp | steamer)flies?' would match 'tramp', 'steamer', 'trampflies', or 'steamerflies'. Contrary to some forms of regular expressions, **vgrindef** alternation binds very tightly. Grouping parentheses are likely to be necessary in expressions involving alternation.

**Keyword List** The keyword list is just a list of keywords in the language separated by spaces. If the 'oc' boolean is specified, indicating that upper and lower case are equivalent, then all the keywords should be specified in lower case.

**EXAMPLE** The following entry, which describes the C language, is typical of a language entry.

```
C | c | the C programming language:\
:pb=^d?*?d?p\d?(a?)\d | {}:bb={:be=}:cb=/*:ce=/*:sb=":se=e":\
:le=e':tl:\
:kw=asm auto break case char continue default do double else enum\
extern float for fortran goto if int long register return short\
sizeof static struct switch typedef union unsigned void while #define\
#else #endif #if #ifdef #ifndef #include #undef # define endif\
ifdef ifndef include undef defined:
```

Note that the first field is just the language name (and any variants of it). Thus the C language could be specified to **vgrind(1)** as 'c' or 'C'.

**FILES** /usr/lib/vgrindefs file containing vgrind descriptions

**SEE ALSO** ex(1), lex(1), troff(1), vgrind(1)

|                    |  |
|--------------------|--|
| <b>NAME</b>        | wstat – wait status  |
| <b>SYNOPSIS</b>    | <b>#include</b> <sys/wait.h>   |
| <b>DESCRIPTION</b> | <p>When a process waits for status from its children via either the <b>wait</b> or <b>waitpid</b> function, the status returned may be evaluated with the following macros, defined in &lt;sys/wait.h&gt;. These macros evaluate to integral expressions. The <i>stat</i> argument to these macros is the integer value returned from <b>wait</b> or <b>waitpid</b>.</p> <p><b>WIFEXITED(<i>stat</i>)</b> Evaluates to a non-zero value if status was returned for a child process that terminated normally.</p> <p><b>WEXITSTATUS(<i>stat</i>)</b> If the value of <b>WIFEXITED(<i>stat</i>)</b> is non-zero, this macro evaluates to the exit code that the child process passed to <b>_exit()</b> (see <b>exit(2)</b>) or <b>exit(3C)</b>, or the value that the child process returned from <b>main</b>.</p> <p><b>WIFSIGNALED(<i>stat</i>)</b> Evaluates to a non-zero value if status was returned for a child process that terminated due to the receipt of a signal.</p> <p><b>WTERMSIG(<i>stat</i>)</b> If the value of <b>WIFSIGNALED(<i>stat</i>)</b> is non-zero, this macro evaluates to the number of the signal that caused the termination of the child process.</p> <p><b>WIFSTOPPED(<i>stat</i>)</b> Evaluates to a non-zero value if status was returned for a child process that is currently stopped.</p> <p><b>WSTOPSIG(<i>stat</i>)</b> If the value of <b>WIFSTOPPED(<i>stat</i>)</b> is non-zero, this macro evaluates to the number of the signal that caused the child process to stop.</p> <p><b>WIFCONTINUED(<i>stat</i>)</b> Evaluates to a non-zero value if status was returned for a child process that has continued.</p> <p><b>WCOREDUMP(<i>stat</i>)</b> If the value of <b>WIFSIGNALED (<i>stat</i>)</b> is non-zero, this macro evaluates to a non-zero value if a core image of the terminated child was created.</p> |
| <b>SEE ALSO</b>    | <b>exit(2)</b> , <b>wait(2)</b> , <b>waitpid(2)</b> , <b>exit(3C)</b>  |
