| Enter the version for Header review of OV (P4210) | Enter a version of the Sales Order Entry program that you want to use for header review. If you leave this option blank, the system uses version ZJDE0001. |
| Enter the version for Detail review of OV (P4210) | Enter a version of the Sales Order Entry program that you want to use for detail review. If you leave this option blank, the system uses version ZJDE0001. |
| Enter the version for OV Date (P42045) | Enter a version of the Customer Service Inquiry program or leave this field blank to use ZJDE0001. |
| Enter the version for OV Address numbers (P42045) | Enter a version of the Customer Service Inquiry program or leave blank to use ZJDE0001. |
| Enter the version for OV Line Detail (P42045) | Enter a version of the Customer Service Inquiry program or leave this field blank to use ZJDE0001. |

**Enter the version for
Customer Service (P4210)**

Enter a version of the Sales Order Entry program that you want to use for customer service. If you leave this option blank, the system uses version ZJDE0001.

(CHL and PER) Working with Billing Information for Chile and Peru

This section provides overviews of the billing process for Chile and Peru, and sales order inquiry by status by batch, lists prerequisites, and discusses how to set processing options for Printing Invoices and Shipping Guides (P76H2565)

See Also

Chapter 41, “(CHL and PER) Setting Up the System for Chile and Peru Legal Requirements,” page 903

Chapter 44, “(CHL and PER) Numbering and Printing Legal Documents for Chile and Peru,” Setting Processing Options for Lot of Printing Review (P76H3B50), page 925

Understanding Billing Information for Chile and Peru

Printing legal documents such as invoices is localized in the JD Edwards EnterpriseOne Sales Order Management and JD Edwards EnterpriseOne Accounts Receivable systems in order to meet Chilean and Peruvian legal requirements. You also use the JD Edwards EnterpriseOne Sales Order Management system to print shipping guides.

The billing process in the JD Edwards EnterpriseOne Sales Order Management system consists of:

1. Running the Print Invoices program (R42565).

This program generates the corresponding invoices, taking into account printing one invoice per page and considers all necessary data according to Chilean and Peruvian legal requirements. At the end of the process, the system issues a .pdf document with the print batch number containing all the invoices generated by during this process.

2. Numbering legal vouchers.

With the batch number generated by the Print Invoices program, you can access the print program and number the legal vouchers in the batch prior to printing. The system performs validation for numbering.

3. Printing vouchers.

After the voucher is numbered, you can print vouchers.

Note. (PER) According to Peruvian legislation, identifiable goods sold or lent in use require that the serial or motor number be included in the invoice, ticket, or shipping guide. In order to comply with the legal requirement, these items must be set up and you must assign the batch or serial number in the order line.

In order to issue shipping guides, set the processing options for Print Invoice to the version that does not update the JD Edwards EnterpriseOne Accounts Receivable system. Entering an internal document type is not necessary.

(CHL) For Chile, it is recommended that you set up a specific version of Print Invoices to process invoice and sales tickets and external services (duty free).

(PER) For Peru, it is recommended that you set up a specific version of Print Invoices to process invoice and sales tickets and another for export invoices.

Invoice Summarizations by Item and Invoice Consolidation by Customer are not included in the Chilean or Peruvian localizations. You must disable this in the processing option for Print Invoice (R42565). You cannot run Billing or Shipping Guides Generation in proof mode.

You can number and print one batch at a time. A batch cannot be numbered with a status of *O* (open) if there is a previous batch that is not at the status of *C* (closed). This enables the user to continue working while the system numbers vouchers.

You cannot delete batches generated in the JD Edwards EnterpriseOne Sales Order Management system because the system generates these batches in the Print Invoice program. You must delete the invoices by generating a credit note. You can delete batches that were generated from the JD Edwards EnterpriseOne Accounts Receivable system if the batch and the voucher have an open status. You must renumber vouchers the same day that you print them. You must renumber vouchers printed on prior dates.

Billing Process Features

Billing process features include:

- The ability to generate shipping guides.
- The ability to generate a print batch containing shipping guides and invoices.

By running the Print Invoices program, the system generates a print batch containing shipping guides and invoices. You must use this program to comply with the Peruvian legal requirement that states that the shipping guide must have the same number as the invoice number, and the invoice must contain the shipping guide number.

- The ability for different users to run the Print Invoices program at the same time to generate invoices, credit and debit notes, export invoices, and so on.
- Automatic invoice voiding when renumbering.

For example, if there is an invoice printing problem, the system enables you to review the invoice, void it, renumber it, and reprint it. When renumbering invoices, the system automatically sends the voided document to a voided documents table.

- A flexible design that enables you to customize an invoice.

Generating Shipping Guides and Invoices

The Print Invoices program calls the Printing Invoices and Shipping Guides (P76H2565) program containing the localization parameters for generating legal documents.

These Chilean and Peruvian legal documents are generated by running Printing Invoices and Shipping Guides program:

- Invoices.
- Tickets.
- Shipping guides.
- Credit notes.
- Debit notes.
- Export invoices.
- Export credit and debit notes.
- Chile only: Tax-free goods and service invoices (duty free).
- Chile only: Tax free goods and service tickets (duty free).

The Printing Invoices and Shipping Guides program generates:

- A print batch.
Each print batch consists of various documents (invoices, shipping guides, or shipping guides and invoices together), depending on the parameters that you set in the localized program processing options. Users locate the batch and number and print the documents in the batch.
- A .pdf file containing the number for the batch and the number of document processed.
For example, the program generates batch 428, containing 1,000 invoices.
- Invoices, taking into account space limits by document.
Depending on the setup, these invoices can contain discounts, attached data, shipping guide numbers, and all required legal information.
- Internal document type and number.
Vouchers do not have a legal number assigned. To enter the legal number and print the voucher, you must use the Lot Review Inquiry.
- A .pdf document with a warning to address the work center to verify errors if the program does not run successfully.
Users must correct sales orders, correct their statuses, and then run the program again. Sales orders with billing errors have a *last* status of 931 and *next* status of 831 or the statuses specified by the user in the processing options. This enables you to easily identify incorrect sales orders, correct them, and reprocess them.

Localized Tables

Tables the system uses for localized data include:

- F76H3B10 Legal documents Header.
- F76H211 Shipping Guide/Invoices.
- F76H3B50 Print Batch Header.
- F76H3B51 Print Batch Detail.
- F76H3B31 Print Header Image.
- F76H3B32 Print Detail Image.

- F76H3B33 Tax Detail.
- F76H3B34 Sales Order Lines.
- F76H3B35 Sales Order Price Adjustments Detail.
- F76H3B36 Attached Data Detail.
- F76H3B38 Shipping Guide Detail.

Understanding Sales Order Inquiry by Status by Batch

You can access the internal voucher type and number of the voucher using the voucher legal number.

You can also update the next status of orders in the batch after voucher printing (shipping guide or invoice). Renumbering vouchers does not update sales orders status.

Additionally, you can inquire on batches according to sales order status. You can choose to display or hide batches that belong to a sales order status range according to the processing options on the Sales Order Processing (SOP) tab. The batches that are not in the status range appear in light gray, and you can inquire on the detailed information, but you cannot number, renumber, or print the batch. This enables you to inquire on the batches that are in the status range that you entered in the processing options and other batches from the same batch version.

Prerequisites

Before you complete the tasks in this section:

- Verify that sales orders have a correct status code to print shipping guides and invoices.
- Set up legal document types.
- Set up print layout.
- Set the processing options for the Print Invoices and Printing Invoices and Shipping Guides program.

You must enter the same version in the processing option.

- Set up legal document types relationship.
- Verify localized tax area information.
- Set up activity rules for sales order types.
- Set up status codes.

Forms Used to Work with Billing Information

| Form Name | FormID | Navigation | Usage |
|---------------------------------------|-----------|--|---|
| Lot Review | W76H3B50A | <ul style="list-style-type: none"> (CHL) Sales Order (G76H42), Lot of Printing Review (Inquiry and Re.) Complete the processing options, and then click OK. (PER) Sales Order (G76P42), Lot of Printing Review (Inquiry and Re.) Complete the processing options, and then click OK. | Inquire on batch vouchers, or inquire on sales orders by status by batch. |
| Edit Lot | W76H3B50B | Select the batch, and select Sales Legal Document Inquiry from the Row menu on Edit Lot. | Display sales orders in which a legal document relates to a print batch. |
| Get Internal Number From Legal Number | W76H3B50I | Select the batch, and select Get Internal Number from the Form menu on Lot Review. | Attach a legal number to a document. |

Setting Processing Options for Printing Invoices and Shipping Guides (P76H2565)

Processing options enable you to specify the default processing for programs and reports.

General

Although processing options are set up during system implementation, you can change processing options each time that you run a program.

- | | |
|------------------------------------|---|
| 1. Document to be generated | Specify the document the system will generate. Values are: <i>1</i> : Generate an invoice, ticket, C/N, or D/N. <i>2</i> : Generate a shipping guide. <i>3</i> : Generate simultaneous invoice and shipping guide. |
| 2. Issuing Series | Enter <i>001</i> for invoice, shipping guide, or simultaneous invoice and shipping guide. |
| 3. Internal type document | Enter the internal document type (DCT) for the legal types relationship. For example, enter <i>GD</i> for the legal types relationship for the shipping guide or enter <i>FD</i> for invoice generation. |
| 4. Shipping Guide | Enter the internal document type (DCT) for the legal types relationship. For example, enter <i>GD</i> for the legal types relationship for the shipping guide or enter <i>FD</i> for invoice generation. |

Shipping Guides

Although processing options are set up during system implementation, you can change processing options each time that you run a program.

- | | |
|--|--|
| 1. Weight Unit of Measure for Print | Enter the weight unit of measure for printing. For example, enter <i>KG</i> for shipping guides and simultaneous invoice and shipping guide. |
| 2. Volume Unit of Measure for print | Enter the volume unit of measure for printing. For example, enter <i>M3</i> for shipping guides and simultaneous invoice and shipping guide. |
| 3. Item unit price or Shipping Guides | Enter <i>1</i> to print the item unit price for shipping guides. This processing option does not apply for Peru. |

Error Processing

Although processing options are set up during system implementation, you can change processing options each time that you run a program.

- | | |
|------------------------------------|---|
| 1. Last Status Invoices | Enter the last status code to be used in invoices when errors are found. If you leave this processing option blank, the default value is <i>931</i> . |
| Next Status Invoices | Enter the next status code to be used in invoices when errors are found. If you leave this processing option blank, the default value is <i>831</i> . |
| Last Status Shipping Guides | Enter the last code status to be used in shipping guides when errors are found. If you leave this blank, the default value is <i>931</i> . |
| Next Status Shipping Guides | Enter the next code status to be used in shipping guides when errors are found. If you leave this blank, the default value is <i>832</i> . |

(CHL) Changing Invoice Dates for Chile

This section provides an overview of invoice dates and discusses how to:

- Set processing options for Lot of Printing Invoice Date - CHI - 03B (P76H3B53).
- Change the invoice date.

Understanding Invoice Dates for Chile

When you print invoices using the Lot of Printing Review program (R76H3B50), the system uses the current system date as the date of the invoice. When you set the processing option to display the Invoice Date Override form, the Lot of Printing Invoice Date - CHI - 03B program (P76H3B53) enables you to change the invoice date. If you enter a new date for an invoice that is generated from the JD Edwards EnterpriseOne Sales Order Management system, the system verifies that the date entered is the equal to or greater than the order date. The system does not perform this validation for invoices generated from the JD Edwards EnterpriseOne Accounts Receivable system.

The Generate Legal Document Number - CHI - 03B program (R76H3B29) uses the invoice date that you enter instead of the current date.

Forms Used to Change the Invoice Date

| Form Name | FormID | Navigation | Usage |
|----------------------------|-----------|--|---|
| Lot Review | W76H3B50A | Accounts Receivable (G76H03B), Lot of Printing Review | Review print batches. |
| Send Lot to Print | W76H3B50D | On the Lot Review form, locate and select the print batch for which you want to assign legal numbers, and then select Generate Legal Num (Generate Legal Numbers) from the Row menu. | Assign legal numbers to invoices in print batches. |
| Invoice Date Override | W76H3B53A | Click OK on the Send Lot to Print form. | Override the system assigned date for the invoice. Note. You must set the processing option for the Lot of Printing Date program (P76H3B53) to 1 to enable this form. |
| Review Lot Printing Orders | W76H3B53B | Select Orders Review from the Row menu on the Invoice Date Override form. | Verify the order and invoice dates. |

Changing the Invoice Date

Access the Invoice Date Override form.

Setting Processing Options for Lot of Printing Date (P76H3B53)

Processing options enable you to specify the default processing for programs and reports.

Default

Override Invoice Date

Enter *1* to display the Invoice Date Override form and enable the change of the invoice date.

CHAPTER 46

(CHL and PER) Calculating Inventory Adjustment and Actual Cost

This chapter provides an overview of the inventory adjustment and actual cost calculation process and discusses how to:

- (CHL and PER) Enter indirect costs, bill of material information, and actual costs.
- (CHL and PER) Update the localized cardex.
- (CHL and PER) Inquire on localized cardexes.
- (CHL and PER) Print the inventory ledger.
- (CHL and PER) Set up the system for inflation adjustments for raw materials and resale goods.
- (CHL and PER) Calculate inventory adjustments for raw materials and resale goods.
- (CHL) Calculate the inflation adjustments for WIP and FG.

(CHL and PER) Understanding the Inventory Adjustment and Actual Cost Calculation Process for Chile and Peru

Calculating inventory adjustment and actual cost includes functionality from the JD Edwards EnterpriseOne Inventory Management, JD Edwards EnterpriseOne Manufacturing, JD Edwards EnterpriseOne Product Data Management, and JD Edwards EnterpriseOne Advanced Cost Accounting systems.

For the year for which you make year-end adjustments, you must run the inventory inflation adjustment and actual cost calculation processes for raw materials and resale products.

(CHL) For Chile, you must also run the processes for work in progress (WIP) and finished goods (FG).

Actual Costs

In order to calculate actual cost, products must comply with this setup:

| Products | Setup | Description |
|---------------------------------------|--|---|
| Raw materials and resale | Method 02 (Weighted Average Cost) must be set up as the main method of sales and inventories in the F4105 table. | Legislation prescribes that products be valued according to their Weighted Average Cost. The JD Edwards EnterpriseOne Inventory Management system provides this functionality. |
| Products in progress and manufactured | Method 07 (Standard Cost) must be set up as the main method of sales and inventories in F4105 table. Method 02 must be set up as secondary method in the F4105 table. | Method 07 is typically used in manufacturing. The localization obtains the actual cost to weighted average cost and updates it according to Method 02. |

Additionally, these assumptions apply:

- The actual cost calculation process is used only for discrete production and is not used for continuous production.
- Products have the same setup in all branch/plants. The actual cost calculation is made according to the product costing level.
- The actual cost is calculated according to Method 02 (weighted average cost).
- Batch programs run by the actual cost process must be run from the Actual Cost Process Header program (P76H6001).

These programs and systems have been localized to meet Chilean and Peruvian legal requirements for the actual cost calculation of products in progress and manufactured products:

- JD Edwards EnterpriseOne Advanced Cost Accounting system information interface to the F30026 table.
- The program that creates an actual bill of materials according to the period production in which the process is being run.
- The Actual Cost Calculation of Products in Progress and Manufactured Products program.
- The Localized Cardex Update program according to the actual cost calculation of products in progress and manufactured products.
- The program that generates a journal entry by the cost difference of inventory and goods sold, between the actual cost and that registered by the system as standard cost.

Actual cost calculation by weighted average cost of WIP and FG is complex due to the large number of variables that affect the cost of a manufactured item. Variables include the materials actually used to produce the item, the labor cost used, production time, labor expenses, machinery cost, machine hours, and overheads such as electricity and power.

Example: Weighted Average Cost (WAC)

To calculate the actual cost of products in progress and manufactured products, it is necessary to obtain the unit cost of raw materials. This unit cost is obtained from the weighted average cost of the item according to the F76H6112 table. If, for example, it is desired to obtain the actual cost of products in progress and manufactured products for the period 11, it is necessary to obtain the weighted average cost of raw materials for the period 11 from the F76H6112 table, as in this example:

| Period | Balance (quantity) | Balance (in USD) | Weighted Average Cost |
|-----------|--------------------|------------------|-----------------------|
| Period 10 | 100 | 446 | n/a |
| Period 11 | 20 | 118 | n/a |
| Total | 120 | 564 | 4.7 |

The system calculates the unit cost of the raw material xx, the value USD 4.7 for the calculation of products in progress and manufactured products. Such value does not update the F4105 table and is used only for the purpose of calculating the actual cost of products in progress and manufactured products. The as-of calculated unit cost was used for raw materials since the unit cost of the F4105 table at the time of the actual cost calculation is not necessarily the raw material cost corresponding to the run period.

The actual cost calculation process involves running two batches:

- The first batch corresponds to the Actual Cost Simulation report (R76H6812).

This batch program updates the actual cost calculation and simulates those in the F30026 table, but does not update the F4105 table with the simulated cost. This batch is similar to the Cost Simulation (R30812) program and has the same processing options.

Note. This must be run for Method 02 (weighted average cost). It is recommended that you do not modify the processing options for the R76H6812 report.

- The second batch corresponds to the cost generation or freezing of actual costs obtained from the Item Actual Cost Component (R76H6835) program.

This batch may be run in proof or final mode. The final mode freezes the cost in the F30026 table, updates the F4105 table with the unit cost calculated for products in progress and manufactured products according to the 02 weighted average cost costing method and updates the F76H6105 table. This batch is similar to the R30835 cost freezing standard program and has the same processing options though it does not update the accounting.

Note. Both batches must be run for Method 02 (weighted average cost). It is recommended that you do not modify the processing options R76H6812.

It is important that the localized As Of process be run in order to enable the system to obtain the appropriate unit cost of raw materials.

(PER) Overhead Allocation

The JD Edwards EnterpriseOne standard functionality of the JD Edwards EnterpriseOne Advanced Cost Accounting system is used to calculate the tracking of indirect manufacturing costs by product. the JD Edwards Enterprise One Advanced Cost Accounting system performs overhead allocation, or cost object tracking. For this reason, the scope of this localization consists in sending the costs obtained by product through the JD Edwards EnterpriseOne Advanced Cost Accounting system to the F30026 table.

The allocation of these cost components of products in progress and manufactured products must be performed through the JD Edwards Enterprise One Advanced Cost Accounting system for the period in which the actual cost process is run:

- Actual labor expenses
- Actual machinery costs

- Actual costs

All costs considered necessary can be distributed in order to obtain the cost of products in progress and manufactured products, such as electricity costs.

Depending on the setup used for the expense allocation in the JD Edwards Enterprise One Advanced Cost Accounting system, the results of the expense allocation by item is recorded in the F1602 table or in the F1642 and F16421 tables. The localization of overhead allocation consists of sending information from those files to the F30026 table.

The JD Edwards Enterprise One Advanced Cost Accounting system provides a broad functionality to perform the expense allocation per item. Through the JD Edwards Enterprise One Advanced Cost Accounting system, a unit cost must be obtained by product cost concept.

See *JD Edwards EnterpriseOne Inventory Management 8.12 Implementation Guide*, “Updating Costs,” Updating Item Costs.

Prerequisites

Before you calculate inventory adjustments and actual cost, you must complete the setup tasks in these sections discussed in the Using Inventory Inflation Adjustment chapter:

See *JD Edwards EnterpriseOne General Accounting 8.12 Implementation Guide*, “JD Edwards EnterpriseOne General Accounting Reports,” Processing Options for Trial Balance By Object Report (R094121).

See *JD Edwards EnterpriseOne Inventory Management 8.12 Implementation Guide*, “Setting Up the Inventory Management System,” Setting Up Constants.

(PER) Before sending overhead information to the F30026 table:

- Verify that the overheads allocation has been performed in the JD Edwards Enterprise One Advanced Cost Accounting system.
- Verify that overheads allocation is performed by product.
- Verify that the relationship between account and cost type is set up.
- Verify that the indirect cost of the actual cost process are set up.

Legal Requirement – Chile

According to Section 30° of the Chilean Revenue Act that refers to inventory valuation, the valuation method adopted for a year determines the inventory value at the end of that year notwithstanding the adjustment set forth in section 41. The method you select must be maintained for a minimum period of five consecutive business years.

Legal Requirement – Peru

According to Section 62° of the Rent Tax Act, goods valued at acquisition or production cost must uniformly apply the same valuation method or methods from year to year.

According to Section 35° of the Rent Tax Act Regulations, most companies must keep a standard cost system that values their goods to actual cost. The taxpayer must provide the report and the technical studies that support the application of the cost system when required by SUNAT (*Superintendencia nacional de administración tributaria*).

Common Fields Used in This Chapter

| | |
|---|--|
| To/From Period | Enter the period which the actual cost calculation process is run. |
| GI Status | Enter the overhead process status. <i>P</i> : Proof mode. <i>F</i> : Final mode. |
| Bill of Materials Status | Enter the status of the bill of materials process. <i>F</i> : Final mode. |
| Actual Cost Status (CR) | Enter the actual cost calculation process status. <i>T</i> : The status after executing the Actual Cost Simulation process. <i>P</i> : Proof mode. <i>F</i> : Final mode. |
| Localized Cardex Status | Enter the status of the Updating the Localized Cardex and Accounting process. <i>P</i> : Proof mode. <i>F</i> : Final mode. |
| WO Required Date (DRQJ field in the F4801 table) | Enter the date used to obtain the WO that is taken into account in the actual cost calculation process. To add the WO to the actual bill of materials calculation, the system compares the WO required date with the period selected to run the actual cost process. |
| WO End Date (STRX field in the F4801 table) | Enter the date used to obtain the WO that is taken into account in the actual cost calculation process. To add the WO to the actual bill of materials calculation, the system compares the WO end date with the period selected to run the actual cost process. |
| WO Status | Enter the status that WO must have in order to be taken into account in the actual cost process. If the field is left blank, the system does not use the WO status. |
| Bill of Materials Type | Enter the value for the bill of materials that you want the system to use to create an actual bill of materials in the F3002 table. |
| Bill of Materials Status | Enter the status of the Actual Bill of Materials process. |
| ITM Cost Object Type | Enter the cost object type used in the actual cost process to identify a product. |
| MCU Cost Object Type | Enter the cost object type used in the actual cost process to identify the branch/plant. |
| LOCN Cost Object Type | Enter the cost object type used in the actual cost process to identify the location. |
| LOTN Cost Object Type | Enter the cost object type used in the actual cost process to identify a batch. |
| Costing Method | Costing method used for calculating the actual cost. |

Important! Enter the 02 Weighted Average Cost method required by law.

| | |
|----------------------------|--|
| General Ledger Type | Enter the general ledger type of the expenses accounts derived from the JD Edwards Enterprise One Advanced Cost Accounting system. |
| IE Status | Enter the status of the overheads process. |

(CHL and PER) Entering Indirect Costs, Bill of Material Information, and Actual Costs for Chile and Peru

This section provides overviews of indirect costs, bills of material, and actual costs; lists prerequisites, and discusses how to:

- Enter indirect costs.
- Generate the actual bill of material.
- Enter actual costs.

Understanding Indirect Costs

Records from the F1602, F1642, and F16421 tables must meet these conditions in order to be selected:

- Every selected record must have an associated product.

The system obtains the product from the cost object where it is kept or from the Item Cost Code field.

- Every selected record must have a valid branch/plant.

If the branch/plant is not in any cost object of the record, it must be entered manually in the screen header.

- Every selected record must have an associated cost in the period column where the actual cost is being processed.

For example, if period 12, 2003 is being processed, the 721431 item must have an associated cost for period 12.

- The account/cost type relationship must be set up.

The records you select through this application are sent to the F76H6002 and F76H6003 tables. After the system updates these tables, select either Indirect Cost Proof Mode or Indirect Cost Final Mode from the Work With Item Cost Component WF form. If you select proof mode, the F76H6004 table is updated. If you select final mode, the F76H6004 and F30026 tables are updated.

Understanding Actual Bills of Material

Generate the actual bill of materials of the items manufactured within the period in which the actual cost calculation process is run, thus obtaining the actual consumptions of their components.

Any product in progress or product manufactured by a standard procedure has a specific bill of materials that indicates the component quantities needed to manufacture a certain item. Standard bills of materials are located in the F3002 table and typically have a bill type of M.

The actual bill of materials calculation process completes the F3002 and F76H6008 tables and generates a PDF file containing a detailed list of units manufactured by item.

Note. The actual bill of materials generation may be run as many times as necessary, provided the last actual cost calculation process has not been run. Each new process run deletes the records generated in the F3002 table for the specified bill type and also deletes the record in the F76H6008 table.

To calculate the actual bill of materials, all products in progress and manufactured products production entries from work orders that meet these conditions:

- Selected work order branch/plants must belong to a transactional company that belongs to a legal company.
- The required date (DRQJ field from the F4801 table) or work order end date (STRX field from the F4801 table) is compared with the actual cost process run in the period. Work order dates are selected for the calculation provided they are within the period.
- Work orders meet the status entered into the actual cost process header.
- Selected work orders meet the document type and work order type specified in the setup.
- Products with a stock type different from *R* in the Item Master are taken into account.

Note. To calculate the actual bill of materials, the system converts everything to the primary unit of measure (UM).

Understanding Actual Costs

Run the cost simulation to verify the costs that have been generated thus far. Then, run the Actual Cost Generation process in proof or final mode. When you run the process in final mode, it updates the F76H6007, F30026, and F4105 tables according to Method 02 (Weighted Average Cost).

Prerequisites

Before generating the actual bill of materials:

- Verify the actual bill of materials generation process setup.
- Verify that the indirect cost calculation has been performed.
- Verify that the order type and allowed WO type relationship is set up.

Forms Used for Entering Indirect Costs, Bill of Material Information, and Actual Costs

| Form Name | FormID | Navigation | Usage |
|----------------------------------|-----------|--|--|
| Work with Actual Cost Process | W76H6001A | (CHL) Actual Cost (G76H31), Actual Cost Process Header. (PER) Actual Cost (G76P31), Actual Cost Process Header. | View and select existing records. |
| Actual Cost Process | W76H6001B | Click Add on the Work with Actual Cost Process form. | Add indirect cost, bill of material, and actual cost information. |
| Work With Item Actual Cost File | W76H6105A | On Actual Cost Process, select Actual Cost from the Form menu. Select Actual Cost Simulation from the Row menu to run cost simulation. Select Actual Cost Generation to run cost generation in either proof or final mode. | Run the cost simulation and generation to enter actual costs. |
| Manufactured Items | W76H6008A | On Actual Cost Process, select Bill of Materials from the Row menu. Select Actual BOM Gen. from the Form menu | Generate an actual bill of materials. |
| Bill of Material | W76H6008B | Select Bill of Material from the Row menu on the Manufactured Items form. | Inquire on the actual bill of materials that you generated. |
| Work With Item Cost Component WF | W76H6002F | On Actual Cost Process, select Indirect Cost from the Form menu. | Select costs to update. |
| Cost Analyzer Balances Selection | W76H6002B | Select Cost Analyzer from the Form menu on the Work With Item Cost Component WF form. | Select the records from the F1602 table to update. Update records interactively or by batch mode. |
| Rates Selection | W76H6002C | Select Rates Selection from the Form menu on the Work With Item Cost Component WF form. | Select F1642 and F16421 records to update. Update records interactively or by batch mode. |

Adding Indirect Costs

Access the Actual Cost Process form.

Generating the Actual Bill of Materials

Access the Manufactured Items form.

Entering Actual Costs

Access the Work With Item Actual Cost File form.

Many fields are completed as specified in the processing options of the Actual Cost Process Header program (P76H6001). The system generates the records in the F76H6001 table.

(CHL and PER) Updating the Localized Cardex for Chile and Peru

This section provides an overview of the localized cardex and discusses how to update the localized cardex.

Understanding the Localized Cardex

Use the Updating the Localized Cardex and Accounting process to update the F76H611 table with the actual costs calculated for products in progress and manufactured products. The process also makes an adjustment journal entry. Be sure to take into account the difference between the cost accounted to standard cost and the F0911 table new actual cost of the items.

You must have run the actual cost calculation process in final mode prior to running the Cardex and Accounting update process (R76H611).

The Cardex and Accounting update process updates all the records in the F76H611 table that meet these conditions:

- The branch/plant of the cardex transaction belongs to a transactional company that belongs to a legal company.
- Products in progress and manufactured products are processed with Method 07 as main costing method of sales and inventories.

Raw materials and resale products are not processed since they are calculated by their actual cost in the standard way.

- The accounting dates of cardex transactions must be within the run period of the actual cost calculation.

Updating the localized cardex is critical because the inventory ledger obtains item movements and balances from the F76H611 table.

The program creates a journal entry to indicate the difference between the inventory value and the cost of goods sold by the cost change of the item. This example illustrates a journal entry with a value greater than that of the inventory and the AAIs used to create it:

| Concept | Debit | Credit | AAI |
|---------|-------|--------|------|
| A1 | X USD | n/a | 3130 |
| X1 | X USD | n/a | 3130 |

| Concept | Debit | Credit | AAI |
|-------------------------|-------|--------|------|
| X2 | X USD | n/a | 3130 |
| X4 | X USD | n/a | 3130 |
| To Inventory Difference | n/a | X USD | 3910 |
| Sales Cost | X USD | n/a | 4124 |
| To Cost Difference | n/a | X USD | 3911 |

Important! To update the cardex and accounting, run the R76H611 batch program in proof or final mode. The proof mode may be run as many times as needed. The final mode cannot be changed. The R76H611 batch program has no processing options and must be run from the P76H6001 program.

When you run the R76H611 program in proof mode, the system generates a PDF file containing a detail of cost differences between the F4111 table and the F76H611 table, taking into account the actual cost calculated by the process. It indicates the entries to be generated and the accounts on which the accounting charge will be performed.

When you run the program in final mode, the system generates a PDF file similar to that of the proof mode. In addition, it generates the document number and batch number and updates the F76H611 table with the actual cost. It also creates journal entries taking into account the difference in cost in the F0911 table. Then you can post the batch generated by the process.

Form Used to Update the Localized Cardex

| Form Name | FormID | Navigation | Usage |
|-------------------------------|-----------|--|--|
| Work with Actual Cost Process | W76H6001A | (CHL) Actual Cost menu (G76H31), Actual Cost Process Header. (PER) Actual Cost menu (G76P31), Actual Cost Process Header. | Locate existing records. |
| Actual Cost Process | W76H6001B | Click Add on the Work with Actual Cost Process form. | Enter information required to update the cardex. |
| Cardex at Actual Cost | W76H611B | On Actual Cost Process, select Cardex to Actual Cost from the Form menu. Select to run in either proof or final mode from the Form menu. | Update the localized cardex. |

Updating the Localized Cardex

Access the Cardex at Actual Cost form.

(CHL and PER) Inquiring on Localized Cardexes for Chile and Peru

This section provides an overview and describes how to inquire on localized cardexes.

After you run the actual cost calculation process, you might want to inquire on the localized cardexes.

Understanding Localized Cardex Inquiries

There are two types of localized inquiries you can use for localized inventory files:

- P76H611B - Localized Cardex Inquiry (F76H611).
- P76H6112 - Localized Cardex As Of Inquiry (F76H6112).

These applications have the same functionality as the Item Ledger Inquiry (P4111) program and the Direct As Of Entry (P41112A) program. You can perform inquiries by:

- Item
- Plant
- Item/Plant
- Item/Plant/Location

Forms Used to Inquire on the Localized Cardexes

| Form Name | FormID | Navigation | Usage |
|------------------------------|-----------|---|--|
| Work With Item Ledger | W76H611BA | <ul style="list-style-type: none"> • (CHL) Actual Cost (G76H31), Actual Localization Item Ledger Inquiry. Complete the processing options and click OK. • (PER) Actual Cost (G76P31), Actual Localization Item Ledger Inquiry. Complete the processing options and click OK. | Locate existing records. |
| Item Ledger Detail | W76H611BB | Select a record and then select Detail from the Row menu on Work With Item Ledger. | Inquire on the updated the localized cardex. |
| Work with Direct As Of Entry | W76H6112A | <ul style="list-style-type: none"> • (CHL) Actual Cost menu (G76H31), Ledger Inquiry Localization As Of. Complete the processing option and click OK. • (PER) Actual Cost menu (G76P31), Ledger Inquiry Localization As Of. Complete the processing option and click OK. | Locate existing records. |
| Direct As Of Entry | W76H6112B | Click Add on the Work with Direct As Of Entry form. | Enter as of information. |

Inquiring on Localized Cardexes

Access the Item Ledger Detail form.

Document Type

Enter a document type. You should use a special document type in order to differentiate movements by the actual cost difference.

GL Type

Enter the GL type to identify where journal entries generated by cost difference are sent.

Do not use the AA ledger because it may affect the integrity between the F4111 and the F0911 tables.

Batch Type

Enter batch type *N*.

(CHL and PER) Printing the Inventory Ledger for Chile and Peru

This section provides an overview of the inventory ledger and discusses how to: run the inventory ledger.

- Run the Inventory Ledger program.
- Set processing options for Inventory Ledger (R76H6540).

Understanding the Inventory Ledger

The objective of the inventory ledger is to reflect for each item the initial balance, the inventory movements, and the final balance for the period. All movements are valued according to their unit. You must run total cost, indirect cost, and actual cost processes in final mode in order to run this process. The report may be run as many times as necessary.

To generate inventory ledgers, the process goes through the F76H6112 and the cardex F76H611 according to processing options and data selection parameters.

Data Selection

In addition to selecting by legal company (using a processing option), use data selection to specify whether the ledger is for one or many plants, for one or many items, or for one or many values of the category code defined in the processing option.

If you do not enter data selection, the report lists all inventory movements for those plants that make part of the transactional companies of the legal company selected in the processing option.

The report is divided into sections:

- Plant.
- Product type (raw material, product in progress, manufactured product and resale product).
- Item code.
- Initial and final balance for cuts and total level.

(PER) Inventory Ledger

According to Peruvian legislation, an inventory ledger must be generated on an annual basis at the closing of each business year. You can generate an inventory ledger after:

- The actual cost and inventory adjustment processes have been run in final mode.
- The localized As Of generating (R76H6542) program and the localized As Of generating (R76H397) program for previous years have been run.

In order to issue an inventory ledger you should perform these tasks:

- Set up items.
- Run the Localized As Of Generating program.
- Generate Initial Balance in the Localized As Of.
- Run the Actual Cost process in final mode.
- Run the indirect cost process in final mode.

- Issue the inventory ledger.

Running the Inventory Ledger

(CHL) Select Inventory (G76H41), Inventory Ledger.

(PER) Select Inventory (G76P41), Inventory Ledger.

Setting Processing Options for Inventory Ledger (R76H6540)

Processing options enable you to specify the default processing for programs and reports.

General

| | |
|-------------------------|---|
| Legal Company | Enter the address book number of the company to be reported as the legal company. |
| Century | Enter the century to run the report in. |
| From Fiscal Year | Enter the year from which it is to be reported. |
| From Period | Enter the period from which it is to be reported. |
| To Fiscal Year | Enter the period to which it is to be reported. |
| To Period | Enter the period to which it is to be reported. |
| Category Code | Enter the category code number (6 to 10) used to differentiate the product type. The default number is 6. Enter the category code used to define the document type and whether it is manufactured or sold. This value is calculated by item/plant. Coding defines control divisions in the report. |

(CHL and PER) Calculating Inventory Inflation Adjustments for Raw Materials and Resale Goods for Chile and Peru

This section provides an overview of inventory adjustment for raw materials and resale goods, and discusses how to:

- (CHL) Enter indexes and exchange rates.
- Generate the Localized As Of report.
- Set processing options for the Localized As Of report.
- Generate the Initial Balance in the Localized As Of report.

Understanding Inventory Adjustments for Raw Materials and Resale Goods

You must run the inventory inflation adjustments for raw materials annually at year end. The processes are based on these assumptions:

- The stock of raw materials or resale products existing at the end of the balance is adjusted to its replacement cost to the specified date.
- The stock of raw materials must be set up in the system by Method 02 (weighted average cost) as the primary costing method.

Goods must be valued by the weighted average cost as provided by the Chilean legislation.

- The replacement cost calculation is treated differently for domestic and imported origin raw material or resale products.
- All companies define the business year as January through December.

Setting Up Item Coding

You must set up the country of origin for each branch/plant relationship to determine whether it is an imported or domestic item.

If the country of origin is different from the country code defined by the company, the item is imported. If they are equal, the item is domestic.

AAIs for Inflation Adjustments

Set up the 3910 and 3911 AAIs.

Indexes

Inventory adjustment maintains the inflation adjustment indexes. Indexes are identified by a code, for example, adjustment code in UDC (76A/CA).

Note. Indexes must not be changed or deleted after they are used for an adjustment.

Exchange Rates

Exchange rates are a standard function of the JD Edwards EnterpriseOne Inventory Management system.

Note. Exchange rates must not be changed nor deleted after they are used for an adjustment.

The Item Ledger As Of Record Generation Report

The Item Ledger As Of Record Generation report (R76H6542) is based on the F76H611 table and generates the As Of transactions in the F76H6112 table.

You must run this report whenever the F76H611 table has been changed, as the F76H6112 table is used for the inventory adjustment calculation.

This report summarizes parallel cardex movements (the F76H611 table) by period in the F76H6112 table.

The Create Missing As OF Record Report

The Create Missing As OF Record report (R76H397) generates records in the F76H6112 table and is based on the F76H611 table.

This report adds records to new fiscal year beginnings that have not had any stock movement during the year. It generates a record in the F76H6112 table for the new fiscal year and completes the initial balance fields with the same quantity and amount that corresponds to the previous balance.

(CHL) Forms Used to Enter Indexes and Exchange Rates

| Form Name | FormID | Navigation | Usage |
|-----------------------------------|----------|---|--------------------------------|
| Work with Adjustment Indexes | W76A391A | Inventory Monetary Correction (G76H39), Adjustment Indexes. | (CHL) Locate existing records. |
| Adjustment Indexes | W76A391B | Click Add on the Work with Adjustment Indexes form. | Enter adjustment indexes. |
| Work with Currency Exchange Rates | W0015AA | Inventory Monetary Correction (G76H39), Set Daily Transaction Rates | Locate existing records. |
| Revise Currency Exchange Rates | W0015AC | Click Add on the Work with Currency Exchange Rates form. | Enter exchange rates. |

Entering Indexes and Exchange Rates for Chile

Access the Adjustment Indexes form.

Adjustment Indexes - Adjustment Indexes

OK Cancel Tools

Adjustment Code: CPI ADJis

Calendar Month: 2

Adjustment Index: 2.3434330

Adjustment Indexes form

Generating the Item Ledger As Of Record Generation Report

(CHL) Select Inventory Inflation Adjustment (G76H39), Item Ledger As Of Record Generation.

(PER) Select Inventory Inflation Adjustment (G76P39), Item Ledger As Of Record Generation.

Setting Processing Options for Item Ledger As Of Record Generation (R76H6542)

Processing options enable you to specify the default processing for programs and reports.

General

| | |
|----------------------------|---|
| Generation | Enter 1 to regenerate all the F41112 table. If you leave this field blank, the table is updated with any transaction of the F4111 table that has not been processed yet in the As Of generation. Select the document to generate. |
| Regeneration Option | Enter 1 to print a final report. If you leave this field blank, the report is printed only if there are errors. |

Generating the Create Missing As-Of Record Report

(CHL) Select Inventory Inflation Adjustment (G76H39), Create Missing As Of Record.

(PER) Select Inventory Inflation Adjustment (G76P39), Create Missing As Of Record.

Processing Options for Create Missing As-Of Record Report (R76H397)

Processing options enable you to specify the default processing for programs and reports.

General

| | |
|--------------------|---|
| Century | Enter the two-digit century for which you run the report. |
| Fiscal Year | Enter the two-digit year for which you run the report. |

(CHL) Calculating the Replacement Cost for WIP and FG for Chile

This section provides an overview of how the system calculates replacement costs and discusses how to:

- Set processing options for the Replacement Cost Process Header program (P76H6201).
- Create the replacement cost process header
- Calculate replacements costs for works in process (WIPG) and finished goods (FG) produced for the period.
- Calculate replacements costs for WIPG and FG with a balance but not produced.
- Update the item cost, item ledger, and generate journal entries.
- Set processing options for Replacement Cost Journal Entry (R76H6396).

Understanding the Replacement Cost for WIPG and FG Process

The fiscal authority in Chile requires that WIPG and FG that exist at the end of a reporting cycle be valued at their replacement cost. The replacement cost is calculated using the adjusted value of the raw materials and the cost of the labor for the items for the last month of production. The new calculated cost becomes the new unit cost for the item. The system generates a journal entry to reflect the cost difference between the new calculated unit cost and the historical cost.

To make inventory inflation adjustments, for the same period in time:

1. Execute the actual cost process for WIP and FG.
2. Execute the inventory inflation adjustment process for raw materials and resale goods that have a balance.

The system calculates the adjustment for raw materials and resale goods that have a balance and those that do not have a balance. For items without a balance, the system does not update the item cost and the general ledger; the system stores the values in tables for later use. The system calculates and stores these values because the raw material values are used in the calculations for WIP and FG.

3. Execute the inventory inflation adjustment process for WIP and FG that have balances at the end of the period.

If the WIP and FG had production in the period, the system uses the adjusted costs of the raw materials, the cost of labor, and the indirect costs for the period to calculate the inventory inflation adjustment.

If the WIP and FG did not have any production in the period, the system calculates the inventory adjustment uses the historic actual cost multiplied by the consumer price index (IPC). The historic actual cost includes the cost of the raw materials, labor costs, machine costs, and indirect costs.

Important! You must execute the actual cost and inventory inflation adjustment processes in the order indicated to ensure data integrity. The system verifies that the actual cost and inventory inflation adjustments for raw materials were completed before enabling the execution of the inventory inflation adjustment process for WIP and FG, but the system does not validate the order in which you run the processes.

The system calculates the inflation adjustment for WIPG and FG that have a balance at the end of the specified period. You can execute the adjustment process in proof mode before completing it in final mode, and you can inquire on the new calculated costs.

Use these programs to calculate and update costs.

Replacement Cost Process Header (P76H6201)

Use the Replacement Cost Process Header program (P76H6201) to calculate the replacement cost for WIPG and FG produced in this period, and for WIPG and FG that were not produced in this period, but which have balances.

The Work with Replacement Cost Process header form displays the existing records in the F76H6201 table. You create new records for the F76H6201 table when you use the Add option on the form. When you add records, the system validates that the actual cost process and the inflation adjustment for raw materials was completed for the same period for which you calculate the replacement costs for WIPG and FG.

You also use the Replacement Cost Process Header program to launch the program that updates the item cost and item ledger (cardex) and to generate the journal entries that records the difference between the historical actual cost and the new calculated cost.

Item Replacement Cost Program

When you use the Replacement Cost Option in the Replacement Cost Process Header program, the system calls the Item Replacement Cost program (P76H6205) and enables you to view replacement costs for items by legal company, fiscal year, and period.

The Item Replacement Cost program enables you to launch programs in proof or final mode to calculate the replacement costs for items that were produced and for items that were not produced but which have balances. The system updates the item cost when you run the program in final mode.

Non Produced Item Replacement Cost Program

Use the Non Produced Item Replacement Cost program (R76H6395) to calculate the costs for WIPG and FG which were not produced in the period. This program reads the F76H6112 table and populates the F75H6205 table with the new cost, quantity, and amounts for the items. The program selects items that use cost method 07 and that have stock that was not produced during the period. It accumulates the quantity and amounts by the cost level and adjusts the cost by the inflation index. The system updates the item cost when you run the program in final mode.

Replacement Cost Journal Entry Program

Use the Replacement Cost Journal Entry program (R76H6396) to generate the journal entries that record the difference between the historical average cost and the new cost (replacement cost).

The Replacement Cost Journal Entry program selects all records in the F76H6205 table for the legal company, century, and period specified in the processing options of the Replacement Cost Header Process program.

For each selected record, the system:

- Calculates the adjustment amount.
- Accumulates the adjustment amount.
- When all selected records are processed in final mode, writes entries to the F0911 table for the accumulated amounts for each account.

The system uses AAI 3910 for inventory and uses AAI 3911 for the adjustment amounts.

- When processed in final mode, updates the item ledger if the GL entry was not created as a reverse and the ledger type of the record is AA.
- Prints a report indicating the account number, debits, and credits for the selected records.

Forms Used to Create the Replacement Cost Process Header

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|--|
| Work With Replacement Cost Process Header | W76H6201A | WIPG and FG Inflation Adjustment (G76H40) Replacement Cost Process Header | Display the fields from the F76H6201 table and select the records to update. |
| Replacement Cost Process | W76H6201B | Select Add on the Work With Replacement Cost Process Header form. | Enter the parameters for the records for which you update the costs. Access controls to run the Replacement Cost Journal Entry program (R76H6396) in proof or final mode. |
| Item Replacement Cost | W76H6205A | Select Replacement Cost Calculation from the Form menu on the Replacement Cost Process form. | Calculate in proof or final mode the replacement costs for items produced and for items not produced but which have a balance. |
| View G/L | W76H911A | Select View G/L from the Form menu on the Replacement Cost Process form. | View the journal entries created by the process. |

Setting Processing Options for Replacement Cost Process Header (P76H6201)

Processing options enable you to specify the default processing for programs and reports.

G/L Generation

| | |
|----------------------|---|
| Document Type | Enter the document type of the records to include in the replacement cost process header. |
| Ledger Type | Enter the ledger type of the records to include in the replacement cost process header. |
| Batch Type | Enter the batch type of the records to include in the replacement cost process header. |

Creating the Replacement Cost Process Header

Access the Replacement Cost Process form.

Calculating Replacements Costs for Work in Process Goods and Finished Goods Produced for the Period

Access the Item Replacement Cost form.

Select Calc. Produced Items - Proof from the Form menu to simulate the calculation of the replacement costs for works in process and finished goods produced for the period.

Alternatively, select Calc. Produced Items - Final from the Form menu to calculate the replacement costs for works in process and finished goods produced for the period. When you run the program in final mode, the system updates the unit cost of the item.

Calculating Replacement Costs for Work in Process Goods and Finished Goods With a Balance But Not Produced

Access the Item Replacement Cost form.

Select Cal. Non Produced Items - Proof from the Form menu to simulate the calculation of the replacement costs for works in process and finished goods that have a balance but which were not produced during the period.

Alternatively, select Cal. Non Produced Items - Final from the Form menu to calculate the replacement costs for works in process and finished goods that have a balance but which were not produced during the period. When you run the program in final mode, the system updates the unit cost of the item.

Updating the Item Ledger and Generating Journal Entries

Access the Replacement Cost Process form.

Select Update Cost & G/L Proof Mode from the Form menu to preview new item costs and journal entries that are created when you run the program in final mode.

Alternatively, select Update Cost & G/L Proof Mode from the Form menu to update the item ledger and create journal entries.

Setting Processing Options for Replacement Cost Journal Entry (R76H6396)

Processing options enable you to specify the default processing for programs and reports. For reports, processing options enable you to specify the information that appears on reports.

General

| | |
|-------------|--|
| Mode | Enter <i>1</i> to run the report in final mode. If you leave this processing option blank, the system runs the report in proof mode. |
|-------------|--|

CHAPTER 47

(CHL and PER) Working With General Ledger Functionality for Chile and Peru

This chapter discusses how to:

- Review the ledger by legal number.
- Review account balances by account and category code.
- Review debit and credit balances by month.
- Repost the Account Ledger Tag file.

Reviewing Ledgers by Legal Number for Chile and Peru

This section discusses how to:

- Set processing options for Journal Entries Inquiry by Legal Number (P76H9002).
- Review ledgers by legal number.

Form Used to Review Ledgers by Legal Number

| Form Name | FormID | Navigation | Usage |
|---|-----------|---|---|
| Journal Entries Inquiry by Legal Number | W76H9002A | <ul style="list-style-type: none">• (CHL) General Accounting (G76H09), Journal Entries Inquiry by Legal Number• (PER) General Accounting (G76P09), Journal Entries Inquiry by Legal Number | Review journal entries by legal number. |

Setting Processing Options for Journal Entries Inquiry by Legal Number (P76H9002)

Processing options enable you to specify the default processing for programs.

General

Ledger Type

Enter the UDC table in which you specified the ledger types to process. If you do not complete this processing option, the system uses UDC table 76H/LL.

Reviewing Ledgers by Legal Number

Access the Journal Entries Inquiry by Legal Number form.

Reviewing Account Balances by Account and Category Code for Chile and Peru

This section discusses how to:

- Set processing options for Balance Inquiry by Account/Category Code (P76H9006).
- Review balances by account and category code.

Form Used to Review Account Balances by Account and Category Code

| Form Name | FormID | Navigation | Usage |
|-------------------------|-----------|--|---|
| Account Balance Inquire | W76H9006A | General Accounting (G76H09) or General Accounting (G76P09), Balance Inquiry by Account/Cat. Code | Display balances by account and subsidiary or by category code, as well as by business unit with detail or summary information. |

Setting Processing Options for Balance Inquiry by Account/Category Code (P76H9006)

Use these processing options to specify how to display cost centers, the level of detail in which to summarize balances, the process method, and so on.

Process

- 1. Cost Center** Specify how to display cost centers. Values are:
Blank: Display detail by cost center.
I: Display all of the cost centers for a legal company and display summary information for the object and subsidiary account.
- 2. Level of Detail** Specify the level of detail. The system summarizes all general ledger balances by the account level of detail specified. Values are 3–9. The default value is 9.
- 3. Legal Company** Specify the company number in which to retrieve general ledger balances.
- 4. Process Method** Specify the process method. Values are:
Blank: Display asset and liabilities according to the operation sign. Asset accounts appear with a positive sign in the Asset column and liabilities appear with a negative sign in the Liability column.
A: Display asset accounts in the Asset column and liability accounts in the Liability column according to AAI items GLG2 (Beginning Assets) and GLG3 (Beginning Liabilities).

- 5. Business Unit** Specify the business unit in which to display object and subsidiary accounts.
- 6. Ledger Type** Specify the ledger type code from UDC table 76H/XX. The system uses LL (ledger types to process) as the default value.
- 7. Category Code** Specify the category code from UDC table 09/21–09/23 in which to group the GL accounts. The system displays the category code description instead of the GL account.
- If you leave this processing option blank, balances are grouped and displayed by object and subsidiary account.

Print Options

- Accounts with Zero Amounts** Specify whether to display accounts with zero amounts.
- Blank: Do not display accounts with zero amounts.
- 1: Display accounts with zero amounts.
- 2: Do not display accounts with zero amounts and with the same level of detail that is specified in the Level of Detail processing option.

Dates

- Period Number** Specify the tax period to display on the form.
- Fiscal Year** Specify the fiscal year to display on the form.

Reviewing Balances by Account and Category Code

Access the Account Balance Inquire form.

Reviewing Debit and Credit Balances by Month for Chile and Peru

This section discusses how to:

- Set processing options for Debit/Credit Inquiry by Month (P76H9007).
- Review debit and credit account monthly balances.

Form Used to Review Debit and Credit Balances by Month

| Form Name | FormID | Navigation | Usage |
|------------------|-----------|---|--|
| Account Balances | W76H9007A | General Accounting (G76H09) or General Accounting (G76P09), Debit/Credit Inquiry by Month | Display debit and credit balances by account number and month. |

Setting Processing Options for Debit/Credit Inquiry by Month (P76H9007)

Use these processing options to set default values for the Account Balances form.

Defaults

| | |
|-------------------------------------|---|
| Fiscal Year | Specify the fiscal year to display on the form. |
| Ledger Type | Specify the ledger type code to display from UDC table 76H/XX. The system uses LL (ledger types to process) as the default value. |
| Subledger and Subledger Type | Specify the subledger and subledger type to display. To display account balances for all subledgers, enter *. |
| Currency Code | Specify the currency code in which to display debit and credit amounts. To display accounts balances for all currency codes, enter *. |

Reviewing Debit and Credit Monthly Balances

Access the Account Balances form.

Reposting the Account Ledger Tag File for Chile and Peru

This section discusses how to:

- Run the Localization Account Repost program.
- Set processing options for Localization Account Repost.

Running the Localization Account Repost Program

Select General Accounting (G76H09 or G76P09), Localization Account Repost.

Setting Processing Options for Localization Account Repost (R76H9102)

Use these processing options to specify the processing mode as well as comparison between tables.

Mode

| | |
|------------------------|--|
| 1. Process Mode | Specify the processing mode. Values are: 1: Proof mode. Prints the report and shows the differences between the F0911 and F76H902T tables. 2: Final mode. Prints the report and updates the F0902 table. Shows the differences between the F0911 and F76H902T tables and updates the F76H902T table. |
|------------------------|--|

2. F0902 Balance

Specify whether to compare the balances in the F76H902T table to the F0902 table:

Blank: Do not compare the balances.

I: Compare the balances.

3. F0911 Entries

Specify whether to check for records that are in the F76H0902T table and are missing in the F0911 table:

Blank: Do not check for missing entries.

I: Check for missing entries.

CHAPTER 48

(PER) Working with Accounts Payable Functionality for Peru

This chapter provides overviews of IGV withholding calculations and payment groups for Peru and discusses how to:

- Enter vouchers for Peru.
- Process SPOT vouchers.

Understanding IGV Withholding Calculations for Peru

When you run the Create Payment Control Groups (R04570) program, the system calculates IGV withholding taxes when tax lines exist for the voucher being paid.

When calculating IGV withholding, the system:

- Bases the taxable amount calculation on the net amount of all vouchers for the payment that exceeds the minimum taxable amount specified for the supplier in the Withholding Percentage (P76P405) program.
- Determines the minimum amount based on the total of the vouchers when the original document was paid, but calculates the withholding based on only the original document (for related credit or debit memo vouchers).

If the original document for a credit or debit memo was not paid, you must include both vouchers in the payment. If both vouchers are included in the payment, the system determines the minimum amount for the taxable amount calculation on both vouchers. The withholding calculation is made for both vouchers.

Understanding Payment Groups for Peru

When you run the Create Payment Control Groups program, the system:

- Verifies that an internal document type for the IGV voucher exists in the Legal Company Constants - PER (F76P002) table.
- Verifies that an internal document type for the payment voucher exists in the F76P002 table.
- Verifies the IGV withholding percentage and payment date to calculate the withholding amount.
- Verifies the payment status of the correct vouchers when related vouchers exist.
- Verifies that a legal numbering scheme exists for the IGV vouchers.

When you use the Work With Payment Groups (P04571) program to write and update payment groups, the system:

- Assigns a voucher number to the calculated withholding amount from the next numbering scheme set up for the company and withholding document type.
- Prints the withholding certificate, if appropriate.
- Generates an additional report for Peru if you set up matching versions for the Work With Payment Group program and the PO - PCG process - PER - 04 program.
- Prints three copies of the withholding vouchers, one each for the supplier, the company, and the tax authority (*Superintendencia nacional de administración tributaria* [SUNAT]).

You can reprint the IGV withholding certificate by using the IVG Withholding Report program (R76P4600).

Paying SPOT Vouchers

You pay the positive amount (positive lines) of the SPOT (*Sistema de Pago de Obligaciones Tributarias*) voucher when you generate automatic payments. The amounts that are reflected in the positive lines are sent to the National Bank. When you generate automatic payments, you must pay the positive lines for SPOT vouchers without including any other vouchers in the payment group.

You pay the original voucher on which SPOT vouchers are based by creating payment groups that include both the original voucher and the negative amounts (negative lines) for the SPOT vouchers. You can include other types of vouchers in the payment group that includes these vouchers. Before you can pay these vouchers, you must:

- Pay the positive lines of the SPOT voucher to send payments to the National Bank.
- Enter the bank deposit information from the National Bank into the system by using the Spot Data Entry (P76P480) program.

Entering Vouchers for Peru

This section provides an overview of voucher entry for Peru, lists prerequisites, and discusses how to:

- Set processing options for Peruvian Add Vouchers Set Up (P76P411T).
- Enter additional information for vouchers.

Understanding Voucher Entry for Peru

You use the standard voucher entry programs to enter vouchers for Peru, and use a country-specific program to enter additional information for Peru.

Voucher Entry

Use the standard voucher entry programs to enter vouchers for Peru. After you enter a voucher, the system displays the Voucher Additional Information - Revision form which enables you to enter withholding information for the supplier and information about the original supplier invoice. The system stores the information that you enter in the Peru AP Tag File - PER - 04 (F76P0411T) table.

See [Chapter 42, “\(PER\) Setting Up Withholding,” page 911](#).

When you enter multiple vouchers for suppliers, the Voucher Additional Information - Revision form appears for each entered voucher. When working with multiple vouchers, you can:

- Void multiple vouchers by selecting Cancel Voucher.

The system voids all vouchers after the voucher that is displayed on the form.

- Void a single voucher by clicking Cancel.

The system voids the voucher that is displayed on the form and then displays the next voucher.

When you enter vouchers for suppliers, you must enter the corresponding withholding amounts for general sales (*Impuesto General a la Venta* [IGV]) and the tax duty payment (*Sistema de Pago de Obligaciones Tributarias* [SPOT]) taxes. When you enter amounts for IGV and SPOT, the system validates the amounts that you enter by verifying that:

- The company is a withholding agent.

You specify whether a company is a withholding agent in the Legal Company Constants program (P76P002).

- The supplier did not submit a withholding exemption certificate, or the certificate is expired.
- The document type for the tax line is defined as a tax in the Withholding Document Type (76H/HO) UDC table.
- The amount of the voucher is greater than the minimum withholding amount for the identified in the Spot Maintenance Percentage (P76P410) program.

When you enter the withholding amounts, you enter the amount as a negative amount, and use a tax explanation code of VT (VAT tax). You must enter separate lines for each tax.

Each voucher for IGV withholding includes only lines for IGV; you cannot include lines for other taxes or for other transactions.

Review or Modification of Vouchers

You can view voucher information for Peru on the Enter Voucher Additional Information form in the Peruvian Add Vouchers Set Up (P76P411T) program. You can also modify the legal invoice number. Voucher information that is specific to Peru can be viewed only on this form; you cannot access the information by using the standard voucher inquiry programs.

Legal Invoice Number Verification

When you enter the legal invoice number, you enter the number in two segments separated by a hyphen. You can enter up to four numerical characters preceding the hyphen to represent the issuing center, and can enter up to seven characters after the hyphen. If the number of characters after the hyphen is less than seven, the system adds zeros to the left of the characters entered to create a total of seven characters after the hyphen. For example, if you enter 002-10, the system stores the legal invoice number as 002-0000010.

When you enable legal number verification by setting the processing option in the Peruvian Add Vouchers Set Up program to validate the number, the system issues an error message if the number entered does not contain 3 or 4 characters in the first segment, or if you enter more than seven characters in the second segment.

You must set up matching versions of the Peruvian Add Vouchers Set Up program and the Standard Voucher Entry (P0411) program to validate the legal invoice number.

Prerequisites

Before you complete the tasks in this section:

- Verify that the Localization Country Code field in the User Profile Revisions form is set to *PE* (Peru).
- Verify that legal company constants, supplier information for Peru, and withholding information for Peru are set up.

See Chapter 40, “(CHL and PER) Setting Up Functionality for Chile and Peru,” (CHL and PER) Setting Up Legal Companies for Chile and Peru, page 890.

See *JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide*, “Entering Supplier Information,” Entering Supplier Master Information.

Forms Used to Enter Voucher Information for Peru

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|--|
| Enter Voucher - Payment Information | W0411A | Supplier & Voucher Entry (G0411), Standard Voucher Entry Click Add on the Supplier Ledger Inquiry form. | Enter standard voucher information. |
| Multi-Voucher Entry | W0411G | Other Voucher Entry Methods (G04111), Multi Voucher - Multi Supplier Click Add on the Supplier Ledger Inquiry form. | Enter multiple vouchers for multiple suppliers. |
| Voucher Additional Information - Revision | W76P411TB | <ul style="list-style-type: none"> Enter a voucher, then click OK on the Enter Voucher - Payment Information form. Enter a voucher, then click OK on the Multi-Voucher Entry form. | Add original document, legal document, IGV, and SPOT information to a voucher. |
| Work With Voucher Additional Information | W76P411TA | Accounts Payable (G76P04), Peruvian Add Vouchers Set Up | View existing vouchers. |
| Enter Voucher Additional Information | W76P411TC | Select a record on the Work With Voucher Additional Information form and click Select. | View voucher information required for Peru, or add or modify the legal invoice number. |

Setting Processing Options for Peruvian Add Vouchers Set Up (P76P411T)

Processing options enable you to specify the default processing for programs and reports.

General

Legal Number Validation Enter *N* to suppress validation of the legal number when you enter vouchers. Leave this processing option blank to have the system perform the validation.

Entering Additional Information for Vouchers for Peru

Access the Voucher Additional Information - Revision form.

| | |
|---------------------------------|---|
| Original Document Number | <p>The Original Document Number is a combination of the document type, original document number, and original document company.</p> <p>In the first segment of the processing option, enter the Document Type from the Document Type (00/DT) UDC table.</p> <p>In the second segment, enter the document number from the document for which the voucher is entered. For example, you might enter the original invoice number.</p> <p>In the third segment, enter the company number from the F0010 table that represents the company that issued the document whose number you entered in the second segment.</p> |
| Legal Document Type | Enter the legal document type for the voucher. The value that you enter must exist in the Legal Document Type - CHI - 00 (F76H005) table. |
| Registered for Taxes | The system displays the value that exists for the supplier in the supplier's address book record. You cannot change this value in the Voucher Additional Information - Revision form. |
| IGV Withholding Concept | The system displays the value that exists for the supplier in the supplier's address book record. You can change this value by entering a value that exists in the IGV Withholding Concept (76P/01) UDC table. |
| SPOT Concept | The system displays the value that exists for the supplier in the supplier's address book record. You can change this value by entering a value that exists in the SPOT Concept (76P/02) UDC table. the value that you enter determines how the system calculates the tax amount due. |

Processing SPOT Vouchers for Peru

This section provides an overview of tax duty payment system (*Sistema de Pago de Obligaciones Tributarias* [SPOT]) vouchers and discusses how to:

- Generate SPOT vouchers.
- Set processing options for Spot Voucher Generation (P76H4800).
- Enter bank information for SPOT vouchers.

Understanding SPOT Vouchers

You generate SPOT vouchers when a supplier is subject to the payment of a duty tax. SPOT vouchers differ from the regular vouchers that you generate because you make a payment to the National Bank for the tax due at the same time that you pay the supplier. The National Bank sends you deposit information about the payment, which you track in the Spot Data Entry (P76P480) program.

When a supplier's invoice is subject to the duty tax, you enter a voucher for the invoice by using the standard Voucher Entry (P0411) program. When the Localization County Code is set to PE (Peru), the system automatically displays the Voucher Additional Information - Revision form on which you enter the SPOT concept. The value that you enter determines how the system calculates the tax due. You set up SPOT concepts in the Spot Maintenance Percentage (P76P410) program.

See [Chapter 48, “\(PER\) Working with Accounts Payable Functionality for Peru,” Entering Vouchers for Peru, page 974.](#)

See [Chapter 42, “\(PER\) Setting Up Withholding,” Setting Up SPOT Withholding Information for Peru, page 912.](#)

The system generates two lines in the accounts for suppliers when it generates SPOT vouchers. The line with the positive amount is paid to the National Bank. The line with the negative amount is paid along with the original voucher. The system stores the relationship between the original voucher and the SPOT vouchers in the SPOT Voucher Information (F76P480) table.

SPOT vouchers cannot be modified; they can only be voided. If a SPOT voucher is paid, you cannot void it. If you need to modify an original voucher, you must first void any SPOT vouchers associated with it.

SPOT Voucher Generation

After you enter SPOT vouchers, you use the SPOT Voucher Generation (R76P4800) program to produce the SPOT vouchers. When you run the SPOT Voucher Generation program, the system:

- Validates that the total original voucher amount is greater than the minimum amount defined as the non-taxable amount in the F76P410 table.
- Verifies that valid tax explanation codes exist for the tax lines.

For example, if the tax explanation code for the line is E (exempt) or S (Sales or VAT tax), the system does not generate a SPOT voucher.

- Generates the SPOT voucher in the currency of the original voucher.

Bank Deposit Information for SPOT Vouchers

You make the bank deposit for SPOT vouchers by using the automatic payment process to send payments to the National Bank. When the National Bank sends you the bank deposit information, you must enter the information into the system before you can pay the supplier.

See Also

[Chapter 48, “\(PER\) Working with Accounts Payable Functionality for Peru,” Understanding Payment Groups for Peru, page 973](#)

Forms Used to Enter Bank Information for SPOT Vouchers

| Form Name | FormID | Navigation | Usage |
|------------------------------------|----------|---|--|
| Work With Spot Voucher Information | W76P480B | Accounts Payable (G76P04), Spot Data Entry | Access records generated by the Spot Voucher Generation program to enter bank information. |
| Edit SPOT Voucher Information | W76P480A | On the Work With Spot Voucher Information form, select a record and click Select. | Add the deposit number, invoice number, and voucher number to the record. |

Generating SPOT Vouchers

Select Accounts Payable (G76P04), SPOT Voucher Generation.

Setting Processing Options for SPOT Voucher Generation (R76P4800)

Processing options for reports enable you to specify the information that appears on the reports.

General

| | |
|----------------------------|---|
| Final or Proof Mode | Enter 1 to print in final mode and update tables. Leave this processing option blank to print in proof mode. |
| Document Type | Enter the document type that identifies SPOT vouchers. The value that you enter must exist in the Document Type (00/DT) UDC table and in the Document Type - Vouchers Only (00/DV) UDC table. |
| Issuing Series | Enter the number of the issuing center. |

Defaults

| | |
|-----------------------------|---|
| Tax Explanation Code | Enter the code from the Tax Explanation Code (00/EX) UDC that identifies the type of tax for the SPOT voucher. |
| Tax Area | Enter the tax area from the Tax Rate/Area (F4008) table for the SPOT voucher. |
| Payment Instrument | Enter the code from the Payment Instrument (00/PY) UDC table that represents the type of payment for the positive amount for the SPOT voucher. The positive amount is the amount being tax amount being paid through the National Bank. |
| Payment Terms Code | Enter the code from the Payment Terms (F0014) table that represents the conditions of the payment of the SPOT voucher. |

G/L

| | |
|------------------------|---|
| G/L Date to Use | Enter 1 to specify that the system uses the invoice date as the date of the SPOT voucher. Enter 2 to specify that the system uses the GL date. Leave this processing option blank to use the system date. |
| Account ID | Enter the account ID of the account from which you pay the tax on the SPOT voucher. |

Entering Bank Information for SPOT Vouchers

Access the Edit SPOT Voucher Information form.

| | |
|----------------------------|--|
| Spot Deposit Date | Enter the date on which the deposit to the National Bank was made. |
| Spot Deposit Number | Enter the deposit number for the transaction. |
| Spot Invoice Number | Enter the legal invoice number for the tax invoice. |
| Voucher Number | Enter the supplier's invoice number. |

Processing Options for PO - PCG process - PER (P76P470)

Processing options enable you to specify the default processing for programs and reports.

General

Payment Terms Code

Enter a payment term code for the withholding voucher. The value that you enter must exist in the Payment Terms (F0014) table.

Emission Serial

Enter the serial number of the legal number for the withholding voucher. You must complete this processing option.

CHAPTER 49

(CHL and PER) Working With Other Functionality for Chile and Peru

This chapter provides an overview of voucher entry for Chile and discusses how to:

- (CHL) Verify which documents appear in legal reports.
- (CHL) Print purchase invoices from the JD Edwards EnterpriseOne Accounts Payable system.
- (CHL and PER) Processing invoices for Chile and Peru.
- (CHL and PER) Voiding invoices.
- (CHL and PER) Work with batch invoices.

(CHL) Understanding Voucher Entry for Chile

When you enter vouchers for Chile, the system validates:

- Legal invoice number.
- Valid dates for reimbursable tax.
- Existence of a detail line for fees.

Legal Invoice Number

The invoice number that you enter cannot exceed 10 characters. The invoice number can be preceded by a two-character code that identifies the place of issue. When you enter an invoice number with fewer than 10 characters, the system stores the number in the F0411 table with leading zeros so that a 10-character number is saved. For example, if you enter 34567 for the invoice number, the system saves the number as 0000034567. When you enter an invoice number with more than 10 characters, the system displays an error message.

You set a processing option in the Chilean Add Vouchers Set Up (P76H0411) program to specify whether the system validates the invoice number.

Valid Dates for Reimbursable Tax

When you enter vouchers, the system accesses the information in the Legal Company Constants (F76H002) table to determine if the date of the voucher is within the time period allowed for reimbursable VAT. If the date of the voucher makes the voucher ineligible for reimbursement, the system records the VAT as non-reimbursable.

For each voucher line, the tax area for the item is replaced with the tax area defined for the item in the Tax Rate Columns Reports Set Up (F76H020) table when:

- The voucher date is within the period of time allowed by law.

- The tax type is equal to VAT.
- The tax percentage in the tax area is other than 0 (zero).

Withholding Fees

For vouchers for fees, the document type assigned to the detail lines must exist in the Withholding Document Type (76H/HO) UDC table. The system also validates that:

- The company is a withholding agent.
- The supplier did not submit a tax exemption certificate or the certificate that exists has not expired.
- The voucher amount is greater than the minimum amount defined in the F76H002 table.

Enter withholding fees as a negative amount with a tax explanation code of VT.

(CHL) Verifying Documents in Reports for Chile

This section provides an overview of verifying which documents appear in legal reports and discusses how to verify documents in reports.

Understanding How to Verify Documents in Reports

You use the Documents Printed on AP Legal Reports program (P76H401) to view which documents are included on legal reports for Chile. The program lists each document by document type for the company specified, and indicates the reports in which the documents appear.

Form Used to Verify Documents

| Form Name | FormID | Navigation | Usage |
|--|----------|--|---|
| Work With Document Printed in AP Reports | W76H401A | Accounts Payable (G76H04), Documents Printed on AP Legal Reports | View by company the documents included in the VAT Purchasing Report and the Rent Withholding Ledger report. |

Verifying Legal Documents in Reports

Access the Work With Document Printed in AP Reports form.

Printing Purchase Invoices from the Accounts Payable System

This section provides an overview of how to print purchase invoices and list prerequisites.

See Also

Chapter 44, “(CHL and PER) Numbering and Printing Legal Documents for Chile and Peru,” Setting Processing Options for Lot of Printing Review (P76H3B50), page 925

Understanding How to Print Purchase Invoices

You can print purchase invoices for Chile from the JD Edwards EnterpriseOne Accounts Payable system as well as printing invoices from the JD Edwards EnterpriseOne Accounts Receivable and JD Edwards EnterpriseOne Sales Order Management systems.

When you print or reprint purchase invoices from the JD Edwards EnterpriseOne Accounts Payable system, the system prints them in duplicate, prints the term *Factura de Compra* (Purchase Invoice), and includes this information:

- Complete name and address of the emitter.
- Registro Unico Tributarios (RUT) number (Tax Unique Register) of the emitter
- Invoice date.
- Complete name and address of the supplier.
- RUT and Personal Aid number of the supplier.
- RUT and Personal Aid number of the supplier.
- Details of the transaction, including the tax amount, unit price, total amount, and VAT withholding.

Invoice Print Process

To print purchase invoices from the JD Edwards EnterpriseOne Accounts Payable system:

1. Use the Standard Voucher Entry program (P0411) to enter vouchers.
2. Post the vouchers.
3. Verify legal number availability.

This step is optional, but recommended. If you verify legal number availability prior to generating the legal document number, you might avoid errors that prevent you from completing the process to print invoices.

4. Use the Lot of Printing Review (P76H3B50) program to select the voucher and generate the legal document number.

The system performs the standard validations and calculations for the selected vouchers and creates print batches (lots). Each lot includes all of the documents that have the same legal company, document type, and emission serial.

5. Use the Print Legal Document (R76H3B30) program to print the invoices.

The system verifies that the voucher lines will print on one page. If more than one page is required, the system splits the voucher.

Deleting and Modifying Vouchers

You cannot delete or modify a voucher after you have used the Lot of Printing Review program to add the voucher to a lot. If you need to delete or modify a voucher that is included in a lot, you must delete the lot.

Understanding the Programs Used to Print Invoices

The process for printing invoices from the JD Edwards EnterpriseOne Accounts Payable system requires that you use Chile specific programs.

Generate Legal Document Number (R76H3B29)

The system calls the Generate Legal Document Number program when you choose the Generate Legal Num (generate legal number) option from the Row menu on the Send Lot to Print form in the Lot of Printing Review program.

The Generate Legal Document Number program:

- Validates the status of the lot selected.
- Validates that the legal document fit on one page.

If the legal document does not fit on one page, the system splits the document into two or more legal documents.

- Retrieves the next legal document number.
- Retrieves the format of the document.

Lot of Printing Review (P76H3B50)

Use the Lot of Printing Review program to create and print legal documents. This program enables you to:

- Create, modify, and delete legal document print batches for invoices that you enter in the JD Edwards EnterpriseOne Accounts Payable or JD Edwards EnterpriseOne Accounts Receivable systems.

When you create and process print batches, the system assigns a batch status to identify the current status:

- O: Open

The print batch has been created, but legal numbers have not been assigned to the batch. The system also assigns this status to print batches for which legal numbers have been renumbered.

- U: Use

Legal numbers are in the process of being assigned to the print batch.

- N: Numbered

Legal numbers are assigned to invoices in the print batch. To print legal documents in a print batch, the print batch must be at this status.

- P: Process

The print batch is being updated. For example, a print batch has this status when the legal documents are being printed.

- C: Closed

Legal documents for the batch have been printed.

- A: Open (document status of invoice in a print batch).

The invoice has not been processed. The print batch status is *O*.

- N: Numbered (document status of invoice in a print batch).

The invoice has been assigned a legal number. The print batch status is *N*.

- P: Processed (document status of invoice in a print batch).

The invoice has been printed. The print batch status is *C*.

- R: Renumbered (document status of invoice in a print batch).

The invoice legal number has been renumbered. The print batch status is *O*.

- E: Error (document status of invoice in a print batch).

The invoice has an error.

- Verify legal number availability.

This feature enables you to verify availability of legal numbers prior to assigning legal numbers to print batches. This assists in preventing issues during the numbering process.

- Number and renumber batches.

After legal numbers are assigned to invoices in print batches, you can renumber the print batches with different legal numbers.

- Print legal documents.

The system submits the version of the Print Legal Documents program that you specify for the legal company, legal document types, and emission serial.

- Inquire on legal documents that are associated with invoices.

This feature enables you to review invoices that are in print batches.

- Review batch audit information.

This feature enables you to review information about print batches, including the user ID of the person who last modified the batch, the date and time when the batch was last modified, and so on.

The system stores data about legal document print batches in the Lot of Printing – Header (F76H3B50) and the Lot of Printing – Detail (F76H3B51) tables and in the image tables (F76H3B31, and F76H3B32 through F76H3B40). It also saves information about the accounts payable lines in the AP Document Line (Print Info) table (F76H3B40).

Print Legal Documents (R76H3B30)

The system runs the Print Legal Document program when you specify in the processing options for the Lot of Printing Review program that the system is to print the invoice after the legal number is generated.

The Print Legal Document program reads information in these tables:

- F76H3B50
- F76H3B51
- F76H3B31
- F76H3B32
- F76H3B33
- F76H3B34
- F76H3B35
- F76H3B36
- F76H3B37

- F76H3B38
- F76H3B39
- F76H3B40

Prerequisites

Before completing the tasks in this section:

- Verify the legal company, the next numbers, legal document type, legal document type relationship, and print layout setup.

See Chapter 41, “(CHL and PER) Setting Up the System for Chile and Peru Legal Requirements,” page 903.

- Set up versions of the Print Legal Documents program (R76H3B30) to specify which version the Lot of Printing Review program uses to print invoices in print batches.
- Post invoices for which you generate legal document print batches.

Forms Used to Print Purchase Invoices for Chile

| Form Name | FormID | Navigation | Usage |
|--------------------|-----------|--|--|
| Lot Review | W76H3B50A | Accounts Payable (G76H041), Lot of Printing Review. Complete the processing options, and click OK. | Review print batches. Verify legal number availability prior to assigning legal numbers to invoices in print batches. |
| Edit Lot | W76H3B50B | To work with an existing record, select the record and click Select on the Lot Review form. To add a new record, click Add on the Lot Review form. | Create, review, and renumber invoices associated with print batches. |
| Select AP Invoices | W76H3B50K | On the Edit Lot form, select Select AP Invoice from the Form menu. Select the invoices, then click Select or select Include Invoice from the Row menu. | Select invoices for which legal document print batches are created. The system saves information about the invoices you select to the image tables. Edit or add information about lots. |
| Audit Information | W76H3B50E | On the Lot Review form, select the print batch for which you want to review audit information and then select Audit Information from the Row menu. | Review audit information pertaining to a print batch, such as the user ID of the person who last modified the print batch. |
| Send Lot to Print | W76H3B50D | On the Lot Review form, select the print batch for which you want to assign legal numbers, and then select Generate Legal Num (generate legal number) from the Row menu. | Assign legal numbers to invoices in print batches. |
| Print Invoices | W76H3B50J | On the Lot Review form, select the print batch for which you want to print legal documents, and then select Print Invoices from the Row menu. | Print the invoice. |

(CHL and PER) Processing Invoices for Chile and Peru

This section provides an overview of invoice requirements for Chile and Peru and discusses how to:

- Set processing options for Chilean - Add Invoice PO (P76H3B11).
- Enter related credit notes.

Understanding Invoice Requirements for Chile and Peru

When you enter invoices in the JD Edwards EnterpriseOne Accounts Receivable system for Chile and Peru, you must set up a version of the Chilean Add Invoices - PO program (P76H3B11) that is the same as the version of the Standard Invoice Entry program. For example, if you use version ZJDE0001 of the Standard Invoice Entry program, set up version ZJDE0001 of the Chilean - Add Invoice PO program. When you enter invoices using the Standard Invoice Entry program, the system calls the Chilean - Add Invoice PO program if the Localization Country Code in user preferences is set to *CL* (Chile) or *PE* (Peru).

When you enter invoices for Chile and Peru, the system:

- Validates that the entered invoice is related to a legal document. If it is not, the system generates an error message.
- Prevents you from revising and voiding invoices that are:
 - Not in the accounting period for the company.
 - In print batches.
 - In the VAT sales report.
- Prevents you from revising and modifying related documents.

Note. To void an invoice that is related, you must first void the related document.

Prerequisites

Before completing the tasks in this section:

- Set up user preferences with a Localization Country Code of *CL* (Chile) or *PE* (Peru).
- Set up a version of the Chilean - Add Invoice PO program that is the same version of the Standard Invoice Entry program (P03B11) that you use to enter invoices.
- Review the steps for entering a standard invoice.
- Set up document type relationships and create legal next numbers.

See [Chapter 41, “\(CHL and PER\) Setting Up the System for Chile and Peru Legal Requirements,”](#) page 903.

- Set the Invoice related to NC/ND processing options on the Chilean Add Invoices - PO program (P76H3B11) to display the NC/ND Related to Invoice form if you are entering related credit notes.

Forms Used to Process Invoices

| Form Name | FormID | Navigation | Usage |
|-----------------------------------|-----------|---|--|
| Work with Customer Ledger Inquiry | W03B2002A | Customer Invoice Entry (G03B11), Standard Invoice Entry. | Locate, review, and delete invoices. |
| Standard Invoice Entry | W03B11A | On the Work with Customer Ledger Inquiry form, click Add. | Enter invoices. |
| G/L Distribution | W03B11C | On the Standard Invoice Entry form, click OK. | Distribute the invoice amount to the G/L accounts. |
| NC/ND Related to Invoice | W76H3B15A | On the Standard Invoice Entry form, complete the fields to enter a standard invoice, specifying a negative amount, and then click OK. | Assign the credit note to an original invoice by using the internal number or the legal number of the invoice. |
| Select Related Documents | W76H3B15B | On the NC/ND Related to Invoice form, Select Invoice Inquiry from the Form menu. | Select invoices for which you want to relate to credit notes. |

Setting Processing Options for Chilean Add Invoices - PO (P76H3B11)

Processing options enable you to specify the default processing for programs and reports.

Legal Number

This processing option specifies the emission series of legal document numbers.

Emission Serial Specify the series of emission of the legal document number (*Timbraje*).

NC/ND Related

These processing options specify how the system processes related documents.

Invoice Related to NC/ND Specify whether to enter documents related to NC/ND. Values are:
 Blank: Do not enter related documents.
 1: Enter related documents. The system displays the NC/ND Related to Invoice form when you enter invoices in the JD Edwards EnterpriseOne Accounts Receivable system.

Document Related with Different Emission Serial Specify whether to relate documents with different emission serials.

Document Related for Different Client Specify whether to relate documents for different clients.

Batch Process

These processing options specify how the system processes legal numbers.

| | |
|---------------------------------|--|
| Legal Number Mandatory | Enter <i>1</i> to specify that the legal number is required when processing batch invoices. If left blank, the system does not require a legal number. |
| Legal Number Edit | Specify whether the system edits the legal number when processing batch invoices. Values are: Blank: Do not edit the legal number. <i>1</i> : Edit the legal number against an active serial number range. <i>2</i> : Edit the legal number against any serial number range, regardless of the state. |
| Duplicate Invoice Number | Specify whether duplicate invoice numbers are allowed when processing batch invoices. Values are: Blank: Allow duplicate invoice numbers. <i>1</i> : Do not allow duplicate invoice numbers. |

Entering Related Credit Notes

Access the NC/ND Related form.

To enter related credit notes:

1. Select Related Documents from the Form menu.
2. Find and select the invoices for which you want to relate, and then click Select.
The system displays the documents in the detail area of the NC/ND Related form.
3. Click OK.

(CHL and PER) Voiding Invoices for Chile and Peru

This section discusses how to void invoices.

Forms Used to Void Invoices

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|--|
| Work with Legal Next Numbers for Cancellation | W76H3B20A | <ul style="list-style-type: none"> • (CHL) Accounts Receivable (G76H03B) • (PER) Accounts Receivable (G76P03B) | Select an invoice. |
| Invoices not Printed | W76H3B20B | On the Work with Legal Next Numbers for Cancellation form, select an invoice to void and click Select. | Enter the date, code, and reason for the void. |

Voiding an Invoice

Access the Invoices not Printed form.

| | |
|---------------------------------|---|
| Last Invoice Not Printed | Enter the legal document number of the invoice you void. |
| Cancellation Date | Enter the date that you void the invoice. If you leave this field blank, the system uses the current date. |
| Cancellation Code | Enter a value that exists in the Cancellation Code (76HCC) UDC table to indicate why the invoice is voided. |
| Cancellation Detail | Enter an additional remark to explain the reason the invoice is cancelled. (optional) |

(CHL and PER) Working with Batch Invoices for Chile and Peru

To process batch invoices for Chile and Peru, run the standard processes for batch invoice processing, and then copy data to country-specific tables.

When you create invoices using an external system, you can transfer them to the JD Edwards EnterpriseOne Accounts Receivable system using the Batch Invoice Processor program (R03B11Z1A). Before you perform batch invoice processing, you need to write a custom program to copy the data from the external system to these tables:

- Batch Invoices (F03B11Z1).
- Journal Entry Transactions - Batch File (F0911Z1).

For Chile and Peru, you must also copy data to these tables:

- F76H3B10 EDI Tag File - CHI - 03B table (F76H3B1Z).
- F76H3B15 EDI Tag File - CHI - 03B table (F76H3B5Z).

CHAPTER 50

(CHN) Understanding Country-Specific Functionality for China

This chapter provides an overview of China-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

China-Specific Setup and Processes

This table lists the country-specific setup and functionality for China.

| Setup or Process | Description |
|--|---|
| UDCs (user defined codes) | <p>Set up base-software UDCs with China-specific values, and set up China-specific UDCs for:</p> <ul style="list-style-type: none">• Financial reports• Accounts payable <p>See Chapter 51, “(CHN) Setting Up Country-Specific Functionality for China.” Setting Up UDCs for China, page 1003.</p> |
| AAIs (automatic accounting instructions) | <p>There are no China-specific AAIs to set up. Set up the standard financial and distribution AAIs to work with standard processes for vouchers, invoices, sales and purchase orders, and tax processing.</p> |
| Next numbers | <p>Set up next numbers for JinSui processing.</p> <p>JinSui is a third-party software. To perform JinSui processing, you must set up next numbers for system 75 (ASEAN Localization), row 1 before you run the Print Invoices program (R42565).</p> <p>See Chapter 51, “(CHN) Setting Up Country-Specific Functionality for China.” Setting Up Next Numbers for China, page 1007.</p> |
| Suppliers | <p>In addition to the standard setup for suppliers, in China, enter the invoice category code required for JinSui processing.</p> <p>See Chapter 51, “(CHN) Setting Up Country-Specific Functionality for China.” Understanding Supplier Information for China, page 1001.</p> |

| Setup or Process | Description |
|--------------------|---|
| Voucher processing | <p>To work with voucher processing in China, set up document types with specific special handling codes.</p> <p>See Chapter 51, “(CHN) Setting Up Country-Specific Functionality for China,” Setting Up UDCs for Accounts Payable for China, page 1006.</p> |
| Tax processing | <p>To work with tax processing in China:</p> <ul style="list-style-type: none"> • Set up base prices for free goods. <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Setting Up Tax Information,” (CHN) Setting Up VAT for China.</p> <ul style="list-style-type: none"> • Generate the VAT report for free goods. <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Working With VAT Processing,” (CHN) Generating VAT on Free Goods Journal - China Report.</p> <ul style="list-style-type: none"> • Set up suppliers with the invoice category code required for JinSui processing. <p>See Chapter 51, “(CHN) Setting Up Country-Specific Functionality for China,” Understanding Supplier Information for China, page 1001.</p> <ul style="list-style-type: none"> • Report VAT transactions using the JinSui Invoice Data Interface (JinSui) system. <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “(CHN) JinSui Processing”.</p> |

| Setup or Process | Description |
|-----------------------------|--|
| Financial reporting (setup) | <p>To setup your system to work with financial reports for Beijing, Shanghai, and Guangzhou:</p> <ul style="list-style-type: none"> Consider how the system uses category code UDCs to obtain report format information. <p>See Chapter 51, “(CHN) Setting Up Country-Specific Functionality for China,” Understanding Category Code UDCs for Chinese Reports, page 1001.</p> <ul style="list-style-type: none"> Set up the Scaling (75C/SC) UDC table. <p>See Chapter 51, “(CHN) Setting Up Country-Specific Functionality for China,” Setting Up UDCs for Financial Reports for Beijing, Shanghai, and Guangzhou, page 1003.</p> <ul style="list-style-type: none"> Copy UDC values from system 75C (China) to system 09 (JD Edwards EnterpriseOne General Accounting). <p>See Chapter 51, “(CHN) Setting Up Country-Specific Functionality for China,” Copying UDC Values for Financial Reports for China, page 1007.</p> <ul style="list-style-type: none"> Associate your chart of accounts to the Chinese reporting codes. <p>See Chapter 51, “(CHN) Setting Up Country-Specific Functionality for China,” Associating Your Chart of Accounts to the Chinese Reporting Codes, page 1010.</p> <p>See Chapter 52, “(CHN) Generating Financial Reports for Beijing, Guangzhou, and Shanghai,” Printing Account Master Reports for China, page 1016.</p> |

| Setup or Process | Description |
|----------------------------------|--|
| Financial reporting (processing) | <p>To work with the financial reports for China:</p> <ul style="list-style-type: none"> Consider the requirements of the reports for Beijing, Shanghai, and Guangzhou. <p>See Chapter 52, “(CHN) Generating Financial Reports for Beijing, Guangzhou, and Shanghai,” Understanding Financial Reports for Beijing, Guangzhou, and Shanghai, page 1013.</p> <ul style="list-style-type: none"> Generate reports for Beijing. <p>See Chapter 52, “(CHN) Generating Financial Reports for Beijing, Guangzhou, and Shanghai,” Generating Beijing Financial Reports, page 1016.</p> <ul style="list-style-type: none"> Generate reports for Shanghai. <p>See Chapter 52, “(CHN) Generating Financial Reports for Beijing, Guangzhou, and Shanghai,” Generating Shanghai Financial Reports, page 1050.</p> <ul style="list-style-type: none"> Generate reports for Guangzhou. <p>See Chapter 52, “(CHN) Generating Financial Reports for Beijing, Guangzhou, and Shanghai,” Generating the Guangzhou Financial Reports, page 1031.</p> <ul style="list-style-type: none"> Generate a sample balance sheet and income statement. <p>See Chapter 53, “(CHN) Working with Other Chinese Functionality,” Generating a Balance Sheet and Income Statement, page 1079.</p> |

| Setup or Process | Description |
|---------------------------|--|
| JinSui processing (setup) | <p>To set up your system to work with JinSui processing:</p> <ul style="list-style-type: none"> • Set up next numbers. <p>See Chapter 51, “(CHN) Setting Up Country-Specific Functionality for China,” Setting Up Next Numbers for China, page 1007.</p> <ul style="list-style-type: none"> • When setting up suppliers, enter the invoice category code. <p>See Chapter 51, “(CHN) Setting Up Country-Specific Functionality for China,” Understanding Supplier Information for China, page 1001.</p> <ul style="list-style-type: none"> • Set up corresponding versions of: <ul style="list-style-type: none"> - GUI Interface File from Sales Order (R75C421) and Print Invoice from Sales Order (R42565). - GUI Interface file from A/R (R75C03B1) and Invoice Print (R03B505). |
| JinSui processing | <p>To work with JinSui invoice processing:</p> <ul style="list-style-type: none"> • Set processing options for Create Chinese GUI interface file from A/R (R75C03B1). • Set processing options for GUI Interface File from Sales Order (R75C421). • Set processing options for Cancel Invoice Print (R75C09Z1). • Review and modify GUI numbers, print invoices from the JD Edwards EnterpriseOne Accounts Receivable system, and cancel invoices (optional). • Print invoices from the JD Edwards EnterpriseOne Sales Order Management system. • Run the Download <i>JinSui</i> Return File into JDE program (R75C01Z2). • Use the Text File Processor program (P00701) to copy information from flat files created in the JinSui invoice process to a file that you can submit to JinSui. <p>See <i>JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide</i>, “Working with the Text File Processor”.</p> <p>See Chapter 53, “(CHN) Working with Other Chinese Functionality,” Printing Invoices in China, page 1082.</p> <p>See Chapter 53, “(CHN) Working with Other Chinese Functionality,” Processing JinSui Invoices for China, page 1079.</p> <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “(CHN) JinSui Processing”.</p> |

CHAPTER 51

(CHN) Setting Up Country-Specific Functionality for China

This chapter provides an overview of supplier information for China, category codes for UDCs, and discusses how to:

- Set up user-defined codes (UDCs).
- Set up next numbers.
- Set up corresponding versions.
- Copy UDC values for financial reports.
- Associate the chart of accounts to Chinese reporting codes.

Understanding Supplier Information for China

You must enter additional supplier master information for Chinese suppliers. The system uses the country-specific information that you enter to process supplier invoices from the JD Edwards EnterpriseOne system to *JinSui*. *JinSui* requires a 10-digit invoice category code. The 10 digits are based on the location and industry of the supplier. The 10 digits are required and are defined as follows:

| Code | Description |
|--------|--|
| 1 - 4 | Area code (indicates the location of the supplier). |
| 5 - 7 | Invoice version (indicates the industry of the supplier). |
| 8 - 10 | Invoice code (indicates additional information such as language, number of copies, and so on). |

The system stores the invoice category code in the China Supplier Master Additional Information table (F75C0401).

Understanding Category Code UDCs for Chinese Reports

The chart of accounts that you set up for your business might not be the same as the codes which are required for reporting purposes for cities in China. To report required data to the city governments, you must associate your accounts to the Chinese reporting codes that are required by different cities. You use account category codes to associate your accounts to the Chinese reporting codes. The Account Category Codes table (F0901C) stores values for the account category codes in system 09.

Each financial report for China must be generated in the layout that is specified by the government. JD Edwards EnterpriseOne software delivers separate system 75C UDC tables for each report. The UDC tables contain layout information, such as line numbers and headings for section totals, and reporting code information, such as description of accounts.

Important! The system uses the values in the UDC table lists to generate the financial reports. If you change the values in the Codes field or the Special Handling code field of the UDC, the system does not produce an accurate report. You can change the values in the Description 01 and Description 02 fields.

This table lists the system 75C (China) UDCs that contain the values that you use to specify the layout and, thus, the reporting codes for each report:

| UDC | Report |
|---|---|
| BJ-01 Statement of Tax Payable (75C/B1) | Beijing Statement of Value Added Tax Payable (R75C10001) |
| BJ-02 Yearly Balance Sheet (75C/B2) | Beijing Balance Sheet Yearly (R75C10002) |
| BJ-04 Income Statement (Ind.) (75C/B4) | Beijing Income Statement (Industrial) (R75C10004) |
| GZ-01 Balance Sheet (75C/G1) | Guangzhou Balance Sheet (R75C10005) |
| GZ-02 Income Statement (75C/G2) | Guangzhou Income Statement (R75C10006) |
| GZ-03 Supplemental Form (75C/G3) | Guangzhou Supplemental Statement (R75C10007) |
| SH-01 Balance Sheet Monthly (75C/S1) | Shanghai Balance Sheet Monthly (R75C10008) |
| SH-02 Statement of Tax Payable (75C/S2) | Shanghai Detail Statement of Main Tax Payable Monthly (R75C10009) |
| SH-03 Income Statement Monthly (75C/S3) | Shanghai Income Statement Monthly (R75C10010) |
| SH-04 Income Statement (75C/S4) | Shanghai Income Statement (Commercial) (R75C10011) |
| SH-06 Balance Sheet Yearly (75C/S6) | Shanghai Balance Sheet Yearly (R75C10012) |
| SH-08 Income Statement (Ind.) (75C/S8) | Shanghai Income Statement (Industrial) (R75C10013) |
| SH-09 Income Statement (Serv.) (75C/S9) | Shanghai Income Statement (Service) (R75C10014) |

The values in the system 75C UDCs exist merely as a method to deliver the Chinese reporting codes and layout information to you; the system does not read the values from system 75C when you run the reports. Before the system can read the values for the reporting codes and layout details, you must copy the values from the system 75C UDC tables to account category codes in system 09. The values must be in system 09 because the values must be associated to your chart of accounts. You can copy the system 75C UDC values to category codes 24 through 43 in system 09.

You copy values from the system 75C UDC tables to the account category codes in system 09 (09/24- 09/43) by running the Copy UDC from F0005 and F0005D program (R090005). The Copy UDC from F0005 and F0005D program copies values from the system 75C UDC tables that you specify in the processing options to the system 09 UDC tables that you specify in the processing options.

After you copy the values to system 09, you use the Accounts program (P0901) to associate the values to accounts in your chart of accounts. The system can then print the amounts from your chart of accounts in the correct place on the report.

What You Should Know About Category Codes for Chinese Reports

Consider these points about category codes for Chinese reports:

- Line numbers for each item are stored in the Special Handling Code field of the category code UDC tables.
- Some amounts on the report must be printed as a reverse of the amounts that appear in the Account Balances table (F0902).

For example, if an amount in table F0902 is a positive number, it might need to be printed as a negative number on the report. If the amounts in a particular line need to be printed as a reversed number, the Special Handling Code field in the UDC table includes an R before the line number. For example, a value of R10 causes the system to print the amount on line 10 as a reverse of the amount, or sum of the appropriate amounts, in table F0902.

- You specify in a processing option whether the system indicates that a number is a negative number by surrounding the number with parentheses or by printing a minus sign (-) before the number.
- You do not need to associate the section headings or the headings for totals to accounts in your chart of accounts; the system automatically prints the headings in the appropriate places.
- You must print the Chinese financial reports in Simplified Chinese. Some reports are also printed in English. The system stores category code values for Simplified Chinese in table F0005D.

Setting Up UDCs for China

Setting up Chinese-specific UDCs enables you to use Chinese-specific functionality. You also set up some base software UDCs with Chinese-specific values.

Setting Up UDCs for Financial Reports for Beijing, Shanghai, and Guangzhou

These UDCs contain the values that you must copy to system 09 UDC category codes before you generate financial reports for Beijing, Shanghai, and Guangzhou. You use the Copy UDC from F0005 and F0005D program (R090005) to copy the values from the system 75C UDC to system 09. You can copy the UDC values in these UDC tables to any system 09 account category code from 24 through 43, using a different system 09 category code for each system 75C UDC.

Important! Do not change the values in the Codes field in these UDC tables, or in the category code in system 09 to which you copy these values. The system might not produce an accurate report. Additionally, the system will not use any values that you add to these UDC tables.

See [Chapter 51, “\(CHN\) Setting Up Country-Specific Functionality for China,” Understanding Category Code UDCs for Chinese Reports, page 1001](#).

BJ-01 Statement of Tax Payable (75C/B1)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Beijing Statement of Value Added Tax Payable program (R75C10001). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/B1 UDC when you run the Beijing Statement of Value Added Tax Payable program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Beijing Statement of Value Added Tax Payable program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

BJ-02 Yearly Balance Sheet (75C/B2)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Beijing Balance Sheet Yearly program (R75C10002). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/B2 UDC when you run the Beijing Balance Sheet Yearly program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Beijing Balance Sheet Yearly program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

BJ - 04 Income Statement (Ind.) (75C/B4)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Beijing Income Statement (Industrial) program (R75C10004). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/B4 UDC when you run the Beijing Income Statement (Industrial) program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Beijing Income Statement (Industrial) program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

GZ-01 Balance Sheet (75C/G1)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Guangzhou Balance Sheet program (R75C10005). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/G1 UDC when you run the Guangzhou Balance Sheet program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Guangzhou Balance Sheet program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

GZ-02 Income Statement (75C/G2)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Guangzhou Income Statement program (R75C10006). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/G2 UDC when you run the Guangzhou Income Statement program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Guangzhou Income Statement program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

GZ-03 Supplemental Form (75C/G3)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Guangzhou Supplemental Statement program (R75C10007). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/G3 UDC when you run the Guangzhou Supplemental Statement program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Guangzhou Supplemental Statement program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

SH – 01 Balance Sheet Monthly (75C/S1)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Shanghai Balance Sheet Monthly program (R75C10008). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/S1 UDC when you run the Shanghai Balance Sheet Monthly program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Shanghai Balance Sheet Monthly program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

SH-03 Income Statement Monthly (75C/S3)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Shanghai Income Statement Monthly program (R75C10010). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/S3 UDC when you run the Shanghai Income Statement Monthly program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Shanghai Income Statement Monthly program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

SH-04 Income Statement (75C/S4)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Shanghai Income Statement (Commercial) program (R75C10011). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/S4 UDC when you run the Shanghai Income Statement (Commercial) program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Shanghai Income Statement (Commercial) program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

SH – 06 Balance Sheet Yearly (75C/S6)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Shanghai Balance Sheet Yearly program (R75C10012). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/S6 UDC when you run the Shanghai Balance Sheet Yearly program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Shanghai Balance Sheet Yearly program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

SH – 08 Income Statement (Ind.) (75C/S8)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Shanghai Income Statement (Industrial) program (R75C10013). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/S8 UDC when you run the Shanghai Income Statement (Industrial) program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Shanghai Income Statement (Industrial) program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

SH - 09 Income Statement (Serv.) (75C/S9)

This UDC table contains the hard-coded values that correlate to the Chinese reporting codes for the report that is produced by the Shanghai Income Statement (Service) program (R75C10014). It also contains information, such as line numbers, that the system uses to determine the layout of the report.

The system does not read the 75C/S9 UDC when you run the Shanghai Income Statement (Service) program; the values are provided in the UDC so that you can copy them to the system 09 account category code list that you reserve for the Shanghai Income Statement (Service) program. The values must be in a system 09 category code list because the values must be associated with the appropriate accounts in your chart of accounts.

Scaling (75C/SC)

The system uses the Scaling UDC table (75C/SC) to determine how to print numerical values on financial reports for Beijing, Guangzhou, and Shanghai. You specify in a processing option the scaling value, if any, that you want the system to use.

When you choose to scale numerical values, the system divides the numerical values on the report by the scaling amount that you specify. For example, suppose that the amount for an account in the Accounts Balances table (F0902) is 23,929. If you choose to scale the amount by a factor of 1000, the system divides 23,929 by 1000, rounds to the nearest whole number, and prints 24 on the report.

The following table shows examples of scaling amounts:

| Codes | Description 01 |
|-------|----------------|
| 1 | One |
| 1000 | One thousand |
| 10000 | Ten thousand |

Setting Up UDCs for Accounts Payable for China

You must enter identical document types in both UDC 00/DT and UDC 00/DV. You must also add the valid values in the Special Handling Code fields in both user defined codes lists.

Document Type - All Documents (00/DT) and Document Type - Vouchers Only (00/DV)

Set up original document types so that you can identify, group, and process similar transactions. In addition to the hard-coded document types that are used throughout the system, you can set up document types that are based on your specific business needs.

In China, you must set up these document types with predefined special handling codes:

To process accounts payable in China, you must set up these document types with predefined special handling codes:

| Document Type | Special Handling Code |
|--------------------------|-----------------------|
| Taxable invoices | s |
| Tax exempt invoices | n |
| Transportation invoices | t |
| Agriculture certificates | a |
| Waste certificates | w |
| Custom tax certificates | g |

Setting Up Next Numbers for China

Before you run either the Invoice Print program (R03B505) or the Print Invoices program (R42565), you must set up next numbers for system 75, row 1. You set up next numbers in the Next Numbers Revisions program (P0002).

If you do not set up next numbers for system 75, row 1, the system does not perform any of the JinSui processing.

Setting Up Corresponding Versions for China

Some country-specific functionality requires that you create versions of the same name for a country-specific programs and a base software program. For example, to have the system access the processing options for a country-specific voucher program, you might need to set up a version named XYZ for the country-specific voucher program, and a version named XYZ of the Standard Voucher Entry (P0411) program.

Set up corresponding versions for these programs:

| Chinese Program | Base Software Program |
|---|---|
| GUI Interface File from Sales Order (R75C421) | Print Invoice from Sales Order (R42565) |
| GUI Interface File from A/R (R75C03B1) | Invoice Print (R03B505) |

Copying UDC Values for Financial Reports for China

This section provides an overview of how to copy UDC values and discusses how to:

- Copy UDC values for Chinese reports.
- Set processing options for Copy UDC from F0005 and F0005D (R090005).

Understanding How to Copy UDC Values

The Copy UDC from F0005 and F0005D program (R090005) copies the UDC values in the User Defined Codes table (F0005) from one Product Code/User Defined Code list to another. For example, you can copy the values from the 75C/G1 UDC table to one of the system 09 category codes that exist for Chinese financial reports (category codes 24-43). When you set the processing options to copy the values from table F0005, the system copies English language values from the UDC table and copies the special handling codes that the system uses for the report layouts.

Note. You must copy the English language values from the system 75C UDCs in table F0005 to the system 09 UDCs in table F0005 that you reserve for each report, even if you do not intend to produce the reports in English. The special handling codes that the system uses to determine the layout of the reports are contained in table F0005; you must copy these values from system 75C to system 09.

When you set the processing options to do so, the system copies the values from the User Defined Codes – Alternate Language Descriptions table (F0005D) from the specified Product Code/User Defined Code list to another. When you set the processing options to copy the values from table F0005D for the UDC tables created for the Chinese financial reports, the system copies Simplified Chinese language values from the system 75C UDC table that you specify to the system 09 category code that you specify. The UDC tables created for the Chinese financial reports are the UDC tables that contain layout information for the Chinese reports, such as 75C/B1, 75C/S1, and 75C/G1.

Before you can generate a financial report in Chinese, you must copy the Chinese language values from the system 75C UDCs in table F0005D to the system 09 UDCs in table F0005D that you reserve for the report. You need to copy only the system 75C values for the reports that you want to use.

When you run the Copy UDC from F0005 and F0005D program, the system produces a report that states whether the copy process was successful.

Example of Copying UDC Values

Suppose you need to submit the Statement of Value Added Tax Payable report in both English and Chinese. You decide to use account category code 09/24 for this report. Copy the values from product code (system code) 75C to product code 09 by completing these steps:

1. Set the processing options in the Copy UDC from F0005 and F0005D program as shown in this table:

| Processing Option | Value |
|---------------------------------|-------|
| 1. Copy From Product Code | 75C |
| 2. Copy From User Defined Codes | B1 |
| 3. Copy to Product Code | 09 |
| 4. Copy to User Defined Codes | 24 |
| 5. Copy F0005D Table | 1 |

| Processing Option | Value |
|----------------------------|---|
| 6. Copy From Language Code | (The value for Simplified Chinese that exists in the Language UDC (00/LP)). |
| 7. Copy To Language Code | (The value for Simplified Chinese that exists in the Language UDC (00/LP)). You do not need to complete this option if you complete the Copy From Language Code option. |

- Run the Copy UDC from F0005 and F0005D program.

The values in table F0005 for UDC 09/24 are now identical to the values in UDC 75C/B1; these values are in English. The values in table F0005D for UDC 09/24 are now identical to the values in UDC 75C/B1; these values are in Chinese.

Copying UDC Values for Chinese Reports

Select Financial Reports (G75C09), Copy UDC from F0005 and F0005D.

Setting Processing Options for Copy UDC from F0005 and F0005D (R090005)

Processing options enable you to set default values for processing.

Select

- 1. Copy From Product Code** Specify the product code (system code) from which the system copies values to the User Defined Codes table (F0005). For example, to copy values from table F0005 for China, enter 75C. You must complete this processing option.
- 2. Copy From User Defined Codes** Specify the user defined code list from which the system copies values for the product (system) that you specified in the Copy from Product Code processing option. For example, to copy values from UDC 75C/B1, enter 75C in the Copy From Product Code processing option and enter B1 in this processing option. You must complete this processing option.
- 3. Copy To Product Code** Specify the product code (system code) to which the system copies values from the User Defined Codes table (F0005). For example, to copy values to table F0005 for system 09, enter 09. You must complete this processing option.
- 4. Copy To User Defined Codes** Specify the user defined code table to which the system copies values for the product (system) that you specified in the Copy To Product Code processing option. For example, to copy values to UDC 09/24, enter 09 in the Copy To Product Code processing option and enter 24 in this processing option. You must complete this processing option.

- | | |
|-----------------------------------|---|
| 5. Copy F0005D Table | Enter <i>I</i> to copy values from the User Defined Codes - Alternate Language Descriptions table (F0005D). |
| 6. Copy From Language Code | Specify a code for the language from which the system copies the UDC values from the User Defined Codes - Alternate Language Descriptions table (F0005D). The code that you specify must exist in the Language UDC table (01/LP). If you complete the Copy F0005D Table processing option, you must also complete this processing option. |
| 7. Copy To Language Code | Specify a code for the language to which the system copies the UDC values from the User Defined Codes - Alternate Language Descriptions table (F0005D). The code that you specify must exist in the Language UDC table (01/LP). |

Associating Your Chart of Accounts to the Chinese Reporting Codes

The cities of Beijing, Guangzhou, and Shanghai in China require that you report your financial data according to the reporting formats for each city. The chart of accounts for your organization might not correlate to the reporting codes that each city requires. To produce the financial reports in the layout that are required by each city, you must associate your chart of accounts to the reporting codes that are provided by the cities of Beijing, Guangzhou, and Shanghai.

The reporting code information that you need to associate to your chart of accounts is stored in UDC tables in system 75C. Because you must associate your chart of accounts in system 09 to the reporting codes, you must copy the reporting code information from the system 75C UDC tables to the system 09 category code tables that are reserved for this purpose (UDCs 09/24-09/43). After you copy the values in the system 75C UDC tables to the system 09 category code tables, you use the Accounts program to associate the information in the system 09 category codes to the accounts in your chart of accounts.

Example

Suppose you need to submit the three Beijing financial reports. You decide to use account category code 09/24 for the Statement of Value Added Tax Payable report, 09/25 for the Beijing Balance Sheet Yearly report, and 09/26 for the Beijing Income Statement (Industrial).

Complete these steps:

1. Copy the values in UDC 75C/B1 to 09/24, copy the values in UDC 75C/B2 to 09/25, and copy the values from UDC 75C/B4 to 09/26.
2. Use the Account program (P0901) to associate your chart of accounts to the Chinese reporting codes for each of the reports.

Note. The following steps describe associating your accounts receivable accounts to the value for accounts receivable for the reporting codes for the Beijing Balance Sheet Yearly report. You would take similar steps to associate other accounts to the reporting codes for the Beijing Balance Sheet Yearly report, and to associate the values for accounts for the Statement of Value Added Tax Payable report and the Beijing Income Statement (Industrial) report.

3. For the Beijing Balance Sheet Yearly report, associate the accounts that you have set up in your chart of accounts for accounts receivable to the BJ02-0060 value in 09/25. BJ02-0060 is the value for Accounts Receivable in the Chinese reporting codes.

To associate the account, you select an accounts receivable account in your chart of accounts on the Work with Accounts form. Then, on the Revise Single Account form, click the Category Codes 21-30 tab, and enter BJ02-0060 for category code 25. Associate each of your accounts receivable accounts to the BJ02-0060 value for category code 25.

4. Associate the remaining accounts from your chart of accounts in the same manner.

What You Should Know About Category Codes

Consider these factors when working with category code accounts:

- The values that you copy from system 75C and then associate to the accounts in your chart of accounts contain the information that the system uses to generate the reports in the required layouts.

For example, the values contain the headings, line numbers, and whether the account amounts are printed as they appear in the Account Balances table (F0902), or are printed as the reverse of the amounts in table F0902.

- The system displays the values for category codes 09/23 through 09/43 on the Work With Accounts form in the Accounts program, but you cannot perform a query on the category codes from that form.
- You might need to associate more than one of your accounts to a Chinese reporting code value.

When you associate more than one account to a value, the system sums the amounts in all of the accounts and prints the summed value on the appropriate line on the report. For example, if you associate three accounts from your chart of accounts to the BJ02-0060 value, the system sums the amounts in the three accounts and prints the summed amount on line 6 of the Beijing Balance Sheet Yearly report.

CHAPTER 52

(CHN) Generating Financial Reports for Beijing, Guangzhou, and Shanghai

This chapter provides an overview of the financial reports for Beijing, Guangzhou, and Shanghai, lists prerequisites, and discusses how to:

- Print account master reports.
- Generate Beijing financial reports
- Generate Guangzhou financial reports
- Generate Shanghai financial reports

Understanding Financial Reports for Beijing, Guangzhou, and Shanghai

China has a standardized chart of accounts, which is used to create balance sheets and income statements. The country has different balance sheets and income statement formats for different businesses, as well as different formats for state-owned and foreign-invested businesses.

The cities of Beijing, Guangzhou, and Shanghai require that you report financial data according to the Chinese reporting formats for each city. The chart of accounts for your organization might not correlate to the codes that each city requires. To produce the financial reports in the layout that is required by each city, you must link your chart of accounts to the Chinese reporting codes that are provided by the cities of Beijing, Guangzhou, and Shanghai.

To link your chart of accounts to the Chinese reporting codes, you can use account category codes 21–43 in system 09. The values for these category codes are stored in the F0901 table.

The Chinese reporting codes and layout details for financial reports are in separate UDC tables for system 75C. These UDC tables contain layout information, such as line numbers and headings for section totals, and the reporting code information, such as descriptions of accounts. The values in the UDC tables for system 75C exist merely as a method to deliver the reporting codes and layout information to you; the system does not read the values from system 75C when you run the reports.

Before the system can read the values for the Chinese reporting codes and layout details, you must copy the values from the UDC tables in system 75C to category codes 21–43 in system 09 by running the Copy UDC from F0005 and F0005D program (R090005). The values must be copied to system 09 because they must be associated with your chart of accounts.

See [Chapter 51, “\(CHN\) Setting Up Country-Specific Functionality for China,” Copying UDC Values for Financial Reports for China, page 1007.](#)

After you copy the reporting codes and layout detail values to system 09, you can use the Accounts program (P0901) to link the values to accounts in your chart of accounts if your user display preference is set to China (CN). The system prints the amounts from your chart of accounts in the correct place on the financial reports, according to the appropriate layout. After you link your chart of accounts to the reporting codes, you can verify that the accounts are correctly associated by running the Account Master reports.

See [Chapter 51, “\(CHN\) Setting Up Country-Specific Functionality for China,” Associating Your Chart of Accounts to the Chinese Reporting Codes, page 1010.](#)

See [Chapter 52, “\(CHN\) Generating Financial Reports for Beijing, Guangzhou, and Shanghai,” Printing Account Master Reports for China, page 1016.](#)

When you run a financial report for Beijing, Guangzhou, or Shanghai, the system reads the Account Master (F0901) and Account Balances (F0902) tables and writes the summarized data to the China Financial Report Staging Work File table (F75CUI2). The system reads the data in table F75CUI2, reads the appropriate UDC table, performs calculations, and formats the data as it writes the data to the China Financial Report Work File table (F75CUI1). The system then writes the formatted data to the report, according to the processing option settings.

In addition to specifying the category codes value to use for the report layout, you complete processing options to specify how the system scales the numerical values on the report, whether the reports shows decimals, how the report displays negative numbers, and whether the system produces the report in English or Chinese. Some reports let you specify that the system prints the report in English or Chinese, or both.

You can produce the Chinese financial reports in Simplified Chinese or in English. Some reports can also be produced in both Simplified Chinese and English. You should verify with the Chinese government of each province the language in which you must submit the reports for that province.

Note. JD Edwards EnterpriseOne software does not support all of the formats that are accepted in Chinese business practice, but it does provide sample reports that you can customize to your specific reporting needs.

Example

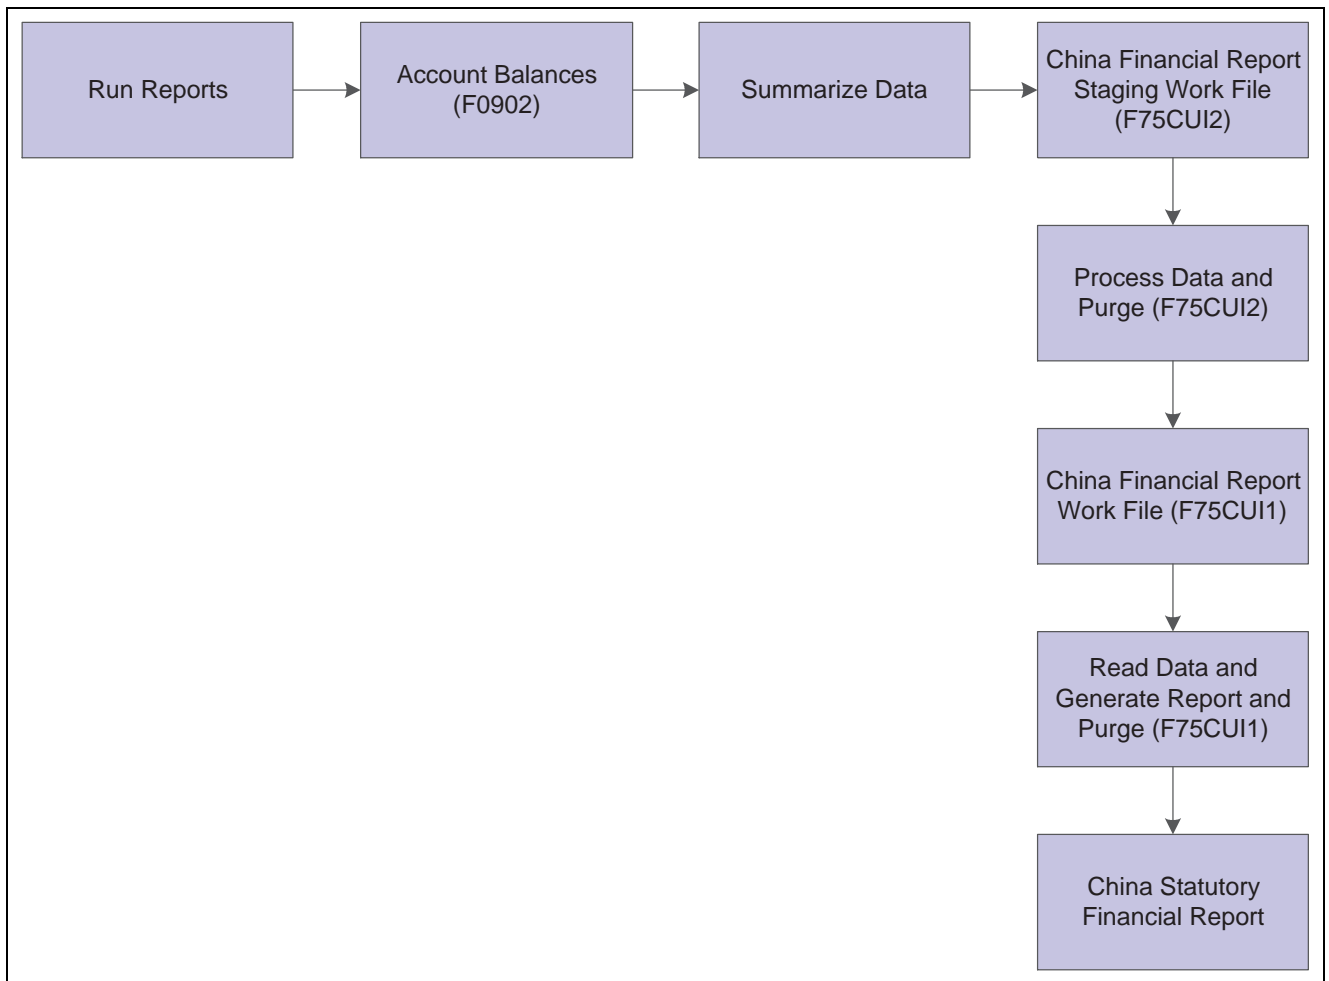

Suppose you need to submit Beijing financial reports. You decide to use account category code 09/24 for the Statement of Value Added Tax Payable report, 09/25 for the Beijing Balance Sheet Yearly report, and 09/26 for the Beijing Income Statement (Industrial) report.

For the Beijing Balance Sheet Yearly report, you would complete these steps:

1. Using R090005, copy the values in UDC 75C/B1 to 09/24, copy the values in UDC 75C/B2 to 09/25, and copy the values from UDC 75C/B4 to 09/26.
2. Use the Review and Revise Accounts program (P0901) to assign the category reporting codes to accounts in your chart of accounts for each of the reports.
3. Assign BJ02–0060 to category code 25 for accounts receivable accounts. BJ02–0060 is the value for Accounts Receivable in the Chinese reporting codes. To assign a category code, select an accounts receivable account on the Work with Accounts form. On the Revise Single Account form, select the Category Codes 21–30 tab and enter *BJ02–0060* in the Category Code 25 field.
4. Assign category code values to the remaining accounts in your chart of accounts.

Process Flow

This graphic shows the system process flow for the Chinese financial reports:

Process flow for Chinese financial reports

Prerequisites

Before you complete the tasks in this section:

- Verify that your user display preference is set to China (CN).
- Verify that the values which are needed for a specific report exist in a system 09 account category code. To generate the report in English, the values must exist in English in the F0005 table for system 09. To generate the report in Chinese, the values must exist in the F0005D table for system 09.
- Use the Accounts program to link your chart of accounts to the Chinese reporting codes for a specific report.

See [Chapter 51, “\(CHN\) Setting Up Country-Specific Functionality for China,” Associating Your Chart of Accounts to the Chinese Reporting Codes, page 1010.](#)

Printing Account Master Reports for China

This section provides an overview of account master reports and discusses how to:

- Print account master reports.
- Set processing options for Account Master Report Cat. Code 24-33 (R75C0701) and Account Master Report Cat. Code 34-43 (R75C0702).

Understanding the Account Master Reports

The Account Master Report Cat. Code 24-33 (R75C0701) program and the Account Master Report Cat. Code 34-43 (R75C0702) program generate reports that show how the accounts in your chart of accounts are associated with the Chinese reporting codes that are required for reporting financial data to the government. You can use these reports to determine if the appropriate accounts in your chart of accounts are associated to the appropriate reporting codes.

Setting Processing Options for Account Master Report Cat. Code 24-33 (R75C0701) and Account Master Report Cat. Code 34-43 (R75C0702)

Processing options enable you to set default values for processing.

Print

- | | |
|---------------------------------------|--|
| 1. Unstructured Account Number | Enter <i>1</i> to print the 3rd account number (unstructured account number) on the report. |
| 2. Business Unit Description | Enter <i>1</i> to print the description of the business unit associated with the accounts when the system changes from printing the accounts for one business unit to printing the accounts for another business unit. |

Printing the Account Master Reports

Use one of these navigations:

- Select Financial Reports (G75C09), Account Master Report Cat. Code 24-33.
- Select Financial Reports (G75C09), Account Master Report Cat. Code 34-43.

Generating Beijing Financial Reports

This section provides overviews of the Beijing Statement of Value Added Tax Payable report, the Beijing Balance Sheet Yearly report, and the Beijing Income Statement (Industrial) report, and discusses how to:

- Print the Beijing Statement of Value Added Tax Payable report.
- Set processing options for Beijing Statement of Value Added Tax Payable (R75C1000).
- Print the Beijing Balance Sheet Yearly report.
- Set processing options for Beijing Balance Sheet Yearly (R75C10002).

- Run the Beijing Income Statement (Industrial) report.
- Set processing options for Beijing Income Statement (Industrial) (R75C10004).

Understanding the Beijing Statement of Value Added Tax Payable Report

The Beijing Statement of Value Added Tax Payable report (R75C1000) generates a balance sheet that companies doing business in Beijing, China, are required to give to the local authorities each accounting period. The report includes data about value-added tax (VAT) payable on sales and purchases, and VAT that has been paid on sales and purchases.

You complete the Category Code (21–43) processing option with the system 09 account category code to which you copied the values from the BJ-01 Statement of Tax Payable UDC table (75C/B1).

The maximum length of the description column is 85 characters. The system truncates longer descriptions.

Report Rows and Columns

For lines 1–10 (UDC values BJ01–020 through BJ01–0110) and lines 12–14 (UDC values BJ01–0140 through BJ01–0160), the system prints these amounts:

- For the Current Month column, prints the sum of the accounts from the first accounting period through the accounting period that precedes the period that you specify in the Period Number processing option. For example, if you specify period 6, the system prints the sum of the accounts for periods 1–5.
- For the Current Year Cumulative column, prints the sum of the accounts for the appropriate UDC value for the period that you specify in the Period Number processing option. For example, if you specify period 6, the system prints the sum of the accounts for periods 1– 6.

This table shows how the system prints amounts in the rows and columns on the Beijing Statement of Value Added Tax Payable report:

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|--|
| BJ01–0010 | VAT payable | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ01–0020 | Amount unpaid at beginning of year | 1 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ01–0030 | VAT on sales | 2 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ01–0040 | VAT refund for exported goods | 3 | Prints the sum of the accounts that you associated with this UDC. |
| BJ01–0050 | Amount transfer out from VAT on purchase | 4 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ01–0060 | Transfer out overpaid VAT | 5 | Prints the sum of the accounts that you associated with this UDC. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|--|
| BJ01-0070 | VAT on purchase | 6 | Prints the sum of the accounts that you associated with this UDC. |
| BJ01-0080 | VAT paid | 7 | Prints the sum of the accounts that you associated with this UDC. |
| BJ01-0090 | Tax reduced and exempted | 8 | Prints the sum of the accounts that you associated with this UDC. |
| BJ01-0100 | VAT payable on domestic sales | 9 | Prints the sum of the accounts that you associated with this UDC. |
| BJ01-0110 | Transfer out unpaid VAT | 10 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ01-0120 | Amount not yet deducted at end of period | 11 | Prints the sum of lines 1–10 for each column. |
| BJ01-0130 | VAT unpaid: | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ01-0140 | Amount unpaid at beginning of year | 12 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ01-0150 | Amount transfer in at current period | 13 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ01-0160 | Amount paid at current period | 14 | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ01-0170 | Amount unpaid at end of period | 15 | Prints the sum of lines 12, 13, and 14 for each column as a reversed number. |

Print the Beijing Statement of Value Added Tax Payable Report

Select Financial Reports (G75C09), Beijing Statement of Value Added Tax Payable.

Setting Processing Options for Beijing Statement of Value Added Tax Payable (R75C10001)

Processing options enable you to specify the default processing for reports.

Selection

Although processing options are set up during JD Edwards EnterpriseOne implementation, you can change processing options each time you run a program.

- 1. Company** Specify the company for which the system runs the report. The company that you enter must exist in the F0010 table. You must complete this processing option.
- 2. Fiscal Year** Specify the year of the fiscal period for which the system runs the report. Enter a two-digit year. If you leave this processing option blank, the system uses the current fiscal year.
- 3. Period Number** Specify the code for the ledger that is assigned to the records that you want to process. If you leave this processing option blank, the system uses the current accounting period.
- 4. Ledger Type** Specify the code for the ledger that is assigned to the records that you want to process. If you leave this processing option blank, the system processes records with a ledger type of AA.
- 5. Category Code (24–43)** Specify the system 09 account category code to which you copied the values from system 75C. Values are category codes 24 through 43. The system uses the values in the category code that you specify to determine the layout of the report.

Display

Although processing options are set up during JD Edwards EnterpriseOne implementation, you can change processing options each time you run a program.

- 1. Scaling** Specify the factor by which the system divides the amounts in the F0902 table before the system prints the amounts on the report. The factor that you specify must exist in the Scaling UDC table 75C/SC. For example, suppose that the amount for an account in table F0902 is 23,929. If you complete this processing option with *1000*, the system divides 23,929 by 1000, rounds to the nearest whole number, and prints 24 on the report. You can set the Display Decimal processing option to make the system display the scaled amount with decimals.

If you leave this processing option blank, the system prints the amounts from table F0902 as they appear in the table.
- 2. Decimal Display** Specify whether the system prints the amounts on the report with a decimal. If you complete the Scaling processing option, the system divides the amount in the F0902 table by the amount that you specify, rounds the amount, and then places the decimal as you specify in this processing option. For example, suppose that the amount for an account in table F0902 is 23,929. You complete the Scaling processing option with *1000* and this processing option with *1*. The system divides 23,929 by 1000, rounds the amount, and prints the amount with two decimal places. In this example, the amount printed on the report would be 23.93. Values are:

Blank: Do not print the amounts with decimals.
1: Print the amounts with two decimals.
- 3. Negative Sign** Specify how negative numbers appear on the report. Values are:

Blank: Print a minus sign (–) before the number.
1: Print parentheses around the number. For example, for the number 10 to appear as a negative number, the report prints (10).

4. Language

Specify the language in which the system prints the report. Values are:

Blank or 1: Print the report in Chinese.

2: Print the report in English.

3: Print the report in both Chinese and English.

5. Language Code for Chinese

Specify the language code for Chinese when you complete the Language processing option with a value that causes the system to print the report in Chinese. The code that you specify must exist in the language UDC table 01/LP. If you leave this processing option blank, the system prints this report in English only, even if the Language processing option specifies that the system prints the report in Chinese, or both English and Chinese.

Understanding the Beijing Balance Sheet Yearly Report

The Beijing Balance Sheet Yearly report (R75C10002) generates a balance sheet that companies doing business in Beijing, China, are required to give to the local authorities each accounting period. The report includes data about assets, liabilities, and owners' equity.

You complete the Category Code (21–43) processing option with the system 09 account category code to which you copied the values from the BJ–02 Yearly Balance Sheet UDC table 75C/B2.

The maximum length of the description columns is 55 and 61 characters. The system truncates longer descriptions.

Report Rows and Columns

The system completes the amounts in the Beginning of Year column with the amount from the Balance Forward field in the F0902 table, and completes the At End of Period column with the amount in the Balance Forward field plus the sum of the period ending amounts for the periods up to and including the period that you specify in the Period Number processing option. For example, if you specify period 4 in the Period Number processing option, the system prints the sum of the Balance Forward field plus the amounts for periods 1, 2, 3, and 4 on the report.

This table shows how the system prints amounts in the rows and columns on the Beijing Balance Sheet Yearly report:

| UDC Value | Row Title | Line | Explanation |
|-----------|-----------------------|-------|---|
| BJ02–0010 | CURRENT ASSETS | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ02–0020 | Cash on hand | 1 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02–0030 | Cash in bank | 2 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02–0040 | Marketable securities | 4 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02–0050 | Notes receivable | 5 | Prints the sum of the accounts that you associated with this UDC. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|--|
| BJ02-0060 | Accounts receivable | 6 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0070 | Less: Provision for bad debts | 7 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0080 | Advances to suppliers | 8 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0090 | Other receivables | 10 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0100 | Prepaid expense | 11 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0110 | Inventories | 12 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0120 | Less: Provision for loss on realization of inventories | 13 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0130 | Long-term investments maturing within one year | 15 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0140 | Other current assets | 16 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0150 | TOTAL CURRENT ASSETS | 17 | Prints the sum of lines 1-16. |
| BJ02-0160 | LONG-TERM INVESTMENTS | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ02-0170 | Long-term investments | 18 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0180 | Receivables collectible after one year | 20 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0190 | FIXED ASSETS: | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ02-0200 | Fixed assets-cost | 21 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0210 | Less: Accumulated depreciation | 22 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0220 | Fixed assets-net value | 24 | Prints the sum of lines 21-22. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---|-------|--|
| BJ02-0230 | Disposal of fixed asset | 27 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0240 | CURRENT LIABILITIES | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ02-0250 | Short-term loans | 42 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0260 | Notes payable | 43 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0270 | Accounts payable | 44 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0280 | Accrued payroll | 45 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0290 | Taxes payable | 46 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0300 | Dividends payable | 47 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0310 | Advances from customers | 48 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0320 | Other payables | 50 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0330 | Accrued expenses | 51 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0340 | Staff and workers' bonus and welfare fund | 52 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0350 | Long-term liabilities due within one year | 53 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0360 | Other current liabilities | 54 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---|-------|--|
| BJ02-0370 | Total current liabilities | 55 | Prints the sum of lines 42–54 as a reversed number. |
| BJ02-0380 | LONG-TERM LIABILITIES | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ02-0390 | Long-term loans | 56 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0400 | Debentures payable | 57 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0410 | Premium (Discount) on debentures payable | 58 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0420 | Payables due after one year | 59 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0430 | TOTAL LONG-TERM LIABILITIES | 60 | Prints the sum of lines 56–59 as a reversed number. |
| BJ02-0440 | CONSTRUCTION IN PROGRESS | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ02-0450 | Construction in progress | 28 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0460 | INTANGIBLE ASSETS | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ02-0470 | Land occupancy right | 29 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0480 | Industry property rights and proprietary technology | 30 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0490 | Other intangible assets | 31 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0500 | TOTAL INTANGIBLE ASSETS | 32 | Prints the sum of lines 29–31. |
| BJ02-0510 | OTHER ASSETS | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--------------------------------------|-------|--|
| BJ02-0520 | Organization expenses | 33 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0530 | Exchange loss during start-up period | 34 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0540 | Deferred loss on investments | 35 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0550 | Deferred tax charges | 36 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0560 | Other deferred expenses | 37 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0570 | Unamortized exchange losses | 38 | Prints the sum of the accounts that you associated with this UDC. |
| BJ02-0580 | TOTAL OTHER ASSETS | 40 | Prints the sum of lines 33–38. |
| BJ02-0590 | TOTAL ASSETS | 41 | Prints the sum of lines 17, 18, 20, 24, 27, 28, 32, and 40 as a reversed number. |
| BJ02-0600 | OTHER LIABILITIES | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ02-0610 | Exchange gain during start-up period | 61 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0620 | Deferred gain on investments | 62 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0630 | Deferred tax credits | 63 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0640 | Other deferred credits | 64 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0650 | Unamortized exchange gain | 65 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0660 | TOTAL OTHER LIABILITIES | 66 | Prints the sum of lines 61– 65 as a reversed number. |
| BJ02-0670 | TOTAL LIABILITIES | 67 | Prints the sum of lines 55, 60, and 66 as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|--|
| BJ02-0680 | OWNER'S EQUITY | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ02-0690 | Registered capital | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ02-0700 | Paid-in capital | 68 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0710 | Including: | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| BJ02-0720 | Including: Chinese investment | 69 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included on line 68. |
| BJ02-0730 | Foreign investment | 70 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included on line 68. |
| BJ02-0740 | Less: Investment returned | 71 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0750 | Capital surplus | 72 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0760 | Reserve fund | 74 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0770 | Enterprise expansion fund | 75 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0780 | Profits capitalized on return of investments | 76 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0790 | Current year net income | 77 | Prints the total of the current year net income, plus the sum of the accounts that you associated with this UDC, as a reversed number. This report calculates the current year net income by subtracting liabilities and owners equity from assets. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--------------------------------------|------|--|
| BJ02-0800 | Undistributed profits | 78 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ02-0810 | TOTAL OWNER'S EQUITY | 80 | Prints the sum of lines 68 and 71-78 as a reversed number. |
| BJ02-0820 | TOTAL LIABILITIES AND OWNER'S EQUITY | 81 | Prints the sum of lines 67-80 as a reversed number. |

Printing the Beijing Balance Sheet Yearly Report

Select Financial Reports (G75C09), Beijing Balance Sheet Yearly.

Setting Processing Option for Beijing Balance Sheet Yearly (R75C10002)

Processing options enable you to specify the default processing for reports.

Selection

Although processing options are set up during JD Edwards EnterpriseOne implementation, you can change processing options each time you run a program.

- 1. Company** Specify the company for which the system runs the report. The company that you enter must exist in the F0010 table. You must complete this processing option.
- 2. Fiscal Year** Specify the year of the fiscal period for which the system runs the report. Enter a two-digit year. If you leave this processing option blank, the system uses the current fiscal year.
- 3. Period Number** Specify the code for the ledger that is assigned to the records that you want to process. If you leave this processing option blank, the system uses the current accounting period.
- 4. Ledger Type** Specify the code for the ledger that is assigned to the records that you want to process. If you leave this processing option blank, the system processes records with ledger type AA.
- 5. Category Code (24-43)** Use this processing option to specify the system 09 account category code to which you copied the values from system 75C. Value are category codes 24 through 43. The system uses the values in the category code that you specify to determine the layout of the report.

Display

Although processing options are set up during JD Edwards EnterpriseOne implementation, you can change processing options each time you run a program.

- 1. Scaling** Specify the factor by which the system divides the amounts in the F0902 table before the system prints the amounts on the report. The factor that you specify must exist in the scaling UDC table 75C/SC.

For example, suppose that the amount for an account in table F0902 is 23,929. If you enter *1000* for this processing option, the system divides 23,929 by 1000, rounds to the nearest whole number, and prints 24 on the report. You can set the Display Decimal processing option to print scale amounts with decimals.

If you leave this processing option blank, the system prints the amounts from table F0902 as they appear in the table.

2. Display Decimal

Specify whether the system prints the amounts on the report with a decimal. If you complete the Scaling processing option, the system divides the amount in the F0902 table by the amount that you specify, rounds the amount, and then places the decimal as you specify in this processing option.

For example, suppose that the amount for an account in table F0902 is 23,929; you enter 1000 for the Scaling processing option and *1* for this processing option. The system divides 23,929 by 1000, rounds the amount, and prints the amount with two decimal places. In this example, the amount printed on the report would be 23.93. Values are:

Blank: Do not print amounts with decimals.

1: Print amounts with two decimals.

3. Negative Sign

Specify how negative numbers print on the report. Values are:

Blank: Print minus sign (–) before the number.

1: Print parentheses around the number. For example, the number 10 prints as (10).

4. Language

Specify the language in which the system prints the report. Values are:

Blank or *1*: Print the report in Chinese.

2: Print the report in English.

3: Print the report in both Chinese and English.

5. Language Code for Chinese

Specify the language code for Chinese when you complete the Language processing option with a value that causes the system to print the report in Chinese. The code that you specify must exist in the language UDC table 01/LP. If you leave this processing option blank, the system prints this report in English only, even if the Language processing option specifies that the system prints the report in Chinese, or both English and Chinese.

Understanding the Beijing Income Statement (Industrial) Report

The Beijing Income Statement (Industrial) report (R75C10004) generates an industry-specific profit and loss report that companies doing business in Beijing, China, are required to give to the local authorities each accounting period. The report includes data about sales, income, and profits.

You complete the Category Code (21–43) processing option with the system 09 account category code to which you copied the values from the BJ–04 Income Statement (Ind.) UDC table 75C/B4.

The maximum length of the description column is 120 characters. The system truncates longer descriptions.

Report Rows and Columns

The system completes the amounts in the Current Period column with the amount for the period that you specify in the Period Number processing option.

The system completes the Current Year Cumulative column with the sum of the amounts from Period 1 through the period that you specify in the Period Number processing option. For example, if you specify 4 in the Period Number processing option, the system prints the sum of period 1, 2, 3, and 4 in the column.

The system completes the Last Year Cumulative column with the amount from the Balance Forward field from the F0902 table.

This table shows how the system prints amounts in the rows and columns on the Beijing Income Statement (Industrial) report:

| UDC Value | Row Title | Line | Explanation |
|-----------|---|------|---|
| BJ04-0010 | Sales | 1 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| BJ04-0020 | Including: Export sales | 2 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is also included in line 1. |
| BJ04-0030 | Less: Sales discounts and allowances | 3 | Prints the sum of the accounts that you associated with this UDC. |
| BJ04-0040 | NET SALES | 4 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is also the sum of lines 1–3. |
| BJ04-0050 | Less: Sales tax | 5 | Prints the sum of the accounts that you associated with this UDC. |
| BJ04-0060 | Cost of sales | 6 | Prints the sum of the accounts that you associated with this UDC. |
| BJ04-0070 | Including: Cost of export sales | 7 | Prints the sum of the accounts that you associated with this UDC. This amount is also included in line 6. |
| BJ04-0080 | GROSS PROFIT | 8 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is also the sum of lines 4– 6. |
| BJ04-0090 | Less: Selling expenses | 9 | Prints the sum of the accounts that you associated with this UDC. |
| BJ04-0100 | General & administrative expenses | 10 | Prints the sum of the accounts that you associated with this UDC. |
| BJ04-0110 | Financial expenses | 11 | Prints the sum of the accounts that you associated with this UDC. |
| BJ04-0120 | Including: Interest expenses (less interest income) | 12 | Prints the sum of the accounts that you associated with this UDC. This amount is also included in line 11. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|------|--|
| BJ04-0130 | Exchange loss (less exchange gains) | 13 | Prints the sum of the accounts that you associated with this UDC. This amount is also included in line 11. |
| BJ04-0140 | INCOME FROM MAIN OPERATION | 14 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is also the sum of lines 8–11. |
| BJ04-0150 | Add: Income from other operations | 15 | Prints the sum of the accounts that you associated with this UDC as a reversed number. A positive number denotes income. A negative number denotes expenses. |
| BJ04-0160 | OPERATING INCOME | 16 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is also the sum of lines 14 and 15. |
| BJ04-0170 | Add: Investments income | 17 | Prints the sum of the accounts that you associated with this UDC as a reversed number. If the sum is equal to zero, the system does not print an amount. |
| BJ04-0180 | Non-operating income | 18 | Prints the sum of the accounts that you associated with this UDC as a reversed number. A positive number denotes income. A negative number denotes expenses. |
| BJ04-0190 | Less: Non-operating expenses | 19 | Prints the sum of the accounts that you associated with this UDC. |
| BJ04-0200 | Add: Adjustment to prior year's income and expense | 20 | Prints the sum of the accounts that you associated with this UDC as a reversed number. A positive number denotes income. A negative number denotes expenses. |
| BJ04-0210 | INCOME BEFORE TAX | 21 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is also the sum of lines 16–20. |
| BJ04-0220 | Less: Income tax | 22 | Prints the sum of the accounts that you associated with this UDC. |
| BJ04-0230 | NET INCOME | 23 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is also the sum of lines 21–23. |

Printing the Beijing Income Statement (Industrial) Report

Select Financial Reports (G75C09), Beijing Income Statement (Industrial).

Setting Processing Options for Beijing Income Statement (Industrial) (R75C10004)

Processing options enable you to specify the default processing for reports.

Selection

- 1. Company** Specify the company for which the system runs the report. The company that you enter must exist in the F0010 table. You must complete this processing option.
- 2. Fiscal Year** Specify the year of the fiscal period for which the system runs the report. Enter a two-digit year. If you leave this processing option blank, the system uses the current fiscal year.
- 3. Period Number** Specify the code for the ledger that is assigned to the records that you want to process. If you leave this processing option blank, the system uses the current accounting period.
- 4. Ledger Type** Specify the code for the ledger that is assigned to the records that you want to process. If you leave this processing option blank, the system processes records with ledger type AA.
- 5. Category Code (24–43)** Use this processing option to specify the system 09 account category code to which you copied the values from system 75C. Value are category codes 24 through 43. The system uses the values in the category code that you specify to determine the layout of the report.

Display

- 1. Scaling** Specify the factor by which the system divides the amounts in the F0902 table before the system prints the amounts on the report. The factor that you specify must exist in the scaling UDC table 75C/SC. For example, suppose that the amount for an account in table F0902 is 23,929. If you enter *1000* for this processing option, the system divides 23,929 by 1000, rounds to the nearest whole number, and prints 24 on the report. You can set the Display Decimal processing option to print the scaling amounts with decimals.

If you leave this processing option blank, the system prints the amounts from table F0902 as they appear in the table.
- 2. Display Decimal** Specify whether the system prints the amounts on the report with a decimal. If you complete the Scaling processing option, the system divides the amount in the F0902 table by the amount that you specify, rounds the amount, and then places the decimal as you specify in this processing option.

For example, suppose that the amount for an account in table F0902 is 23,929. You enter *1000* for the Scaling processing option and *1* for this processing option. The system divides 23,929 by 1000, rounds the amount, and prints the amount with two decimal places. In this example, the amount printed on the report would be 23.93. Values are:

- Blank: Print the amounts with decimals.
1: Print the amounts with two decimals.
- 3. Negative Sign** Specify how negative numbers print on the report. Values are:
 Blank: Print a minus sign (–) before the number.
1: Print parentheses around the number. For example, to print the number 10 as a negative number, the system prints (10).
- 4. Language** Specify the language in which the system prints the report. Values are:
 Blank or *1*: Print the report in Chinese.
 2: Print the report in English.
 3: Print the report in both Chinese and English.
- 5. Language Code for Chinese** Specify the language code for Chinese when you complete the Language processing option with a value that causes the system to print the report in Chinese. The code that you specify must exist in the language UDC table 01/LP. If you leave this processing option blank, the system prints this report in English only, even if the Language processing option specifies that the system prints the report in Chinese, or both English and Chinese.

Generating the Guangzhou Financial Reports

This section provides overviews of the Guangzhou Balance Sheet, Guangzhou Income Statement, and Guangzhou Supplemental Statement, and discusses how to:

- Run the Guangzhou balance sheet.
- Set processing options for Guangzhou Balance Sheet.
- Run the Guangzhou income statement.
- Set processing options for Guangzhou Income Statement.
- Run the Guangzhou supplemental statement.
- Set processing options for Guangzhou Supplemental Statement.

Understanding the Guangzhou Balance Sheet

The Guangzhou Balance Sheet (R75C10005) generates a report that companies that conduct business in Guangzhou, China, are required to give to the local authorities each accounting period. The report includes data about assets, liabilities, and owners' equity.

You complete the Category Code (21–43) processing option with the system 09 account category code to which you copied the values from the GZ-01 Balance Sheet UDC table 75C/G1.

The maximum length of the description columns is 50 characters for each column. The system truncates longer descriptions.

Report Rows and Columns

This table shows how the system prints amounts in the rows and columns on the Guangzhou Balance Sheet report:

| UDC Value | Row Title | Line | Explanation |
|-----------|-------------------------------------|-------|---|
| GZ01-0010 | Current Asset | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| GZ01-0020 | Cash | 1 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0030 | Short-Term Investments | 2 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0040 | Notes Receivable | 3 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0050 | Dividend Receivable | 4 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0060 | Interest Receivable | 5 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0070 | Accounts Receivable | 6 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0080 | Other Receivable | 7 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0090 | Pre-payment | 8 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0100 | Advances to Suppliers | 9 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0110 | Refund Receivable | 10 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0120 | Import/Export Tax Refund Receivable | 11 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0130 | Inventories | 12 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0140 | Include: Material | 13 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 12. |
| GZ01-0150 | Finished Goods | 14 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 12. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|--|
| GZ01-0160 | Pre-Paid Expenses | 15 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0170 | Unallocated Current Asset Gain or Loss | 16 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0180 | Long-term Investments Collectible within One Year | 17 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0190 | Other Current Assets | 18 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0200 | Total Current Assets | 19 | Prints the sum of lines 1–18, excluding lines 13 and 14. |
| GZ01-0210 | Long-term Investments | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| GZ01-0220 | Long-term Equity Investments | 20 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0230 | Long-term Debt Investments | 21 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0240 | Combination Gain/Loss | 22 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0250 | Total Long-Term Investments | 23 | Prints the sum of lines 20–22. |
| GZ01-0260 | Fixed Assets | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| GZ01-0270 | Fixed Assets Cost | 24 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0280 | Less: Accumulated Depreciation | 25 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0290 | Net Fixed Assets before Provision for Depreciation | 26 | Prints the total of lines 24 and 25. |
| GZ01-0300 | Less: Provision for Depreciation | 27 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0310 | Net Fixed Assets | 28 | Prints the sum of lines 26 and 27. |
| GZ01-0320 | Construction Material | 29 | Prints the sum of the accounts that you associated with this UDC. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|---|
| GZ01-0330 | Construction in Progress | 30 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0340 | Disposal of Fixed Assets | 31 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0350 | Unallocated Fixed Asset Gain/Loss | 32 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0360 | Total Fixed Assets | 33 | Prints the sum of lines 28–32. |
| GZ01-0370 | Intangible and Other Assets | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| GZ01-0380 | Intangible Assets | 34 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0390 | Included: Land Occupancy Right | 35 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 34. |
| GZ01-0400 | Deferred Liabilities (long-term deferred expenses) | 36 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0410 | Including: Fix Asset Repair | 37 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 36. |
| GZ01-0420 | Fix Asset Improvement | 38 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 36. |
| GZ01-0430 | Other Long-term Assets | 39 | Prints the sum of the accounts that you associated with this UDC. |
| GZ01-0440 | Included: Stored Assets | 40 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 39. |
| GZ01-0450 | Total Intangible and Other Assets | 41 | Prints the sum of lines 34, 36, and 39. |
| GZ01-0460 | Blank | 42 | Blank |
| GZ01-0470 | Deferred Tax | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| GZ01-0480 | Deferred Tax Charges | 43 | Prints the sum of the accounts that you associated with this UDC. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---------------------------|-------|--|
| GZ01-0490 | Total Assets | 44 | Prints the sum of lines 19, 23, 33, 41, and 43. |
| GZ01-0500 | Current Liabilities | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| GZ01-0510 | Short-term Loans | 45 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0520 | Notes Payable | 46 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0530 | Accounts Payable | 47 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0540 | Advances from Customer | 48 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0550 | Accrued Payroll | 49 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0560 | Accrued Benefits | 50 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0570 | Dividend Payable (profit) | 51 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0580 | Taxes Payable | 52 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0590 | Other Payables | 53 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0600 | Other Advances | 54 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0610 | Accrued Expenses | 55 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0620 | Projected Loans | 56 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---|-------|--|
| GZ01-0630 | Long-term Liabilities due within One Year | 57 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0640 | Other Current Liabilities | 58 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0650 | Total Current Liabilities | 59 | Prints the sum of lines 45–58 as a reversed number. |
| GZ01-0660 | Long-term Liabilities | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| GZ01-0670 | Long-term Loans | 60 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0680 | Debentures Payable | 61 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0690 | Long-term Payable | 62 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0700 | Special Payable | 63 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0710 | Other Long-term Liabilities | 64 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0720 | Included: Required Reserved Fund | 65 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 64. |
| GZ01-0730 | Total Long-term Liabilities | 66 | Prints the sum of lines 60– 64 as a reversed number. |
| GZ01-0740 | Deferred Tax Payable | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| GZ01-0750 | Deferred Tax Charges | 67 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0760 | Total Liabilities | 68 | Prints the sum of lines 59, 66, and 67 as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---|-------|--|
| GZ01-0770 | Owners Equity | Title | Prints this title on the report. You do not associate any accounts to this UDC value. |
| GZ01-0780 | Minority Stock Holder's Interest | 69 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0790 | Paid-in Capital | 70 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0800 | Government Investment | 71 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 70. |
| GZ01-0810 | Local Government Investment | 72 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 70. |
| GZ01-0820 | Corporate Investment | 73 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 70. |
| GZ01-0830 | Including: Government Owned Corporate Investment | 74 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 73. |
| GZ01-0840 | Local Government Owned Corporate Investment | 75 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 73. |
| GZ01-0850 | Private Investment | 76 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 70. |
| GZ01-0860 | Foreign Investment | 77 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 70. |
| GZ01-0870 | Minus: Investment Returned (for joint venture only) | 78 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0880 | Net Investments (for joint ventures only) | 79 | Prints the sum of lines 70 and 78 as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---------------------------------------|------|--|
| GZ01-0890 | Reserved Fund | 80 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0900 | Retained Earnings | 81 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0910 | Including: Required Retained Earnings | 82 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included on line 81. |
| GZ01-0920 | Reserved for Public Benefits | 83 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included on line 81. |
| GZ01-0930 | Added to Working Capital | 84 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included on line 81. |
| GZ01-0940 | Unrealized Investment Loss (use '-') | 85 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0950 | Undistributed Profits | 86 | Prints the total of the current year net income, plus the sum of the accounts that you associated with this UDC, as a reversed number. The system calculates the current year net income by subtracting liabilities and owners' equity from assets. |
| GZ01-0960 | Foreign Exchange Gain/Loss | 87 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ01-0970 | Total Owners' equity | 88 | Prints the sum of lines 69, 79-81, and 85-87 as a reversed number. |
| GZ01-0980 | Total Liabilities and Owners' Equity | 89 | Prints the sum of lines 68 and 88 as a reversed number. |

Understanding the Guangzhou Income Statement

The Guangzhou Income Statement (R75C10006) generates a profit and loss statement that companies that conduct business in Guangzhou, China, are required to give to the local authorities each accounting period. The report includes data about sales, income, and profits.

You complete the Category Code (21-43) processing option with the system 09 account category code to which you copied the values from the GZ-02 Income Statement UDC table 75C/G2.

The maximum length of the description column is 80 characters. The system truncates longer descriptions.

Report Rows and Columns

This table shows how the system prints amounts in the rows and columns on the Guangzhou Income Statement report:

| UDC Value | Row Title | Line | Explanation |
|-----------|--|------|--|
| GZ02-0010 | 1. Revenue From Main Operation | 1 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ02-0020 | Including: Export Products (Merchandise) Sales | 2 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 1. |
| GZ02-0030 | Import Products (Merchandise) Sales | 3 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 1. |
| GZ02-0040 | Less: Sales discounts and allowance | 4 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0050 | 2. Net Revenue from Main Operation | 5 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is also the sum of lines 1 and 4. |
| GZ02-0060 | Less: Costs for Main Operation | 6 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0070 | Including: Cost of good sold for export products (merchandise) | 7 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 6. |
| GZ02-0080 | Main Operation Taxes and Fees | 8 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0090 | Operation Expenses | 9 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0100 | Other Expenses | 10 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0110 | Plus: Deferred Income | 11 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ02-0120 | Income from purchase and sales commission | 12 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---|------|--|
| GZ02-0130 | Other Income | 13 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ02-0140 | 3. Net profit from main operation (use '-' for loss) | 14 | Prints the sum of lines 5 and 6, and lines 8–13 as a reversed number. |
| GZ02-0150 | Plus: Net profit from other operations | 15 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ02-0160 | Less: Operation Expenses | 16 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0170 | General and Administrative expenses | 17 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0180 | Financial expenses | 18 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0190 | Other Expenses | 19 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0200 | 4. Total Operation Profit (Use '-' for loss) | 20 | Prints the sum of lines 14–19 as a reversed number. |
| GZ02-0210 | Plus: Investment Income (use '-' for loss) | 21 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ02-0220 | Income from futures | 22 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ02-0230 | Subsidies | 23 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ02-0240 | Including: Subsidies for prior year unprofitable business | 24 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 23. |
| GZ02-0250 | Income from other operations | 25 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ02-0260 | Other Income | 26 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-----------------|--|
| GZ02-0270 | Including: Adjustments to prior year payroll | 27 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 26. |
| GZ02-0280 | Less: Non-operational Expense | 28 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0290 | Other Expenses | 29 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0300 | Including: Adjustments to Payroll | 30 | Prints the sum of the accounts that you associated with this UDC. This amount is included on line 29. |
| GZ02-0310 | Plus: Adjustment to prior year's income and expenses | 31 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ02-0320 | 5. Total Profit (Use '-' for loss) | 32 | Prints the sums of the amounts on lines 20-23, lines 25 and 26, lines 28 and 29, and line 31 as a reversed number. |
| GZ02-0330 | Less: Income Tax | 33 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0340 | Minority Stock Holder's profit or loss | 34 | Prints the sum of the accounts that you associated with this UDC. |
| GZ02-0350 | Plus: Recognized Investment Loss (use '+') | 35 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ02-0360 | 6. Net Profit | 36 | Prints the sum of lines 32-35 as a reversed number. |
| GZ02-0370 | 1. Profit to Sales or Subsidiary or Invested Business Unit | N/A | Prints the sum of the accounts that you associated with this UDC at the bottom of the report. |
| GZ02-0380 | 2. Loss due to nature disasters | N/A | Prints the sum of the accounts that you associated with this UDC at the bottom of the report. |
| GZ02-0390 | 3. Gain/Loss due to changes in accounting principles | N/A | Prints the sum of the accounts that you associated with this UDC at the bottom of the report. |
| GZ02-0400 | 4. Gain/Loss due to changes in Accounting Estimates | Not applicable. | Prints the sum of the accounts that you associated with this UDC at the bottom of the report. |

| UDC Value | Row Title | Line | Explanation |
|-----------|------------------------------------|-----------------|---|
| GZ02-0410 | 5. Gain/Loss on Debt Restructuring | Not applicable. | Prints the sum of the accounts that you associated with this UDC at the bottom of the report. |
| GZ02-0420 | 6. Other | Not applicable. | Prints the sum of the accounts that you associated with this UDC at the bottom of the report. |

Understanding the Guangzhou Supplemental Statement

The Guangzhou Supplemental Statement (R75C10007) generates a financial report that companies that conduct business in Guangzhou, China, are required to give to the local authorities each accounting period. The report includes data about production, employees, VAT taxes, and general and administrative expenses.

You complete the Category Code (21-43) processing option with the system 09 account category code to which you copied the values from the GZ-03 Supplemental Form UDC table 75C/G3.

The maximum length of the description columns is 52 characters for each column. The system truncates longer descriptions.

Report Rows and Columns

For the Current Period column, prints the sum of the accounts from the first accounting period through the accounting period that precedes the period that you specify in the Period Number processing option. For example, if you specify period 6, the system prints the sum of the accounts for periods 1-5.

For the Current Year Cumulative Amount column, prints the sum of the accounts for the appropriate UDC value for the period that you specify in the Period Number processing option. For example, if you specify period 6, the system prints the sum of the accounts for periods 1 through 6.

This table shows how the system prints amounts in the rows and columns on the Guangzhou Supplemental Statement report:

| UDC Value | Row Title | Line | Explanation |
|-----------|--|------|--|
| GZ03-0010 | 1. Industrial Gross Production (Based on 90 pricing) | 1 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0020 | Including: Export Production (Based on 90 pricing) | 2 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 1. |
| GZ03-0030 | Industrial Gross Production (current pricing) | 3 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0040 | Increase In Industrial Gross Production (Previous Pricing) | 4 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0050 | Industrial Sales (Previous Pricing) | 5 | Prints the sum of the accounts that you associated with this UDC. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|------|--|
| GZ03-0060 | 2. Number of Employees at the end of period | 6 | Prints the sum of the accounts that you associated with this UDC. This amount is from the unit ledger record in the F0902 table. |
| GZ03-0070 | Average number of employees | 7 | Prints the sum of the accounts that you associated with this UDC. This amount is from the unit ledger record in the F0902 table. |
| GZ03-0080 | Number of employees in furlough | 8 | Prints the sum of the accounts that you associated with this UDC. This amount is from the unit ledger record in the F0902 table. |
| GZ03-0090 | Total Payroll | 9 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0100 | 3. Total Payroll Loan Amount | 10 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0110 | I. Manually transferred amounts | 11 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0120 | II. Transferred from manufacturing fund | 12 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0130 | III. Transferred from Administrative fund | 13 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0140 | IV. Transferred from Sales fund | 14 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0150 | V. Other transfers | 15 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0160 | 4. Payment of long-term loan | 16 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0170 | Blank | 17 | na |
| GZ03-0180 | 5. Total employee benefit expense | 18 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0190 | Including: From items in cost of good sold | 19 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 18. |
| GZ03-0200 | From items in manufacturing (operating) expenses | 20 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 18. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|---|
| GZ03-0210 | From items in administrative expense | 21 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 18. |
| GZ03-0220 | 6. General and administrative expense | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| GZ03-0230 | Entertainment expenses | 22 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0240 | Union expenses | 23 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0250 | Employee Education fund expenses | 24 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0260 | Research and Development expenses | 25 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0270 | Real estate taxes | 26 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0280 | Vehicle Use tax | 27 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0290 | Land property tax | 28 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0300 | Additional tax | 29 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0310 | Employee bonus | 30 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0320 | Employment insurance | 31 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0330 | Including: Wages to retired employees | 32 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 31. |
| GZ03-0340 | 7. net interest expense included in financial expenses | 33 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0350 | 8. Income tax payable | 34 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0360 | 9. VAT taxes | Title | Prints this heading. You do not associate any accounts with this UDC value. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|--|
| GZ03-0370 | (-) Reported by individual | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| GZ03-0380 | 1. VAT payable | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| GZ03-0390 | (1) Withholding at the beginning of year (use '-') | 35 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0400 | (2) VAT on Sales | 36 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0410 | VAT Refund for exported goods | 37 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0420 | Amount Transfer our from VAT on Purchase | 38 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0430 | Amount Transfer out on overpaid VAT | 39 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0440 | (3) VAT on purchase | 40 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0450 | VAT Paid | 41 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0460 | Tax Reduction and exemption | 42 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0470 | VAT payable on domestic sales | 43 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0480 | Unpaid VAT tax transfer out | 44 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0490 | (4) Year end amount payable (use '-') | 45 | Prints the sum of lines 35-44 as a reversed number. |
| GZ03-0500 | (5) VAT Payable this period (= 36-37+38-40-42-43+35) | 46 | Prints the sum of lines 35-38, 40, 42, 43, and 44. |
| GZ03-0510 | 2. Vat payable | Title | Prints this heading. You do not associate any accounts with this UDC value. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---|-------|--|
| GZ03-0520 | Payable at the beginning of year (use '-' for over payment) | 47 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0530 | Current Year Addition (use '-' for over payment) | 48 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0540 | Paid in current year | 49 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0550 | Payable at then end of year (use '-' for over payment) | 50 | Prints the sum of lines 47-49 as a reversed number. |
| GZ03-0560 | (2) Reported by Small Business | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| GZ03-0570 | Payable at the beginning of year | 51 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0580 | Current Year Addition | 52 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0590 | Paid in Current Year | 53 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0600 | Payable at the end of year | 54 | Prints the sum of lines 51-53 as a reversed number. |
| GZ03-0610 | 10. Sales Tax | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| GZ03-0620 | Payable at the beginning of year | 55 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0630 | Current Year Addition | 56 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0640 | Paid in current year | 57 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0650 | Payable at the end of year | 58 | Prints the sum of lines 55-57 as a reversed number. |
| GZ03-0660 | (11) Use tax | Title | Prints this heading. You do not associate any accounts with this UDC value. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|--|
| GZ03-0670 | Payable at the beginning of year | 59 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0680 | Current Year Addition | 60 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0690 | Paid in current year | 61 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0700 | Payable at the end of year | 62 | Prints the sum of lines 59–61 as a reversed number. |
| GZ03-0710 | (12) City Tax | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| GZ03-0720 | Payable at the beginning of year | 63 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0730 | Current Year Addition | 64 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0740 | Paid in current year | 65 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0750 | Payable at the end of year | 66 | Prints the sum of lines 63–65 as a reversed number. |
| GZ03-0760 | (13) Income Tax | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| GZ03-0770 | Payable at the beginning of year | 67 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0780 | Current Year Addition | 68 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| GZ03-0790 | Paid in current year | 69 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0800 | Payable at the end of year | 70 | Prints the sum of lines 67– 69 as a reversed number. |
| GZ03-0810 | Quarterly Information (reported in March, June, September) | Title | Prints this heading. You do not associate any accounts with this UDC value. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|------|--|
| GZ03-0820 | 1. Disbursement to retirement fund | 71 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0830 | 2. Total current year Medical and drug expense | 72 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0840 | Including: paid for retired employee | 73 | Prints the sum of the accounts that you associated with this UDC. This amount is from the unit ledger record in the F0902 table. |
| GZ03-0850 | 3. Total retired employee at the end of period | 74 | Prints the sum of the accounts that you associated with this UDC. This amount is from the unit ledger record in the F0902 table. |
| GZ03-0860 | Including: retired employees | 75 | Prints the sum of the accounts that you associated with this UDC. This amount is from the unit ledger record in table F0902. This amount is included in line 74. |
| GZ03-0870 | 4. Current year bad debt expense | 76 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0880 | 5. Bank waived interest payments | 77 | Prints the sum of the accounts that you associated with this UDC. |
| GZ03-0890 | Including: Waived interest payments due to a merger or combination | 78 | Prints the sum of the accounts that you associated with this UDC. This amount is included on line 77. |
| GZ03-0900 | Due to business head count and cost reduction | 79 | Prints the sum of the accounts that you associated with this UDC. This amount is included on line 77. |

Setting Processing Options for Guangzhou Supplemental Statement (R75C10007)

The processing options for this report are the same as those for the Beijing Statement of Value Added Tax Payable report with the exceptions described in this section.

See [Chapter 52, “\(CHN\) Generating Financial Reports for Beijing, Guangzhou, and Shanghai,” Setting Processing Options for Beijing Statement of Value Added Tax Payable \(R75C10001\), page 1018.](#)

Display Tab

The Language processing option on this tab does not allow you to print the report in both Chinese and English.

Selection Tab

This tab includes an additional processing option.

- | | |
|----------------------------|--|
| 5. Unit Ledger Type | Specify the code for the unit ledger that is assigned to the records which you want to process. If you leave this processing option blank, the system processes records with a ledger type of AU (actual units). |
|----------------------------|--|

Display Tab

This tab includes an additional processing option.

- | | |
|----------------------------|---|
| 6. Quarterly Report | Specify whether the system prints quarterly information on the report. Values are: Blank: Do not print quarterly information. <i>I</i> : Print quarterly information. |
|----------------------------|---|

Generating Shanghai Financial Reports

This section provides overviews of the Shanghai reports for Balance Sheet Monthly, Detail Statement of Main Tax Payable Monthly, Income Statement Monthly, Income Statement (Commercial), Balance Sheet Yearly, Income Statement (Industrial), and Income Statement (Service), and discusses how to:

- Run the Shanghai Balance Sheet Monthly report.
- Set processing options for Shanghai Balance Sheet Monthly.
- Run the Shanghai Detail Statement of Main Tax Payable Monthly report.
- Set processing options for Shanghai Detail Statement of Main Tax Payable Monthly.
- Run the Shanghai Income Statement Monthly report.
- Set the processing options for Shanghai Income Statement Monthly.
- Run the Shanghai Income Statement (Commercial) report.
- Set processing options for Shanghai Income Statement (Commercial).
- Run the Shanghai Balance Sheet Yearly report.
- Set processing options for Shanghai Balance Sheet Yearly.
- Run the Shanghai Income Statement (Industrial) report.
- Set processing options for Shanghai Income Statement (Industrial).
- Run the Shanghai Income Statement (Service) report.
- Set processing options for Shanghai Income Statement (Service).

Understanding the Shanghai Balance Sheet Monthly

The Shanghai Balance Sheet Monthly report (R75C10008) generates a balance sheet that companies that conduct business in Shanghai, China, are required to give to the local authorities each accounting period. The report includes data about assets, liabilities, and owners' equity.

You complete the Category Code (21–43) processing option with the system 09 account category code to which you copied the values from the SH-01 Balance Sheet Monthly UDC table 75C/S1.

The maximum length of the description columns is 54 characters for each column. The system truncates longer descriptions.

Report Rows and Columns

This table shows how the system prints amounts to the rows and columns on the Shanghai Balance Sheet Monthly report:

| UDC Value | Row Title | Line | Explanation |
|-----------|----------------|-------|---|
| SH01–0010 | Current assets | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH01–0020 | Cash | 1 | Prints the sum of the accounts that you associated with this UDC. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|---|
| SH01-0030 | Short-term investment | 2 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0040 | Notes receivable | 3 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0050 | Dividend receivable | 4 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0060 | Interest receivable | 5 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0070 | Accounts receivable | 6 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0080 | Other receivable | 7 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0090 | Advances to suppliers | 8 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0100 | Subsidies receivable | 9 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0110 | Inventories | 10 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0120 | Prepaid Expenses | 11 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0130 | Long-term debt investment maturing within one year | 21 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0140 | Other current assets | 24 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0150 | Total current assets | 30 | Prints the sum of lines 1-24. |
| SH01-0160 | Long-term investments | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH01-0170 | Long-term stock investments | 31 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0180 | Long-term debt investments | 32 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0190 | Total long-term investment | 33 | Prints the sum of lines 31 and 32. |
| SH01-0200 | Including: Gain/Loss on business combination (use '-' for negative amount, consolidated) | 34 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 31. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|---|
| SH01-0210 | Including: Gain/Loss on Stock Investment (use '-' for negative amount, consolidated) | 35 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 31. |
| SH01-0220 | Fixed Assets | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH01-0230 | Fixed Assets at Original Cost | 39 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0240 | Less: Accumulated depreciation | 40 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0250 | Fixed Assets after Accumulated depreciation | 41 | Prints the sum of lines 39 and 40. |
| SH01-0260 | Less: Provision for asset impairments | 42 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0270 | Net Fixed Assets | 43 | Prints the sum of lines 41 and 42. |
| SH01-0280 | Construction Material | 44 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0290 | Construction in progress | 45 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0300 | Disposal of fixed assets | 46 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0310 | Total fixed assets | 50 | Prints the sum of lines 43–46. |
| SH01-0320 | Intangible and other assets | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH01-0330 | Intangible assets | 51 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0340 | Long-term pre-paid expenses | 52 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0350 | Other long-term assets | 53 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0360 | Total intangible and other assets | 54 | Prints the sum of lines 51–53. |

| UDC Value | Row Title | Line | Explanation |
|-----------|----------------------------|-------|--|
| SH01-0370 | Deferred Taxes | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH01-0380 | Deferred Tax Charges | 55 | Prints the sum of the accounts that you associated with this UDC. |
| SH01-0390 | Total Assets | 60 | Prints the sum of line 30, 33, 50, 54, and 55. |
| SH01-0400 | Current Liabilities | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH01-0410 | Short-term loan | 61 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0420 | Notes payable | 62 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0430 | Accounts payable | 63 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0440 | Advances from Customer | 64 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0450 | Accrued Payroll | 65 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0460 | Accrued Benefits and Bonus | 66 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0470 | Dividend payable | 67 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0480 | Tax payable | 68 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0490 | Other Payable | 69 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0500 | Other Accruals | 70 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---|-------|--|
| SH01-0510 | Accrued expenses | 71 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0520 | Provision for short-term loan | 72 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0530 | Long-term liabilities due within one year | 78 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0540 | Other current liabilities | 79 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0550 | Total current Liabilities | 80 | Prints the sum of lines 61-79 as a reversed number. |
| SH01-0560 | Long-term Liabilities | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH01-0570 | Long-term loans | 81 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0580 | Debentures payable | 82 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0590 | Long-term payables | 83 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0600 | Special Item payables | 84 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0610 | Other long-term liabilities | 85 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0620 | Total Long-term liabilities | 87 | Prints the sum of lines 81-85 as a reversed number. |
| SH01-0630 | Deferred taxes | 88 | Prints this heading. You do not associate any accounts with this UDC value. |
| SH01-0640 | Deferred production item | 89 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|---|
| SH01-0650 | Total Liabilities | 90 | Prints the sum of lines 80, 87, and 89 as a reversed number. |
| SH01-0660 | Minority Stock Holders' interests (consolidated) | 91 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0670 | Owners' equity | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH01-0680 | Paid-in capital | 92 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0690 | Less: capital refunded | 93 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0700 | Net paid-in capital | 94 | Prints the sum of lines 92 and 93 as a reversed number. |
| SH01-0710 | Capital Surplus | 95 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0720 | Capitalized Profits | 96 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0730 | Including: Mandatory Capitalized profits | 97 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included on line 96. |
| SH01-0740 | Less: Unrecognized Investment loss (consolidated) | 98 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH01-0750 | Undistributed profit | 99 | Print the total of the current year net income, plus the sum of the accounts that you associated with this UDC, as a reversed number. The system calculates the current year net income by subtracting liabilities and owners' equity from assets. |
| SH01-0760 | Gain/Loss from currency translation (consolidated) | 100 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|------|---|
| SH01-0770 | Total Owners' equity | 101 | Prints the sum of lines 91, 94-96, and 98-100 as a reversed number. |
| SH01-0780 | Total liabilities and owners' equity (or share owners' equity) | 102 | Prints the sum of lines 90 and 101 as a reversed number. |

Understanding the Shanghai Detail Statement of Main Tax Payable Monthly Report

The Shanghai Detail Statement of Main Tax Payable Monthly (R75C10009) generates a report that companies that conduct business in Shanghai, China, are required to give to the local authorities each accounting period. The report includes data about VAT, sales, city, and income taxes.

You complete the Category Code (21-43) processing option with the system 09 account category code to which you copied the values from the SH-02 Statement of Tax Payable UDC table 75C/S2.

The maximum length of the description column is 150 characters. The system truncates longer descriptions.

Report Rows and Columns

For the Month to Date column, the system prints the sum of the accounts from the first accounting period through the accounting period that precedes the period that you specify in the Period Number processing option. For example, if you specify period 6, the system prints the sum of the accounts for periods 1-5.

For the Year to Date column, the system prints the sum of the accounts for the appropriate UDC value for the period that you specify in the Period Number processing option. For example, if you specify period 6, the system prints the sum of the accounts for periods 1- 6.

This table shows how the system prints amounts in the rows and columns on the Shanghai Detail Statement of Main Tax Payable Monthly report:

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|---|
| SH02-0010 | 1. VAT | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH02-0020 | 1. VAT Payable | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH02-0030 | (1) Amount not yet deducted at the beginning of period (use '-') | 1 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is the balance at the beginning of the period. |
| SH02-0040 | (2) VAT on Sales | 2 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|-------|---|
| SH02-0050 | VAT refund for exported goods | 3 | Prints the sum of the accounts that you associated with this UDC. |
| SH02-0060 | Amount Transfer out from VAT on purchase | 4 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH02-0070 | Amount transfer out on overpaid VAT | 5 | Prints the sum of the accounts that you associated with this UDC. |
| SH02-0080 | (3) VAT on Purchase | 6 | Prints the sum of the accounts that you associated with this UDC. |
| SH02-0090 | VAT Paid | 7 | Prints the sum of the accounts that you associated with this UDC. |
| SH02-0100 | Blank | 8 | Blank. |
| SH02-0110 | Blank | 9 | Blank. |
| SH02-0120 | Transfer out unpaid VAT | 10 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH02-0130 | (4) Amount not yet deducted at the end of period (use '-') | 11 | Prints the sum of lines 1-10 as a reversed number. |
| SH02-0140 | 2. VAT unpaid | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH02-0150 | (1) Amount unpaid at the beginning of period (use '-' for overpayment) | 12 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is the beginning balance for the period. |
| SH02-0160 | (2) Current period amount transfer in (use '-' for overpayment) | 13 | Prints the sum of lines 5 and 10 as a reversed number. |
| SH02-0170 | (3) Amount paid in current period | 14 | Prints the sum of the accounts that you associated with this UDC. |
| SH02-0180 | (4) Amount unpaid at the end of period | 15 | Prints the sum of lines 12- 14 as a reversed number. |
| SH02-0190 | 2. Use Tax | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH02-0200 | 1. Amount unpaid at the beginning of period (use '-' for overpayment) | 16 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---|-------|--|
| SH02-0210 | 2. Additional Amount payable | 17 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH02-0220 | 3. Amount paid | 18 | Prints the sum of the accounts that you associated with this UDC. |
| SH02-0230 | 4. Amount unpaid at the end of period (use '-' for overpayment) | 19 | Prints the sum of lines 12-14 as a reversed number. |
| SH02-0240 | 3. Sales Tax | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH02-0250 | 1. Amount unpaid at the beginning of period (use '-' for overpayment) | 20 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH02-0260 | 2. Additional Amount payable | 21 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH02-0270 | 3. Amount paid | 22 | Prints the sum of the accounts that you associated with this UDC. |
| SH02-0280 | 4. Amount unpaid at the end of period (use '-' for overpayment) | 23 | Prints the sum of lines 20-22 as a reversed number. |
| SH02-0290 | 4. City Tax | Title | Prints this heading. You do not associate any accounts with this UDC value. |
| SH02-0300 | 1. Amount unpaid at the beginning of period (use '-' for overpayment) | 24 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH02-0310 | 2. Additional Amount payable | 25 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH02-0320 | 3. Amount paid | 26 | Prints the sum of the accounts that you associated with this UDC. |
| SH02-0330 | 4. Amount unpaid at the end of period (use '-' for overpayment) | 27 | Prints the sum of lines 24-26 as a reversed number. |
| SH02-0340 | 5. Income Tax | Title | Prints this heading. You do not associate any accounts with this UDC value. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---|------|--|
| SH02-0350 | 1. Amount unpaid at the beginning of period (use '-' for overpayment) | 28 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH02-0360 | 2. Additional Amount payable | 29 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH02-0370 | 3. Amount paid | 30 | Prints the sum of the accounts that you associated with this UDC. |
| SH02-0380 | 4. Amount unpaid at the end of period (use '-' for overpayment) | 31 | Prints the sum of lines 28-30 as a reversed number. |

Understanding the Shanghai Income Statement Monthly Report

The Shanghai Income Statement Monthly (R75C10010) generates a profit and loss statement that companies that conduct business in Shanghai, China, are required to give to the local authorities each accounting period. The report includes data about sales, income, and profits.

You complete the Category Code (21-43) processing option with the system 09 account category code to which you copied the values from the SH-03 Income Statement Monthly UDC table 75C/S3.

The maximum length of the description column is 96 characters. The system truncates longer descriptions.

Report Rows and Columns

This table shows how the system prints amounts in the rows and columns on the Shanghai Income Statement Monthly report:

| UDC Value | Row Title | Line | Explanation |
|-----------|---|------|--|
| SH03-0010 | 1. Main Operation Revenue | 1 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH03-0020 | Minus: Cost of Main Operations | 2 | Prints the sum of the accounts that you associated with this UDC. |
| SH03-0030 | Main Operation and Sales Taxes | 3 | Prints the sum of the accounts that you associated with this UDC. |
| SH03-0040 | 2. Main Operation Profit (Use '-' for Loss) | 4 | Prints the sum of lines 1-3. |
| SH03-0050 | Plus: Other Operation Profit (Use '-' for Loss) | 5 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH03-0060 | Minus: Operation Expenses | 6 | Prints the sum of the accounts that you associated with this UDC. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|------|--|
| SH03-0070 | Administrative Expenses | 7 | Prints the sum of the accounts that you associated with this UDC. |
| SH03-0080 | Accounting Expenses | 8 | Prints the sum of the accounts that you associated with this UDC. |
| SH03-0090 | Blank | 9 | Blank |
| SH03-0100 | 3. Operation Profit | 10 | Prints the sum of lines 4–8. |
| SH03-0110 | Plus: Investment Profit (Use '-' for Loss) | 11 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH03-0120 | Reimbursed Income | 12 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH03-0130 | Non-operational Income | 13 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH03-0140 | Less: Non-Operational Expenses | 14 | Prints the sum of the accounts that you associated with this UDC. |
| SH03-0150 | 4. Total Profit | 15 | Prints the sum of lines 10–14 as a reversed number. |
| SH03-0160 | Less: Income Tax | 16 | Prints the sum of the accounts that you associated with this UDC. |
| SH03-0170 | Minority Share Holders Gain and Loss (Total) | 17 | Prints the sum of the accounts that you associated with this UDC. |
| SH03-0180 | Plus: Unrecognized Investment Loss (Total) | 18 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH03-0190 | 5. Net Profit (Use '-' for Loss) | 20 | Prints the sum of lines 15–18 as a reversed number. |

Understanding the Shanghai Income Statement (Commercial)

The Shanghai Income Statement (Commercial) (R75C10011) generates an industry-specific profit and loss statement that companies that conduct business in Shanghai, China, are required to give to the local authorities each accounting period. The report includes data about sales, income, and profits.

You complete the Category Code (21–43) processing option with the system 09 account category code to which you copied the values from the SH-04 Income Statement UDC table 75C/S4.

The maximum length of the description column is 96 characters. The system truncates longer descriptions.

Report Rows and Columns

This table shows how the system prints amounts in the rows and columns on the Shanghai Income Statement (Commercial) report:

| UDC Value | Row Title | Line | Explanation |
|-----------|---|------|---|
| SH04-0010 | Sales | 1 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH04-0020 | Less: Sales discounts and allowances | 2 | Prints the sum of the accounts that you associated with this UDC. |
| SH04-0030 | NET SALES | 3 | Prints the sum of lines 1 and 2 as a reversed number. |
| SH04-0040 | Less: Cost of sales | 4 | Prints the sum of the accounts that you associated with this UDC. |
| SH04-0050 | Purchasing expenses | 5 | Prints the sum of the accounts that you associated with this UDC. |
| SH04-0060 | Blank | 6 | Blank. |
| SH04-0070 | Blank | 7 | Blank. |
| SH04-0080 | GROSS PROFIT | 8 | Prints the sum of lines 3–7 as a reversed number. |
| SH04-0090 | Add: Income from purchase and sales commission | 9 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH04-0100 | GROSS PROFIT FROM MAIN OPERATION | 10 | Prints the sum of lines 8 and 9 as a reversed number. |
| SH04-0110 | Less: Selling expenses | 11 | Prints the sum of the accounts that you associated with this UDC. |
| SH04-0120 | General & administrative expenses | 12 | Prints the sum of the accounts that you associated with this UDC. |
| SH04-0130 | Financial expenses | 13 | Prints the sum of the accounts that you associated with this UDC. |
| SH04-0140 | Including: Interest expenses (less interest income) | 14 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 13. |
| SH04-0150 | Exchange loss (less exchange gains) | 15 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 13. |
| SH04-0160 | Blank | 16 | Blank. |

| UDC Value | Row Title | Line | Explanation |
|-----------|---------------------------------------|------|--|
| SH04-0170 | Blank | 17 | Blank. |
| SH04-0180 | Blank | 18 | Blank. |
| SH04-0190 | INCOME FROM MAIN OPERATION | 19 | Prints the sum of lines 10–13 as a reversed number. |
| SH04-0200 | Add: Income from other operations | 20 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH04-0210 | Blank | 21 | Prints the sum of the accounts that you associated with this UDC. |
| SH04-0220 | OPERATING INCOME | 22 | Prints the sum of lines 19–21 as a reversed number. |
| SH04-0230 | Add: Investments income | 23 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH04-0240 | Gains or losses from futures | 24 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH04-0250 | Non-operating income | 25 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH04-0260 | Gains from disposal of fixed assets | 26 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 25. |
| SH04-0270 | Income from non-monetary transactions | 27 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 25. |
| SH04-0280 | Fines received | 28 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 25. |
| SH04-0290 | Subsidies | 29 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

Understanding the Shanghai Balance Sheet Yearly

The Shanghai Balance Sheet Yearly (R75C10012) generates a balance sheet that companies doing business in Shanghai, China, are required to give to the local authorities each accounting period. The report includes data about assets, liabilities, and owners' equity.

You complete the Category Code (21–43) processing option with the system 09 account category code to which you copied the values from the SH-06 Balance Sheet Yearly UDC table 75C/S6.

The maximum length of the description columns is 96 characters for each column. The system truncates longer descriptions.

Report Rows and Columns

This table shows how the system prints amounts in the rows and columns on the Shanghai Balance Sheet Yearly report:

| UDC Value | Row Title | Line | Explanation |
|-----------|-------------------------------------|------|---|
| SH06-0010 | Cash on Hand | 1 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0020 | Short-term Investment | 2 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0030 | Notes Receivable | 3 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0040 | Dividend Receivable | 4 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0050 | Interest Receivable | 5 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0060 | Account Receivable | 6 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0070 | Other Receivables | 7 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0080 | Prepayments | 8 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0090 | Advances to Suppliers | 9 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0100 | Refund Receivable | 10 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0110 | Export Tax Refund Receivable | 11 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0120 | Inventories | 12 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0130 | Including: Material | 13 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 12. |
| SH06-0140 | Finished Goods (in Warehouse) | 14 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 12. |
| SH06-0150 | Prepaid Expenses | 15 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0160 | Deferred Loss on Current Asset | 16 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0170 | Long-Term Bond maturing in one year | 17 | Prints the sum of the accounts that you associated with this UDC. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|------|---|
| SH06-0180 | Other Current Assets | 18 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0190 | Total Current Assets | 19 | Prints the sum of lines 1–18, excluding lines 13 and 14. |
| SH06-0200 | Long-Term Investment | 20 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0210 | Including: Long-term Investment in Stock | 21 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 20. |
| SH06-0220 | Long-term Investment in Bonds | 22 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 20. |
| SH06-0230 | Goodwill from Merger | 23 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0240 | Total Long-term investment | 24 | Prints the sum of lines 20 and 23. |
| SH06-0250 | Fixed Assets at cost | 25 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0260 | Less: Accumulated Depreciation | 26 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH06-0270 | Fixed Assets | 27 | Prints the sum of lines 25 and 26. |
| SH06-0280 | Less: Provision for asset impairment | 28 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH06-0290 | Net Fixed Asset | 29 | Prints the sum of lines 27 and 28. |
| SH06-0300 | Disposal of Fixed Assets | 30 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0310 | Construction Material | 31 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0320 | Construction in Progress | 32 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0330 | Unamortized Loss on Fixed Asset | 33 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0340 | Total Net Fixed Asset | 34 | Prints the sum of lines 29–33. |
| SH06-0350 | Intangible Asset | 35 | Prints the sum of the accounts that you associated with this UDC. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|------|---|
| SH06-0360 | Including: Right to Use Land | 36 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 35. |
| SH06-0370 | Deferred Liabilities (Long-term Deferred Expenses) | 37 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0380 | Including: Fixed Asset Repairs | 38 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 37. |
| SH06-0390 | Fixed Asset Improvements | 39 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 37. |
| SH06-0400 | Other Long-Term Asset | 40 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0410 | Blank | 41 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0420 | Total Intangible and Other Assets | 42 | Prints the sum of lines 35, 37, and 40. |
| SH06-0430 | Deferred Taxes Receivable | 43 | Prints the sum of the accounts that you associated with this UDC. |
| SH06-0440 | Total Assets | 44 | Prints the sum of lines 19, 24, 34, 42, and 43. |
| SH06-0450 | Short-term debt | 45 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH06-0460 | Notes Payable | 46 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH06-0470 | Accounts Payable | 47 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH06-0480 | Advances from Customers | 48 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH06-0490 | Accrued Payroll | 49 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH06-0500 | Employee Benefit and bonus Payable | 50 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

| UDC Value | Row Title | Line | Explanation |
|-----------|-------------------------------------|------|--|
| SH06-0510 | Dividend Payable (Dividend) | 51 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH06-0520 | Tax Payable | 52 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH06-0530 | Other Payables | 53 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH06-0540 | Other accruals | 54 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH06-0550 | Accrued Expenses | 55 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |

| SH09-0130 | Add: Investments income | 13 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH09-0140 | Gains or losses from futures | 14 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH09-0150 | Subsidies | 15 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH09-0160 | Non-operating income | 16 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH09-0170 | Gains on disposal of fixed assets | 17 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 16. |
| SH09-0180 | Income from non-monetary transactions | 18 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 16. |
| SH09-0190 | Fines received | 19 | Prints the sum of the accounts that you associated with this UDC as a reversed number. This amount is included in line 16. |
| SH09-0200 | Blank | 20 | Blank. |
| SH09-0210 | Less: on-operating expenses | 21 | Prints the sum of the accounts that you associated with this UDC. |

| UDC Value | Row Title | Line | Explanation |
|-----------|--|------|---|
| SH09-0220 | Losses on disposal of fixed assets | 22 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 21. |
| SH09-0230 | Losses on debt restructuring | 23 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 21. |
| SH09-0240 | Fines paid | 24 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 21. |
| SH09-0250 | Donations | 25 | Prints the sum of the accounts that you associated with this UDC. This amount is included in line 21. |
| SH09-0260 | Add: Adjustment to prior year's income and expense | 26 | Prints the sum of the accounts that you associated with this UDC as a reversed number. |
| SH09-0270 | Blank | 27 | Blank |
| SH09-0280 | INCOME BEFORE TAX | 28 | Print the sum of lines 12-16, plus line 21 and line 26, as a reversed number. |
| SH09-0290 | Less: Income tax | 29 | Prints this sum of the accounts that you associated with this UDC. |
| SH09-0300 | NET INCOME | 30 | Prints the sum of lines 28 and 29 as a reversed number. |

Running the Shanghai Balance Sheet Monthly Report

Select Financial Reports (G75C09), Shanghai Balance Sheet Monthly.

Setting Processing Options for Shanghai Balance Sheet Monthly (R75C10008)

The processing options for this report are the same as those for the Beijing Statement of Value Added Tax Payable report with one exception. You can print this report in Chinese or English, but not both.

Running the Shanghai Detail Statement of Main Tax Payable Monthly Report

Select Financial Reports (G75C09), Shanghai Detail Statement of Main Tax Payable Monthly.

Setting Processing Options for Shanghai Detail Statement of Main Tax Payable Monthly (R75C10009)

The processing options for this report are the same as those for the Beijing Statement of Value Added Tax Payable report.

Running the Shanghai Income Statement Monthly Report

Select Financial Reports (G75C09), Shanghai Income Statement Monthly.

Setting Processing Options for the Shanghai Income Statement Monthly (R75C10010)

The processing options for this report are the same as those for the Beijing Statement of Value Added Tax Payable report.

Running the Shanghai Income Statement (Commercial) Report

Select Financial Reports (G75C09), Shanghai Income Statement (Commercial).

Setting Processing Options for Shanghai Income Statement (Commercial) (R75C10011)

The processing options for this report are the same as those for the Beijing Statement of Value Added Tax Payable report, except that there is no processing option for period number.

Running the Shanghai Balance Sheet Yearly Report

Select Financial Reports (G75C09), Shanghai Balance Sheet Yearly.

Setting Processing Options for the Shanghai Balance Sheet Yearly (R75C10012)

The processing options for this report are the same as those for the Beijing Statement of Value Added Tax Payable report, except that there is no processing option for period number.

Running the Shanghai Income Statement (Industrial) Report

Select Financial Reports (G75C09), Shanghai Income Statement (Industrial).

Setting Processing Options for Shanghai Income Statement (Industrial) (R75C10013)

The processing options for this report are the same as those for the Beijing Statement of Value Added Tax Payable report, except that there is no processing option for period number.

Running the Shanghai Income Statement (Service) Report

Select Financial Reports (G75C09), Shanghai Balance Sheet Yearly.

Setting Processing Options for Shanghai Income Statement (Service) (R75C10014)

The processing options for this report are the same as those for the Beijing Statement of Value Added Tax Payable report, except that there is no processing option for period number.

CHAPTER 53

(CHN) Working with Other Chinese Functionality

This chapter discusses how to:

- Generate a balance sheet and income statement.
- Process JinSui invoices.
- Print invoices from the JD Edwards EnterpriseOne Sales Order Management system.

Generating a Balance Sheet and Income Statement

This section provides an overview of the balance sheet and income statement for China, lists a prerequisite, and describes how to run the Balance Sheet or Income Statement program (R75C211).

Understanding the Balance Sheet and Income Statement for China

The Balance Sheet and Income Statement program (R75C111) creates a sample balance sheet and a sample income statement for China. You can customize the balance sheet and income statements according to your specific needs. These reports retrieve information from the F0901, F0902, and F0006 tables.

Prerequisite

Set up category code 21 in UDC table 09/21 with the appropriate value for each account.

Running the Sample Balance Sheet and Income Statement

Select Financial Reports (G75C09), Balance Sheet or Income Statement.

Processing JinSui Invoices for China

This section provides an overview of invoices for *JinSui* and discusses how to:

- Run the Print Invoices from A/R program.
- Set processing options for Create Chinese GUI interface file from A/R (R75C03B1).
- Run the Cancel Invoice Print program.
- Set processing options for Cancel Invoice Print (R75C09Z1).

- Run the Download *JinSui* Return File into JDE program.

See Also

JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide, “(CHN) JinSui Processing”

Understanding Invoices for JinSui

In China, special VAT (value added tax) invoices are prepared by using a Government Uniform Invoice (GUI). The GUI format includes a legal invoice number that is supplied and required by the government. The JinSui Invoice Data Interface provides a preprinted format and handles all of the associated printing issues. The JD Edwards EnterpriseOne solution creates a predefined JinSui interface format. The JinSui system then reads and writes the data in the GUI format to preprinted and prenumbered invoices.

Use the Print Invoice from A/R program (R03B505) to print invoices for submission to JinSui. When you run Print Invoice from A/R, the system also runs the GUI Interface file from A/R program (R75C03B1), which populates the Text Processor Header (F007101) and Text Processor Detail (F007111) tables. You must use the Text File Processor program to copy information from these tables to a file that you can submit to JinSui.

The Print Invoice from A/R program also produces a paper report that you can use to review the invoices before you submit them to JinSui.

Note. You can print invoices for JinSui from the JD Edwards EnterpriseOne Accounts Receivable system, from the JD Edwards EnterpriseOne Sales Order Management system, or from both.

After you submit invoices to the JinSui system, the JinSui system generates a return file that contains the GUI numbers that are assigned to the invoices. Use the Download JinSui Return File into JDE program (R75C01Z2) to load the return file into the JD Edwards EnterpriseOne system. The Download JinSui Return File into JDE program also produces a report that contains the JinSui information, including the GUI number.

The GUI number links the system-assigned invoice number and JinSui. You must know the GUI number to inquire on it. If you change the GUI information, use the Invoice Inquire on GUI Number program (P75C001) to update the GUI number and GUI status.

Prerequisites

Before you complete the tasks in this section:

- Before you can run either the Invoice Print program (R03B505) or the Print Invoices program (R42565), you must set up versions of these programs that match the version of the GUI Interface file from A/R program (R75C03B1).
- Set up the next numbers for system 75.

See [Chapter 51, “\(CHN\) Setting Up Country-Specific Functionality for China,” Setting Up Next Numbers for China, page 1007](#).

Forms Used to Process JinSui Invoices

| Form Name | FormID | Navigation | Usage |
|-----------------------|----------|---|---------------------------------------|
| Work With GUI Inquiry | W75C001E | A/R Sales - China (G75C03), Invoice Inquire on GUI Number | Locate invoices by GUI number. |
| Global Update GUI | W75C001B | On the Work With GUI Inquiry form, select an invoice and select Global_UpdateGUI from the Row menu. | Update the GUI number for an invoice. |
| Global Status Update | W75C001C | On the Work With GUI Inquiry form, select an invoice and then select Global_UpdateStatus from the Row menu. | Update the GUI status for an invoice. |

Running the Print Invoices from A/R Program

Select A/R Sales - China (G75C03), Print Invoice from A/R.

Setting Processing Options for Create Chinese GUI interface file from A/R (R75C03B1)

Processing options enable you to specify the default processing for programs and reports.

Print

These processing options customize various printing options for the JinSui interface file or the standard invoice.

- 1. Printing Invoice Type** Specify whether to generate the JinSui interface file with the JD Edwards EnterpriseOne standard invoice or only the JD Edwards EnterpriseOne standard invoice. Values are:

Blank: The system generates the JinSui interface file and the JD Edwards EnterpriseOne standard invoice. Blank is the default value.
I: The system generates only the JD Edwards EnterpriseOne standard invoice.
- 2. Invoice Remarks** Specify an invoice remark that will appear in the JinSui header record.
- 3. Line Item Unit of Measure** Enter the quantity for line items on the JinSui detail record. The value you enter will apply to each line item on each invoice. If you leave this processing option blank, the system uses *I*.
- 4. Line Item Quantity** Enter the quantity for line items on the JinSui detail record. The value you enter will apply to each line item on each invoice. If you leave this processing option blank, the system uses *I*.
- 5. Line Item Category Value (Required)** Enter the category value for line items on the JinSui detail record. The value you enter applies to each line item on each invoice. This is a required value. Neither a blank value nor a value containing a blank is acceptable.
- 6. Item Description (Required)** Specify the item description for the JinSui detail record for any blank values in the Remark field. You use this processing option if you do not complete the

Remark processing option. This is a required value. Neither a blank value nor a value containing a blank is acceptable.

7. Item Specification

Enter the item specification for line items on the JinSui detail record. The value you enter will apply to each line item on each invoice. If you leave this processing option blank, the system uses the Payment Item field (SFX) in the Customer Ledger table (F03B11) for the default value.

8. Checked By

Specify the person who does the verification upon the invoices. This is an optional field. If you leave this field blank, the Checked By field of the JinSui Header record will be blank.

9. Received By

Specify the person who actually receives payments in the accounting department. This is an optional field. If you leave this field blank, the Received By field of the JinSui Header record will be blank.

Running the Cancel Invoice Print Program

If you have already sent the invoice file to JinSui and you discover errors, you must run the Cancel Invoice Print program (R75C09Z1) so that the tax authority will cancel the GUI invoice numbers that correspond to the invoices which have errors.

Select A/R Sales - China (G75C03), Cancel Invoice Print.

Setting Processing Options for Cancel Invoice Print (R75C09Z1)

Processing options enable you to specify the default processing for programs and reports.

Processing

This processing option indicates whether the system runs the Cancel Invoice Print program (R75C09Z1) in proof mode or final mode.

1. Running Mode

Specify the mode in which the program is run. Values are:

Blank: Proof mode. The system creates only the report (R75C04R)

/: Final mode. The system creates the report (R75C04R) and also writes records to the China - Transmitted Vouchers to the JinSui table (F0018CN).

Running the Download JinSui Return File into JDE Program

Select A/R Sales - China (G75C03), Download JinSui Return File into JDE.

Printing Invoices in China

This section provides an overview of printing invoices for China and discusses how to set processing options for GUI Interface File from Sales Order (R75C421).

Understanding the Invoice Print Process for China

Use the standard invoice print program to print invoices for review and to create a flat file that you can submit to JinSui. When you run the Print Invoices program (R42565), the system also runs the Create GUI flat file from SO invoice work file - China program (R75C422), which populates the Text Processor Header table (F007101) and the Text Processor Detail table (F007111). You must use the Text File Processor program (P00701) to copy information from these tables to a file that you can submit to JinSui.

The Print Invoices program also produces a paper report that you can use to review the invoices before you submit them to JinSui.

Note. You can print invoices for JinSui from the JD Edwards EnterpriseOne Accounts Receivable system, from the JD Edwards EnterpriseOne Sales Order Management system, or both.

After you set up the item master, the item branch/plant, or both, you need to complete the processing option Item Category Code Name field for the Chinese GUI Interface file from Sales Order-Set Up - China program. You must use the same value for the category code that you chose for the item master and item branch/plant.

See Also

JD Edwards EnterpriseOne Sales Order Management 8.12 Implementation Guide, “Invoicing,” Setting Processing Options for Print Invoices (R42565)

Setting Processing Options for GUI Interface File from Sales Order (R75C421)

Processing options enable you to specify the default processing for programs and reports.

Defaults

Use these processing options to identify the invoice type, the number of line items per invoice, an item category code, a specification code, and checked by and received by default address book numbers.

- | | |
|--|--|
| 1. Printing Invoice Type | Leave blank and the system generates only the JinSui Interface file. Values are: 1: Generate a standard invoice only. 2: Generate a JinSui Interface file and standard invoice. |
| 2. Number of Line Items per Invoice | Specify how many line items print on one GUI invoice. The default values creates one invoice for each sales order line. |
| 3. Item Category Code Name | Specify which field name in the F4101C table the system uses for item classification in the JinSui interface table. Values are: <ul style="list-style-type: none"> • SRP6 (default) • SRP7 • SRP8 • SRP9 • SRP0 • PRP6 • PRP7 |

- *PRP8*
- *PRP9*
- *PRP0*

- 4. Default Item Category Value** Specify the default item category value for line items on the JinSui detail record. The value that you enter will apply when the item category code field is blank in the item branch/plant master.
- 5. Default Item Specification** Enter the default item specification for line items on the JinSui detail record. The value that you enter will apply when the second item description field (DSC2) is blank on the sales order
- 6. Checked by** Enter a number that identifies an entry in the JD Edwards EnterpriseOne Address Book system, such as employee, applicant, participant, customer, supplier, tenant, or location.
- 7. Received by** Enter a number that identifies an entry in the JD Edwards EnterpriseOne Address Book system, such as employee, applicant, participant, customer, supplier, tenant, or location.

Print Invoices from the Sales Order Management System

Select A/R Sales - China (G75C03), Print Invoice from Sales Order.

PART 10

Colombia

Chapter 54

(COL) Setting Up Country-Specific Functionality for Colombia

Chapter 55

(COL) Setting Up Functionality for Colombia

Chapter 56

(COL) Working with Fixed Assets for Colombia

CHAPTER 54

(COL) Setting Up Country-Specific Functionality for Colombia

This chapter discusses Colombia-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Colombia-Specific Setup and Processes

This table lists the country-specific setup and functionality for Colombia:

| Setup or Process | Description |
|--|---|
| UDCs (user-defined codes) | <p>Set up base-software UDCs with Colombia-specific values, and set up Colombia-specific UDCs for:</p> <ul style="list-style-type: none">• Vouchers and invoices.• Address book records for Colombia. <p>See Chapter 55, “(COL) Setting Up Functionality for Colombia,” Setting Up UDCs for Colombia, page 1089.</p> |
| AAIs (automatic accounting instructions) | No Columbia-specific AAI setup exists. |
| Next numbers | No Columbia-specific next numbers setup exists. |
| Voucher and invoice processing | <p>Before you work with voucher and invoice processing for Colombia set up UDCs 76C/RC and 76C/TC.</p> <p>For vouchers that are saved in a foreign currency, the recycling process uses the exchange rate that corresponds to the invoice or the accounting date as defined in the master business functions (MBFs) for the voucher. The system reads the values in the Recycle Voucher UDC (76C/RC) to determine the version to use.</p> <p>See Chapter 55, “(COL) Setting Up Functionality for Colombia,” Setting Up UDCs for Address Book Records and Accounts Payable for Colombia, page 1091.</p> <p>See <i>JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide</i>, “Processing Accounts Payable Vouchers,” Understanding Recurring Vouchers.</p> |

| Setup or Process | Description |
|----------------------|---|
| Address book records | <p>In addition to the base software setup and processes for address book records, for Colombia:</p> <ul style="list-style-type: none"> • Enter additional information for address book records. <p>See <i>JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide</i>, “Entering Address Book Records,” (COL) Entering Additional Address Book Information.</p> <ul style="list-style-type: none"> • Set processing options for Address Book Colombian Additional Information (P76C0101). <p>See Chapter 55, “(COL) Setting Up Functionality for Colombia,” Setting Processing Options for Address Book Colombian Additional Information (P76C0101), page 1094.</p> <ul style="list-style-type: none"> • Set up UDCs. <p>See Chapter 55, “(COL) Setting Up Functionality for Colombia,” Setting Up UDCs for Address Book Records and Accounts Payable for Colombia, page 1091.</p> |
| Fixed assets | <p>In addition to the base software setup and processes for fixed assets, for Colombia you must set up:</p> <ul style="list-style-type: none"> • Cost accounts for depreciation. • Cost accounts for inflation. <p>See Chapter 55, “(COL) Setting Up Functionality for Colombia,” Setting Up Cost Accounts for Depreciation and Inflation Adjustments for Colombia, page 1095.</p> <p>Country-specific functionality includes:</p> <ul style="list-style-type: none"> • Calculating depreciation adjustments for inflation. • Calculating the end of useful life. • Calculating cost inflation adjustments. <p>See Chapter 56, “(COL) Working with Fixed Assets for Colombia,” page 1099.</p> |
| Payment processing | <p>In addition to the base software setup and processes for payment processing, for Colombia set up payment formats.</p> <p>See Chapter 55, “(COL) Setting Up Functionality for Colombia,” Setting Up Payment Formats for Colombia, page 1097.</p> |
| Fiscal book reports | <p>You can generate reports for Colombia to report fiscal information.</p> <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (COL) Reports for Colombia, page 1824.</p> |

CHAPTER 55

(COL) Setting Up Functionality for Colombia

This chapter discusses how to:

- Set up user-defined codes (UDCs).
- Set up cost accounts for depreciation and inflation adjustments.
- Set up address book information for Colombia.
- Set up payment formats for Colombia.

Setting Up UDCs for Colombia

Setting up Colombian-specific UDCs enables you to use Colombian-specific functionality. You also set up some base software UDCs with Colombian-specific values. This section discusses how to:

- Set up UDCs for tax processing.
- Set up UDCs for address book records and accounts payable.

Setting Up UDCs for Tax Processing for Colombia

In addition to setting up UDCs in system 76C, you set up category code UDCs in system 09 for:

- Tributary codes
- Tributary subcodes
- Department municipal codes
- Accounts to report

For example, you might set up UDC 09/10 to identify tributary codes, and set up UDC 09/20 to identify tributary subcodes.

You must also set up a system 00 category code UDC for economic activity codes for the business unit for which you report. For example, you might set up UDC 00/15 with economic activity codes.

See *JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide*, “Setting Up Organizations,” Setting Up Business Units.

Taxes by City/Economic Activ. (76C/AE)

Set up codes that identify taxes by city and economic activity. Use the Description 02 field to enter the category code UDC for system 00 that you establish for city codes. The system 00 UDC includes the source city for which you pay taxes by city and economic activity. For example, if you use UDC 00/20 to set up city codes for tax accounting, enter 20 in the Description 02 field.

The system uses the values in the 76C/AE UDC when it calculates taxes by economic activity.

Ciiu Code Colombia (76C/CI)

Set up codes that correspond to the Unified Industrial Information Codes. The system uses the values in the UDC when you run the Movements Selection (R76C0110) program to report taxes.

Minimal Description Top (76C/CM)

Set up codes that the system uses to identify accounts which do not meet the minimum amounts. Enter the tributary code and subcode in the Codes field, and enter the account description in the Description 01 field. If the account description does not fit in the Description 01 field, you can use the Description 02 field for the additional text. The system prints the text from the Description 01 and Description 02 fields in the report generated by the Identification and Stamping of Movements (R76C0130) program, which also writes the description to the F76C575 table.

Enter in the Special Handling Code field the subcode by which the system summarizes the accounts which do not meet the minimum reportable amount. You obtain the subcodes from DIAN.

Dependence Code SubCode (76C/DP)

Set up this UDC to identify the original subcode for accounts that currently show tributary code 72 and tributary subcode 11. The system uses this information for accounts for which the tax is dependent on the original expense.

Description of Third Foreign (76C/EX)

Set up codes to identify the tributary subcodes used for foreign payments. Enter the tributary code and subcode that you obtain from DIAN in the Codes field, and enter the description of the codes in the Description 01 field. Use the Special Handling Code field to enter the subcode for foreign payments.

The system uses the values that you set up when you run the Movements Select (R76C0110), Liabilities Selection (R76C0119A), and Identification and Stamping of Movements (R76C0130) programs.

Industry/Commerce withholding (76C/IC)

Set up values to identify tax types for international commerce withholding.

Value Added Tax (76C/IV)

Set up values to identify types of VAT.

Person/Corporation Code (76C/PC)

Specify the person or corporation code in the Code field, and enter the appropriate abbreviation in the Description 02 field. The system uses the values in the Description 02 field on legal reports.

Enter a *Y* or a *I* for the codes for which the system edits the fiscal ID and calculates the control digit. Enter a *2* for the codes for which the system edits the fiscal ID and does not calculate the control digit. Enter *N* for the codes for which the system does not edit the fiscal ID and does not calculate the control digit.

For example, you might enter a code of *A* with the abbreviation of *NIT* in the Description 02 field, and enter a code of *C* with the abbreviation of *C.C* in the Description 02 field.

The system uses the values in this UDC when you run the Movements Selection (R76C0110) program.

Period (76C/PE)

Set up codes to identify the period for which you generate withholding certificates. The system uses the values in this UDC when you run the Rent Withholding (R76C0001) program the VAT Withholding (R76C0003) program, or the Timbre Withholding (R76C0004) program.

Range of Tax ID (76C/PR)

Set up codes to identify ranges for tax IDs that the system uses to validate tax IDs. The first character of the three-character code that you enter in the Codes field is a value from the Person/Corporation Code (76C/PC) UDC table. The second and third characters indicate the number of the range for the code. Enter the minimum value of the range in the Description 01 field, and enter the maximum value of the range in the Description 02 field. You can set up a maximum of five tax ID ranges for each person or corporation code.

For example, you might set up these codes:

- Code: A01, Description 01: 0000000, Description 02: 3000000
- Code: A02, Description 01: 3000001, Description 02: 6000000
- Code: A03, Description 01: 6000001, Description 02: 9999999

The system uses these values when you run the Movements Selection program (R76C0110).

Rent Withholding Tax (76C/RT)

Set up codes to identify tax types for rent withholding.

Tax Payer Type (76C/TC)

Set up codes to identify the tax payer type.

DIAN Person Type (76C/TP)

Set up codes that the system uses to identify the person type. Enter the code for identifying tax payer types to DIAN in the Description 02 field. If you do not set up codes in this UDC, the system uses the person types established in the H00/TA UDC.

Max. amount for magnetic tape (76C/TR)

Set up codes to establish the minimum amounts reported when reporting taxes by magnetic tape. Enter the tributary code and subcode in the Codes field, and enter the minimum amount to report in the Description 01 field. You obtain these values from DIAN.

Enter codes in the Special Handling Code field to identify which tributary codes and subcodes are totaled for comparison to the minimum. For example, if accounts with tributary code 72 and subcode 00 are totaled with accounts with tributary code 72 and subcode 01, assign these lines the same special handling code, such as 01.

The system uses the values that you enter when you run the Identification and Stamping of Movements program.

Setting Up UDCs for Address Book Records and Accounts Payable for Colombia

This table lists UDCs that you must set up for address book records and accounts payable for Colombia:

| UDC | System | Description |
|----------------------------------|---------------------------------------|--|
| Person/Corporation Code (76C/PC) | JD Edwards EnterpriseOne Address Book | <p>The person or corporation codes indicate the class of the third-party for which you are entering the address book record. Values are:</p> <p><i>C</i>: Natural person</p> <p><i>A</i>: Legal person</p> <p><i>E</i>: Natural person with foreign nationality</p> <p>In the Special Handling Code field on the Work With User Defined Codes form, specify whether the system must calculate the verification digit for the user-defined code by entering:</p> <p><i>Y</i> or <i>1</i>: Edit the tax ID number and calculate the verification digit.</p> <p><i>2</i>: Edit the tax ID number, but do not calculate the verification digit.</p> <p><i>N</i> or Blank: Do not edit the tax ID number and do not calculate the verification digit.</p> |
| Range of Tax ID (76C/PR) | JD Edwards EnterpriseOne Address Book | <p>Ranges of tax ID indicate the ranges of numbers for tax IDs that require validation by the system. Set up the codes as follows:</p> <p>Code: For the first character, enter a valid person/corporation code from UDC 76C/TC. For the second two characters, enter either 01 to indicate a beginning number for the range, or 02 to indicate the ending number.</p> <p>Description 01: Enter the beginning number for the range.</p> <p>Description 02: Enter the ending number for the range.</p> |

| UDC | System | Description |
|--------------------------------|---|---|
| Tax Payer Type (76C/TC) | JD Edwards EnterpriseOne Address Book | <p>Tax payer types indicate whether VAT and withholding taxes apply to the third-party for which you are creating an address book record. The system uses this field when creating tax settlements during voucher entry. Values are:</p> <p><i>G</i>: Large self-withholding tax payer</p> <p><i>H</i>: Large non self-withholding tax payer</p> <p><i>A</i>: Common non self-withholding regime</p> <p><i>C</i>: Common self-withholding regime</p> <p><i>S</i>: Simplified regime</p> <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “(COL) Setting Up the System for Colombian Taxes”.</p> |
| City/Economic Activity (01/07) | JD Edwards EnterpriseOne Address Book | City/Economic activity codes identify the supplier’s economic activity. |
| Ciiu Code Colombia (76C/CI) | JD Edwards EnterpriseOne Address Book | Ciiu codes are reported to the District using magnetic media. |
| Recycle Voucher (76C/RC) | JD Edwards EnterpriseOne Accounts Payable | <p>This UDC specifies the recycling report version that you use for accounts payable and accounts receivable transactions. For accounts payable transactions, enter the version number for the Recycle Recurring Vouchers program (R048101) in the Code field. In the Description 02 field, enter the version number of the Voucher Entry MBF Processing Options (P0400047) program in which exists the date that the system uses to retrieve the exchange rate for recycled vouchers.</p> |

Setting Up Address Book Information for Colombia

This section provides an overview of address book information for Colombia and discusses how to set processing options for Address Book Colombian Additional Information (P76C0101).

Understanding Address Book Information for Colombia

Oracle's JD Edwards EnterpriseOne software provides a Colombia-specific form for address book information.

In addition to completing the fields on the Colombian Additional Information Revisions form, you must complete these fields on the Address Book Revision form in the base software:

| Field | Description |
|---|---|
| Address Line 3 and Address Line 4 (Mailing tab) | The system uses the values in these fields when you report account activity electronically. |
| Person/Corporation (Additional 1 tab) | Complete this field for tax reporting purposes. |
| Add'l Tax ID (Additional 1 tab) | Complete this field for tax reporting. You must complete the first four characters with the economic activity of the company, the fifth and sixth characters with the informant entity type, and the seventh and eighth characters with the economic group entity type. |

JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide, "Entering Address Book Records," (COL) Entering Additional Address Book Information

Setting Processing Options for Address Book Colombian Additional Information (P76C0101)

Set this processing option before you enter company, customer, and supplier information for Argentinean companies and individuals. The system uses the values in this processing option for county-specific processing.

General

Enter "1" to allow NIT's Duplicity

Specify whether the system allows duplicate tax identification numbers (*Número de Identificación Tributaria [NIT]*). Values are:

Blank: Do not allow duplicate NIT numbers. You must leave this field blank, as the duplicity of NIT numbers is controlled by parent-child relationships.

1: Allow duplicate NIT numbers.

Display

Enter "1" to call the Colombian Tax Information

Specify whether to automatically display the Colombian Additional Information Revisions form when you enter a new address book record. Values are:

Blank: Do not automatically display the form.

1: Automatically display the screen.

Setting Up Cost Accounts for Depreciation and Inflation Adjustments for Colombia

This section provides an overview of cost inflation adjustments, an overview of cost accounts for depreciation, and discusses how to:

- Set up cost accounts for inflation adjustments.
- Set up cost accounts for depreciation adjustments.

See Also

JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide, “Setting Up the Fixed Assets System,” Setting Up Depreciation Default Values

Understanding Cost Inflation Adjustments

For accurate financial reporting and income tax, Colombian companies adjust the cost amounts of their assets for inflation. These adjustments are recorded in fixed asset inflation adjustment accounts according to the government’s requirements. The asset’s adjusted cost, along with the depreciation inflation adjustment, is used to calculate depreciation.

Note. To adjust current period cost adjustment amounts for inflation, make the cost adjustments before you perform inflation adjustment for the current period. Otherwise, make the cost adjustments after you perform inflation adjustment for the current period.

You set up cost inflation adjustments accounts by company, entering the information by each company and cost account and specifying the related credit (monetary correction) and debit accounts that the system uses to generate the inflation adjustment journal entry. If you use only one ledger, the debit account is the cost inflation adjustment account. If you use two ledgers (subledger for inflation adjustments), the debit account is the same as the cost account. In either case, the credit account is the monetary correction account.

Understanding Depreciation Inflation Adjustment Accounts

You set up Depreciation Inflation Adjustments accounts by company. In the debit account (monetary correction) and the credit account, enter the accounts to be applied in the depreciation inflation adjustments journal entry. If you use only one book, the debit account is the depreciation inflation adjustment account. If you use two books (subledger for inflation adjustments), the debit account can be the depreciation account or the depreciation inflation adjustment account. In either case, the debit account is the monetary correction account. The system uses the debit and credit accounts to create the inflation adjustment journal entry.

Note. If you do not set up cost accounts in this application, the system will not generate the journal entry.

Forms Used to Set Up Cost Accounts for Depreciation and Inflation Adjustments

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|--|
| Adjustment by Inflation to Cost / Deferred Charges Revision | W76C1201B | Fixed Assets (G76C16), Adjustment by Inflation to Cost / Deferred Charge Click Add on the Work With Adjustment by Inflation to Cost / Deferred Charges form. | Set up new cost accounts. |
| Adjustments by Inflation to Depreciation Revision | W76C1202B | Fixed Assets (G76C16), Adjustment by Inflation Depreciation / Amortization Click Add on the Work With Adjustments by Inflation to Depreciation form. | Set up cost accounts for depreciation inflation adjustments. |

Setting Up Cost Accounts for Cost Inflation Adjustments

Access the Adjustment by Inflation to Cost / Deferred Charges Revision form.

Note. If you do not set up cost accounts in this application, the system will not generate the journal entry.

| | |
|---------------------------------|--|
| Cost Business Unit | Specify the business unit to which the system charges original acquisition cost and any supplemental capital additions. The system uses a default value for this field based on the business unit that you specify on the Asset Master Revisions form when you create a new asset master record. You can change this default value on the Depreciation Information form only if you have not entered any transactions for the account. |
| Cost Object Account | Specify the object account to which the original acquisition cost and any supplemental capital additions have been charged. If the asset is a non-capitalized lease, this should be the expense account that lease payments are charged to. This expense account should have default coding instructions set up for method 00 (no depreciation method used). |
| Cost Subsidiary Account | Specify the subsidiary account to which the original acquisition cost and any supplemental capital additions have been charged. |
| Debit Business Unit | Specify the debit business unit to which the system charges the accumulated depreciation amount. |
| Debit Object Account | Specify the debit object account to which the system charges the accumulated depreciation amount. |
| Debit Subsidiary Account | Specify the debit subsidiary account to which the system charges the accumulated depreciation amount. Subsidiary accounts include detailed records of the accounting activity for an object account. |
| Credit Business Unit | Specify the credit business unit to which the system charges the accumulated depreciation amount. |

| | |
|----------------------------------|---|
| Credit Object Account | Specify the credit object account number to which the system charges the accumulated depreciation amount. |
| Credit Subsidiary Account | Specify the credit subsidiary account to which the system charges the accumulated depreciation amount. |

Setting up Cost Accounts for Depreciation Adjustments

Access the Adjustments by Inflation to Depreciation Revision form.

| | |
|----------------------------------|--|
| Company | Specify the code that identifies the specific organization, fund, or other reporting entity for which you are setting up the depreciation inflation adjustment accounts. |
| Cost Business Unit | Specify the business unit to which the system charges original acquisition cost and any supplemental capital additions. The system uses a default value for this field based on the business unit that you specify on the Asset Master Revisions form when you create a new asset master record. You can change this default value on the Depreciation Information form only if you have not entered any transactions for the account. |
| Cost Object Account | Specify the object account to which the original acquisition cost and any supplemental capital additions have been charged. If the asset is a non-capitalized lease, this should be the expense account that lease payments are charged to. This expense account should have default coding instructions set up for method 00 (no depreciation method used). |
| Cost Subsidiary | Specify the subsidiary account to which the original acquisition cost and any supplemental capital additions have been charged. |
| Debit Business Unit | Specify the debit business unit to which the system charges the accumulated depreciation amount |
| Debit Object Account | Specify the debit object account to which the system charges the accumulated depreciation amount |
| Debit Subsidiary | Specify the debit subsidiary account to which the system charges the accumulated depreciation amount. Subsidiary accounts include detailed records of the accounting activity for an object account. |
| Credit Business Unit | Specify the credit business unit to which the system charges the accumulated depreciation amount. |
| Credit Object Account | Specify the credit object account number to which the accumulated depreciation amount is to be charged. |
| Credit Subsidiary Account | Specify the credit subsidiary account to which the accumulated depreciation amount is to be charged. |

Setting Up Payment Formats for Colombia

This section provides an overview of payment formats and discusses how to set up processing options for Print Automatic Payments - COL (R76C572).

Understanding Payment Formats for Colombia

After you assign payment print programs to payment instruments, you must review and revise, if necessary, the processing options for the formats used by the print programs. The payment print program that you assign to a payment instrument launches the version of the payment format when you process payments. For example, P04572 launches the R04572 program. To make changes to the processing options for the payment formats, access them from the Batch Versions program (P98305), entering R instead of P in the first position of the name of the payment format program. The processing options further define the format of each component of a payment instrument.

JD Edwards EnterpriseOne software provides these payment formats for Colombia:

| Format | Description |
|---------|---|
| R76C572 | Print Automatic Payments - COL Use this format to print checks. |
| R76C573 | A/P Special Check Attachment Use this format to print attachments. There are no processing options for this program. |

Setting Processing Options for Print Automatic Payments - COL (R76C572)

Processing options enable you to specify the default processing for programs and reports.

Translation

Translation Program Enter *1* to use the standard program to translate payment amounts from numbers to words. If you leave this processing option blank, the system uses the translation program associated with the payment currency, which is B76C0018 (Colombian pesos).

Payment

Payee Name Enter *1* to print the payee name and number on the stub. If you leave this processing option blank, no payee information is printed.

Conversion

First Line Size and Second Line Size Specify the size of the first line or the second line of the check format. If you leave these processing options blank, the system prints up to 60 characters for each line.

Print

IVA or Discount Enter *1* or leave this processing option blank to print IVA. Enter *2* to print discounts.

CHAPTER 56

(COL) Working with Fixed Assets for Colombia

This chapter discusses how to:

- Calculate depreciation adjustments for inflation.
- Calculate the end of useful life.
- Work with cost inflation adjustments.

See Also

Chapter 55, “(COL) Setting Up Functionality for Colombia,” Setting Up Cost Accounts for Depreciation and Inflation Adjustments for Colombia, page 1095

Calculating Depreciation Adjustments for Inflation for Colombia

This section provides an overview of depreciation adjustments for inflation, lists prerequisites, and discusses how to:

- Calculate the depreciation inflation adjustments.
- Set processing options for Adjustment by Inflation Depreciation/Amortization (R76C1202).

Understanding Depreciation Adjustments for Inflation

Inflation can have a significant effect on the value of an organization's assets. For accurate financial reporting and income tax, Colombian companies apply annual inflation adjustments to revalue all fixed assets. Inflation adjustments affect the calculation of depreciation and amortization and can result in an increase or decrease of taxable income. You use the asset's adjusted balances to calculate depreciation.

Run the Adjustment by Inflation Depreciation/Amortization report (R76C1202) to calculate the depreciation inflation adjustments for the organization. The report lists detailed and summary information for each asset, including:

- Adjustment percentage for the affected year. (*Porcentaje de Ajuste Año Gravable [PAAG]*)
- Period.
- Values.
- Monthly inflation adjustment calculation.

First, you should run the report in proof mode. Carefully review the detailed and summary information for accuracy, and correct any errors, before you run the report in final mode. After you run the report in final mode, post the journal entry that the system generates.

Adjustment by Inflation Depreciation/Amortization (R76C1202)

When you run this report in proof mode, the system:

- Validates the accounts to which the system posts the depreciation inflation adjustment journal entries.
- Prints a report that shows the amount that will post to each depreciation inflation adjustment account when you run the program in final mode.

This report also shows calculated results.

When you run this report in final mode, the system:

- Validates the accounts to which the system posts the depreciation inflation adjustment journal entries.
- Prints a report that shows the amount that posted to each depreciation inflation adjustment account, such as the monetary correction amount.

If any errors occur, the depreciation inflation adjustment process will not generate the journal entry.

- Creates the depreciation inflation adjustment journal entry and monetary correction.

A processing option specifies the document type for these journal entries. The batch type is *G*.

- Creates records in the Entry Transactions file F0911Z and automatically sends the transactions to the transaction file F0911.
- Creates a journal entry that you need to post to the JD Edwards Enterprise One General Ledger and JD Edwards Enterprise One Fixed Assets systems.

After you post the journal entry, the system displays the month inflation adjustment value on the Work with Cost Summary form.

See *JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide*, “Creating Asset Identification Information,” Verifying Depreciation Information.

See *JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide*, “Processing GL to Fixed Assets”.

Data Selection for Adjustment by Inflation Depreciation/Amortization

Enter the ledger or ledgers in which you are working in the data selection. Also, enter the account type (CHCD equals (2).

Prerequisites

Before you calculate the depreciation inflation adjustments:

- Set up cost accounts by company for depreciation inflation adjustments.
- Generate version ZJDE76C12 for the transaction file F0911 from the Journal Entry Batch Processor (R09110Z), with the processing option in final mode, before you run Adjustment by Inflation Depreciation/Amortization in final mode. You need to generate this version so that when the system calculates the depreciation inflation adjustment, it creates the inbound transactions and runs the process in batch mode, using the version ZJDE76C12.

See *JD Edwards EnterpriseOne General Accounting 8.12 Implementation Guide*, “Processing Batch Journal Entries”.

Calculating the Depreciation Inflation Adjustments

Select Fixed Assets (G76C16), Adjustment by Inflation Depreciation/Amortization.

Setting Processing Options for Adjustment by Inflation Depreciation/Amortization (R76C1202)

Set these processing options to specify the mode in which you run the report, the period and fiscal year to use, the PAAG (*Porcentaje de Ajuste Año Gravable*) to apply, and the GL document type, date and ledger type to use on the Journal Entry.

Process

Use these processing options to specify the mode in which to run the report and the default values to use.

- | | |
|---|--|
| 1. Preliminary (' ') / Final (1) | Specify whether to run the report in preliminary/proof or end/final mode. Values are: Blank: Preliminary/proof mode. /: End/final mode. |
| 2. Period No Ap (accounting period number) | Specify the number that indicates the current accounting period. The system uses this period number to identify and read the balances of the month prior to the month in process, and also uses the current period number to determine posted-before and posted-after-cutoff warning messages. |
| 3. Fiscal Year | Specify the 4-digit fiscal year, based on the fiscal date associated with the row and the fiscal date pattern identified in the Business Intelligence constants. The system uses this year to identify and read the balances of the month prior to the month in process. |
| 4. PAAG (adjustment percentage for the affected year) (<i>Porcentaje de Ajuste Año Gravable</i>) | Specify the rate or percentage that the system applies to the cost and depreciation amount to calculate the adjustment. |
| 5. Document Type | Specify the document type code for the journal entry of depreciation inflation adjustment. Several prefixes are reserved for document types, such as vouchers, invoices, receipts, and timesheets. The reserved document type prefixes for codes are: P: Accounts payable documents. R: Accounts receivable documents. T: Time and Pay documents. I: Inventory documents. O: Purchase order documents. S: Sales order documents. |
| 6. Date | Specify the general ledger date in which the journal entry will be generated. Enter the date with or without slashes (/) or dashes (-) as separators. If you leave the date blank, the system supplies the current date. |
| 7. Ledger Type | Specify the UDC (09/LT) that identifies the type of ledger for the journal entry for depreciation inflation adjustment. Ledger types include <i>AA</i> (Actual Amounts), <i>BA</i> (Budget Amount), or <i>AU</i> (Actual Units). |

Subledger

Use these processing options to specify the debit and credit subledgers to use.

1. Debit Subledger and Subledger Type

Specify the number of the subledger to use. Other options include:

Blank: The system creates the Journal Entry without the subledger.

AFE: Retrieve the subledger number from F1201.

Specify the UDC (00/ST) that identifies the subledger type and how the system performs subledger editing. On the User Defined Codes form, the second line of the description controls how the system performs editing. This is either hard-coded or user-defined. Values include:

A: Alphanumeric field, do not edit.

N: Numeric field, right justify and zero fill.

C: Alphanumeric field, right justify and blank fill.

2. Credit Subledger and Subledger Type

Specify the number of the subledger to use. Other options include:

Blank: The system creates the Journal Entry without the subledger.

AFE: Retrieve the subledger number from F1201.

Specify the UDC (00/ST) that identifies the subledger type and how the system performs subledger editing. On the User Defined Codes form, the second line of the description controls how the system performs editing. This is either hard-coded or user-defined. Values include:

A: Alphanumeric field, do not edit.

N: Numeric field, right justify and zero fill.

C: Alphanumeric field, right justify and blank fill.

No Batch Trans.

Use this processing option to specify the batch number of the transaction that the system will use when creating inbound transactions in the F0911Z1 table.

1. Enter the Batch number for Journal Entry generation

Specify the number that the transmitter assigns to the batch. During batch processing, the system assigns a new batch number to the JD Edwards transactions for each control (user) batch number it finds. Do not modify this value when the UBE is running.

Calculating the End of Useful Life for Colombian Assets

This section provides an overview of the Life End Date program (R76C1208), lists prerequisites, and discusses how to:

- Calculate the end of useful life of assets.
- Set processing options for Calculating the End of Useful Life (R76C1208).

Understanding the Life End Date (R76C1208) Program

Any asset generally has a limited life and, over a period of time, loses its value to a company. Depreciation charges are used to account for the loss in value and are spread over the useful life of the asset.

Run the Life End Date report (R76C1208) to validate the fixed assets that finished depreciating in the month that you specify (the net book value in the historical ledger is zero (0)) and that had any depreciation in that month (the balance in the depreciation expense account is not zero (0)).

When you run this report in proof mode, the system:

- Validates the accounts where the system will post the End of Useful Life journal entries.
- Prints the report showing the amounts to be posted in each Depreciation Inflation Adjustments account when executed in final mode.

This report also shows the calculated results.

When you run this report in final mode, the system:

- Validates the accounts where the system will post the End of Useful Life journal entries.
- Prints the report showing the amounts to be posted in the Depreciation inflation adjustments accounts, such as the monetary correction account.

If there is an error, the End of Useful Life process will not create the journal entry.

- Creates a journal entry for depreciation inflation adjustment and depreciation monetary correction accounts to be considered for the calculation.

These journal entries have a document type as specified in the processing option for the Process tab. The batch type is *G*.

- Creates records in the F0911Z table and automatically sends the transactions to the transaction file F0911.
- Creates a journal entry that you need to post to the JD Edwards EnterpriseOne General Accounting and JD Edwards EnterpriseOne Fixed Assets systems.

After the you post the journal entry, the system displays on the Work with Cost Summary form the end of useful life value that is in the inflation adjustments ledger. You can verify how the system updated the depreciation method in the inflation adjustments ledger by reviewing the Depreciation Information form.

See *JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide*, “Creating Asset Identification Information,” Verifying Depreciation Information.

See *JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide*, “Processing GL to Fixed Assets”.

Run the report first in proof mode. Carefully review the report for accuracy and correct any errors.

Run the report in final mode to update the depreciation method to 00 and to validate the net book value for the inflation adjustments ledger. If the net book value for the inflation adjustments ledger is not zero (0), the system creates a journal entry that takes the depreciation inflation adjustments account (P76C1202) for the net book value of the inflation adjustments ledger to zero (0).

Prerequisites

Before you run the Life End Date program in final mode, run version ZJDE76C12 for the transaction file F0911 from the Journal Entry Batch Processor (R09110Z), with the processing option in final mode. You need to generate this version so that the system creates the inbound transactions and executes the call of process in batch mode, using the version ZJDE76C12.

See *JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide*, “Processing GL to Fixed Assets”.

Calculating the End of Useful Life

Select Fixed Assets (G76C16), Life End Date.

Data Selection for Life End Date

Enter the ledgers type and the accounts type (CHCD equals 1, 2) in the data selection.

Setting Processing Options for Life End Date (R76C1208)

Set these processing options to specify the mode in which you run the report, the period and fiscal year to use, and the document type and General Ledger date to use for the journal entry.

Process

- | | |
|---|---|
| 1. Preliminary (') / Final (1) | Specify whether to run the report in preliminary/proof or end/final mode. Values are: Blank: Preliminary/proof mode. 1: End/final mode. |
| 2. Period number | Specify the number that indicates the current accounting period. The system uses this period number to identify and read the balances of the month prior to the month in process, and also uses the current period number to determine posted-before and posted-after-cutoff warning messages. |
| 3. Fiscal Year | Specify the 4-digit fiscal year, based on the fiscal date associated with the row and the fiscal date pattern identified in the Business Intelligence constants. The system uses this year to identify and read the balances of the month prior to the month in process. |
| 4. G/L Date | Specify the GL date to use. Enter the date with or without slashes (/) or dashes (-) as separators. If you leave the date blank, the system supplies the current date. |
| 5. Document Type | Specify the document type code that identifies the origin and purpose of the transaction. Several prefixes are reserved for document types, such as vouchers, invoices, receipts, and timesheets. The reserved document type prefixes for codes are: P: Accounts payable documents. R: Accounts receivable documents. T: Time and Pay documents. I: Inventory documents. O: Purchase order documents. S: Sales order documents. |

No Batch Trans

1. Enter the Batch Number for Journal Entry generation

Specify the number that the transmitter assigns to the batch. During batch processing, the system assigns a new batch number to the JD Edwards transactions for each control (user) batch number it finds. Do not modify this value when the UBE is running.

Ledger

1. Historical Ledger

Specify the historical ledger that the system uses. This ledger type must be created in the UDC 09/LT. The system uses this information to validate that the net Value in Books from the Historical Ledger equals zero, and that it has depreciation expense in the month to determine the fixed assets that ended useful life in that month.

2. Inflation Adjustment Ledger

Specify the ledger that the system modifies when creating the journal voucher. This ledger type must be created in the UDC 09/LT. The system uses this information to validate that the net Value in Books from the Inflation Adjustments ledger is not zero, and then it creates a voucher in this ledger by using the depreciation inflation adjustment accounts (P76C1202).

Working With Cost Inflation Adjustments in Colombia

This section provides an overview of cost inflation adjustments, lists prerequisites, and discusses how to:

- Review and revise cost accounts.
- Calculate cost inflation adjustments.
- Set processing options for Adjustment by Inflation to Cost / Deferred Charge (R76C1201).

Understanding Cost Inflation Adjustments

For accurate financial reporting and income tax, Colombian companies adjust the cost amounts of their assets for inflation. These adjustments are recorded in fixed asset inflation adjustment accounts according to the government's requirements. The asset's adjusted cost, along with the depreciation inflation adjustment, is used to calculate depreciation.

Note. To adjust current period cost adjustment amounts for inflation, make the cost adjustments before you perform inflation adjustment for the current period. Otherwise, make the cost adjustments after you perform inflation adjustment for the current period.

You set up cost inflation adjustments accounts by company, entering the information by each company and cost account and specifying the related credit (monetary correction) and debit accounts that the system uses to generate the inflation adjustment journal entry. If you use only one ledger, the debit account is the cost inflation adjustment account. If you use two ledgers (subledger for inflation adjustments), the debit account is the same as the cost account. In either case, the credit account is the monetary correction account.

Calculating Cost Inflation Adjustments

Run the Adjustment by Inflation to Cost / Deferred Charge report (R76C1201) to calculate the cost inflation adjustments for the organization.

The report lists detailed and summary information for each asset, including:

- Adjustment percentage for the affected year. (Porcentaje de Ajuste Año Gravable [PAAG])
- Period.
- Values.
- Monthly inflation adjustment calculation.

First, you should run the report in proof mode. Carefully review the detailed and summary information for accuracy, and correct any errors, before you run the report in final mode. After you run the report in final mode, post the journal entry that the system generates.

When you run this report in proof mode, the system:

- Validates the accounts to which the system posts the cost inflation adjustment journal entries.
- Prints a report that shows the amount that will post to each cost inflation adjustment account when you run the program in final mode.

This report also shows calculated results.

When you run this report in final mode, the system:

- Validates the accounts to which the system posts the cost inflation adjustment journal entries.
- Prints a report that shows the amount that posted to each cost inflation adjustment account, such as the monetary correction amount.

If any errors occur, the cost inflation adjustment process will not generate the journal entry.

- Creates the cost inflation adjustment journal entry and monetary correction accounts that are applied in this calculation.

A processing option specifies the document type for these journal entries. The batch type is G.

- Creates records in the Entry Transactions file F0911Z and automatically sends the transactions to the transaction file F0911.
- Creates a journal entry that you need to post to the JD Edwards EnterpriseOne General Accounting and JD Edwards EnterpriseOne Fixed Assets systems.

After you post the journal entry, the system displays the month inflation adjustment value on the Work with Cost Summary form.

Data Selection for the Adjustment by Cost / Deferred Charge Report

In the data selection, enter the ledger or ledgers in which you are working, and enter the account type. For example, if you enter account type *I* (cost), the system reads the table F1202 records that are related to the cost account.

Prerequisites

Before you calculate the cost inflation adjustments:

- Set up cost accounts by company for cost inflation adjustments.

See [Chapter 55, “\(COL\) Setting Up Functionality for Colombia,” Setting Up Cost Accounts for Depreciation and Inflation Adjustments for Colombia, page 1095](#).

- Generate version ZJDE76C12 for the transaction file F0911 from the Journal Entry Batch Processor (R09110Z), with the processing option in final mode, before you run the Adjustment by Inflation to Cost / Deferred Charge program in final mode.

Generate this version so that when the system calculates the cost inflation adjustment, it creates the inbound transactions and runs the process in batch mode, using the version ZJDE76C12.

Forms Used to Review and Revise Cost Accounts

| Form Name | FormID | Navigation | Usage |
|--|-----------|---|----------------------------------|
| Work With Adjustment by Inflation to Cost / Deferred Charges | W76C1201A | Fixed Assets (G76C16), Adjustment by Inflation to Cost / Deferred Charge (P76C1201) | Review and select cost accounts. |
| Adjustment by Inflation to Cost / Deferred Charges Revision | W76C1201B | Select an account to revise in the detail area, then click Select on the Work With Adjustment by Inflation to Cost / Deferred Charges form. | Revise existing cost accounts. |

Reviewing and Revising Cost Accounts

Access the Adjustment by Inflation to Cost / Deferred Charges Revision form.

Calculating the Cost Inflation Adjustments

Select Fixed Assets (G76C16), Adjustment by Inflation to Cost / Deferred Charge (R76C1201).

Setting Processing Options for Adjustment by Inflation to Cost / Deferred Charge (R76C1201)

Set these processing options to specify the mode in which you run the report, the default values and subledgers to use, and the batch number of the transaction.

Process

- 1. Preliminary (' ') / End (1)** Enter *I* to run the report in final mode. Leave this processing option blank to run the report in proof mode.
- 2. Period No Ap** Specify the current accounting period. The system uses this period number to determine posted-before and posted-after-cutoff warning messages.
- 3. Fiscal Year** Specify the 4-digit fiscal year for which you run the report.
- 4. PAAG (adjustment percentage for the affected year) (Porcentaje de Ajuste Año Gravable)** Specify the rate or percentage that the system applies for inflation adjustment for the month.
- 5. Document Type** Enter a value that exists in the Document Type (00/DT) UDC table that defines the transaction type.

- 6. Date** Specify the general ledger date for the journal entry.
- 7. Subledger Type** Enter a value that exists in the Subledger Type (09/LT) UDC table that identifies the type of ledger for the journal entry for cost inflation adjustment.

Subledger

- 1. Debit Subledger and Subledger Type** Specify the number of the subledger to use.
- 2. Credit Subledger and Subledger Type** Specify the number of the subledger to use.

No Batch Trans.

- 1. Batch Number** Specify the number that the transmitter assigns to the batch. During batch processing, the system assigns a new batch number to the transactions for each control (user) batch number it finds.

Important! Do not modify this value when the report is running

CHAPTER 57

(DNK) Understanding Country-Specific Functionality for Denmark

This chapter provides an overview of Denmark-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Denmark-Specific Setup and Processes

This table lists the country-specific setup and functionality for Denmark.

| Setup or Process | Description |
|--|---|
| UDCs (user-defined codes) | <p>No Denmark-specific UDC values exist. However, to use Intrastat reporting and International Payment Instructions (IPI):</p> <ul style="list-style-type: none">• Set up UDCs for European Union reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221.• Set up UDCs to print invoices with an attached (IPI). See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.• Set up these UDCs for companies:<ul style="list-style-type: none">- Affiliated Companies (74/AC)- Code Number (74/30) See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for European Companies, page 1230. |
| AAIs (automatic accounting instructions) | <p>No Denmark-specific AAIs exist. Set up the standard AAIs.</p> |
| Next numbers | <p>No Denmark-specific next numbering requirements exist. Set up the standard next numbering schemes.</p> |

| Setup or Process | Description |
|------------------|--|
| Suppliers | <p>In addition to the standard set up for suppliers, in Denmark:</p> <ul style="list-style-type: none">• Enter Denmark-specific supplier master information. <p>See Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” Setting Up Bank Information for Suppliers for Denmark, Finland, Norway, and Sweden, page 1135.</p> <ul style="list-style-type: none">• Enter additional bank account information including the bank account type, fee codes, and payment method for foreign suppliers. <p>See Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” Setting Up Additional Bank Information for Foreign Suppliers, page 1136.</p> |

| Setup or Process | Description |
|--------------------|---|
| Payment processing | <p>In addition to the standard setup for payment processing, in Denmark:</p> <ul style="list-style-type: none"> • Set up payment formats. <p>See Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” (DNK) Setting Up Payment Formats for Denmark, page 1138.</p> <ul style="list-style-type: none"> • Enter an identification code that the Central Bank uses to identify foreign payments. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” Entering Foreign Payment Information for the Central Bank, page 1175.</p> <p>To work with payment processing in Denmark:</p> <ul style="list-style-type: none"> • Use the Nordic Work with Payments program (P0474N5) to revise the GL date for payments and update payments from different control groups. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR and SWE) Working with Payment Groups, page 1176.</p> <ul style="list-style-type: none"> • Upload and review debit advice note information and then update or reset the payments as required. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR, and SWE) Receiving Debit Advice Notices, page 1178.</p> <ul style="list-style-type: none"> • Upload customer payment information. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR and SWE) Uploading Customer Payment Information for the Nordic Countries, page 1182.</p> <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, NOR, and SWE) Uploading Information to the F03B13Z1 Table, page 1195.</p> |

| Setup or Process | Description |
|--------------------|---|
| Voucher processing | <p>When processing vouchers in Denmark, use the Enhanced Due Date Processing Sweden program (R74W0020) to automatically change the due date of a credit note to the due date of a matching voucher.</p> <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR, and SWE) Preparing Vouchers and Credit Notes for Payment Processing, page 1198.</p> |
| Invoice processing | <p>When processing invoices in Denmark, run the Invoice Print Sweden (R74W0030) program as a complement to the Late Payment Delinquency Fees program (R03B221) to summarize delinquency fee information at the customer level.</p> <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR, and SWE) Printing Interest Invoices for Nordic Countries, page 1197.</p> <p>In addition to standard invoice processing, you can print invoices with an attached International Payment Instructions (IPI). To print these invoices and attachments:</p> <ul style="list-style-type: none"> • Set up UDCs for IPIs. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.</p> <ul style="list-style-type: none"> • Set processing options for the invoice print program. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Invoice Print with International Payment Instruction (R03B5053), page 1247.</p> <ul style="list-style-type: none"> • Print invoices with attached IPIs. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing Invoices with an Attached International Payment Instruction, page 1245.</p> |

| Setup or Process | Description |
|------------------|---|
| Intrastat | <p>To set up and use Intrastat reporting:</p> <ul style="list-style-type: none"> Review the overview about European Union reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Understanding European Union Functionality, page 1215. Set up UDCs. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221. Set up commodity codes. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up Commodity Code Information, page 1230. Set up cross-references between suppliers and items to show the country of origin. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Entering Cross-References for Items and Suppliers, page 1231. Set the processing options for the Intrastat workfiles programs. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Sales (R0018I1), page 1254. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Procurement (R0018I2), page 1256. Populate the workfiles. See Chapter 66, “(Europe) Working With European Union Functionality,” Populating the Intrastat Workfile, page 1250. Revise the workfiles as necessary. See Chapter 66, “(Europe) Working With European Union Functionality,” Revising Intrastat Information, page 1258. |

| Setup or Process | Description |
|--------------------------------|--|
| Intrastat (continued) | <p>To print and purge Intrastat records:</p> <ul style="list-style-type: none"> • Use the IDEP/IRIS Interface program (R0018I3) to generate an electronic Intrastat declaration in the format required for Denmark. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Using the IDEP/IRIS Interface for Intrastat Reporting, page 1264.</p> <ul style="list-style-type: none"> • Purge records from the Intrastat table (F0018T). <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Purging Records from the Intrastat Table (F0018T), page 1263.</p> |
| Other European Union reporting | <p>In addition to Intrastat reporting, you can generate these reports:</p> <ul style="list-style-type: none"> • EC Sales List Reports <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding EC Sales List Reports for European Reporting, page 1245.</p> <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sales List Report (R0018L), page 1273.</p> <ul style="list-style-type: none"> • EC Sales A/R Report <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sale List - AR Report (R0018S), page 1276.</p> |

CHAPTER 58

(FIN) Understanding Country-Specific Functionality for Finland

This chapter provides an overview of Finland-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Finland-Specific Setup and Processes

This table lists the country-specific setup and functionality for Finland.

| Setup or Process | Description |
|--|---|
| UDCs (user-defined codes) | <p>No Finland-specific UDC values exist. However, to use Intrastat reporting and International Payment Instructions (IPI):</p> <ul style="list-style-type: none">• Set up UDCs for European Union reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221.• Set up UDCs to print invoices with an attached (IPI). See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.• Set up these UDCs for companies:<ul style="list-style-type: none">- Affiliated Companies (74/AC)- Code Number (74/30) See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for European Companies, page 1230. |
| AAIs (automatic accounting instructions) | No Finland-specific AAIs exist. Set up the standard AAIs. |
| Next numbers | No Finland-specific next numbering requirements exist. Set up the standard next numbering schemes. |

| Setup or Process | Description |
|-------------------------|---|
| Bank account validation | <p>The system performs bank account validation for Finland.</p> <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding Bank ID and Bank Account Validation, page 1238.</p> |
| Suppliers | <p>In addition to the standard set up for suppliers, in Finland:</p> <ul style="list-style-type: none"> • Enter Finland-specific supplier master information. <p>See <i>JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide</i>, “Setting Up Bank Accounts,” (CAN, DEU, FIN, GBR, NOR, SWE, and USA) Setting Up Country-Specific Supplier Bank Account Information.</p> <p>See Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” Setting Up Bank Information for Suppliers for Denmark, Finland, Norway, and Sweden, page 1135.</p> <ul style="list-style-type: none"> • Enter additional bank account information including the bank account type, fee codes, and payment method for foreign suppliers. <p>See Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” Setting Up Additional Bank Information for Foreign Suppliers, page 1136.</p> |

| Setup or Process | Description |
|---------------------------|--|
| Payment processing | <p>In addition to the standard setup for payment processing, in Finland:</p> <ul style="list-style-type: none"> Set up payment formats. <p>See Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” (FIN) Setting Up Payment Formats for Finland, page 1163.</p> <ul style="list-style-type: none"> Enter an identification code that the Central Bank uses to identify foreign payments. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” Entering Foreign Payment Information for the Central Bank, page 1175.</p> <p>To work with payment processing in Finland:</p> <ul style="list-style-type: none"> Use the Nordic Work with Payments program (P0474N5) to revise the GL date for payments and update payments from different control groups. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR and SWE) Working with Payment Groups, page 1176.</p> <ul style="list-style-type: none"> Upload and review debit advice note information and then update or reset the payments as required. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR, and SWE) Receiving Debit Advice Notices, page 1178.</p> <ul style="list-style-type: none"> Upload customer payment information. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR and SWE) Uploading Customer Payment Information for the Nordic Countries, page 1182.</p> <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (FIN) Uploading Electronic Bank Statements for Finland, page 1192.</p> |
| Bank statement processing | <p>In Finland, you can provide your customers with electronic statements after uploading information from your bank to JD Edwards EnterpriseOne tables.</p> <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (FIN) Uploading Electronic Bank Statements for Finland, page 1192.</p> |

| Setup or Process | Description |
|--------------------|--|
| Voucher processing | <p>When processing vouchers in Finland, use the Enhanced Due Date Processing Sweden program (R74W0020) to automatically change the due date of a credit note to the due date of a matching voucher.</p> <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR, and SWE) Preparing Vouchers and Credit Notes for Payment Processing, page 1198.</p> |
| Invoice processing | <p>To work with invoices in Finland:</p> <ul style="list-style-type: none"> Set up the business function to calculate Finnish reference numbers. <p>See Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” (FIN) Calculating the Finnish Reference Number, page 1160.</p> <ul style="list-style-type: none"> Run the Invoice Print Sweden (R74W0030) program as a complement to the Late Payment Delinquency Fees program (R03B221) to summarize delinquency fee information at the customer level. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR, and SWE) Printing Interest Invoices for Nordic Countries, page 1197.</p> <p>In addition to standard invoice processing, you can print invoices with an attached International Payment Instructions (IPI). To print these invoices and attachments:</p> <ul style="list-style-type: none"> Set up UDCs for IPIs. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.</p> <ul style="list-style-type: none"> Set processing options for the invoice print program. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Invoice Print with International Payment Instruction (R03B5053), page 1247.</p> <ul style="list-style-type: none"> Print invoices with attached IPIs. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing Invoices with an Attached International Payment Instruction, page 1245.</p> |

| Setup or Process | Description |
|---------------------|---|
| Intrastat reporting | <p>To set up and use Intrastat reporting:</p> <ul style="list-style-type: none"> Review the overview about European Union reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Understanding European Union Functionality, page 1215. Set up UDCs. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221. Set up commodity codes. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up Commodity Code Information, page 1230. Set up cross-references between suppliers and items to show the country of origin. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Entering Cross-References for Items and Suppliers, page 1231. Set the processing options for the Intrastat workfiles programs. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Sales (R0018I1), page 1254. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Procurement (R0018I2), page 1256. Populate the workfiles. See Chapter 66, “(Europe) Working With European Union Functionality,” Populating the Intrastat Workfile, page 1250. Revise the workfiles as necessary. See Chapter 66, “(Europe) Working With European Union Functionality,” Revising Intrastat Information, page 1258. |

| Setup or Process | Description |
|---------------------------------|--|
| Intrastat reporting (continued) | <p>To print and purge Intrastat records:</p> <ul style="list-style-type: none"> • Use the IDEP/IRIS Interface program (R0018I3) to generate an electronic Intrastat declaration in the format required for Finland. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Using the IDEP/IRIS Interface for Intrastat Reporting, page 1264.</p> <ul style="list-style-type: none"> • Purge records from the Intrastat table (F0018T). <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Purging Records from the Intrastat Table (F0018T), page 1263.</p> |

CHAPTER 59

(NOR) Understanding Country-Specific Functionality for Norway

This chapter provides an overview of Norway-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Norway-Specific Setup and Processes

This table lists the country-specific setup and functionality for Norway.

| Setup or Process | Description |
|--|--|
| UDCs (user-defined codes) | <p>No Norway-specific UDC values exist. However, to use Intrastat reporting and International Payment Instructions (IPI):</p> <ul style="list-style-type: none">• Set up UDCs for European Union reporting. <u>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221.</u>• Set up UDCs to print invoices with an attached (IPI). <u>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.</u>• Set up these UDCs for companies:<ul style="list-style-type: none">- Affiliated Companies (74/AC)- Code Number (74/30)<u>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for European Companies, page 1230.</u> |
| AAIs (automatic accounting instructions) | No Norway-specific AAIs exist. Set up the standard AAIs. |
| Next numbers | No Norway-specific next numbering requirements exist. Set up the standard next numbering schemes. |

| Setup or Process | Description |
|------------------|---|
| Bank accounts | <p>Enter additional customer and security information for bank accounts.</p> <p>See Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” (NOR) Setting Up Enterprise Information for Norway, page 1166.</p> |
| Suppliers | <p>In addition to the standard set up for suppliers, in Norway:</p> <ul style="list-style-type: none"> • Enter Norway-specific supplier master information. <p>See <i>JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide</i>, “Setting Up Bank Accounts,” (CAN, DEU, FIN, GBR, NOR, SWE, and USA) Setting Up Country-Specific Supplier Bank Account Information.</p> <p>See Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” Setting Up Bank Information for Suppliers for Denmark, Finland, Norway, and Sweden, page 1135.</p> <ul style="list-style-type: none"> • Enter additional bank account information including the bank account type, fee codes, and payment method for foreign suppliers. <p>See Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” Setting Up Additional Bank Information for Foreign Suppliers, page 1136.</p> |

| Setup or Process | Description |
|--------------------|--|
| Payment processing | <p>In addition to the standard setup for payment processing, in Norway:</p> <ul style="list-style-type: none"> • Set up payment formats. <p>See Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” (NOR) Setting Up Payment Formats for Norway, page 1167.</p> <ul style="list-style-type: none"> • Enter an identification code that the Central Bank uses to identify foreign payments. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” Entering Foreign Payment Information for the Central Bank, page 1175.</p> <p>To work with payment processing in Norway:</p> <ul style="list-style-type: none"> • Use the Nordic Work with Payments program (P0474N5) to revise the GL date for payments and update payments from different control groups. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR and SWE) Working with Payment Groups, page 1176.</p> <ul style="list-style-type: none"> • Upload and review debit advice note information and then update or reset the payments as required. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR, and SWE) Receiving Debit Advice Notices, page 1178.</p> <ul style="list-style-type: none"> • Upload customer payment information. <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR and SWE) Uploading Customer Payment Information for the Nordic Countries, page 1182.</p> <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, NOR, and SWE) Uploading Information to the F03B13Z1 Table, page 1195.</p> |

| Setup or Process | Description |
|--------------------|---|
| Voucher processing | <p>When processing vouchers in Norway, use the Enhanced Due Date Processing Sweden program (R74W0020) to automatically change the due date of a credit note to the due date of a matching voucher.</p> <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR, and SWE) Preparing Vouchers and Credit Notes for Payment Processing, page 1198.</p> |
| Invoice processing | <p>To work with invoices in Norway, run the Invoice Print Sweden (R74W0030) program as a complement to the Late Payment Delinquency Fees program (R03B221) to summarize delinquency fee information at the customer level.</p> <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR, and SWE) Printing Interest Invoices for Nordic Countries, page 1197.</p> <p>In addition to standard invoice processing, you can print invoices with an attached International Payment Instructions (IPI). To print these invoices and attachments:</p> <ul style="list-style-type: none"> • Set up UDCs for IPIs. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.</p> <ul style="list-style-type: none"> • Set processing options for the invoice print program. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Invoice Print with International Payment Instruction (R03B5053), page 1247.</p> <ul style="list-style-type: none"> • Print invoices with attached IPIs. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing Invoices with an Attached International Payment Instruction, page 1245.</p> |

| Setup or Process | Description |
|---------------------|---|
| Intrastat reporting | <p>To set up and use Intrastat reporting:</p> <ul style="list-style-type: none"> Review the overview about European Union reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Understanding European Union Functionality, page 1215. Set up UDCs. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221. Set up commodity codes. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up Commodity Code Information, page 1230. Set up cross-references between suppliers and items to show the country of origin. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Entering Cross-References for Items and Suppliers, page 1231. Set the processing options for the Intrastat workfiles programs. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Sales (R0018I1), page 1254. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Procurement (R0018I2), page 1256. Populate the workfiles. See Chapter 66, “(Europe) Working With European Union Functionality,” Populating the Intrastat Workfile, page 1250. Revise the workfiles as necessary. See Chapter 66, “(Europe) Working With European Union Functionality,” Revising Intrastat Information, page 1258. |

| Setup or Process | Description |
|---------------------------------|--|
| Intrastat reporting (continued) | <p>To print and purge Intrastat records:</p> <ul style="list-style-type: none"> • Use the IDEP/IRIS Interface program (R0018I3) to generate an electronic Intrastat declaration in the format required for Norway. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Using the IDEP/IRIS Interface for Intrastat Reporting, page 1264.</p> <ul style="list-style-type: none"> • Purge records from the Intrastat table (F0018T). <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Purging Records from the Intrastat Table (F0018T), page 1263.</p> |

CHAPTER 61

(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden

This chapter discusses how to set up:

- Bank information for suppliers.
- Additional bank information for foreign suppliers.
- (DNK) Payment formats.
- (FIN) Calculate the Finnish reference number.
- (FIN) Payment formats.
- (NOR) Enterprise information for Norway.
- (NOR) Payment formats.
- (SWE) Enterprise information for Sweden.
- (SWE) Payment formats

Setting Up Bank Information for Suppliers for Denmark, Finland, Norway, and Sweden

When entering supplier master information:

- Complete the Bank Account Number field with your bank, *Bankgiro*, or *Postgiro* account number.
- Complete the Remark field with the correct identification code for foreign vouchers.
 - (FIN) For domestic Finnish vouchers, enter the reference number.
- (NOR) Complete the Reference/Roll Number field with the number provided by the DNB Telebank.
- (FIN) Complete the Reference/Roll Number field with the payee business code.
- (FIN) Complete the Add'l Ind Tax ID field with the payee business code when using domestic payments.

Setting Up Additional Bank Information for Foreign Suppliers

This section provides an overview of additional bank information for foreign suppliers, lists prerequisites, and discusses how to:

- Set up additional bank information for foreign suppliers.
- Override additional bank information when writing or updating payments.

Understanding Additional Bank Information for Foreign Suppliers

Foreign payments made by Nordic companies require additional bank information. If you use a foreign payment format, you must enter this additional bank information for each foreign supplier.

You can use the Work With Payment Groups program (P04571) to override the additional bank information for a specific payment, if necessary.

Prerequisites

Before you complete the tasks in this section:

- Create an address book record for each bank, ensuring that both the name of the bank and the name of the local office are entered in the Alpha Name field.

See *JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide*, “Entering Address Book Records”.

- Set up your user preferences with one of these localization country codes:
 - SE (Sweden)
 - NO (Norway)
 - DK (Denmark)
 - FI (Finland)

Forms Used to Set Up Additional Bank Information for Foreign Suppliers

| Form Name | FormID | Navigation | Usage |
|--------------------------------|----------|--|---|
| Revise Supplier Info. Foreign | W0474N3B | Swedish Localization (G74W), Swedish Supplier Inf. Foreign Payments Click Add on the Work With Supplier Info. Foreign form. | Set up additional bank information for foreign suppliers. |
| Work With Payment Groups | W04571A | Automatic Payment Processing (G0413), Work with Payment Groups | View payment groups for a specific bank account or a specific status. |
| Foreign Supplier Info Override | W74W001B | On the Work With Payment Groups form, select a record and select Payments from the Row menu. On the Work With Payment Group - Write or Update Status form, select a payment and then select Regional Info from the Row menu. | Override additional bank information. |

Setting Up Additional Bank Information for Foreign Suppliers

Access the Revise Supplier Info. Foreign form.

Address Number

Enter the address book number of the supplier.

Account flag

Enter the type of bank account to be used for payments, for example, checking or currency account. Values are:

0: SEK account (Sweden), NOK account (Norway), DKK account (Denmark), or EUR/FIM account (Finland)

1: Currency account

Fee code

Enter a code that indicates who is going to pay the bank fees.

(SWE) Values for Sweden are:

0: All fees are paid by the remitter.

1: Express fees are paid by the receiver.

2: All fees are paid by the receiver.

(NOR) Values for Norway are:

0: All fees are paid by the payer.

1: The payee is responsible for paying the charges in Norway and the payer is responsible for paying the charges abroad.

2: All fees are paid by the payee.

(DNK) Values for Denmark are:

0: All fees are paid by the payer.

| | |
|------------------------|---|
| | <p><i>1</i>: The payer is responsible for paying the charges in Denmark, and the payee is responsible for paying the charges abroad.</p> <p><i>2</i>: All fees are paid by the payee.</p> <p>(FIN) Values for Finland are:</p> <p><i>1</i>: The beneficiary pays his own bank's expenses.</p> <p><i>0</i>: The payer pays the expenses of the beneficiary's bank.</p> |
| Payment Method | <p>Enter a code that indicates the type of payment, for example, normal or express payment. Values are:</p> <p><i>0</i>: Normal</p> <p><i>1</i>: Express (always bank)</p> <p><i>2</i>: Concern (network bank)</p> <hr/> <p>Note. (SWE) Value 2 is valid only in Sweden.</p> <hr/> |
| Supplier Number | <p>The system displays a unique seven-digit number that the bank uses to identify the supplier. The system generates this number automatically for existing records.</p> |

Overriding Additional Bank Information

Access the Foreign Supplier Info Override form.

(DNK) Setting Up Payment Formats for Denmark

This section provides an overview of payment formats for Denmark and discusses how to set up processing options for:

- Create A/P Bank Tape - Denmark DDB - Domestic (R04572DK1).
- Create A/P Bank Tape - Denmark DDB Foreign (R04572DK2).
- Create A/P Bank Tape - Denmark UNIBANK - Domestic (R04572DK3).
- Create A/P Bank Tape - Denmark UNIBANK - Foreign (R04572DK4).
- Create A/P Bank Tape - Denmark GiroBank (R04572DK5).

Understanding Payment Formats for Denmark

JD Edwards EnterpriseOne software provides these payment formats for Denmark:

| Format | Description |
|-----------|---|
| R04572DK1 | Create A/P Bank Tape - Denmark DDB - Domestic |
| R04572DK2 | Create A/P Bank Tape - Denmark DDB Foreign |
| R04572DK3 | Create A/P Bank Tape - Denmark UNIBANK - Domestic |

| Format | Description |
|-----------|--|
| R04572DK4 | Create A/P Bank Tape - Denmark UNIBANK - Foreign |
| R04572DK5 | Create A/P Bank Tape - Denmark GiroBank |

Considerations for Create A/P Bank Tape - Denmark DDB Foreign (R04572DK2)

You can determine the payment category code for the Central Bank at these levels:

1. You can accept the default value, which is hard-coded in the print program, for each country (for example, Denmark = %0006).
2. You can use processing option 10 on the Payment Cat. tab to override the default value from the program. The value that you enter becomes the new default value.
3. When you enter a voucher, you can override the default value from the program and the processing option. Use the Remark field to enter the Central Bank code.

Considerations for Create A/P Bank Tape - Denmark UNIBANK - Domestic

Use the Create A/P Bank Tape - Denmark UNIBANK - Domestic payment format when making domestic payments through Nordea Bank. The system uses the payment instrument of the payment to determine which of these Unitel bank software formats to use:

- Domestic Transfer (UBT04500).
- Transfer Form/Giro Payment (UBT04600).
- Domestic Check (UBT04700).

When setting up supplier bank accounts to use the Domestic Transfer format (UBT4500):

- Leave the Control Digit field blank on the Set Up Bank Accounts by Address form.
- Enter the international bank account number (IBAN) for the supplier's bank account in the IBAN field on the Set Up Bank Accounts by Address form.
- Enter your IBAN number in the IBAN field of the Revise Bank Information form when you set up the bank account information for your bank.

When setting up supplier bank accounts to use the Transfer Form/Giro Payment format (UBT4600):

- The value in the Control Digit field on the Set Up Bank Accounts by Address form must not be blank. You must use one of these values:
 - 01
 - 04
 - 15
 - 41
 - 71
 - 73
 - 75
- Complete the Reference/Roll Number field with a seven or eight character value.

- Enter your IBAN number in the IBAN field of the Revise Bank Information form when you set up the bank account information for your bank.

When setting up supplier bank accounts to use the Domestic Check format (UBT4700):

- The supplier's bank account information should be blank for this format.
- Enter your IBAN number in the IBAN field of the Revise Bank Information form when you set up the bank account information for your bank

When you run the Create A/P Bank Tape - Denmark (R04572DK3) program for domestic transfers, the system uses the domestic transfer format (UTB04500) and creates one record for each payment, as illustrated in this table.

Note. Fields 19, 21 and 23 are variable fields. If the maximum amount of lines is not used, the subsequent fields are moved forward in the file. Spaces (blanks) count as filled.

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|------------------------------|---------------------------|---|
| 1 (alphanumeric) | System | 1 (3) | A fixed value of UBT. This field is mandatory. |
| 2 (numeric) | Type | 4 (3) | A fixed value of 045. This field is mandatory. |
| 3 (numeric) | Kind | 7 (2) | A fixed value of 00. This field is mandatory . |
| 4 (numeric) | Type of Advice | 9 (2) | Return advice to remitter. Values are: 00: No advice 01: Long 02: Brief The system obtains this value from a processing option. This field is mandatory. |
| 5 (alphanumeric) | Account Information Remitter | 11 (35) | IBAN or four-digit sort code, followed by the ten-digit account number of remitter's bank. If the account number has less than ten digits, include preceding zeros. The system obtains this value from the IBAN field. If no IBAN number exists, the system uses the bank plus the bank account number (data items TNST and CBNK). This field is mandatory. |
| 6 (numeric) | Amount | 46 (15) | The amount with two decimal places. For example, 100.00 DKK appears as 10000. This field is mandatory. |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|----------------------------------|---------------------------|---|
| 7 (alphanumeric) | Currency Code | 61 (3) | Currency code of the payment, in accordance with ISO 4217. The system obtains this value from the payment currency. This field is mandatory. |
| 8 (alphanumeric) | Currency Equivalent | 64 (1) | Indicates the relationship between the Amount and the Currency Code fields. Values are: N: No currency equivalent. The amount is paid in the specified currency. J (yes): The amount is paid in the foreign currency as specified in the Currency Code field that is equivalent to the amount in Danish kroner. This field is mandatory. |
| 9 (numeric) | Transfer Date | 65 (8) | Date on which to effect transfer in Nordea Bank. The date format is: YYYYMMDD. This field is mandatory. |
| 10 (alphanumeric) | Own Reference | 73 (20) | Contains the reference entered by the remitter in the Own Reference field on each payment instruction. Own Reference is specified on the remitter's bank statement and is not passed on to the beneficiary. The field may be used for electronic reconciliation. This field is optional. |
| 11 (alphanumeric) | Account Information: Beneficiary | 93 (35) | IBAN, or the four digit sort code and the ten-digit account number of the beneficiary's bank. The system obtains this value from the IBAN field. If no IBAN number exists, the system uses the bank plus the bank account number (data items TNST and CBNK). This field is mandatory. |
| 12 (alphanumeric) | Express Advice | 128 (1) | Indicates whether the beneficiary's bank notifies the customer immediately. Values are: J (yes): The beneficiary's bank will send a letter with the advice to the beneficiary on the same day as the amount is credited to the beneficiary's account. N (no): The beneficiary will receive the advice in the next bank statement at the latest. This field is mandatory. |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|--|---------------------------|---|
| 13 (numeric) | Text Code | 129 (3) | <p>The field contains a digit code, which is translated by Unitel for PC into the text that appears from the beneficiary's bank statement. The text informs the beneficiary of the item covered by the transfer. If text code 100 is entered, Text Line Code must also be completed.</p> <p>This field is optional.</p> |
| 14 (alphanumeric) | Text Line Code | 132 (20) | <p>Free text line. Use this field when the value in the Text Code field is 100. This field is optional.</p> |
| 15 (alphanumeric) | Beneficiary's Identification of the Remitter | 152 (35) | <p>Used in connection with transfers to a third-party enabling the beneficiary to identify the remitter. For example, a customer number might be used.</p> <p>This field is optional.</p> |
| 16 (alphanumeric) | Reference to Primary Document | 187 (35) | <p>Reference to a primary document, such as an invoice number. This field is optional.</p> |
| 17 (numeric) | Batch Entry | 222 (3) | <p>Enter 000, if batch entry is not used.</p> <p>Identification of total amount debited on the remitter's bank statement. Unitel allows you to collect a number of payments into one total debit amount. All payments made with the same transfer date and with the same batch entry number will be debited to your account as one total amount. The field may be completed if the payment type is 45 (domestic transfer) or 46 (transfer form/Giro transfer form). The batch entry number appears on your bank statement.</p> <p>This field is optional.</p> |
| 18 (numeric) | Beneficiary's Name/ Number | 225 (2) | <p>Number of lines for the beneficiary's name. The maximum number of lines is four. Enter 00, if there are no lines for the beneficiary's name.</p> <p>This field is mandatory.</p> |
| 19 (alphanumeric) | Beneficiary's Name | 227 (140) | <p>Name of the beneficiary, with a maximum of four lines, 35 bytes each. The number of lines depends on the value entered in the Beneficiary's Name/ Number field.</p> <p>This field is optional.</p> |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|---------------------------------|---------------------------|--|
| 20 (numeric) | Message to Beneficiary - Number | 367 (2) | <p>Number of message lines to the beneficiary, with a maximum of 41 lines. Enter 00, if there is no message to the beneficiary.</p> <p>Minimum and maximum number of lines appear based on the format for each payment type. For example the number of used lines, plus two lines (headings) will be deducted from the 41 advice lines available for domestic payments when an alternative remitter is entered. This means that only 36 lines are available if all three lines are used in alternative remitter.</p> <p>This field is mandatory.</p> |
| 21 (alphanumeric) | Message to Beneficiary | 369 (1435) | <p>Message to beneficiary, with a maximum of 41 lines with 35 bytes each. Data fields 21 and 23 share the same location. If data field 23 is not used (field 22 = 00), 41 lines may be entered in data field 21. If 01, 02 or 03 lines are entered in data field 23, data field 21 may contain 38, 37 or 36 lines since Nordea uses two lines for headings.</p> <p>Complete this field if you entered a value other than 00 in the Message to Beneficiary - Number field.</p> |
| 22 (numeric) | Alternative Remitter-Number | 1804 (2) | <p>Number of lines for alternative remitter, with a maximum of three lines. Enter 00, if there is no alternative remitter.</p> <p>This field is mandatory.</p> |
| 23 (alphanumeric) | Alternative Remitter | 1806 (105) | <p>Alternative remitter, with a maximum of three lines with 35 bytes each. The name and address of an alternative remitter may be entered in this field. If the field is not used, the name and address registered for your Unitel access will be entered for the payment. Data fields 21 and 23 share the same location. If data field 23 is not used (field 22 = 00), 41 lines may be entered in data field 21. If 01, 02 or 03 lines are entered in data field 23, data field 21 may contain 38, 37 or 36 lines since Nordea uses 2 lines for headings.</p> <p>This field is mandatory.</p> |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|-----------------------------------|---------------------------|--|
| 24 (alphanumeric) | Danish Central Bank Notification | 1911 (1) | An indication of whether the fields intended for notifying the Danish central bank are completed or not. Values are: N (no). J (yes): Enter J if the payment exceeds DKK 250,000 or the currency equivalent. For this payment type, the value of this field is always N. This field is mandatory. |
| 25 (alphanumeric) | Supplemental Payment Purpose Text | 1912 (140) | Supplementary text used when the value in field 26 is 1. This field is not used for this payment format. |
| 26 (alphanumeric) | Payment Purpose Code | 2052 (4) | Enter either four characters or one character accompanied by text in the Supplemental Payment Purpose Text field. This field is not used for this payment format. |
| 27 (numeric) | Import Date | 2056 (6) | Import date text used when the value in field 24 is J. Since the value in field 24 is always N for this payment type, this field is not used. |
| 28 (alphanumeric) | Beneficiary's Nationality | 2062 (2) | The field contains a country code (ISO) to specify the nationality of the beneficiary and is used when the value in field 24 is J. Since the value in field 24 is always N for this payment type, this field is not used. |

When you run the Create A/P Bank Tape - Denmark (R04572DK3) program for domestic transfers for GiroBank, the system uses the Transfer Form/Giro Payment (UBT04600) format and creates one record for each payment as illustrated in this table:

Note. Fields 16, 18 and 20 are variable fields. If the maximum amount of lines is not used, the subsequent fields are moved forward in the file. Spaces (blanks) count as filled.

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|------------|---------------------------|--|
| 1 (alphanumeric) | System | 1 (3) | A fixed value of UBT. This field is mandatory. |
| 2 (numeric) | Type | 4 (3) | A fixed value of 046. This field is mandatory. |
| 3 (numeric) | Kind | 7 (2) | A fixed value of 00. This field is mandatory . |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|----------------------------------|---------------------------|---|
| 4 (numeric) | Type of Advice | 9 (2) | Return advice to remitter. Values are: 00: No advice 01: Long 02: Brief The system obtains this value from a processing option. This field is mandatory. |
| 5 (alphanumeric) | Account information remitter | 11 (35) | IBAN or four-digit sort code, followed by the ten-digit account number of remitter's bank. If the account number has less than ten digits, include preceding zeros. The system obtains this value from the IBAN field. If no IBAN number exists, the system uses the bank plus the bank account number (data items TNST and CBNK). This field is mandatory. |
| 6 (numeric) | Amount | 46 (15) | The amount with two decimal places. For example, 100.00 DKK appears as 10000. This field is mandatory |
| 7 (alphanumeric) | Currency Code | 61 (3) | Currency code of the payment, in accordance with ISO 4217. The system obtains this value from the payment currency. This field is mandatory. |
| 8 (alphanumeric) | Currency equivalent | 64 (1) | Indicates the relationship between the Amount and the Currency Code fields. For this format, the value is always N (no). This field is mandatory. |
| 9 (numeric) | Transfer Date | 65 (8) | Date on which to effect transfer in Nordea Bank. The date format is: YYYYMMDD. This field is mandatory. |
| 10 (alphanumeric) | Own Reference | 73 (20) | Contains the reference entered by the remitter in the Own Reference field on each payment instruction. Own Reference is specified on the remitter's bank statement and is not passed on to the beneficiary. The field may be used for electronic reconciliation. This field is optional. |
| 11 (alphanumeric) | Account Information, Beneficiary | 93 (10) | The account number of the creditor's account to which the amount is credited. Enter the seven to ten digit GiroBank account number. This field is mandatory. |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|---------------------------------|---------------------------|---|
| 12 (numeric) | Form Type Code | 103 (2) | Form type code from OCR line. This field is mandatory. |
| 13 (numeric) | Payment Reference | 105 (19) | Payment reference from OCR line. This field is mandatory. |
| 14 (numeric) | Batch Entry | 124 (3) | <p>Enter 000 if batch entry is not used.</p> <p>Identification of total amount debited on the remitter's bank statement. Unitel allows you to collect a number of payments into one total debit amount. All payments made with the same transfer date and with the same batch entry number will be debited to your account as one total amount. The field may be completed if the payment type is 45 (domestic transfer) or 46 (transfer form/Giro transfer form). The batch entry number appears on your bank statement.</p> <p>This field is mandatory.</p> |
| 15 (numeric) | Beneficiary's Name/ Number | 127 (2) | <p>Number of lines for the beneficiary's name. The maximum number of lines is four. Enter 00 if there are no lines for the beneficiary's name.</p> <p>This field is mandatory.</p> |
| 16 (alphanumeric) | Beneficiary's Name | 129 (140) | <p>Name of the beneficiary, with a maximum of four lines with 35 bytes each. The number of lines depends on the value entered in the Beneficiary's Name/ Number field.</p> <p>This field is optional.</p> |
| 17 (numeric) | Message to Beneficiary - Number | 269 (2) | <p>Number of message lines to the beneficiary, with a maximum of 41 lines. Enter 00 if there is no message to the beneficiary.</p> <p>Minimum and maximum number of lines appear based on the format for each payment type. For example the number of used lines, plus two lines (headings) will be deducted from the 41 advice lines available for domestic payments when an alternative remitter is entered. This means that only 36 lines are available if all three lines are used in alternative remitter.</p> <p>This field is mandatory.</p> |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|-----------------------------------|---------------------------|---|
| 18 (alphanumeric) | Message to Beneficiary | 271 (1435) | <p>Message to beneficiary, with a maximum of 41 lines with 35 bytes each. Data fields 18 and 20 share the same location. If data field 20 is not used (field 19 = 00), 41 lines may be entered in data field 18. If 01, 02 or 03 lines are entered in data field 20, data field 18 may contain 38, 37 or 36 lines since Nordea uses two lines for headings.</p> <p>Complete this field if you entered a value other than 00 in the Message to Beneficiary - Number field.</p> |
| 19 (numeric) | Alternative Remitter - Number | 1706 (2) | <p>Number of lines for alternative remitter, with a maximum of three lines. Enter 00, if there is no alternative remitter.</p> <p>This field is mandatory.</p> |
| 20 (alphanumeric) | Alternative Remitter | 1708 (105) | <p>Alternative remitter, with a maximum of three lines with 35 bytes each. Use this field with form type 73. The name and address of an alternative remitter may be entered in this field. If the field is not used, the name and address registered for your Unitel access will be entered for the payment. Data fields 18 and 20 share the same location. If data field 20 is not used (field 19 = 00), 41 lines may be entered in data field 21. If 01, 02 or 03 lines are entered in data field 20, data field 18 may contain 38, 37 or 36 lines since Nordea uses 2 lines for headings.</p> <p>This field is optional.</p> |
| 21 (alphanumeric) | Danish Central Bank Notification | 1813 (1) | <p>An indication of whether the fields intended for notifying the Danish central bank are completed or not. Values are:</p> <p>N (no).</p> <p>J (yes): Enter J if the payment exceeds DKK 250,000 or the currency equivalent. For this payment type, the value of this field is always N.</p> <p>This field is mandatory.</p> |
| 22 (alphanumeric) | Supplemental Payment Purpose Text | 1814 (140) | <p>Supplementary text used when the value in field 23 is 1. This field is not used for this payment format.</p> |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|---------------------------|---------------------------|---|
| 23 (alphanumeric) | Payment Purpose Code | 1954 (4) | Enter either four characters or one character accompanied by text in the Supplemental Payment Purpose Text field. This field is not used for this payment format. This field is new for this payment format. |
| 24 (numeric) | Import Date | 1958 (6) | Import date text used when the value in field 21 is J. Since the value in field 21 is always N for this payment type, this field is not used. |
| 25 (alphanumeric) | Beneficiary's Nationality | 1964 (2) | The field contains a country code (ISO) to specify the nationality of the beneficiary and is used when the value in field 21 is J. Since the value in field 21 is always N for this payment type, this field is not used. |

When you run the Create A/P Bank Tape – Denmark (R04572DK3) program for domestic checks, the system uses the Domestic Check (UBT04700) format and creates one record for each payment as shown in this table:

Note. Fields 13, 15 and 17 are variable fields. If the maximum amount of lines is not used, the subsequent fields are moved forward in the file. Spaces (blanks) count as filled.

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|------------------------------|---------------------------|---|
| 1 (alphanumeric) | System | 1 (3) | A fixed value of UBT. This field is mandatory. |
| 2 (numeric) | Type | 4 (3) | A fixed value of 047. This field is mandatory. |
| 3 (numeric) | Kind | 7 (2) | A fixed value of 00. This field is mandatory. |
| 4 (numeric) | Type of Advice | 9 (2) | Return advice to remitter. Values are: 00: No advice 01: Long 02: Brief The system obtains this value from a processing option. This field is mandatory. |
| 5 (alphanumeric) | Account Information Remitter | 11 (35) | IBAN or four-digit sort code, followed by the ten-digit account number of remitter's bank. If the account number has less than ten digits, include preceding zeros. The system obtains this value from the IBAN field. If no IBAN number exists, the system uses the bank plus the bank account number (data items TNST and CBNK). This field is mandatory. |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|----------------------------|---------------------------|---|
| 6 (numeric) | Amount | 46 (15) | The amount with two decimal places. For example, 100.00 DKK appears as 10000. This field is mandatory. |
| 7 (alphanumeric) | Currency Code | 61 (3) | Currency code of the payment, in accordance with ISO 4217. The system obtains this value from the payment currency. This field is mandatory. |
| 8 (alphanumeric) | Currency Equivalent | 64 (1) | Indicates the relationship between the Amount and the Currency Code fields. For this format, the value is always N (no). This field is mandatory. |
| 9 (numeric) | Transfer Date | 65 (8) | Date on which to effect transfer in Nordea Bank. The date format is: YYYYMMDD. This field is mandatory. |
| 10 (alphanumeric) | Own reference | 73 (20) | Contains the reference entered by the remitter in the Own Reference field on each payment instruction. Own Reference is specified on the remitter's bank statement and is not passed on to the beneficiary. The field may be used for electronic reconciliation. This field is optional. |
| 11 (alphanumeric) | Check Delivery | 93 (1) | Indicates where the check is to be sent. Values are: C: Remitter D: Beneficiary This field is mandatory. |
| 12 (numeric) | Beneficiary's Name/ Number | 94 (2) | Number of lines for the beneficiary's name. The maximum number of lines is five. Enter 00 if there are no lines for the beneficiary's name. This field is mandatory. |
| 13 (alphanumeric) | Beneficiary's Name | 96 (175) | Name of the beneficiary, with a maximum of five lines with 35 bytes each. The number of lines depends on the value entered in the Beneficiary's Name/ Number field. This field is optional. |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|-----------------------------------|---------------------------|---|
| 14 (numeric) | Message to Beneficiary - Number | 271 (2) | <p>Number of message lines to the beneficiary, with a maximum of 41 lines. Enter <i>00</i> if there is no message to the beneficiary.</p> <p>Minimum and maximum number of lines appear based on the format for each payment type. For example, the number of used lines, plus two lines (headings) are deducted from the 41 advice lines available for domestic payments when an alternative remitter is entered. This field is mandatory.</p> |
| 15 (alphanumeric) | Message to Beneficiary | 273 (140) | Message to beneficiary, with a maximum of 41 lines with 35 bytes each. Complete this field if you entered a value other than <i>00</i> in the Message to Beneficiary - Number field. |
| 16 (numeric) | Alternative Remitter - Number | 413 (2) | Number of lines for alternative remitter, with a maximum of three lines. Enter <i>00</i> if there is no alternative remitter. This field is mandatory. |
| 17 (alphanumeric) | Alternative Remitter | 415 (105) | Alternative remitter, with a maximum of three lines with 35 bytes each. This field is optional. |
| 18 (alphanumeric) | Danish Central Bank Notification | 520 (1) | <p>An indication of whether the fields intended for notifying the Danish central bank are completed or not. Values are:</p> <p>N (no).</p> <p>J (yes): Enter J if the payment exceeds DKK 250,000 or the currency equivalent. For this payment type, the value of this field is always N. This field is mandatory.</p> |
| 19 (alphanumeric) | Supplemental Payment Purpose Text | 521 (140) | Supplementary text used when the value in field 20 is 1. This field is not used for this payment format. |
| 20 (alphanumeric) | Payment Purpose Code | 661 (4) | Enter either four characters or one character accompanied by text in the Supplemental Payment Purpose Text field. This field is not used for this payment format. |
| 21 (numeric) | Import Date | 665 (6) | Import date text used when the value in field 18 is J. Since the value in field 18 is always N for this payment type, this field is not used. |
| 22 (alphanumeric) | Beneficiary's Nationality | 671 (2) | The field contains a country code (ISO) to specify the nationality of the beneficiary and is used when the value in field 18 is J. Since the value in field 18 is always N for this payment type, this field is not used. |

Consideration for Create A/P Bank Tape - Denmark UNIBANK - Foreign

Use the Create A/P Bank Tape - Denmark UNIBANK - Foreign payment format when making international payments through Nordea Bank. The system uses the payment instrument of the payment to determine which of these Unitel bank software formats to use:

- Economy Transfer (UBT04800).
- Ordinary Transfer (UBT04900).
- Express Transfer (UBT05000).
- Intercompany Transfer to Foreign Bank (UBT05100).
- Intercompany Transfer to Nordea's International Units (UBT05200).

The file layout is the same for all of the international payment formats. When you run the Create A/P Bank Tape - Denmark UNIBANK - Foreign program, the system uses one of the formats and creates one record for each payment as shown in this table:

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|------------------------------|---------------------------|---|
| 1 (alphanumeric) | System | 1 (3) | A fixed value of UBT. This field is mandatory. |
| 2 (numeric) | Type | 4 (3) | A fixed value of 048, 049, 050, 051, or 052. The value used depends on the payment instrument of the payment. This field is mandatory. |
| 3 (numeric) | Kind | 7 (2) | A fixed value of 00. Value is the same as in the UBT00700 format. This field is mandatory. |
| 4 (numeric) | Type of Advice | 9 (2) | Return advice to remitter. Values are: 00: No advice 01: Long 02: Brief The system obtains this value from a processing option. This field is mandatory. |
| 5 (alphanumeric) | Account Information Remitter | 11 (35) | IBAN or four-digit sort code, followed by the ten-digit account number of remitter's bank. If the account number has less than ten digits, include preceding zeros. The system obtains this value from the IBAN field. If no IBAN number exists, the system uses the bank plus the bank account number (data items TNST and CBNK). This field is mandatory. |
| 6 (numeric) | Amount | 46 (15) | The amount with two decimal places. For example, 100.00 DKK appears as 10000. This field is mandatory. |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|-------------------------|---------------------------|--|
| 7 (alphanumeric) | Currency Code | 61 (3) | Currency code of the payment, in accordance with ISO 4217. The system obtains this value from the payment currency. This field is mandatory. |
| 8 (alphanumeric) | Currency Equivalent | 64 (1) | Indicates the relationship between the Amount and the Currency code fields. Values are N: No currency equivalent. The amount is paid in the specified currency. J (yes): The amount is paid in the foreign currency as specified in the Currency Code field that is equivalent to the amount in Danish kroner. This field is mandatory. |
| 9 (numeric) | Transfer Date | 65 (8) | Date on which to effect transfer in Nordea Bank. The date format is: YYYYMMDD. This field is mandatory. |
| 10 (alphanumeric) | Own Reference | 73 (20) | Contains the reference entered by the remitter in the Own Reference field on each payment instruction. Own Reference is specified on the remitter's bank statement and is not passed on to the beneficiary. The field may be used for electronic reconciliation. This field is optional. |
| 11 (alphanumeric) | Exchange Rate Reference | 93 (11) | A reference number for a forward or contract rate. This field is mandatory only if an agreement has been entered into with Nordea Markets. This field cannot be used for payment type 51 (intercompany transfer to a foreign bank). |
| 12 (numeric) | Exchange Rate | 104 (12) | The exchange rate with six decimals. For example, enter 123 as 123000000. The exchange rate (with 6 decimals) agreed on in connection with a forward exchange contract. This field is mandatory if a value exists in the Exchange Rate Reference field. |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|-----------------------------------|---------------------------|---|
| 13 (alphanumeric) | Expense Code | 116 (1) | <p>Indicates who is to pay the expenses for the transfer. Values are:</p> <p>A: Remitter: The costs of both banks are debited to the remitter's account.</p> <p>M: Beneficiary: The costs of both banks are paid by the beneficiary. Nordea's costs are deducted from the transfer amount.</p> <p>N: Both. The remitter and the beneficiary each pay their own bank's costs.</p> <p>The system obtains this value from a processing option. If the processing option is not completed, the system uses the Fee Code for the supplier. If the supplier does not have a fee code, the system uses a default value of N.</p> |
| 14 (alphanumeric) | Bank Code | 117 (17) | <p>The sort code of beneficiary's bank. The term for this code varies from country to country. So it may be, for instance, ABA number, FW number, or BLZ and sorting code. If the BIC/SWIFT address is entered together with a bank code, there must be no discrepancies between the two in order to avoid paying a repair fee.</p> <p>This field is optional.</p> |
| 15 (alphanumeric) | Account Information Beneficiary | 134 (35) | <p>The IBAN or the account number of the foreign account. If no IBAN number exists, the system uses the bank plus the bank account number (data items TNST and CBNK). This field is mandatory.</p> |
| 16 (alphanumeric) | Beneficiary's Bank | 169 (140) | <p>The name and address of the beneficiary's bank. Enter up to four line with 35 bytes each. This field is mandatory.</p> |
| 17 (alphanumeric) | SWIFT Address | 309 (11) | <p>SWIFT address of beneficiary's bank. You must enter 11 characters for the BIC/SWIFT number for these formats. If you enter fewer than 11 characters, the system completes the field with an x for each remaining character.</p> <p>This field is optional.</p> |
| 18 (alphanumeric) | Country Code | 320 (2) | <p>The ISO country code of the beneficiary's bank.</p> |
| 19 (alphanumeric) | Danish Central Bank Notification | 322 (1) | <p>The system completes this field with N.</p> |
| 20 (alphanumeric) | Supplemental Payment Purpose Text | 323 (140) | <p>This field is not used.</p> |

| Field Number and Type | Field Name | Start Position and Length | Description |
|-----------------------|---------------------------------|---------------------------|---|
| 21 (alphanumeric) | Payment Purpose Code | 463 (4) | This field is not used. |
| 22 (numeric) | Import Date | 467 (6) | Import date text used when the value in field 18 is J. Enter the date using the format: MMYYYY. |
| 23 (alphanumeric) | Beneficiary's Nationality | 473 (2) | The field contains a country code (ISO) to specify the nationality of the beneficiary. |
| 24 (numeric) | Beneficiary's Name - Number | 475 (2) | Number of lines for the beneficiary's name. The maximum number of lines is five. Enter 00 if there are no lines for the beneficiary's name. |
| 25 (alphanumeric) | Beneficiary's Name | 477 (140) | Name of the beneficiary, with a maximum of five lines with 35 bytes each. The number of lines depends on the value entered in the Beneficiary's Name/ Number field. This field is mandatory. |
| 26 (numeric) | Message to Beneficiary - Number | 617 (2) | Number of message lines to the beneficiary, with a maximum of four lines. Enter 00 if there is no message to the beneficiary. Minimum and maximum number of lines appear based on the format for each payment type This field is mandatory. |
| 27 (alphanumeric) | Message to Beneficiary | 619 (140) | Message to beneficiary, with a maximum of four lines with 35 bytes each. Complete this field if you entered a value other than 00 in the Message to Beneficiary - Number field. |
| 28 (numeric) | Alternative Remitter Number | 759 (2) | Number of lines for alternative remitter, with a maximum of three lines. Enter 00 if there is no alternative remitter. This field is mandatory. |
| 29 (alphanumeric) | Alternative Remitter | 761 (105) | Alternative remitter, with a maximum of three lines with 35 bytes each. This field is optional. |
| 30 (alphanumeric) | Message to Nordea | 866 (40) | Text for messages about the execution of the payment. This field is used only with prior agreement with Nordea. This field must be blank in all unused position. |

Setting Processing Options for Create A/P Bank Tape - Denmark DDB - Domestic (R04572DK1)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|------------------------|----------------------------|
| 1. Devise Name | Enter the devise name. |
| 2. Tape Density | Enter the tape density. |
| 3. Label Name | Enter the label name. |
| 4. Block Size | Enter the block size. |
| 5. New Volume | Enter the new volume name. |

More Tape

- | | |
|------------------------|-------------------------|
| 6. New Owner ID | Enter the new owner ID. |
| 7. File Name | Enter the file name. |

Payment Date

Due Date Enter 1 to use the due date as payment date and GL date. If you leave this processing option blank, the date entered during the write process is used as payment date and GL date.

Warnings Enter 1 to enable warnings for the due date. The system ignores this processing option if you leave the due date processing option blank.

Text

External Attachments For this format it is not possible to specify all vouchers that are included in a payment. The format enables you to include 39 text records for each payment. These text records are used to specify vouchers and external attachments for a payment.

Enter 1 to include only the supplier invoice number and invoice amount in the bank file. No external attachments are included.

Enter 2 to include external attachments if the payment consists of one voucher. If the payment consists of more than one voucher, the supplier invoice number and invoice amount only are included in the bank file; no external attachments are included.

Enter 3 to include external attachments for all vouchers in the payment. When the system reaches 41 text records, it generates a report listing all vouchers and the external attachments.

If you leave this processing option blank, the system does not include external attachments.

Setting Processing Options for Create A/P Bank Tape - Denmark DDB Foreign (R04572DK2)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|------------------------|----------------------------|
| 1. Devise Name | Enter the devise name. |
| 2. Tape Density | Enter the tape density. |
| 3. Label Name | Enter the label name. |
| 4. Block Size | Enter the block size. |
| 5. New Volume | Enter the new volume name. |

More Tape

- | | |
|------------------------|-------------------------|
| 6. New Owner ID | Enter the new owner ID. |
| 7. File Name | Enter the file name. |

Payment Date

Due Date Enter *1* to use the due date as the payment date and GL date. If you leave this processing option blank, the date entered during the write process is used as payment date and GL date.

Warnings Enter *1* to enable warnings for the due date. The system ignores this processing option if you leave the due date processing option blank.

Payment Cat. (Payment Category Code)

Payment Category Code Specify the default value for the Payment Category Code for the Central Bank of Sweden.

Type of Goods Specify the type of goods the payment concerns.

Setting Processing Options for Create A/P Bank Tape - Denmark UNIBANK - Domestic (R04572DK3)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|------------------------|----------------------------|
| 1. Devise Name | Enter the devise name. |
| 2. Tape Density | Enter the tape density. |
| 3. Label Name | Enter the label name. |
| 4. Block Size | Enter the block size. |
| 5. New Volume | Enter the new volume name. |

More Tape

6. New Owner ID Enter the new owner ID.

7. File Name Enter the file name.

Payment Date

Due Date Enter *1* to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date.

Due Date Warnings Enter *1* to enable warnings for the due date. The system ignores this processing option if you leave the due date processing option blank.

Text

External Attachments For this format it is not possible to specify all vouchers that are included in a payment. The format enables you to include 39 text records for each payment. These text records are used to specify vouchers and external attachments for a payment.

Enter *1* to include only the supplier invoice number and invoice amount in the bank file. No external attachments are included.

Enter *2* to include external attachments if the payment consists of one voucher. If the payment consists of more than one voucher, the supplier invoice number and invoice amount only are included in the bank file; no external attachments are included.

Enter *3* to include external attachments for all vouchers in the payment. When the system reaches 41 text records, it generates a report listing all vouchers and the external attachments.

If you leave this processing option blank, the system does not include external attachments.

Advise Type

Advise Type Specify the advise type for the flat file. The system inserts the value that you enter in this processing option into the flat file to indicate the type of return advise sent to the remitter. Values are:

00: No advise

01: Long advise

02: Brief advise

Setting Processing Options for Create A/P Bank Tape - Denmark UNIBANK - Foreign (R04572DK4)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|------------------------|----------------------------|
| 1. Devise Name | Enter the devise name. |
| 2. Tape Density | Enter the tape density. |
| 3. Label Name | Enter the label name. |
| 4. Block Size | Enter the block size. |
| 5. New Volume | Enter the new volume name. |

More Tape

- | | |
|------------------------|-------------------------|
| 6. New Owner ID | Enter the new owner ID. |
| 7. File Name | Enter the file name. |

Payment Date

- | | |
|-------------------------|---|
| Due Date | Enter <i>1</i> to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date. |
| Due Date Warning | Enter <i>1</i> to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank. |

Text

- | | |
|-----------------------------|--|
| External Attachments | <p>For this format it is not possible to specify all vouchers that are included in a payment. The format enables you to include 39 text records for each payment. These text records are used to specify vouchers and external attachments for a payment.</p> <p>Enter <i>1</i> to include only the supplier invoice number and invoice amount in the bank file. No external attachments are included.</p> <p>Enter <i>2</i> to include external attachments if the payment consists of one voucher. If the payment consists of more than one voucher, the supplier invoice number and invoice amount only are included in the bank file; no external attachments are included.</p> <p>Enter <i>3</i> to include external attachments for all vouchers in the payment. When the system reaches 41 text records, it generates a report listing all vouchers and the external attachments.</p> <p>If you leave this processing option blank, the system does not include external attachments.</p> |
|-----------------------------|--|

Advise Type

- | | |
|--------------------|---|
| Advise Type | <p>Specify the advise type for the flat file. The system inserts the value that you enter in this processing option into the flat file to indicate the type of return advise sent to the remitter. Values are:</p> <p><i>00</i>: No advise</p> <p><i>01</i>: Long advise</p> <p><i>02</i>: Brief advise</p> |
|--------------------|---|

Default Text

Default Payment Purpose Text This processing option is not used.

Default Payment Purpose Code This processing option is not used.

Expense Code

Expense Code Specify who pays the expenses associated with the payment. Enter *0* to specify that the remitter pays the costs of both banks. Enter *1* to specify that each bank pays its own expenses. Enter *2* to specify that the beneficiary pays the costs of both banks.

If you do not complete this processing option, the system uses the Fee Code for the supplier. If the supplier does not have a fee code, the system uses the default value of 1.

Setting Processing Options for Create A/P Bank Tape - Denmark GiroBank (R04572DK5)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

1. **Devise Name** Enter the devise name.
2. **Tape Density** Enter the tape density.
3. **Label Name** Enter the label name.
4. **Block Size** Enter the block size.
5. **New Volume** Enter the new volume name.

More Tape

6. **New Owner ID** Enter the new owner ID.
7. **File Name** Enter the file name.

Payment Date

Due Date Enter *1* to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date.

Due Date Warning Enter *1* to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank.

Text

External Attachments

For this format it is not possible to specify all vouchers that are included in a payment. The format enables you to include 39 text records for each payment. These text records are used to specify vouchers and external attachments for a payment.

Enter 1 to include only the supplier invoice number and invoice amount in the bank file. No external attachments are included.

Enter 2 to include external attachments if the payment consists of one voucher. If the payment consists of more than one voucher, the supplier invoice number and invoice amount only are included in the bank file; no external attachments are included.

Enter 3 to include external attachments for all vouchers in the payment. When the system reaches 41 text records, it generates a report listing all vouchers and the external attachments.

If you leave this processing option blank, the system does not include external attachments.

(FIN) Calculating the Finnish Reference Number

This section provides an overview of the Finnish reference number and discusses how to set up the reference number business function.

Understanding the Finnish Reference Number

In Finland, companies use reference numbers to identify the invoices that are sent to customers. The customers then include the reference numbers on their payments, which enables the payments to be transferred to the invoicing company's bank account that is reserved for payments with a reference number.

Invoicing companies can formulate their own reference numbers. The reference number must include one or more of these numbers:

- Company number
- Invoice number
- Customer number

You do not need to include all three numbers, but you must include at least one of these numbers in the reference number. It is recommended that you use the invoice number.

Note. For periodically recurring payments, such as rents, the item number should not form part of the reference number.

A short reference number reduces the risk of entry errors. However, a reference number should not be shorter than four digits (three digits plus the check digit). The maximum length for a reference number is 20 digits (19 digits plus the check digit).

Check Digits

The last digit of the reference number is always a check digit. The check digit provides a means of validating the reference number to prevent erroneous data from being entered.

The check digit is calculated in this manner:

1. Each digit in the basic reference number (for example, the invoice number) to be verified is multiplied by the weights 7, 3, and 1 from right to left.

That is, the right-most digit is multiplied by 7, the next digit to the left is multiplied by 3, the next digit to the left is multiplied by 1, the next digit to the left is multiplied by 7, and so on until the first digit has been multiplied.

2. The results of the multiplications are added together.
3. The sum is rounded up to the nearest 10, and then the sum is subtracted from the rounded number.

The resulting difference is the check digit, which becomes the last digit of the reference number. If the resulting difference is 10, the check digit is 0.

Example: Calculation of the Check Digit

This example illustrates the calculation of a check digit.

Reference number (invoice number): 4 5 3 2 1 2 3 4

1. Assign weights from right to left:

| Digit | Digit | Digit | Digit | Digit | Digit | Digit | Digit |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 4 | 5 | 3 | 2 | 1 | 2 | 3 | 4 |
| 3 | 7 | 1 | 3 | 7 | 1 | 3 | 7 |

2. Multiply each digit of the reference number by the corresponding weight:

| Digit | Digit | Digit | Digit | Digit | Digit | Digit | Digit |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 4 | 5 | 3 | 2 | 1 | 2 | 3 | 4 |
| 3 | 7 | 1 | 3 | 7 | 1 | 3 | 7 |
| 12 | 35 | 3 | 6 | 7 | 2 | 9 | 28 |

3. Add the resulting numbers: $12 + 35 + 3 + 6 + 7 + 2 + 9 + 28 = 102$.
4. Round up the sum to the nearest 10: 110.
5. Subtract the sum from the rounded number: -102 .
6. The difference is the check digit: 8.

The full reference number is: 4 5 3 2 1 2 3 4 8.

Setting Up the Reference Number Business Function

The system provides this business function that calculates Finnish reference numbers, including the check digit:

| Field | Value |
|-------------|-----------------------------------|
| Object Name | N74V0001 |
| Description | Generate Reference Number Finland |
| Object Type | Minor business rule |
| Location | Client/Server |
| Language | NER |

This business function is not attached to any program. To use this business function, you must add a call to the business function from the program with which you want the reference number to be calculated.

Data Structure

This table specifies the data structure of the Generate Reference Number Finland business function:

| Name | Description | Req/Opt (Required /Optional) | I/O/Both |
|------------------------|--|------------------------------|----------|
| szCompany | Company | Opt (optional) | Input |
| mnAddressNumber | Customer number | Opt | Input |
| MnDocVoucherInvoiceE | Invoice number | Opt | Input |
| xzReferenseNumber | Reference number | Req (required) | Output |
| mnLengthCompanyNumber | Length of company number (1-3 characters) | Opt | Input |
| mnLengthAddressNumber | Length of customer number (1-8 characters) | Opt | Input |
| mnLengthInvoiceNumber | Length of invoice number (1-8 characters) | Opt | Input |
| szErrorMessage | Error text | Req | Output |
| DocumentPosInRefNumber | Position of company number in the reference number | Opt | Input |
| AddressPosInRefNumber | Position of customer number in the reference number | Opt | Input |
| InvoicePosInRefNumber | Position of the invoice number in the reference number | Opt | Input |

Note. Although these items are optional, the reference number must include at least one of these items:

Company

Customer number

Invoice number

(FIN) Setting Up Payment Formats for Finland

This section provides an overview of payment formats for Finland and discusses how to set up processing options for:

- Create A/P Bank Tape - Finland-Domestic (R04572FI1).
- Create A/P Bank Tape - Finland Foreign (R04572FI2).
- Create A/P Bank Tape - Finland-Domestic LM03 (R04572FI3).

Understanding Payment Formats for Finland

JD Edwards EnterpriseOne software provides these payment formats for Finland:

| Format | Description |
|-----------|---|
| R04572FI1 | Create bank tape for domestic payments. |
| R04572FI2 | Create bank tape for foreign payments |
| R04572FI3 | Create bank tape for domestic LM03 payments |

Considerations for the Processing Options for Create A/P Bank Tape - Finland Foreign (R04572FI2)

You can determine the payment category code for the Central Bank at these levels:

1. You can accept the default value, which is hard-coded in the print program, for each country (for example, Finland = %999).
2. You can use processing option 10 on the Payment Cat. tab to override the default value from the program. The value that you enter becomes the new default value.
3. When you enter a voucher, you can override the default value from the program and the processing option. Use the Remark field to enter the Central Bank code.

On the Service Charge tab, processing option 12 is used in Finland to determine who pays the service charges for the payment.

Setting Processing Options for Create A/P Bank Tape - Finland - Domestic (R04572FI1)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|------------------------|----------------------------|
| 1. Devise Name | Enter the devise name. |
| 2. Tape Density | Enter the tape density. |
| 3. Label Name | Enter the label name. |
| 4. Block Size | Enter the block size. |
| 5. New Volume | Enter the new volume name. |

More Tape

- | | |
|------------------------|-------------------------|
| 6. New Owner ID | Enter the new owner ID. |
| 7. File Name | Enter the file name. |

Payment Date

| | |
|-----------------|---|
| Due Date | Enter <i>/</i> to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date. |
|-----------------|---|

| | |
|-------------------------|--|
| Due Date Warning | Enter <i>/</i> to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank. |
|-------------------------|--|

Setting Processing Options for Create A/P Bank Tape - Finland Foreign (R04572FI2)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|------------------------|----------------------------|
| 1. Devise Name | Enter the devise name. |
| 2. Tape Density | Enter the tape density. |
| 3. Label Name | Enter the label name. |
| 4. Block Size | Enter the block size. |
| 5. New Volume | Enter the new volume name. |

More Tape

- | | |
|------------------------|-------------------------|
| 6. New Owner ID | Enter the new owner ID. |
| 7. File Name | Enter the file name. |

Payment Date

- Due Date** Enter *I* to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date.
- Due Date Warning** Enter *I* to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank.

Payment Cat. (Payment Category Code)

- Payment Category Code** Specify the default value for the Payment Category Code for the Central Bank of Finland.
- Type of Goods** Specify the type of goods the payment concerns.

Service Charge

- Service Charge Code** Enter *V* to have a foreign bank's service charges deducted from the payment. Enter *T* to have the remitter pay the foreign bank's service charges. Enter *J* to share the foreign banks' service charges shared by the remitter and beneficiary.

Setting Processing Options for Create A/P Bank Tape - Finland-Domestic LM03 (R04572FI3)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

1. **Devise Name** Enter the devise name.
2. **Tape Density** Enter the tape density.
3. **Label Name** Enter the label name.
4. **Block Size** Enter the block size.
5. **New Volume** Enter the new volume name.

More Tape

6. **New Owner ID** Enter the new owner ID.
7. **File Name** Enter the file name.

Payment Date

- Due Date** Enter *I* to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date.
- Due Date Warning** Enter *I* to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank.

(NOR) Setting Up Enterprise Information for Norway

This section provides an overview of enterprise information for Norway and discusses how to set up enterprise information for Norway.

Understanding Enterprise Information for Norway

To transmit bank files, you must enter additional information about the financial institution for security and identification reasons. For example, you can seal the bank file before transmitting it to *Postgirot/Bankgirot*.

The information that is required depends on the financial institution that you use for electronic payments. You receive the required information, such as the seal (*sigill*) and customer number, from your bank.

Form Used to Set Up Enterprise Information for Norway

| Form Name | FormID | Navigation | Usage |
|--------------------------------------|----------|---|---|
| Revise Enterprise Info. - Norway DNB | W0474N2B | Norwegian Localization (G74O), Enterprise Information for DNB-Domestic Click Add on the Work With Enterprise Info - Norway DNB form. | Set up enterprise information for Norway. |

Setting Up Enterprise Information for Norway

Access the Revise Enterprise Info. - Norway DNB form.

| | |
|--------------------------------------|--|
| Enterprise Number | Enter the customer's identification number in the bank. Enter the same number as in the Reference/Roll Number field on the BACS Info form. |
| Division | Enter the identifying designation of the division, department, subsidiary, and so on. You can use only one division number within a batch. Enter the same information as in the Bank Reference Name field on the BACS Info form. |
| Password 1 | Enter the password, chosen by the customer, that the bank knows at all times. Norwegian banks require a password. |
| Operator No (operator number) | Enter the number of the operator of the verifier or signatory. This number is allocated to the verifier or signatory by the bank. |
| Proc. Count Date | Enter the six-digit sequence number that works in conjunction with the AH transaction date. Set this field to 000001 every day. |
| Date Proc. Count | Enter the date when you last transferred payments to the bank. |
| Proc. Counter | The system displays a counter that runs continuously up to 9999, regardless of the date. The first time that data is transferred to the bank, the counter starts with 0001. The number after 9999 is 0000. |

(NOR) Setting Up Payment Formats for Norway

This section provides an overview of payment formats for Norway and discusses how to set up processing options for:

- Create A/P Bank Tape - Norway DNB - Domestic (R04572NO1).
- Create A/P Bank Tape - Norway DNB - Foreign (R04572NO2).

Understanding Payment Formats for Norway

JD Edwards EnterpriseOne software provides these payment formats for Norway:

| Format | Description |
|-----------|---|
| R04572NO1 | Create bank tape for domestic payments. |
| R04572NO2 | Create bank tape for foreign payments. |

Setting Processing Options for Create A/P Bank Tape - Norway DNB - Domestic (R04572NO1)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|-----------------|----------------------------|
| 1. Devise Name | Enter the devise name. |
| 2. Tape Density | Enter the tape density. |
| 3. Label Name | Enter the label name. |
| 4. Block Size | Enter the block size. |
| 5. New Volume | Enter the new volume name. |

More Tape

- | | |
|-----------------|-------------------------|
| 6. New Owner ID | Enter the new owner ID. |
| 7. File Name | Enter the file name. |

Payment Date

Due Date Enter 1 to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date.

Due Date Warning Enter 1 to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank.

Bank Format

Format

Enter *1* to print TBII in the application header of the flat file. Leave the processing option blank or enter a value other than 1 to print IPII in the application header.

Contact your bank for information about whether to specify TBII or IPII for the application header of the flat file.

Setting Processing Options for Create A/P Bank Tape - Norway DNB - Foreign (R04572NO2)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|------------------------|----------------------------|
| 1. Devise Name | Enter the devise name. |
| 2. Tape Density | Enter the tape density. |
| 3. Label Name | Enter the label name. |
| 4. Block Size | Enter the block size. |
| 5. New Volume | Enter the new volume name. |

More Tape

- | | |
|------------------------|-------------------------|
| 6. New Owner ID | Enter the new owner ID. |
| 7. File Name | Enter the file name. |

Payment Date

Due Date Enter *1* to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date.

Due Date Warning Enter *1* to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank.

Bank Format

Format

Enter *1* to print TBIU in the application header of the flat file. Leave the processing option blank or enter a value other than 1 to print IPIU in the application header.

Contact your bank for information about whether to specify TBIU or IPIU for the application header of the flat file.

Payment Category Code

Enter the default value for the Payment Category Code for the Central Bank of Norway.

You can determine the payment category code for the Central Bank at these levels:

- Accept the default value, which is hard-coded in the print program, for each country (for example, Norway = %14).
- Override the default value by entering a value.
- When entering a voucher, enter a value in the Remark field to override the default value.

Description of Goods

Enter the description of goods.

(SWE) Setting Up Enterprise Information for Sweden

This section provides an overview of enterprise information for Sweden and discusses how to set up enterprise information for Sweden.

Understanding Enterprise Information for Sweden

To transmit bank files, you must enter additional information for the financial institution for security and identification reasons. For example, you can seal the bank file before transmitting it to *Postgirot/Bankgirot*.

The information that is required depends on the financial institution that you use for electronic payments. You receive the required information, such as the seal (*sigill*) and customer number, from your bank.

Form Used to Set Up Enterprise Information for Sweden

| Form Name | FormID | Navigation | Usage |
|-------------------------|----------|---|---|
| Revise Enterprise Info. | W0474N1B | Swedish Localization (G74W), Swedish Enterprise Information for BG/PG Click Add on the Work With Enterprise Info form. | Set up enterprise information for Sweden. |

Setting Up Enterprise Information for Sweden

Access the Revise Enterprise Info. form.

Bank Account Number

Enter your bank, *Bangiro*, or *Postgiro* account number.

Seal Date

Enter the date on which the seal key is valid.

Even if you are transmitting from a PC, you must enter the seal date every month for each *Bankgiro* or *Postgiro* account. This date is not used in the payment process, but the program validates that a record exists for the month when the payments are made.

Seal (Y/N)

Specify whether you are using the seal feature. A contract with the provider of the seal function, SAKDATA, must be assigned.

If you are transmitting from a PC, enter *N*. In this situation, the seal (*sigill*) is entered in the PC communications program.

Seal Key

Enter the key that the system uses in the seal process.

Client Number

Enter the number that is assigned to the client by the *Postgirot*. This number is required for *Postgiro* accounts.

Client number is used for Swedish Postgiro.

(SWE) Setting Up Payment Formats for Sweden

This section provides an overview of the payment formats for Sweden and discusses how to set up processing options for:

- Create A/P Bank Tape - Sweden BG - Domestic (R04572SE1).
- Create A/P Bank Tape - Sweden BG - Foreign (R04572SE2).
- Create A/P Bank Tape - Sweden PG - Domestic (R04572SE3).

Understanding Payment Formats for Sweden

JD Edwards EnterpriseOne software provides these payment formats for Sweden:

| Format | Description |
|-----------|---|
| R04572SE1 | Create bank tape for domestic payments. |
| R04572SE2 | Create bank tape for foreign payments. |
| R04572SE3 | Create bank tape for domestic payments. |

Considerations for Processing Options for Create A/P Bank Tape - Sweden BG - Foreign (R04572SE2)

You can determine the payment category code for the Central Bank at these levels:

- You can accept the default value for each country that is hard-coded in the print program (for example, Sweden = %101).
- You can use the processing option on the Payment Cat. tab to override the default value from the program. The value that you enter becomes the new default value.
- When you enter a voucher, you can override the default value from the program and the processing option. Use the Remark field to enter the Central Bank code.

Setting Processing Options for Create A/P Bank Tape - Sweden BG Domestic (R04572SE1)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|------------------------|----------------------------|
| 1. Devise Name | Enter the devise name. |
| 2. Tape Density | Enter the tape density. |
| 3. Label Name | Enter the label name. |
| 4. Block Size | Enter the block size. |
| 5. New Volume | Enter the new volume name. |

More Tape

- | | |
|------------------------|-------------------------|
| 6. New Owner ID | Enter the new owner ID. |
| 7. File Name | Enter the file name. |

Payment Date

- | | |
|-------------------------|---|
| Due Date | Enter <i>1</i> to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date. |
| Due Date Warning | Enter <i>1</i> to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank. |

Payment Date

- | | |
|-----------------|---|
| Due Date | <p>Enter <i>1</i> to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date.</p> <p>If you enter <i>1</i> for this processing option, you must also set the Create Payment Control Groups program (R04570) to process payments by the due date. You complete this task by setting the Due Date processing option on the Process By tab of the Work With Payment Groups program to <i>1</i>.</p> |
| Warnings | Enter <i>1</i> to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank. |

Swedish Chars (Swedish Characters)

- | | |
|-------------------|---|
| Characters | Enter the last character in the Swedish alphabet. |
|-------------------|---|

Setting Processing Options for Create A/P Bank Tape - Sweden BG-Foreign (R04572SE2)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|------------------------|----------------------------|
| 1. Devise Name | Enter the devise name. |
| 2. Tape Density | Enter the tape density. |
| 3. Label Name | Enter the label name. |
| 4. Block Size | Enter the block size. |
| 5. New Volume | Enter the new volume name. |

More Tape

- | | |
|------------------------|-------------------------|
| 6. New Owner ID | Enter the new owner ID. |
| 7. File Name | Enter the file name. |

Payment Date

- | | |
|-------------------------|---|
| Due Date | Enter <i>1</i> to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date. |
| Due Date Warning | Enter <i>1</i> to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank. |

Payment Date

- | | |
|-----------------|---|
| Due Date | <p>Enter <i>1</i> to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date.</p> <p>If you enter <i>1</i> for this processing option, you must also set the Create Payment Control Groups program (R04570) to process payments by the due date. You complete this task by setting the Due Date processing option on the Process By tab of the Create Payment Groups program to 1.</p> |
| Warnings | Enter <i>1</i> to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank. |

Payment Cat. (Payment Category)

- | | |
|------------------------------|---|
| Payment Category Code | Enter the default value for the Payment Category Code for the Central Bank of Sweden. |
|------------------------------|---|

Setting Processing Options for Create A/P Bank Tape - Sweden PG - Domestic (R04572SE3)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|------------------------|-------------------------|
| 1. Devise Name | Enter the devise name. |
| 2. Tape Density | Enter the tape density. |

- | | |
|----------------------|----------------------------|
| 3. Label Name | Enter the label name. |
| 4. Block Size | Enter the block size. |
| 5. New Volume | Enter the new volume name. |

More Tape

- | | |
|------------------------|-------------------------|
| 6. New Owner ID | Enter the new owner ID. |
| 7. File Name | Enter the file name. |

Payment Date

- | | |
|-------------------------|---|
| Due Date | Enter <i>1</i> to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date. |
| Due Date Warning | Enter <i>1</i> to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank. |

Payment Date

- | | |
|-----------------|---|
| Due Date | <p>Enter <i>1</i> to use the due date as the payment date and GL date. If you leave this processing option blank, the system uses the date entered during the write process as the payment date and GL date.</p> <p>If you enter <i>1</i> for this processing option, you must also set the Create Payment Control Groups program (R04570) to process payments by the due date. You complete this task by setting the Due Date processing option on the Process By tab of the Create Payment Groups program to 1.</p> |
| Warnings | Enter <i>1</i> to enable warnings for the due date. The system ignores this processing option if you leave the Due Date processing option blank. |

CHAPTER 62

(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden

This chapter provides overviews of payment processing and additional information for vouchers and discusses how to:

- (DNK, FIN, NOR and SWE) Work with payment groups.
- (DNK, FIN, NOR, and SWE) Receive debit advice notices.
- (DNK, FIN, NOR and SWE) Upload customer payment information.
- (FIN) Upload electronic bank statements for Finland
- (DNK, NOR, and SWE) Upload information to the F03B13Z1 table.
- (DNK, FIN, NOR, and SWE) Print interest invoices.
- (DNK, FIN, NOR, and SWE) Prepare vouchers and credit notes for payment processing.

Understanding the Payment Processing for Denmark, Finland, Norway, and Sweden

When you write payments for Nordic countries, the system produces the A/P Bank File Report - Nordic Countries report (R0474N1). This report lists every voucher in the payment group or groups that have been written. To access this report, view submitted jobs.

Note. (DNK, FIN, NOR, and SWE) Nordic payments do not use a print sequence for payments. However, the system requires that a print sequence be set up. You should use the DEMO sequence to set up Nordic payments.

(DNK, FIN, NOR, and SWE) Understanding Additional Information for Vouchers

You must enter foreign payment information for the Central Bank during standard voucher entry. For Finnish domestic payments, you must also enter a reference number.

Entering Foreign Payment Information for the Central Bank

The Central Bank requires that an identification code be included on foreign payments. The Central Bank issues a list of valid identification codes for foreign payments. You enter the appropriate identification code in the Remark field during voucher entry. If you do not enter an identification code, the system assigns one of these values when you create the automatic payment file:

| Country | Value |
|---------|-------|
| Sweden | %101 |
| Denmark | %0006 |
| Norway | %14 |
| Finland | %999 |

You can change this default value by using the processing options for the various Write programs (for example, P04572SE2).

(FIN) Entering Reference Numbers for Finnish Domestic Payments

In Finland, vouchers are identified by a reference number. For domestic payments in Finland, you enter the reference number in the Remark field during voucher entry.

(DNK, FIN, NOR and SWE) Working with Payment Groups

The Nordic Work with Payments program (P0474N5) enables you to change the GL date for single or multiple payments, and to update payments from different payment control groups.

This section discusses how to:

- Set processing options for A/P Bank File Report - Nordic Countries (R0474N1).
- Set processing options for Nordic Work with Payments (P0474N5).
- Revise the GL date for payments and update payments from different control groups.

Forms Used to Work With Payment Groups for the Nordic Countries

| Form Name | FormID | Navigation | Usage |
|-----------------|----------|--|---|
| Revise Payments | W0474N5C | <p>Use one of the following navigations:</p> <p>Danish Localization (G74M), Work with Payments.</p> <p>Norwegian Localization (G74O), Work with Payments.</p> <p>Finnish Localization (G74V), Work with Payments.</p> <p>Swedish Localization (G74W), Work with Payments.</p> <p>Perform one of the following actions:</p> <p>Select Load Date from the Row menu to update the GL date.</p> <p>Select Update from the Row menu to update payments from different control groups.</p> | <p>Locate payments for which you want to revise the GL date and update payments from different control groups.</p> <p>See Chapter 62, “(DNK, FIN, NOR and SWE) Working With Country-Specific Functionality for Denmark, Finland, Norway, and Sweden,” (DNK, FIN, NOR and SWE) Working with Payment Groups, page 1176.</p> |

Setting Processing Options for A/P Bank File Report - Nordic Countries (R0474N1)

Processing options enable you to specify the default processing for programs and reports.

Default

| | |
|---|---|
| Exchange Rate Effective Date | Enter a date to use for the effective date of the exchange rate. |
| Use Voucher's Rate for Exchange Rate | Enter <i>1</i> to use the exchange rate of the voucher rate as the exchange rate. If you leave this processing option blank, the system uses the exchange rate as of the payment GL date. |
| Summary record for Finland | (FIN) Enter <i>1</i> to print a summary record for Finland with information about number of payments. |

Setting Processing Options for Nordic Work with Payments (P0474N5)

Processing options enable you to specify the default processing for programs and reports.

Update

| | |
|-------------------------------|---|
| Version Number | Enter a version number for the register program, or leave this processing option blank to use version ZJDE0001. |
| Post Void Payments | Enter <i>1</i> to post void payments to the GL. |
| Submit AP Post Program | Enter <i>1</i> to automatically submit the AP payment post program after payments are updated. |

Revising the GL Date for Payments and Updating Payments from Different Control Groups

Access the Revise Payments form.

(DNK, FIN, NOR, and SWE) Receiving Debit Advice Notices

This section provides an overview of receiving debit advice notices and discusses how to:

- Run the Load Payments Return File program.
- Set processing options for Load Payments Return File (R74W210).
- Set processing options for Debit Advice Payment Driver (R74W211).
- Set processing options for Debit Advice - Format Program, DNB (R74O212).
- Review debit advice notes and update or reset payments.

Understanding Debit Advice Note

In the Nordic countries, the bank sends a debit advice note to the company after the bank has made electronic payments on behalf of the company. The most common types of debit advice notes are:

- Notice of Delivery

This debit advice note indicates that the bank has received the payments file.

- Confirmation of Payment

This debit advice note indicates that the bank has made the payments, and the payment groups can be updated.

- Error message

This debit advice note contains information about payments that have not been made.

The debit advice notes contain the following information regarding the payments that were made:

- Paid amount.
- Payment date.
- Reference number.
- Actual currency rate that was used for foreign payments.
- Error messages.

You can upload the debit advice note information into these tables:

- F74W001
- F74W201
- F74W202
- F74W203
- F74W204

You can review the debit advice note information in these tables and then update or reset the payments. You can also update or reset the payments when you upload the debit advice note information without reviewing the information.

Loading the Payment Return File

The Load Payments Return File program uploads the debit advice file to the F007101 and F007111 tables, and then calls the Debit Advice Payment Driver program (R74W211), which calls a debit advice format program. The debit advice format program writes the debit advice information to the following tables:

- F74W001
- F74W201
- F74W202
- F74W203
- F74W204

The Debit Advice - Format program, DNB (R74O212), is currently available.

Note. If the debit advice file has already been loaded in the F007101 and F007111 tables, you can set up the Load Payments Return File program (R74W210) to call the Debit Advice Payment Driver program (R74W211) without first loading the debit advice file. For this action, leave the Path to the Bank File processing option on the Load Payments Return File program blank.

You use a processing option on the Debit Advice Payment Driver program (R74W211) to specify whether the program should automatically update or reset the payments. If the program does not automatically update or reset the payments, you can review the debit advice information in the Work with Debit Advice program (P74W200), and then update or reset the payments.

If you specify in processing option 1 that the program should automatically update or reset the payments, the program uses the status of the file and the value in processing option 2 (individual update) to determine whether to update, reset, or take no action for each payment group as described in this table:

| File Status | Value in Processing Option 2 | Action |
|----------------------------------|------------------------------|--------|
| 0 - Debit Advice no errors | 1 | Update |
| | 0 | Update |
| | | |
| 1 - Notice of Delivery no errors | 1 | None |
| | 0 | None |
| | | |

| File Status | Value in Processing Option 2 | Action |
|------------------------------------|------------------------------|--|
| 2 - Debit Advice with errors | 1 | Update passed groups, reset the others |
| | 0 | Reset all groups |
| | | |
| 3 - Server Error | 1 | None |
| | 0 | None |
| | | |
| 4 - Notice of Delivery with errors | 1 | Reset |
| | 0 | Reset |

Working with Debit Advice Notes

If you do not automatically update or reset payments when you load the payment return file, you can review the debit advice information in the Work with Debit Advice program (P74W200), and then update or reset the payments.

You can update payments using any of the following programs:

- Work with Payment Groups (P04571)
- Work with Debit Advice (P74W200)
- Work with Payments (P0474N5)

You can reset payments by using the Work with Debit Advice program or the Work with Payment Groups program.

To change the GL date of the payment or payments, use the Work with Payments program. To review debit advice information, use the Work with Debit Advice program. Otherwise, use the Work with Payment Groups program.

Note. The Delete option on the Row menu for the Work With Debit Advice program deletes debit advice information from the following tables:

F74W201

F74W202

F74W203

F74W204

The Delete option does not undo the payment group.

Form Used to Review Debit Advice Notes and Update or Reset Payments

| Form Name | FormID | Navigation | Usage |
|------------------------|----------|--|---|
| Work With Debit Advice | W74W200A | In the Fast Path, enter P74W200. To update payments, select Update from the Row menu. To reset payments, select Reset from the Row menu. | Locate debit advice records. Update and reset selected payments. |
| Work With Invoices | W74W200B | Click Select on the Work With Debit Advice form. | Review invoice information. |
| Display Errors | W74W200C | Click Select on the Work With Invoices form. | Review errors. |

Running the Load Payment Return File Program

Run the Load Payments Return File program (R74W210) from Batch Versions.

Setting Processing Options for Load Payment Return File (R74W210)

Processing options enable you to specify the default processing for programs and reports.

Defaults

- 1. Company** Specify the company for which you are loading the payments return file.
- 2. Payment Instrument** Specify the payment instrument that is assigned to the payment return file.
- 3. Path to the Bank File** Specify the location of the bank file.

If you are running this program on an NT server, enter the path in the following format: c:\\bankdata\\bankfile.txt

If you are running this program on a UNIX server, enter the path in the following format: c//bankdata//bankfile.txt

If you are running this program on an AS/400 server, enter the path in the following format: bankdata/bankfile
- 4. Version to use when calling R74W211** Specify the version to use when for the Debit Advice Payment Driver (R74W211) program.

Process

- 1. Interface Files (F007101 and F007111)** Enter 1 to purge the F007101 and F007111 tables after loading the information from these tables to the F03B13Z1 table.

Setting Processing Options for Debit Advice Payment Driver (R74W211)

Processing options enable you to specify the default processing for programs and reports.

Defaults

| | |
|---------------------------|---|
| Automatic Reset | Enter <i>Y</i> to automatically reset and update the payments that you received. |
| Reset Individually | Enter <i>I</i> to update and reset payments individually. Enter <i>0</i> to reset the entire file if it contains errors. |
| Format Program | Enter the name of the format program that extracts data from the file that you received. |
| Version Number | Enter a version number for the format program. If you leave this processing option blank, the system uses version ZJDE0001. |

Update

| | |
|---------------------------|---|
| Version Number | Enter a version number for the register program. If you leave this processing option blank, the system uses version ZJDE0001. |
| Post Void Payments | Enter <i>I</i> to post void payments to the general ledger. |
| Submit | Enter <i>I</i> to automatically submit the AP payment post program after payments have been updated. |

Setting Processing Options for Debit Advice - Format, DNB (R74O212)

Processing options enable you to specify the default processing for programs and reports.

Update

| | |
|-------------------------------------|--|
| Spot Rate Allow Update (Y/N) | Enter <i>Y</i> to enable an update to the spot rate. |
|-------------------------------------|--|

Reviewing Debit Advice Notes, Updating Payments, and Resetting Payments

Access the Work With Debit Advice form.

(DNK, FIN, NOR and SWE) Uploading Customer Payment Information for the Nordic Countries

This section provides an overview of the upload of customer payment information and discusses how to:

- (DNK) Upload customer payment information for Denmark.
- (DNK) Set processing options for Automatic Receipts Denmark (R74M001).

- (FIN) Upload customer payment information for Finland.
- (FIN) Set processing options for Automatic Receipts Finland (R74V001).
- (NOR) Upload customer payment information for Norway.
- (NOR) Set processing options for Automatic Receipts Norway (R74O001).
- (SWE) Upload customer payment information for Sweden.
- (SWE) Set processing options for Automatic Receipts Sweden BG OCR (R74W001), Automatic Receipts Sweden PG OCR (R74W002), and Automatic Receipts Sweden BG AA (R74W003).
- Print interest invoices for the Nordic countries.

JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide, “Processing Automatic Receipts,” Reviewing, Revising, and Adding Electronic Receipts

(DNK, FIN, NOR, SWE) Understanding the Upload of Customer Payment Information for the Nordic Countries

You can use the Nordic bank format programs to upload a text file containing bank-supplied receipt information to the Text Processor Header (F007101) and Text Processor Detail (F007111) tables, and then transfer the information from those tables to the F03B13Z1 table.

Alternatively, you can use the Copy Bank File to Interface file A/R program (R74W0010) to load information from the bank file to tables F007101 and F007111. In this case, you use the Nordic bank format programs only to transfer receipt information from the F007101 and F007111 tables to the F03B13Z1 table. You use a processing option on the Nordic bank format programs to specify whether the bank file has already been loaded to the F007101 and F007111 tables.

(FIN) Reference Numbers

The standard reference number that is used for payments in Finland is limited to twenty characters, with one character used as a check digit. You must include one or more of these numbers in the reference number:

- Customer number
- Invoice number
- Company number

You use the processing options on the Automatic Receipts Finland program (R74V001) to specify the format of the reference number.

The fields in the reference number are limited to these maximum lengths:

- Customer number - 8 characters
- Invoice number - 8 characters
- Company number - 3 characters

The system provides a business function that you can use to calculate Finnish reference numbers. For example, you might launch this business function when you want to print reference numbers on the invoices that you create in the JD Edwards EnterpriseOne Accounts Receivable system or JD Edwards EnterpriseOne Sales Order Management system.

Note. Implementing the reference number functionality requires customization.

See Also

Chapter 61, “(DNK, FIN, NOR and SWE) Setting Up Functionality for Denmark, Finland, Norway, and Sweden,” (FIN) Calculating the Finnish Reference Number, page 1160

(DNK) Uploading Customer Payment Information for Denmark

The JD Edwards EnterpriseOne system provides this Danish bank format:

| Object | Navigation | Bank Format |
|---------|---|--|
| R74M001 | Danish Localization (G74M), Automatic Receipts Denmark | <i>Faelles Indbetalningskort</i> (OCR) |

(DNK) Setting Processing Options for Automatic Receipts Denmark (R74M001)

Processing options enable you to specify the default processing for programs and reports.

Defaults

These processing options let you specify various setting that are used by the bank format program.

- 1. Company**

Specify the company to use to select payments. If you enter a company number, only payments for the company you enter are loaded into the F03B13Z1 table. Only transactions for that company are matched.

If you leave this processing option blank, transactions are matched for all companies in the environment. This option is useful if customers are paying to the wrong company in a group.
- 2. Document Type**

Specify the document type for the invoices to be paid, for example, *RI*.
- 3. Payment Instrument**

Specify the payment instrument to applied to the payments. This processing option is optional.
- 4. G/L Bank Account**

Specify the short account ID of the default G/L bank account, if the short account ID field is blank in the F03B13Z1 table.

A valid short account ID must exist for the system to process records. Enter the short account ID as an eight-digit number starting with zeros. For example, 00000108.
- 5. Bank file**

Specify whether the bank file has already been loaded to the Text Processor Header (F007101) and the Text Processor Detail (F007111) tables. Values are:

Blank: The bank file has already been loaded.

1: The bank file has not been loaded.

If you enter *I*, the system loads the bank file to the F007101 and F007111 tables, and then populates the F03B13Z1 table with information from the F007101 and F007111 tables.

If you leave this processing option blank, the system populates the F03B13Z1 table with information already in the F007101 and F007111 tables. Leave this processing option blank only if the F007101 and F007111 tables are already loaded with payment information.

6. Path to the Bank File

Specify the location of the bank file.

If you are running this program on an NT server, enter the path in this format:
c:\\bankdata\\bankfile.txt

If you are running this program on a UNIX server, enter the path in this format: c//bankdata//bankfile.txt

If you are running this program on an AS/400 server, enter the path in this format: bankdata/bankfile

Process

This processing option enables you to specify whether to purge the Text Processor Header (F0071010) and Text Processor Detail (F007111) tables.

7. Interface Files (F007101 and F007111)

Specify whether the system should purge the F007101 and F007111 tables after loading the information from these tables to the F03B13Z1 table. Values are:

Blank: Do not purge the text processor tables.

I: Purge the text processor tables.

Select

These processing options let you specify the position of the customer and invoice numbers in the reference number.

1. Starting Position of Supplier Number and 2. End Position of Supplier Number

Specify the positions in the reference number (OCR number) at which the customer number starts and ends. The reference number can be the invoice number or the customer number and the invoice number.

Example:

- The customer number is 1001.
- The invoice number is 1234.
- The bank file reference number is displayed as 00010011234.

You enter 4 in the Starting Position of Supplier Number processing option because the customer number starts at position 4 and 7 in the End Position of Supplier Number processing option because the customer number ends at position 7.

3. Start Position of Invoice Number and 4. End Position of Invoice Number

Specify the position in the reference number (OCR number) at which the invoice number starts and ends. The reference number can be the invoice number, or the customer number and the invoice number.

Example:

- The customer number is 1001.

- The invoice number is 1234.
- The reference number is displayed as 00010011234.

You enter 8 in the Start Position of Invoice Number processing option because the invoice number starts at position 8. You enter 11 in the End Position of Invoice Number processing option because the invoice number ends at position 11.

(FIN) Uploading Customer Payment Information for Finland

The JD Edwards EnterpriseOne system provides this Norwegian bank format:

| Object | Navigation | Bank Format |
|---------|--|------------------------|
| R74V001 | Finnish Localization (G74V), Automatic Receipts Finland | V1.0 Standard, Finland |

(FIN) Setting Processing Options for Automatic Receipts Finland (R74V001)

Processing options enable you to specify the default processing for programs and reports.

Defaults

These processing options let you specify various setting that are used by the bank format program.

- 1. Company**
Specify the company to use to select payments. If you enter a company number, only payments for the company you enter are loaded into the F03B13Z1 table. Only transactions for that company are matched.

If you leave this processing option blank, transactions are matched for all companies in the environment. This option is useful if customers are paying to the wrong company in a group.
- 2. Document Type**
Specify the document type for the invoices to be paid, for example, *RI*.
- 3. Payment Instrument**
Specify the payment instrument to apply to the payments. This processing option is optional.
- 4. G/L Bank Account**
Specify the short account ID of the default G/L bank account if the short account ID field is blank in the F03B13Z1 table.

A valid short account ID must exist for the system to process records. Enter the short account ID as an eight-digit number starting with zeros. For example, 00000108.
- 5. Bank File**
Specify whether the bank file has already been loaded to the F007101 and F007111 tables. Values are:

Blank: The bank file has already been loaded.
I: The bank file has not been loaded.

If you enter *I*, the system loads the bank file to the F007101 and F007111 tables, and then populates the F03B13Z1 table with information from the F007101 and F007111 tables.

If you leave this processing option blank, the system populates the F03B13Z1 table with information already in the F007101 and F007111 tables. Leave this processing option blank only payment information has already been loaded to the F007101 and F007111 tables.

6. Path to the Bank File

Specify the location of the bank file.

If you are running this program on an NT server, enter the path in this format: c:\\bankdata\\bankfile.txt

If you are running this program on a UNIX server, enter the path in this format: c//bankdata//bankfile.txt

If you are running this program on an AS/400 server, enter the path in this format: bankdata/bankfile

7. Receipt Number

Specify how you want to generate receipt numbers. Values are:

Blank: Use Next Numbers to generate the receipt number.

Note. If you leave this processing option blank to use Next Numbers, you must set up Next Numbers for system 74V in the Next Numbers table.

I: Use the invoice number as the receipt number.

Process

This processing option lets you specify whether to purge the Text Processor Header (F0071010) and the Text Processor Detail (F007111) tables.

1. Interface Files (F007101 and F007111)

Specify whether the system should purge the F007101 and F007111 tables after loading the information from these tables to the F03B13Z1 table. Values are:

Blank: Do not purge the text processor tables.

I: Purge the text processor tables.

Select

These processing options let you specify the position of the customer and invoice numbers in the reference number.

1. Starting Position of Customer Number and 2. End Position of Customer Number

Specify the positions in the reference number at which the customer number starts and ends. The reference number can be the customer number, the invoice number, and the company number.

For example:

- The customer number is 1001.
- The invoice number is 1234.
- The company number is 100.
- The reference number is displayed as 0000100100001234100.

You enter *I* in the Starting Position of Customer Number processing option because the customer number starts at position 1. You enter *8* in the End Position of Customer Number processing option because the customer number ends at position 8.

3. Starting Position of Invoice Number and 4. End Position of Invoice Number

Specify the positions in the reference number at which the invoice number starts and ends. The reference number can be the customer number, the invoice number, and the company number.

For example:

- The customer number is 1001.
- The invoice number is 1234.
- The company number is 100.
- The reference number is displayed as 0000100100001234100.

You enter *9* in the Starting Position of Invoice Number processing option because the invoice number starts at position 9. You enter *16* in the End Position of Invoice Number processing option because the invoice number ends at position 16.

5. Starting Position of Company Number and 6. End Position of Company Number

Specify the positions in the reference number at which the company number starts and ends. The reference number can be the customer number, the invoice number, and the company number.

For example:

- The customer number is 1001.
- The invoice number is 1234.
- The company number is 100.
- The reference number is displayed as 0000100100001234100.

You enter *17* in the Starting Position of Company Number processing option because the company number starts at position 17. You enter *19* in the End Position of Company Number processing option because the company number ends at position 19.

(NOR) Uploading Customer Payment Information for Norway

The JD Edwards EnterpriseOne system provides this Norwegian bank format:

| Object | Navigation | Bank Format |
|---------|---|-------------------------|
| R74O001 | Norwegian Localization (G74O), Automatic Receipts Norway | Standard, OCRGiro (OCR) |

(NOR) Setting Processing Options for Automatic Receipts Norway (R74O001)

Processing options enable you to specify the default processing for programs and reports.

Defaults

These processing options enable you to specify various settings that are used by the bank format program.

1. Company

Specify the company to use to select payments. If you enter a company number, only payments for the company you enter are loaded into the F03B13Z1 table. Only transactions for that company are matched.

- If you leave this processing option blank, transactions are matched for all companies in the environment. This option is useful if customers are paying to the wrong company in a group.
- 2. Document Type** Specify the document type for the invoices to be paid, for example, RI.
- 3. Payment Instrument** Specify the payment instrument to applied to the payments. This processing option is optional.
- 4. G/L Bank Account** Specify the short account ID of the default G/L bank account, if the short account ID field is blank in the F03B13Z1 table.
- A valid short account ID must exist for the system to process records. Enter the short account ID as an eight-digit number starting with zeros. For example, 00000108.
- 5. Bank File** Specify whether the bank file has already been loaded to the Text Processor Header (F007101) and Text Processor Detail (F007111) tables. Values are:
- Blank: The bank file has already been loaded.
- 1*: The bank file has not been loaded.
- If you enter *1*, the system loads the bank file to the F007101 and F007111 tables, and then populates the F03B13Z1 table with information from the F007101 and F007111 tables.
- If you leave this processing option blank, the system populates the F03B13Z1 table with information already in the F007101 and F007111 tables. Leave this processing option blank only if the F007101 and F007111 tables are already loaded with payment information.
- 6. Path to the Bank File** Specify the location of the bank file.
- If you are running this program on an NT server, enter the path in this format: c:\\bankdata\\bankfile.txt
- If you are running this program on a UNIX server, enter the path in this format: c//bankdata//bankfile.txt
- If you are running this program on an AS/400 server, enter the path in this format: bankdata/bankfile

Process

This processing option lets you specify whether to purge the Text Processor Header (F007101) and Text Processor Detail (F007111) tables.

- 1. Interface Files (F007101 and F007111)** Specify whether the system should purge the F007101 and F007111 tables after loading the information from these tables to the F03B13Z1 table. Values are:
- Blank: Do not purge the text processor tables.
- 1*: Purge the text processor tables.

Select

These processing options let you specify the position of the customer and invoice numbers in the reference number.

1. Starting Position of Supplier Number and End Position of Supplier Number

Specify the positions in the reference number (OCR number) at which the customer number starts and ends. The reference number can be the invoice number, or the customer number and the invoice number.

For example:

- The customer number is 1001.
- The invoice number is 1234.
- The reference number is displayed as 00010011234.

You enter 4 in the Starting Position of Supplier Number processing option because the customer number starts at position 4. You enter 7 in the End Position of Supplier Number processing option because the customer number ends at position 7.

3. Starting Position of Invoice Number and End Position of Invoice Number

Specify the positions in the reference number (OCR number) at which the invoice number starts and ends. The reference number can be the invoice number, or the customer number and the invoice number.

For example:

- The customer number is 1001.
- The invoice number is 1234.
- The reference number is displayed as 00010011234.

You enter 8 in the Starting Position of Invoice Number processing option because the invoice number starts at position 8. You enter 11 in the End Position of Invoice Number processing option because the invoice number ends at position 11.

(SWE) Uploading Customer Payment Information for Sweden

The JD Edwards EnterpriseOne system provides these Swedish bank formats:

| Object | Navigation | Bank Format |
|---------|--|--|
| R74W001 | Swedish Localization (G74W), Automatic Receipts Sweden BG OCR | Bankgirot, Inbetalningsservice (OCR) |
| R74W002 | Swedish Localization (G74W), Automatic Receipts Sweden PG OCR | Postgirot, Inbetalningsservice (OCR) |
| R74W003 | Swedish Localization (G74W), Automatic Receipts Sweden BG AA | Bankgirot, Automatisk Avprickning (LM) |

(SWE) Setting Processing Options for Automatic Receipts Sweden BG OCR (R74W001), Automatic Receipts Sweden PG OCR (R74W002), and Automatic Receipts Sweden BG AA (R74W003)

Processing options enable you to specify the default processing for programs and reports.

Note. The processing options on the Select tab do not apply to the Automatic Receipts Sweden BG AA program (R74W003).

Defaults

These processing options let you specify various setting that are used by the bank format program.

- | | |
|---------------------------------|--|
| 1. Company | Specify the company to use to select payments. If you enter a company number, only payments for the company you enter are loaded into the F03B13Z1 table. Only transactions for that company are matched. If you leave this processing option blank, transactions are matched for all companies in the environment. This option is useful if customers are paying to the wrong company in a group. |
| 2. Document Type | Specify the document type for the invoices to be paid, for example, <i>RI</i> . |
| 3. Payment Instrument | Specify the payment instrument to be applied to the payments. This processing option is optional. |
| 4. G/L Bank Account | Specify the short account ID of the default G/L bank account, if the short account ID field is blank in the F03B13Z1 table. A valid short account ID must exist for the system to process records. Enter the short account ID as an eight-digit number starting with zeros. For example, 00000108. |
| 5. Bank File | Specify whether the bank file has already been loaded to the F007101 and F007111 tables. Values are: Blank: The bank file has already been loaded. <i>1</i> : The bank file has not been loaded. If you enter 1, the system loads the bank file to the F007101 and F007111 tables, and then populates the F03B13Z1 table with information from the F007101 and F007111 tables. If you leave this processing option blank, the system populates the F03B13Z1 table with information already in the F007101 and F007111 tables. Leave this processing option blank only if the F007101 and F007111 tables are already loaded with payment information. |
| 6. Path to the Bank File | Specify the location of the bank file. If you are running this program on an NT server, enter the path in this format: c:\\bankdata\\bankfile.txt If you are running this program on a UNIX server, enter the path in this format: c//bankdata//bankfile.txt If you are running this program on an AS/400 server, enter the path in this format: bankdata/bankfile |

Process

This processing option lets you specify whether to purge the Text Processor Header (F007101) and Text Processor Detail (F007111) tables.

1. Interface Files (F007101 and F007111)

Specify whether the system should purge the F007101 and the F007111 tables after loading the information from these tables to the F03B13Z1 table. Values are:

Blank: Do not purge the text processor tables.

I: Purge the text processor tables.

Select

These processing options let you specify the position of the customer and invoice numbers in the reference number.

1. Starting Position of Supplier Number and End Position of Supplier Number

Specify the positions in the reference number (OCR number) at which the customer number starts and ends. The reference number can be the invoice number, or the customer number and the invoice number.

For example:

- The customer number is 1001.
- The invoice number is 1234.
- The reference number is displayed as 00010011234.

You enter 4 in the Starting Position of Supplier Number processing option because the customer number starts at position 4. You enter 7 in the End Position of Supplier Number processing option because the customer number ends at position 7.

3. Starting Position of Invoice Number and End Position of Invoice Number

Specify the positions in the reference number (OCR number) at which the invoice number starts and ends. The reference number can be the invoice number, or the customer number and the invoice number.

For example:

- The customer number is 1001.
- The invoice number is 1234.
- The reference number is displayed as 00010011234.

You enter 8 in this processing option because the invoice number starts at position 8. You enter 11 in this processing option because the invoice number ends at position 11.

(FIN) Uploading Electronic Bank Statements for Finland

This section provides an overview of electronic bank statements and discusses how to:

- Upload transactions from electronic bank statements.
- Set processing options for Automatic Debit Statements Input Finland (R74V002).

See Also

JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide, “Working with the Text File Processor”

Understanding Electronic Bank Statements

Finnish banks can support their corporate customers with electronic account statements. Electronic account statements are obtained from the bank's information system. You receive the statements by using a bank transfer program that is separate from the JD Edwards EnterpriseOne system. The bank transfer program enables you to add account information to transactions, such as bank charges, that are created in the bank's information system.

You can use the Automatic Debit Statements Input Finland program (R74V002) to upload transactions from the electronic account statement to the text processor header F007101 and detail F007111 tables and to transfer journal entries from these tables to the F0911Z1 batch table.

Alternatively, you can use the Copy Bank File to Interface file A/R - Sweden program (R74W0010) to load the electronic account statement to the F007101 and F007111 tables, and then use the Automatic Debit Statements Input Finland program only to transfer journal entries from the F007101 and F007111 tables to the F0911Z1 table.

You set a processing option to specify whether the Automatic Debit Statements Input Finland program should upload data to the F007101 and F007111 tables before it transfers journal entries from those tables to the F03B13Z1 electronic receipts table. Uploading the data into the text file processing system allows the system to maintain the processing status of each tape record, including its purge capability.

When you upload the journal entries to the JD Edwards EnterpriseOne General Accounting system, the transactions are stored in batch tables. You can review and revise the transactions prior to processing them.

Note. All transactions in the bank file are uploaded to one document in the JD Edwards EnterpriseOne General Accounting system. Therefore, the bank file should contain only transactions with the same currency.

If the bank file contains transactions for different companies, the system creates a journal entry for each company.

Bank File Format

This table describes the format of the bank file:

| Description | Length | Position |
|------------------|--------|----------|
| Transaction type | 2 | 1–2 |
| Document number | 8 | 3–10 |
| G/L date | 6 | 11–16 |
| Business unit | 11 | 17–27 |
| Object account | 6 | 28–33 |
| Subsidiary | 8 | 34–41 |
| Subledger | 8 | 42–49 |
| Account type | 1 | 50–50 |
| Not in use | 7 | 51–57 |
| Not in use | 2 | 58–59 |

| Description | Length | Position |
|------------------------|--------|----------|
| Name alpha explanation | 30 | 60–89 |
| Debit/credit | 1 | 90–90 |
| Amount | 14 | 91–104 |
| Currency code | 3 | 105–108 |
| Currency amount | 14 | 109–122 |
| Not in use | 14 | 123–136 |
| Company number | 4 | 137–140 |
| Not in use | 11 | 141–151 |

Uploading Transactions from Electronic Bank Statements

Access the Automatic Debit Statements Input Finland program (R74V002) using Batch Versions (P98305).

Setting Processing Options for Automatic Debit Statements Input Finland (R74V002)

Use these processing options to specify settings that are used during the processing of the bank file.

Defaults Tab

- 1. Company**
Specify the company number to use to select payments. The system loads only payments for this company into the F03B13Z1 table and matches only transactions for this company.

If you leave this processing option blank, the system matches transactions for all companies in the environment. You might leave this processing option blank if customers are paying to the wrong company in a group.
- 2. Document Type, if left blank 'JE' is used.**
Specify the document type, such as RI, of the invoices to be paid. If you leave this processing option blank, the system uses the document type JE.
- 3. Enter the Subledger Type to use, if left blank 'X' is used.**
Enter the subledger type that the system uses for the transactions. If you use subledgers, you must enter a value for this processing option. If you leave this processing option blank, the system uses subledger type X.
- 4. Path to the Bank File**
Specify the location of the bank file.

If you run this program on an NT server, enter the path in this format:
c:\\bankdata\\bankfile.txt.

If you run this program on a UNIX server, enter the path in this format:
c//bankdata//bankfile.txt.

If you are run this program on an AS/400 server, enter the path in this format:
bankdata/bankfile.

5. Bank File

Specify whether the bank file has already been loaded to the F007101 and F007111 table. Values are:

Blank: The bank file has been loaded.

Leave this processing option blank only if payment information has already been loaded to the F007101 and F007111 tables. The system populates the F03B13Z1 table with information in the F007101 and F007111 tables.

I: The bank file has not been loaded.

The system loads the bank file to the F007101 and F007111 tables, and then populates the F03B13Z1 with information from the F007101 and F007111 tables.

Process Tab**1. Interface Files (F007101 and F007111)**

Specify whether the system should purge the F007101 and F007111 text processor tables after loading the information from these tables to the F03B13Z1 table. Values are:

Blank: Do not purge the F007101 and F00711 tables.

I: Purge the F007101 and F00711 tables.

(DNK, NOR, and SWE) Uploading Information to the F03B13Z1 Table

This section provides an overview of the Copy Bank File to Interface File A/R program and discusses how to:

- Run the Copy Bank File to Interface File A/R program.
- Set processing options for Copy Bank File to Interface File A/R (R74W0010).

Understanding the Copy Bank File to Interface File A/R Program

You use the Copy Bank File to Interface File A/R program (R74W0010) to upload bank files that contain receipt information into the F007101 and the F007111 tables. You use country-specific bank format programs to transfer the receipt information from tables F007101 and F007111 to the F03B13Z1 table. After the information is transferred to table F03B13Z1, the information can be uploaded and matched against outstanding customer invoices.

Uploading the information in the text file processor enables data to be managed efficiently with automatic maintenance of the processing status of each tape record, including purging capability.

Complete these steps to upload a text file from the bank to the F03B13Z1 table:

1. Receive a text file containing payment information from the bank.
2. Run the Copy Bank File To Interface File A/R program (R74W0010) to load the bank information into table F007101 and table F007111 in the correct format. You then run the appropriate bank format program (R74W001, R74V001, and so on) to transfer the data from tables F007101 and F007111 to table F03B13Z1.
3. Run the standard automatic receipts matching process.

Note. Alternatively, you can run the appropriate bank format program (R74W001, R74V001, and so on), configuring the processing options on the bank format program to first upload the bank information into tables F007101 and F007111, and then transfer that data into table F03B13Z1. This process does not use the Copy Bank File to Interface File A/R program and is well-suited to small businesses in which the person who uploads the file from the bank is also the person who processes automatic receipts.

Running the Copy Bank File to Interface File A/R Program

Use one of these navigations:

Select Danish Localization (G74M), Copy Bank File to Interface File A/R.

Select Norwegian Localization (G74O), Copy Bank File to Interface File A/R.

Select Swedish Localization (G74W), Copy Bank File to Interface File A/R.

Setting Processing Options for Copy Bank File to Interface File A/R (R74W0010)

Processing options enable you to specify the default processing for programs and reports.

Defaults

These processing options let you specify information that the system uses when loading the bank file.

- | | |
|---------------------------------|---|
| 1. Description | Specify the description of the interface file. If you are uploading a file from the Swedish BG and it is in the OCR format, enter BG OCR. |
| 2. Format Program | <p>Specify the bank format program that you are using to load the bank file. Values are:</p> <p><i>R74W001:</i> Sweden BG OCR</p> <p><i>R74W002:</i> Sweden PG OCR</p> <p><i>R74W003:</i> Sweden BG AA</p> <p><i>R74O001:</i> Norway OCR</p> <p><i>R74M001:</i> Denmark OCR</p> <p><i>R74V001:</i> Finland Reference Payments</p> |
| 3. Path to the Bank File | <p>Specify the location of the bank file.</p> <p>If you are running this program on an NT server, enter the path in this format: c:\\bankdata\\bankfile.txt</p> <p>If you are running this program on a UNIX server, enter the path in this format: c://bankdata//bankfile.txt</p> <p>If you are running this program on an AS/400 server, enter the path in this format: bankdata/bankfile</p> |

Version

This processing option lets you specify the version of the bank format program to use.

1. Version of the Format Program

Specify the version name of the bank format program that you are using to upload the bank file.

(DNK, FIN, NOR, and SWE) Printing Interest Invoices for Nordic Countries

This section provides an overview of interest invoices and discusses how to:

- Run the Invoice Print Sweden - 03B program.
- Set processing options for Invoice Print Sweden - 03B (R74W0030).

Understanding Interest Invoices

The base system uses the Invoice Print program (R03B505) to print delinquency fees. This program creates summarized information at the customer level.

To support business practice in Nordic countries, use the Invoice Print Sweden - 03B program (R74W0030) to print detailed information about the late paid invoices that have caused the delinquency fee.

You run the Invoice Print Sweden program as a complement to the Late Payment Delinquency Fees program (R03B221). The system launches the Late Payment Delinquency Fees program from the Credit Analysis Refresh program (R03B525) if you activate late payment delinquency fees in the processing options on the Fees tab for the Credit Analysis Refresh program.

Note. If you use the Late Payment Delinquency Fees program to calculate delinquency fees for both open and paid amounts, the system does not complete all of the columns in the interest invoice.

Running the Invoice Print Sweden - 03B Program

Set up a menu selection for the Invoice Print Sweden - 03B program (R74W0030).

Setting Processing Options for Invoice Print Sweden - 03B (R74W0030)

Processing options enable you to specify the default processing for programs and reports.

Print

- | | |
|------------------------------|--|
| 1. Invoice Print Date | Specify the date on which the invoice is printed. If you leave this option blank, the system uses today's date. |
| 2. Tax Amount | Specify whether the system prints tax amounts on invoices. Values are: Blank: Do not print tax amounts. <i>I</i> : Print tax amounts. |
| 3. Currency | Specify whether the system prints invoices with currency. Values are: Blank: Do not print invoices with currency. <i>I</i> : Print invoices with currency. |

4. Attachments

Specify whether the system prints attachments associated with invoices.
Values are:

Blank: Do not print attachments associated with invoices.

I: Print attachments associated with invoices.

(DNK, FIN, NOR, and SWE) Preparing Vouchers and Credit Notes for Payment Processing

This section provides an overview of the process for preparing vouchers and credit notes for payment processing and discusses how to:

- Run the Enhanced Due Date Processing Sweden report.
- Set processing options for Enhanced Due Date Processing Sweden (R74W0020).
- Run the Enhanced Due Date Processing - Discounts Sweden - 04.
- Set processing options for Enhanced Due Date Processing - Discounts Sweden - 04 (R74W0021).

Understanding the Process for Preparing Vouchers and Credit Notes for Payment Processing

Businesses in Nordic countries use a credit note, if one exists, for payments before using the company's bank account. If you use due date processing in automatic payments, which is common in Nordic countries, the base system requires you to manually match the due dates for a credit note and a voucher. In this localization, the system can automatically match the due dates of credit notes and vouchers.

If a supplier offers payment terms with a discount, the system sets the payment date to the discount due date. If the discount due date has passed, you might want to change the due date to the net due date. In the base system, you must change the net due date manually. This localization enables you to automatically change the due date.

Revising Due Dates for Credit Notes

Use the Enhanced Due Date Processing Sweden program (R74W0020) to automatically change the due date of a credit note to the due date of a matching voucher. The program creates a report that specifies the new due date for the credit note. The program can be run in proof or final mode.

You can run the Enhanced Due Date Processing Sweden program from the Create Payment Control Groups program (R04570) or as a stand-alone program. It is recommended that you first submit this program as a stand-alone program in proof mode. Use processing options to specify whether the program runs as a stand-alone program or is launched from the Create Payment Control Groups program.

If you set the processing options to run the Enhanced Due Date Processing Sweden program (R74W0020) from the Create Payment Control Groups program (R04570), the processing options on the Select tab and the first four processing options on the Process tab use the values of the corresponding processing options from the Create Payment Control Groups program.

To run this program as a stand-alone program, you must set up a menu selection for the Enhanced Due Date Processing Sweden program.

Important! The Enhanced Due Date Processing Sweden program retrieves pay items from the F0411 table. If a voucher contains both negative and positive pay items, this program might change the due date for a negative pay item that is a part of a voucher. If it does so, the action results in the negative and positive amounts on the same voucher having different due dates.

The program matches credit notes to vouchers in this sequence:

- Payment ID.
- GL bank account.
- Business unit (only if the Process by Business Unit processing option is set to *I*).
- Currency.
- Payee address number (only if the Process by Payee processing option is set to *I*).
- Company.
- Address number.
- Due date.

Example of Credit Note Equal to Voucher Amount

In this example, a supplier has a credit note for the amount of negative 500 with a due date of July 15, 2005, and a voucher for the amount of 500 with a due date of July 30, 2005.

If you use due date processing without changing the due date, the voucher is paid in full and the credit is not used because the due dates for the credit note and the voucher are different.

This form shows the voucher and the credit note with different due dates:

Standard Voucher Entry - Supplier Ledger Inquiry

Select Find Add Copy Delete Close Form Row Tools

Recurring Summarize Paid Open Withheld All

Batch Number 9903 Currency Code *

Records 1 - 3

| | Document Number | Doc Type | Doc Co | Invoice Date | G/L Date | Due Date | Gross Amount | Open Amount |
|--------------------------|-----------------|----------|--------|--------------|----------|----------|--------------|-------------|
| <input type="checkbox"/> | 17 | PD | 00001 | 07/15/05 | 07/15/05 | 07/15/05 | 500.00- | 500.00- |
| <input type="checkbox"/> | 1040 | PV | 00001 | 06/03/05 | 06/03/05 | 07/03/05 | 500.00 | 500.00 |
| <input type="checkbox"/> | | | | | | | | |

Supplier Ledger Inquiry form

When you run the Enhanced Due Date Processing Sweden program (R74W0020) in proof mode, the system produces a report that shows that the due date of the credit note can be changed to match the due date of the voucher.

When you run the Enhanced Due Date Processing Sweden program in final mode, the system changes the due date of the credit note to July 30, 2005. Because the due dates of the credit note and the voucher are now the same, the system reduces the payment amount by the amount of the credit note in the next automatic payment to the supplier.

The Supplier Ledger Inquiry form displays the voucher and credit note with matching due dates.

Example of Credit Note in Excess of Voucher Amount

In this example, a supplier has a credit note for the amount of negative 1,200 with a due date of July 14, 2005 and a voucher for the amount of 1,000 with a due date of July 06, 2005. The amount of the credit exceeds that which is needed to pay the voucher.

When you run Enhanced Due Date Processing Sweden (R74W0020) in final mode, the system uses part of the credit note to pay the voucher. The system creates a new pay item for the remaining part of the credit note. The matching pay item has the same due date as that of the voucher. The remaining amount on the credit note has an unchanged due date.

The system generates the Enhanced Due Date Processing Sweden report, which shows the new due date of the credit note and the newly created pay item.

The Supplier Ledger Inquiry form now displays the new pay item that offsets the voucher.

Revising Due Dates for Discounted Vouchers

Use the Enhanced Due Date Processing - Discounts Sweden - 04 program (R74W0021) to automatically change the payment date of a voucher from the discount due date to the net due date if the discount due date has passed. The program creates a report that lists the new due date. The program can be run in proof or final mode.

You can run the Enhanced Due Date Processing - Discounts Sweden - 04 program from the Create Payment Control Group program (R04570), or you can run it as a stand-alone version. It is recommended that you first submit this program as a stand-alone version in proof mode. Use processing options for this program to control whether the program runs as a stand-alone version or runs from the Create Payment Control Group program.

To run this program as a stand-alone version, you need to set up a menu selection for the Enhanced Due Date Processing - Discounts Sweden - 04 program.

Example of Discount Due Date Has Passed

In this example, a supplier has a voucher with payment terms that offer a discount if paid within ten days of the invoice date. The invoice date is February 15, 2008; thus, the due date is February 25, 2008.

When you run Enhanced Due Date Processing - Discounts Sweden (R74W0021) in final mode after the discount due date has occurred, the system changes the due date of the voucher from the discount due date to the net due date, which is March 16, 2008, or 30 days after the invoice date.

Running the Enhanced Due Date Processing Report

Select one of these navigations:

Swedish Localization (G74W), Enhanced Due Date Processing.

Norwegian Localization (G74O), Enhanced Due Date Processing.

Finnish Localization (G74V), Enhanced Due Date Processing.

Danish Localization (G74M), Enhanced Due Date Processing.

Setting Processing Options for Enhanced Due Date Processing (R74W0020)

Processing options enable you to specify the default processing for programs and reports.

Select

1. Pay Thru Date

Specify the due date through which you want to process credit notes. The system processes all credit notes with due dates up to and including the date that you enter. For example, to process a group consisting of credit notes with due dates through March 15, 2005, enter 03/15/05. Enter the date in this processing option or leave the processing option blank to select credit notes using the Displacement Days processing option.

Note. If you leave the Pay Through Date field blank and the Displacement Days processing option blank, the system uses the system date as the pay through date.

2. Displacement Days

Specify the number of days from the current date through which you want to process credit notes. For example, if the current date is March 10 and you specify three displacement days, the system processes vouchers with due dates through March 13. Enter the number of days in this processing option or leave this processing option blank and use the Pay Through Date processing option to select credit notes.

Note. If you leave the Displacement Days processing option blank and leave the Pay Through Date processing option blank, the system date is used as the pay through date.

3. Discount Cutoff Date

Enter the final date for which you allow discounts. Pay items with a due date prior to the date that you enter are not eligible for discounts, so the system sets the discount amounts of these pay items to zero. If you leave this processing option blank, the program takes all discounts that are currently available for the selected pay items.

Process

1. Company

Enter *1* to create separate payments based on the company.

2. Due Date

Enter *1* to create payments separately, based on due date. If you leave this processing option blank, the Enhanced Due Date Processing program does not run.

3. Payee

Enter *1* to create payments separately based on payee, regardless of the supplier.

For example, this list illustrates one possible voucher, supplier, and payee combination:

Voucher 1, Supplier 1001, Payee 1001.

Voucher 2, Supplier 1001, Payee 1002.

Voucher 3, Supplier 1001, Payee 1002.

Voucher 4, Supplier 1002, Payee 1002.

Voucher 5, Supplier 1003, Payee 1001.

If you leave the Payee processing option blank in the Create Payment Control Groups program, the system generates four payments, based on the payee and then on the supplier:

Payee 1001: Supplier 1001, Voucher 1.

Payee 1001: Supplier 1003, Voucher 5.

Payee 1002: Supplier 1001, Vouchers 2 and 4.

Payee 1002: Supplier 1002, Voucher 4.

If you set the Payee processing option to *I*, you have two payments based only on the payee:

Payee 1001: Supplier 1001, Voucher 1, and Supplier 1003, Voucher 5.

Payee 1002: Supplier 1001, Vouchers 2 and 3, and Supplier 1002, Voucher 4.

4. Business Unit

Enter *I* to create payments separately based on business unit.

5. Inline Execution from within R04570

Specify whether to run the Enhanced Due Date Processing Sweden program (R74W0020) from the Create Payment Control Groups program (R04570) prior to generating payments. Running the Enhanced Due Date Processing Sweden program from the Create Payment Groups program produces the best match of debit and credit documents. However, running this program online might slow down processing. If you rarely use the enhanced due date processing feature, consider leaving this processing option blank. Values are:

Blank: Do not run the Enhanced Due Date Processing Sweden program.

I: Run the Enhanced Due Date Processing Sweden program.

6. Stand-Alone Execution from Menu Item

Specify whether to run the Enhanced Due Date Processing Sweden program (R74W0020) standalone from a menu item. Running the Enhanced Due Date Processing Sweden program standalone enables you to reorganize credit invoices to produce best matching against debit documents at any time. Values are:

Blank: Do not enable the Enhanced Due Date Processing Sweden program to run standalone.

I: Run the Enhanced Due Date Processing Sweden program standalone.

7. Mode

Specify whether to run the report in proof or final mode. If you select proof mode, the system generates a report of possible changes, but no changes are made in the database. If you select final mode, the system generates a report and updates the invoices specified on the report. Values are:

Blank: Run the report in proof mode.

I: Run the report in final mode.

Defaults

This processing option lets you specify the minimum payment amount.

- | | |
|--------------------------|---|
| 1. Payment Amount | Specify the smallest possible value of a payment. Specify an amount to avoid creating zero amounts when matching vouchers and credit notes. |
|--------------------------|---|

Running the Enhanced Due Date Processing - Discounts Report

Use one of these navigations:

Swedish Localization (G74W), Enhanced Due Date Processing - Discounts.

Norwegian Localization (G74O), Enhanced Due Date Processing - Discounts.

Finnish Localization (G74V), Enhanced Due Date Processing - Discounts.

Danish Localization (G74M), Enhanced Due Date Processing - Discounts.

Setting Processing Options for Enhanced Due Date Processing - Discounts (R74W0021)

Processing options enable you to specify the default processing for programs and reports.

Process

These processing options enable you to specify whether the Enhanced Due Date Processing - Discounts Sweden - 04 (R74W0021) should run stand-alone or inline, and whether the program should run in proof or final mode.

- | | |
|--|--|
| 1. Inline Execution from within R04570 | <p>Specify whether to run the Enhanced Due Date Processing - Discounts Sweden program (R74W0021) from the Create Payment Control Groups program (R04570) prior to generating payments. Running this program online can slow down processing. If you rarely use the enhanced due date processing - discounts feature, you might want to run this program as standalone. Values are:</p> <p>Blank: Do not run.</p> <p><i>I</i>: Run.</p> |
| 2. Stand-Alone Execution from Menu Item | <p>Specify whether to run the Enhanced Due Date Processing - Discounts Sweden program (R74W0021) standalone from a menu item. Values are:</p> <p>Blank: Do not enable the Enhanced Due Date Processing - Discounts Sweden program to run standalone.</p> <p><i>I</i>: Run the Enhanced Due Date Processing - Discounts Sweden program standalone.</p> |
| 3. Mode | <p>Specify whether to run the report in proof or final mode. If you select proof mode, the system generates a report of possible changes but makes no changes in the database. If you select final mode, the system generates a report and updates the invoices specified on the report. Values are:</p> <p>Blank: Run the report in proof mode.</p> <p><i>I</i>: Run the report in final mode.</p> |

PART 12

Ecuador

Chapter 63

(ECU) Understanding Country-Specific Functionality for Ecuador

Chapter 64

(ECU) Setting Up Country-Specific Functionality for Ecuador

CHAPTER 63

(ECU) Understanding Country-Specific Functionality for Ecuador

This chapter discusses Ecuador-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Ecuador-Specific Setup and Processes

This table lists the country-specific setup and functionality for Ecuador:

| Setup or Process | Description |
|-----------------------------------|---|
| UDCs (user-defined codes) | <p>In addition to the base software UDCs:</p> <ul style="list-style-type: none">• Set up UDCs for tax reporting.• Set up UDCs for identification type codes.• Set up UDCs for fiscal identification for Accounts Payable transactions. <p>See Chapter 64, “(ECU) Setting Up Country-Specific Functionality for Ecuador,” Setting Up UDCs for Ecuador, page 1209.</p> |
| Automatic accounting instructions | <p>No Ecuadoran-specific AAI setup exists.</p> |
| Next numbers | <p>You must set up next numbering by company before you can process withholding certificates for rent and value-added taxes (VAT) withholding.</p> <p>See Chapter 64, “(ECU) Setting Up Country-Specific Functionality for Ecuador,” Setting Up Next Numbers for Ecuador, page 1211.</p> <p>See <i>JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide</i>, “Setting Up the Accounts Payable System,” Setting Up Accounts Payable Next Numbers.</p> |
| Address book records | <p>In addition to entering the standard information for address book records, in Ecuador, enter country-specific information for tax reporting.</p> <p>See <i>JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide</i>, “Entering Address Book Records,” (ECU) Entering Additional Address Book Information.</p> |

| Setup or Process | Description |
|--------------------|---|
| Tax processing | <p>Ecuador-specific setup or functionality exists for:</p> <ul style="list-style-type: none"> • Tax rate areas <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Setting Up Tax Information,” (ECU, PER, and VEN) Understanding Tax Rate/Areas for Ecuador, Peru, and Venezuela.</p> <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Setting Up Tax Information,” (ECU) Setting Up Additional Pair Tax (P76E0002).</p> • Tax withholding certificates <p>See <u>Chapter 64, “(ECU) Setting Up Country-Specific Functionality for Ecuador,” Understanding Tax Withholding Certificates for Ecuador, page 1209.</u></p> |
| Payment processing | <p>To process payment vouchers for Ecuador, you must set processing options for the Print Automatic Payments Check (R76E0001) program.</p> <p>See <u>Chapter 64, “(ECU) Setting Up Country-Specific Functionality for Ecuador,” Setting Up the Payment Format for Ecuador, page 1211.</u></p> |

CHAPTER 64

(ECU) Setting Up Country-Specific Functionality for Ecuador

This chapter provides an overview of tax withholding certificates, lists prerequisites, and discusses how to:

- Set up user-defined codes (UDCs).
- Set up next numbers.
- Set up payment formats.

Understanding Tax Withholding Certificates for Ecuador

When processing payments for Ecuador, you must produce a withholding certificate that lists the withholdings for rent and value-added tax (VAT). The system launches the Withholding Certificate - EC (R76E4010) program to produce the withholding certificate when you post payments.

The system uses the first line in the tax area to determine rent withholding.

Prerequisites

Before processing payments for Ecuador:

- Verify that the tax rate areas for Ecuador are set up to use the first line for rent withholding .
- Verify that a next numbering scheme is set up for withholding certificates.

See *JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide*, “Setting Up Next Numbers,” Setting Up Next Numbers by Company and Fiscal Year.

- Verify that the values of U2 and U3 exist in the Document Types (00/DT) UDC table.
- Verify that appropriate values exist in the Fiscal ID Size (76E/TL) UDC table.

Setting Up UDCs for Ecuador

Setting up Ecuadoran-specific UDCs enables you to use Ecuadoran-specific functionality. You also set up some base software UDCs with Ecuadoran-specific values.

Setting Up UDCs for Address Book Records and Accounts Payable for Ecuador

In addition to UDCs that you must set up in the base software, this table lists UDCs that you must set up for address book records and accounts payable for Ecuador:

| UDC | System | Description |
|---|---|--|
| Record Identification Type Codes (H00/TA) | JD Edwards EnterpriseOne Address Book | Record identification type codes specify the entity for which you are creating an address book record. Values are: Blank: Corporate entity 0: No validation 1: Individual 2: Corporate entity 3: Both an individual and a corporate entity 4: Non-corporate entity 5: Customs authority C: Corporate entity N: Non-corporate entity P: Individual Enter the number of characters for the tax identification number in the Special Handling field. |
| Person/Corporation Code 76C/PC | JD Edwards EnterpriseOne Address Book | The tax person code specifies the type of tax payer. Examples include: E: Special N: Non-special P: Person Z: Foreigner |
| Tax Person Code (76E/TC) | JD Edwards EnterpriseOne Accounts Payable | Use this UDC to set up codes for person types. |
| Fiscal ID Size (76E/TL) | JD Edwards EnterpriseOne Accounts Payable | Use this UDC to set up values for the character length of fiscal identification numbers. Enter a code in the Codes field, and enter the character length in the Description 02 field. |

See *JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide*, “Setting Up the Address Book System,” Setting Up User-Defined Codes for Address Book.

See *JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide*, “Setting Up the Accounts Payable System,” Setting Up UDCs for Accounts Payable.

Setting Up Next Numbers for Ecuador

You must set up next numbering schemes by company for system 76E (Ecuador) to process withholding certificates for rent and VAT withholding. Set up a next numbering scheme for document type U2 to process rent withholding, and set up a next numbering scheme for document type U3 to process rent withholding.

See *JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide*, “Setting Up Next Numbers,” Setting Up Next Numbers by Company and Fiscal Year.

Setting Up the Payment Format for Ecuador

This section provides an overview of the payment format for Ecuador and discusses how to set processing options for Print Automatic Payments Check (R76E0001).

Understanding the Payment Format for Ecuador

When you enter *P76E0001* as the print program when writing payments, the system prints a document that includes a check and information about the voucher for which the payment is generated. The information about the voucher includes:

| Information | Description |
|-------------------------------------|---|
| Company Name, Tax ID, and Fiscal ID | The system uses the values that exist in the Address Book Master table (F0101). |
| Address | The system uses the address that exists in the Address Line 1 and Address Line 2 fields of the F0101 table. |
| City, Country | The system uses the values that exist in the County and Country fields of the F0101 table. |
| Check Format Number | The system uses the next number by company setup for the document type @O. |
| Beneficiary | The system uses the value from the Accounts Payable Ledger table (F0411). |
| Document Payment Number | The system prints the payment sequence by payment method and bank account. |
| Date | The system prints the date entered during the write process. |

| Information | Description |
|--|--|
| Exchange Rate | The system prints a value from the Currency Exchange Rates (F0015) table for the exchange rate if the voucher has been processed in a foreign currency. The system prints the currency value as of the date that you generate the payment group. |
| Bank | The system prints the bank account description |
| Account Number | The system prints the bank account number from the bank account information. |
| Account | The system prints the voucher account values from the account master information. |
| Invoice, Description, Document Type, Document Number, Invoice Date | The system uses the values that exist in the Accounts Payable Ledger table (F0411) |
| Value | The system prints the value from the A/P Payment Processing - Detail (F04573) table. |

Setting Processing Options for Print Automatic Payments Check (R76E0001)

Processing options enable you to specify the default processing for programs and reports.

Translation

- 1. Translation Program** Specify which translation program to use to translate the payment amount into words. The value that you enter must exist in the Check Translation (98/CT) UDC table. If you leave this processing option blank, the system uses the translation program associated with the payment currency.

Defaults

- 1. Address Format (FUTURE)** This processing option is not used.

Select

- 1. Company Information** Enter 1 to print the company name and address on the payment stub.
- 2. Payee Information** Enter 1 to print the payee name and number on the payment stub.
- 3. Purchase Order** Enter 1 to print the purchase order number. Leave this processing option blank to print the supplier invoice number.
- 4. Alternate Stub Information** Enter 1 to print the supplier name. Enter 2 to print the supplier invoice number. Leave this processing option blank to print the remark.

Print

- 1. Form Type (FUTURE)** This processing option is not used.

PART 13

European Union

Chapter 65
(Europe) Setting Up European Union Functionality

Chapter 66
(Europe) Working With European Union Functionality

CHAPTER 65

(Europe) Setting Up European Union Functionality

This chapter provides an overview of the functionality commonly in use in European countries and discusses how to:

- Set up user-defined codes (UDCs) for European Union functionality.
- Set up commodity code information.
- Enter cross-references for items and suppliers.
- Set up layout for the IDEP/IRIS interface.
- Set up Intracommunity value-added taxes (VAT).

Understanding European Union Functionality

This table provides an overview of European Union setup and processes that you use in addition to the standard setup and processes provided in the base software.

| Setup or Process | Description |
|---------------------------|---|
| User-defined codes (UDCs) | <p>In addition to the base software UDCs, set up European Union UDCs to work with:</p> <ul style="list-style-type: none">• Intrastat reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221.• Invoices with an attached International Payment Instruction (IPI). See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.• Companies:<ul style="list-style-type: none">- Affiliated Companies (74/AC)- Code Number (74/30) See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for European Companies, page 1230. |

| Setup or Process | Description |
|----------------------------|--|
| Import and export of goods | <p>In addition to the standard setup for items, suppliers and companies, to work with imported and exported goods in the European Union:</p> <ul style="list-style-type: none"> • Set up commodity codes to identify the products that are exported from or introduced to the country. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up Commodity Code Information, page 1230.</p> <ul style="list-style-type: none"> • Enter cross-reference for items and suppliers to track the country of origin of goods. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Entering Cross-References for Items and Suppliers, page 1231.</p> |
| Bank account information | <p>Countries in Europe commonly use the International Bank Account Number (IBAN) for banking transactions. JD Edwards EnterpriseOne software supports the use of the IBAN.</p> <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding International Bank Account Numbers, page 1237.</p> <p>Bank ID and bank account validation routines exist for:</p> <ul style="list-style-type: none"> • Belgium • Finland • France • Italy • Spain <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding Bank ID and Bank Account Validation, page 1238.</p> |

Setting Up UDCs for European Union Functionality

Set up UDCs for:

- International payment instructions (IPI).
- Intrastat reporting.
- Companies

Setting Up UDCs for International Payment Instructions

Set up these UDCs before processing invoices with IPI attachments.

IPI - Address Line Sequencing (00/IA)

The IPI - Address Line Sequencing UDC table (00/IA) determines the combination of the values for the postal code, city, and country that the system includes as the second address line of the ordering customer's address on the international payment instruction (IPI).

These values are hard-coded and consistent with the requirements for IPIs. The European Committee for Banking Standards publishes the requirements for IPIs.

IPI - Charges Paid By (00/IC)

The IPI - Charges Paid By UDC table (00/IC) contains values that specify the entity who is responsible for paying the bank charges that are associated with the IPI. These values are hard-coded and consistent with the requirements for IPIs. The European Committee for Banking Standards publishes the requirements for IPIs.

IPI - Form Types (00/IF)

The IPI - Form Types UDC table (00/IF) contains hard-coded values that represent the types of preformatted IPI forms that are available to use. The values in this UDC are consistent with the requirements for IPIs. The European Committee for Banking Standards publishes the requirements for IPIs.

IPI - Languages and Countries (00/IL)

Most of the values for the UDCs for IPIs are hard-coded. However, you must set up values for the IPI - Languages and Countries (00/IL) UDC table.

IPIs must be printed in English, but they can also contain a second language. You specify the secondary language by setting up a value in the IPI - Languages and Countries UDC table (00/IL). Some countries require that you print IPI forms with a secondary language; for some countries, the use of a secondary language is optional. The European Committee for Banking Standards publishes the requirements for IPIs.

When you set up the IPI - Languages and Countries UDC, you complete the Special Handling field with a value from the Language (01/LP) UDC table. The system uses the value in the Special Handling field to determine the secondary language that prints on the IPI form. If you do not want the system to print a secondary language on the IPI form, set the Special Handling code for a country to *E* (English). Generally, you use the language of the country where the customer's bank is located.

You can set up only one language per country. For example, for banks in Belgium, you must specify a secondary language, but you can select to use French, German, or Dutch. In the 00/IL UDC, you can set up only one of those languages for Belgium; you cannot set up a value for each language.

This table shows examples of the languages that you can set up for countries:

| Codes | Description 01 | Description 02 | Special Handling |
|--------------|-----------------------|--------------------------------|-------------------------|
| <i>AT</i> | Austria | O - German | <i>G</i> |
| <i>BE</i> | Belgium | R - French, Dutch, or German | <i>F</i> |
| <i>CH</i> | Switzerland | O - German, French, or Italian | <i>F</i> |
| <i>DE</i> | Germany | R - German | <i>G</i> |
| <i>DK</i> | Denmark | Unspecified - Danish | <i>DN</i> |
| <i>ES</i> | Spain | R - Spanish | <i>S</i> |
| <i>FI</i> | Finland | R - Finnish and Swedish | <i>FN</i> |
| <i>FR</i> | France | R - French | <i>F</i> |
| <i>GB</i> | Great Britain | NA | <i>E</i> |

IPI - Details of Payment (00/IP)

The IPI - Details of Payment UDC table (00/IP) determines the data that appears in the Details of Payment section on the IPI. These values are hard-coded and are consistent with the requirements for IPIs. The European Committee for Banking Standards publishes the requirements for IPIs.

Setting Up UDCs for Intrastat Reporting

Many fields throughout the system accept UDCs as valid values. You must set up several UDCs to provide valid information for Intrastat reporting.

Set up these UDCs to use Intrastat reporting:

- Country Codes (00/CN).
- European Union Members (00/EU).
- Intrastat Regime Code (00/NV).
- State and Province Codes (00/S).
- Condition of Transport (00/TC).
- Mode of Transport (00/TM).
- Triangulation Tax Rates (00/VT).
- Shipping Commodity Class (41/E).
- Purchasing Reporting Codes 01 through 05 (41/P1 through 41/P5).
- Sales Reporting Codes 01 through 05 (41/S1 through 41/S5).
- Freight Handling Code (42/FR).
- European Community Members (74/EC).
- Intrastat Declaration Type (74/IT).

- Nature of Transaction - EU (74/NT).
- Arrivals or Dispatchings (74/TD).

Country Codes (00/CN)

You must specify a country code in the address book records for the branch/plants, customers, and suppliers.

This table shows examples of country codes:

| Codes | Description 01 | Special Handling |
|-------|----------------------------|------------------|
| AE | United Arab Emirates (UAE) | 784 |
| AF | Afghanistan | 004 |
| AG | Antigua and Barbuda | 028 |
| AR | Argentina | 032 |
| AT | Austria | 040 |
| AU | Australia | 036 |

To find the country code for the branch/plants, the system searches for records based on the address number in the Inventory Constants table (F41001). If no address number is specified, the system uses the address number that is specified in the Business Unit Master table (F0006).

Transaction eligibility for Intrastat reporting is based on the country of the customer or supplier, the country of origin of the goods, and the country of the declarant.

Important! Do not use blank as the default country code. You must use a nonblank country code on the address book records for the country code to be included on Intrastat reports.

European Union Members (00/EU)

Each European Monetary Union (EMU) member currency must be set up in UDC table 00/EU.

The User-Defined Codes form (00/EU) contains default currency codes and effective dates when the country joins the EMU. Verify the existing values and ensure that a valid currency code exists for the euro (EUR).

The Special Handling Code field is a text field, not a date field. You *must* enter the effective date in this format, regardless of the date preferences:

DD/MM/YYYY

Each currency has an effective date, which enables you to enter existing EMU currencies now and, at a later time, add other currencies that join the EMU. Enter the effective date for a currency in the Special Handling Code field on the User-Defined Codes form (00/EU), as shown:

| Codes | Description 01 | Description 02 | Special Handling | Hard Coded |
|-------|----------------|-------------------------------|------------------|------------|
| EUR | Euro | E - Electronic Format Euro | January 01, 1999 | N |

French and Italian companies that use domestic electronic formats in accounts receivable (AR) have a special setup requirement. This setup enables domestic formats, which state bank file amounts in the domestic currency, to also state bank file amounts in an alternate currency. French and Italian companies can then state amounts in either the euro or an alternate currency, regardless of the company's domestic currency.

To state AR domestic format amounts in the euro or an alternate currency, French and Italian companies must assign a currency value to the corresponding currency code on the European Union Members UDC table (00/EU), as shown in the examples in this table:

| Codes | Description 01 | Description 02 | Special Handling | Hard Coded |
|-------|----------------|----------------------------------|------------------|------------|
| EUR | Euro | E - Electronic Format Euro | January 01, 1999 | N |
| FRF | French Franc | F - Electronic Format French | January 01, 1999 | N |
| ITL | Italian Lira | I - Electronic Format Italian | January 01, 1999 | N |

To set up AR electronic formats for the euro, assign a one-character currency value in the Description 02 field. Values are:

- *E* (for the euro currency code, EUR).
- Blank or *F* (for the French franc currency code, FRF).
- Blank or *I* (for the Italian lira currency code, ITL).

Note. Leave the Description 02 field blank if the currency code is the domestic currency.

Intrastat Regime Code (00/NV)

Use the Intrastat Regime UDC to set up the Nature of VAT Regime codes. The Nature of VAT Regime code is similar to the nature of transaction code (NAT) and is applicable only to certain countries.

(FRA) Nature of VAT Regime codes are commonly used in France.

Important! If the reporting requirements for the country do not include Nature of VAT Regime, you must add a blank code to UDC 00/NV to prevent errors in the Intrastat Revision table (F0018T).

This table shows examples of Intrastat regime codes:

| Codes | Description 01 |
|-------|-------------------------------|
| 10 | Permanent export |
| 11 | Permanent export after rework |
| 21 | Temporary export |
| 22 | Temporary export after rework |

State and Province Codes (00/S)

For countries that require regional information, use the State field in the address book record to specify the region. Set up state and province codes to identify the region of origin for shipments or the region of destination for purchases.

The system searches for address book records based on the address number in the Inventory Constants table (F41001). If no address number is specified, the system uses the address number specified in the Business Unit Master table (F0006).

This table shows examples of state and province codes:

| Codes | Description |
|-------|----------------|
| * | All states |
| AB | Alberta |
| AI | Arctic Islands |
| AK | Alaska |
| AL | Alabama |
| AM | Amazonas |
| AR | Arkansas |

Condition of Transport (00/TC)

You set up Condition of Transport codes (00/TC) to indicate how goods are transported.

You must set up values in UDC 00/TC that correspond to the first three characters of the values that you set up in the Description 02 field in the Freight Handling Code UDC table (42/FR). For example, if you set up a value in UDC 42/FR for Cost, Insurance, and Freight and use *CIF* as the value in the Description 02 field, you must set up a code of *CIF* in UDC 00/TC.

You can set up default conditions of transport by using the Supplier Master program (P04012). Enter the condition of transport in the Freight Handling Code field. When you enter purchase orders, this information appears in the purchase order header fields.

This table shows examples of condition of transport codes:

| Codes | Description 01 |
|-------|------------------------------|
| CIF | Cost, Insurance, and Freight |
| DDP | Delivered Duty Paid |
| DDU | Delivered Duty Unpaid |
| EXW | Ex Works |
| FOB | Free on Board |

Mode of Transport (00/TM)

You set up codes for the modes of transport on UDC table 00/TM (Mode of Transport). The first eight code values are predefined for EU trade reporting.

This table shows examples of mode of transport codes:

| Codes | Description 01 |
|-------|---------------------|
| 1 | Transport by sea |
| 2 | Transport by rail |
| 3 | Transport by road |
| GRD | Ground Service |
| LTL | Less than Truckload |
| NDA | Next Day Air |

The fifth position of the Description 02 field of the Freight Handling Code UDC (42/FR) is used to indicate the mode of transport; it corresponds to the values in UDC 00/TM. To assign a default mode of transport to a supplier, complete the Freight Handling Code field on the Supplier Master Revision form of the Supplier Master program (P04012). Setting up a supplier in this way causes freight handling and mode of transport information to appear in purchase order header fields.

Triangulation Tax Rates (00/VT)

If you use the EC Sales List (R0018S), you must list the tax rates that are used for trade triangulation transactions. Transactions that use any of the tax rates that are listed on this UDC are flagged as trade triangulation transactions on the EC Sales AR.

Shipping Commodity Class (41/E)

Use Shipping Commodity Class codes (41/E) to further identify the products that the company imports or exports.

To comply with Intrastat guidelines, commodity codes must have a corresponding commodity value.

Use the Intrastat Commodity Code form to set up commodity values and supplemental units of measure for commodity codes.

This table shows examples of shipping commodity classes:

| Codes | Description 01 |
|-------|----------------------------------|
| Blank | Blank - Shipping Comm Class 41/E |
| CSE | Consumer Electronics |
| FPD | Food Products |
| LST | Livestock |

Purchasing Reporting Codes 01 through 05 (41/P1 through 41/P5)

Use purchasing reporting codes 01 through 05 (41/P1 through 41/P5) to set up nature of transaction codes specifically for purchase order transactions. Using these UDC tables to indicate the nature of transaction for the item is an alternative to using UDC 74/NT to indicate the nature of transaction.

You can designate any one of the five purchasing reporting codes to specify the nature of transaction for individual items. You must indicate the reporting code that you are using for nature of transaction in the processing options for the Intrastats Tax Update - Purchasing program (R0018I2). The reporting code that you specify in these processing options should correspond to the reporting code that you use to identify the nature of transaction for the item in the Item Master program (P4101). Enter 1 for table 41/P1, 2 for table 41/P2, and so on.

This table shows examples for purchase reporting codes:

| Codes | Description 01 |
|-------|-------------------------------|
| Blank | Blank - Commodity Class 41/P1 |
| A | Aluminum |
| B | Brass |
| C | Copper |
| DRG | Drugs-Pharmaceutical |
| ELC | Electrical |

When you update the Intrastat Revision table (F0018T), you use a processing option to specify the UDC that you want the system to use to find the applicable information.

Sales Reporting Codes 01 through 05 (41/S1 through 41/S5)

Use these codes to identify the type of import and export rules to which an item is subject. The import and export rules depend on the way that a product is moved; whether it is for sales, purchases, or leases; or other reasons.

You can set up nature of transaction codes specifically for EU reporting on UDC table 74/NT, or you can use the UDC tables from the Inventory Management system (specifically, 41/P1-P5 and 41/S1-S5). You can also create a UDC table to store nature of transaction codes.

You can designate any one of the five sales reporting codes to specify the nature of transaction for individual items. You must indicate the reporting code that you are using for nature of transaction in the processing options for the Intrastat - Tax Update - Sales program (R0018I1). The reporting code that you specify in these processing options should correspond to the reporting code that you use to identify the nature of transaction for the item in the Item Master program (P4101). Enter 1 for table 41/S1, 2 for table 41/S2, and so on.

This table shows examples of sales reporting codes:

| Codes | Description 01 |
|-------|-----------------|
| APP | Apparel Section |
| AVA | Aviation |

| Codes | Description 01 |
|-------|--------------------------|
| COM | Commuter Bike Section |
| MNT | Mountain Bike Section |
| SAF | Safety Equipment Section |
| TRG | Touring Bike Section |

When you update the Intrastat Revision table (F0018T), you use a processing option to specify the UDC that you want the system to use to find the applicable information.

Freight Handling Code (42/FR)

You use freight handling codes to identify various freight information. To comply with EU requirements, modify the freight handling codes to include the codes that you set up for the Condition of Transport, Condition of Transport extension, and Mode of Transport tables. For this action, enter the codes for the conditions of transport, conditions of transport extension, and the modes of transport in the second description field for the table.

Note. You must set up one freight handling code line in UDC 42/FR for each separate combination of Condition of Transport, Condition of Transport extension, and Mode of Transport tables.

The Description 02 field accepts up to 15 characters. When you modify freight handling codes, use the first three characters in the field to specify the conditions of transport. Use the fourth character to indicate the COTX extension (the code for the place indicated in the contract of transport). The COTX extension is required only in certain countries. Enter the code for mode of transport as the fifth character of the second description.

Note. You should define the codes that indicate the various conditions and modes of transport on their respective UDC tables, in addition to indicating the conditions and modes of transport on the freight handling codes. If the conditions and modes of transport are not defined in their respective tables, you receive an error when you try to modify the condition or mode of transport in the Intrastat Revision table (F0018T).

For IDEP, the Incoterms field accepts only these values:

- *C* - Main transportation expenses paid (CFR, CIF, CPT, CIP).
- *D* - Arrival (DAF, DES, DEQ, DDU, DDP).
- *E* - Depart (EXW).
- *F* - Main transportation not paid (FCA, FAS, FOB).

For IDEP, set up UDC 42/FR with these codes, rather than the standard transport conditions, in the first three positions of the Description 02 field.

This table shows examples of freight handling codes:

| Codes | Description 01 | Description 02 | Special Handling |
|-------|---------------------------|----------------|------------------|
| A | Free Alongside Ship | FAS | Not applicable |
| BRR | Bypass Routing and Rating | Not applicable | 9 |

| Codes | Description 01 | Description 02 | Special Handling |
|-------|--------------------------|----------------|------------------|
| C | Freight Collect | Not applicable | 1 |
| D | Delivered, Duty Paid | DDP | Not applicable |
| F | Free On Board - Our Dock | FOB | Not applicable |
| FP | Freight Pre-pay and Add | Not applicable | Not applicable |

European Community Members (74/EC)

Only transactions between European Union (EU) members are included in the Intrastat Revision table (F0018T). Verify that a one-to-one relationship exists between the country codes that you set up in UDC 00/CN and the country codes for all EU countries on UDC table 74/EC. When you run the Intrastat update programs, the system cross-references the country codes that you specify for customers, suppliers, and branch/plants in UDC table 00/CN to the codes in 74/EC.

This table shows examples of EU country codes:

| Codes | Description 01 |
|-------|------------------------|
| AT | Austria |
| BE | Belgium |
| BL | Belgium and Luxembourg |
| DE | Germany |
| DK | Denmark |
| ES | Spain |
| FI | Finland |
| FR | France |
| GB | Great Britain |

Intrastat Declaration Type (74/IT)

Set up UDC 74/IT to specify whether the IDEP declaration is fiscal, statistical, or complete.

This table shows examples of Intrastat declaration type codes:

| Codes | Description 01 | Special Handling |
|-------|----------------|------------------|
| 1 | Fiscal | F |
| 2 | Statistical | S |
| 3 | Complete | C |

You specify the character that the system uses to populate the Intrastat declaration in the special handling code for each value. The code specified in the special handling code is written to the text field in the Text Processor Detail Table (F007111) when you process the IDEP/IRIS Interface (R0018I3). This special handling code is also used to determine the VAT registration number for sales transactions. For statistical declarations, the system uses the ship to address number. For fiscal or complete declarations, the system uses the sold to address number.

The default value is 3 (complete).

Nature of Transaction - EU (74/NT)

Use Nature of Transaction (74/NT) to set up nature of transaction codes specifically for EU reporting.

Set up UDC table 74/NT following these steps:

- Use the Codes field to enter a concatenated value to identify the nature of transaction.
Concatenate these values in sequence without any separators, such as commas or spaces: Company Number, Order Document Type, and Line Type.
- Enter the nature of transaction code in the Description 02 field.
- Enter the nature of the value-added tax (VAT) regime (statistical procedure) in the Special Handling field, if required.

This table shows examples of nature of transaction codes:

| Codes | Description 01 | Description 02 |
|----------|----------------------|----------------|
| 00100XIS | Export to Customer | 16 |
| 00100COC | Credit to Customer | 16 |
| 00100SOS | Stock Inv Item | 10 |
| 00100X2S | Transfer from Branch | 10 |
| 00200SOS | Stock Inv Item | 11 |
| 00200X1S | Export to Customer | 16 |
| 00200X2S | Transfer from Branch | 11 |

When you update the Intrastat Revision table (F0018T), you use a processing option to specify the UDC table that you want the system to use to find the applicable information.

Arrivals or Dispatchings (74/TD)

If you use the Single European Market Declaration (SEMDEC) interface for Intrastat submissions, set up a UDC for each document type that is used in Intrastat transactions to indicate whether the document type corresponds to the arrival (purchase) or dispatch (sale) of goods.

To set up UDC 74/TD, enter the same codes in the Codes field that you use for document types on UDC 00/DT. The Description 01 field must contain either *Arrival* or *Dispatch*. The system uses UDC 74/TD, in conjunction with UDC 00/DT, to determine whether the transaction represents the arrival or dispatch of goods for Intrastat reporting purposes. You need to include on UDC 74/TD only those document types that are used in sales or purchasing.

Note. If you do not set up UDC 74/TD, the system assumes that all sales are dispatches and that all purchases are arrivals.

Setting Up UDCs for European Companies

Set up these UDCs to specify company parameters.

Affiliated Companies (74/AC)

You must set up UDC 74/AC so that the system can determine whether the customer or supplier company is affiliated with the reporting company. You must list the address book records of all companies with which the reporting company is affiliated. The system uses the Affiliated Companies UDC list 74/AC to select records for reporting, and to group data for affiliated companies and non-affiliated companies in this manner:

| Type of Company | Usage |
|-------------------------|---|
| Affiliated companies | If the address book number from a record in the Accounts Payable Ledger table (F0411) matches an address book record in UDC list 74/AC, the system selects the record for reporting for affiliated companies. |
| Nonaffiliated companies | If the address book number from a record in the F0411 table does not match an address book record in UDC list 74/AC, the system selects the record for reporting for non-affiliated companies. |

Code Number (74/30)

Set up code numbers to indicate the type of service industry. For example, you might set up these values:

- 014: Transportation by domestic air carrier.
- 015: Transportation by foreign air carrier.
- 016: Transportation by other carrier.

Setting Up Commodity Code Information

You use commodity codes to identify the products that are exported from or introduced to the country. Commodity code information is stored in the Intrastat Commodity Code Additional Information table (F744102). This section lists a prerequisite and discusses how to set up commodity codes.

Prerequisite

Set up shipping commodity class codes in UDC 41/E.

Form Used to Set Up Commodity Codes

| Form Name | FormID | Navigation | Usage |
|--------------------------|----------|---|----------------------|
| Intrastat Commodity Code | W744102B | Set Up (G74STAT4), Commodity Codes On the Work With Intrastat Commodity Code form, click Add. | Add commodity codes. |

Setting Up Commodity Codes

Access the Intrastat Commodity Code form.

Shipping Commodity Class Enter a UDC (41/E) that represents an item property type or classification (for example, international shipment handling). The system uses this code to sort and process similar items. This field is one of three classification categories available primarily for inventory and shipping purposes.

Commodity Code Enter the commodity code number for the item.

Supplementary UOM (supplementary unit of measure) Enter a UDC (00/UM) that indicates the quantity in which to express an inventory item. For example, enter *CS* (case) or *BX* (box).

Volume Conversion Factor Enter the weight of one unit of an item, expressed in the primary unit of measure.

Enter the density of the product in the Volume Conversion Factor field only if the product is typically measured in liquid volume but needs to be reported in kilograms. The system multiplies the volume of the product by the density that you enter to calculate the mass of the product.

Entering Cross-References for Items and Suppliers

This section provides an overview of cross-references for items and suppliers and discusses how to enter cross-references.

Understanding Cross-References for Items and Suppliers

An important element of including purchases on Intrastat reports is tracking the country of origin of goods. In some countries, Intrastat reports must contain the country of origin and the original country of origin for each item.

For example, a German company might place a purchase order with a French supplier for goods manufactured in France. These goods are stored in a warehouse in Belgium, so the actual delivery comes from Belgium. The country of origin is Belgium, but the original country of origin is France.

Depending on the business and the suppliers, you might need to set up a more advanced relationship among the supplier, the item, and the country of origin. You can cross-reference this information in the Intrastat Item/Supplier Cross Reference program (P744101):

- Supplier

- Item
- Country of origin
- Original country of origin

The Supplier and Item Cross Reference program stores information in the Intrastat Supplier/Item Cross Reference Table (F744101). The Intrastats - Update - Purchasing program (R0018I2) retrieves the cross-referenced information if you specify in the processing options to use table F744101.

Note. The system retrieves the country of origin from the address book record of the supplier. The supplier's country of origin can be overridden when you update the Order Address Information table (F4006) for an individual order. If necessary, you can override the country of origin in the Country of Origin field (ORIG) in table F744101 and specify in the processing options of the Intrastats - Update - Purchasing program (R0018I2) to use table F744101.

The system uses the Country of Origin field (ORIG) to determine transaction eligibility for Intrastat reporting. The Original Country of Origin field (ORGO) is for information only.

Note also that in the United Kingdom, country of origin is called country of consignment, and original country of origin is called country of origin.

Form Used to Enter Cross-References for Items and Suppliers

| Form Name | FormID | Navigation | Usage |
|---------------------------|----------|---|-----------------------|
| Intrastat Cross Reference | W744101B | Set Up (G74STAT4), Supplier and Item Cross Reference On the Work the With Intrastat Cross Reference form, click Add. | Add cross-references. |

Entering Cross-References

Access the Intrastat Cross Reference form.

Address Number

Enter **ALL* in the Address Number field to indicate that the item always comes from the specified country of origin and original country of origin, regardless of supplier.

When the system searches for a specific record in the Intrastat Supplier/Item Cross Reference Table (F744101), it first searches for a record that matches the item number and address number. If no record is found, the system searches for a record that matches the address number, with an item number of **ALL*. If no record is found, the system then searches for a record that matches the item number with an address number of **ALL*.

Country of Origin

Enter a code (00/CN) that identifies the country in which an item originates. This information is useful to organizations that must periodically separate their inventory by source.

Original Country of Origin

Enter a code (00/CN) that indicates the original country of origin of goods. For example, you are a German company that places a purchase order with a French supplier for goods that are manufactured in France but are warehoused

in and delivered from Belgium. The country of origin is Belgium, but the original country of origin is France.

Setting Up Layouts for the IDEP/IRIS Interface

This section discusses how to set up layouts for the IDEP/IRIS interface.

Before importing this information from an external system, such as from JD Edwards EnterpriseOne software to IDEP/CN8, you need to specify the format of the file to be imported. After you specify the format, you need to indicate the structure of the file to be imported (field sequence, field number, field size, and so forth) into IDEP/CN8.

This table illustrates the structure that you must set up for an IDEP/CN8 file:

| Field | Position [Length] |
|-----------------------------|-------------------|
| Declarant Reference Number | 1-14[14] |
| Partner VAT number | 16-35[20] |
| Original Country of Origin | 37-39[3] |
| Country of Origin | 41-43[3] |
| Nature of Transaction A | 45-45[1] |
| Nature of Transaction B | 47-47[1] |
| Statistical Procedure | 49-53[5] |
| Mode of Transport | 55-55[1] |
| Port of Entry | 57-60[4] |
| Region of Origin | 62-63[2] |
| Terms of Delivery | 65-67[3] |
| Related Location 1 Identity | 69-69[1] |
| Commodity Code | 71-78[8] |
| Goods Description | 80-219[140] |
| Supplementary Unit | 221-233[13] |
| Net Mass | 235-248[12,2] |
| Invoice Value | 250-262[13] |
| Foreign Invoice Value | 264-276[13] |

| Field | Position [Length] |
|---------------------------|-------------------|
| Statistical Value | 278-289[10,2] |
| Foreign Statistical Value | 291-302[10,2] |
| Currency Code | 304-306[3] |
| Declaration Type | 307-307[1] |

Note. The comma in the Net Mass, Statistical Value, and Foreign Statistical Value field lengths listed above denotes that a decimal point can be used before the last two characters in those field lengths.

CBS-IRIS - Netherlands

The Dutch version of CBS-IRIS requires no fixed record layout for the import file. However, you must map the data coming from an import file in CBS-IRIS.

Note. The data to be imported must be in flat file format. Also, you must indicate the first position and the number of positions of each field to be imported from the flat file. The number of positions to import should not exceed the number of positions that is defined in CBS-IRIS for the field. The fields cannot overlap. You should end each field with a carriage return and a line feed.

In CBS-IRIS, the file containing the data to be imported should be a blank-separated txt-file (this type of file can be compared with a Microsoft Excel file that is saved as a text file with blanks as separation characters).

In CBS-IRIS, you can leave the fields blank, as long as the positions defined are correct (in other words, each blank stands for one position in the record).

This table illustrates the structure that you must set up for a CBS-IRIS - Holland file:

| Field | Position [Length] |
|--|-------------------|
| Declarant Reference Number | 1-10[10] |
| Del VAT Number | 12-23[12] |
| Partner VAT Number | 25-42[18] |
| Original Country of Origin | 44-46[3] |
| Country of Origin | 48-50[3] |
| Nature of Transaction A | 52-52[1] |
| Statistical Procedure/Nature of VAT Regime | 554-55[2] |
| Mode of Transport | 57-57[1] |
| Port of Entry | 59-60[2] |
| Commodity Code | 62-69[8] |
| Tariff Code | 71-72[2] |

| Field | Position [Length] |
|--------------------|-------------------|
| Currency Code | 74-74[1] |
| Supplementary Unit | 76-85[10] |
| Net Mass | 87-96[10] |
| Invoice Value | 98-107[10] |
| Statistical Value | 109-118[10] |
| Commodity Flow | 120-120[1] |
| Reporting Period | 122-127[6] |

CBS-IRIS - Germany

The German version of CBS-IRIS requires no fixed record layout for the import file. However, you must map the data coming from an import file. For each field imported in the flat file format, you need to set up the beginning position and the length of the field. This table illustrates the structure that you must set up for a CBS-IRIS - Germany file:

| Field | Position [Length] |
|--|-------------------|
| Declarant VAT Number | 1-16[16] |
| Original Country of Origin | 18-20[3] |
| Country of Origin | 22-24[3] |
| Nature of Transaction | 26-27[2] |
| Statistical Procedure/Nature of VAT Regime | 29-33[5] |
| Mode of Transport | 35-35[1] |
| Port of Entry | 37-40[4] |
| Region of Origin | 42-44[3] |
| Commodity Code | 46-53[8] |
| Currency Code | 55-55[1] |
| Supplementary Unit | 57-65[9] |
| Net Mass | 67-75[9] |
| Invoice Value | 77-85[9] |
| Statistical Value | 87-95[9] |

| Field | Position [Length] |
|------------------|-------------------|
| Commodity Flow | 97-97[1] |
| Reporting Period | 99-104[6] |

Setting Up Intracommunity VAT

See *JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide*, “Setting Up Tax Information,” (Europe) Setting Up Intracommunity VAT.

See *JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide*, “Setting Up Tax Information,” Setting Up Tax Rate Areas.

CHAPTER 66

(Europe) Working With European Union Functionality

This chapter provides overviews of international bank account numbers (IBAN), bank ID and bank account validation, tax ID validation, and European Union reporting; and discusses how to:

- Populate the Intrastat workfile.
- Revise Intrastat information.
- Purge records from the Intrastat Revision table (F0018T).
- Use the IDEP/IRIS interface for Intrastat reporting.
- (GBR) Use the SEMDEC Interface for Intrastat reporting.
- (DEU) Print the German Intrastat report.

Understanding International Bank Account Numbers

The International Organization for Standardization (ISO) and the European Committee for Banking Standards (ECBS) developed the International Bank Account Number (IBAN) to assist companies with account identification.

The IBAN is used internationally to uniquely identify the account of a customer at a participating financial institution. The IBAN allows for validation checks through the use of international 2-character country codes as established by ISO. Additional validation is performed through the use of an algorithm/check-digit process. The account-administering bank is responsible for calculating the IBAN and providing it to its customers.

The IBAN format differs, depending on whether it is transmitted electronically or printed on paper. The variance is only in its presentation; the IBAN number remains the same whether in electronic or print format. The IBAN consists of these segments:

| Segment | Definition |
|--------------|--|
| Country code | A two-letter country code as specified by ISO. The country code used in the IBAN is the code of the county in which the bank or branch that is servicing the IBAN resides. |

| Segment | Definition |
|----------------------------------|---|
| Check digits | Two digits that are assigned according to an algorithm. |
| Basic Bank Account Number (BBAN) | <p>An alphanumeric string of characters of up to 30 characters that includes 0-9 and A-Z in upper case letters only. The electronic format cannot contain separators or county-specific characters.</p> <p>The length of the BBAN is determined by the country of origin, and includes an explicit identification code of the bank or branch servicing the account at a fixed position within the BBAN.</p> |

When transmitted electronically, the IBAN is one string of characters. When printed, the IBAN is preceded by the text string "IBAN" and is split into groups of four characters that are separated by a space. The last group might contain fewer than four characters.

You can link the IBAN number with a bank address in the address book system. When you link the IBAN with a bank address, the automatic payment process can identify the correct country for suppliers and customers who have bank accounts in multiple countries. You enter the IBAN in the Bank Account Cross-Reference (P0030A) and the Bank Account Information (P0030G) programs in the electronic format. The system stores the IBAN in the electronic format in the Bank Transit Master table (F0030).

This table shows examples of IBANs in Belgium and France:

| Table Column Heading | Example for Belgium | Example for France |
|------------------------|--------------------------|--|
| Account Number | 510-0075470-61 | 20041 01005 0500013M026 06 |
| Electronic IBAN format | BE62510007547061 | FR1420041010050500013M02606 |
| Print IBAN format | IBAN BE62 5100 0754 7061 | IBAN FR14 2004 1010 0505 0001 3M02 606 |

The ECBS specifies that the IBAN appear on the International Payment Instruction (IPI) form in the print format but without the term IBAN. For example, the IBAN for the Belgian account number in the previous table would appear on an IPI as BE62 5100 0754 7061.

Understanding Bank ID and Bank Account Validation

A bank identification (ID) number identifies the bank with which you have established an account. The bank ID number is included in the customer information that you remit for processing accounts receivable drafts and EFT payments.

You activate bank ID validation routines for these countries by setting up the localization country code in your user profile:

- Italy
- France
- Belgium
- Finland

- Spain

Completing the Localization Country Code field on the User Profile Revisions form causes the system to search for a bank ID validation routine, but the validation routine to use is not specified. For example, if you specify Belgium in the Localization Country Code field, you can still validate bank IDs for other countries. When you use the Bank Account Cross-Reference program (P0030A), the system uses the value in the Country field on the Mailing tab on the Address Book Revision form to determine which validation to use for the address book record.

The system validates bank code numbers and bank branch codes when you enter bank IDs into the Bank Account Cross-Reference or the Bank Account Information (P0030G) program. The system identifies the customers whose bank information is invalid with an error message.

You can check for missing bank information for customers by running the Bank Account Exception Report (R00314).

The system validates account and bank identification information throughout the draft process:

| Process | Function |
|------------------------------------|---|
| A/R Batch Draft Creation (R03B671) | The system prints an error report that lists customers with missing or invalid bank information. You can review the list to correct or update the bank information before you generate the drafts. |
| Draft Remittance (R03B672) | When you remit drafts, the system validates bank information again and includes the drafts for all of the specified customers in the electronic bank file. The system prints an error report that lists the customers with missing or invalid bank information. |

Bank ID Validation Overrides

You can override bank ID validation for a specific country by adding the country code to UDC 70/BI. The system does not run bank ID validation routines for countries listed in this UDC table.

(BEL) Bank Account Validation

To process bank transactions for Belgium, the account information that you enter must be accurate to avoid service charges from the bank and possible rejection of electronic funds transfers. Electronic funds transfers can be rejected for payments and receipts because of incomplete or incorrect account information.

The JD Edwards EnterpriseOne system automatically validates the bank account information for Belgian suppliers and customers, including the bank account numbers, according to the standards set by the Belgian banking authority. The Modulus 97 algorithm validates the bank account number when you add or change a bank account number. If you enter an invalid bank account number, you receive an error message stating that the bank account is invalid.

Note. When you add bank account information in the Bank Account Number field, ensure that the Control Digit is included, in addition to the Bank Account number in the Bank Account Number field. The Control Digit field is considered part of the bank account number in Belgium.

(FRA) Bank Account Validation

To process bank transactions for France, the account information that you enter must be accurate to avoid service charges from the bank and possible rejection of electronic funds transfers. Electronic funds transfers can be rejected for payments; receipts can be rejected because of incomplete or incorrect account information.

The system automatically validates the *Rélevé d'Identité Bancaire* (R.I.B.), including the bank account and transit numbers, according to the standards set by the French banking authority. You must enter the R.I.B. key in the Control Digit field for the account information to be validated. The Modulus97 algorithm checks the R.I.B. key.

Note. In addition to online validation, you can run the Bank Account Exception Report (R00310) to verify that your account information is correct. When you run this report, the system verifies the account numbers based on a control digit (R.I.B. key) and the bank transit number.

(ITA) Bank Account and Bank ID Validation

In Italy, businesses that remit incorrect or incomplete bank identification or account information to the bank are subject to fees. To avoid these charges, businesses must carefully validate bank identification and account information that is entered into the system during data entry.

You can set up your system to automatically validate account information when you use these programs:

- Bank Account Cross-Reference (P0030A).
- Bank Account Information (P0030G).
- Bank Revision - Italy (P7430IT).
- Enter Customer Drafts (P03B602).
- Pre-Authorized Drafts (R03B671).
- A/R Magnetic RIBA Draft Remittance Tape Format (R03B672IT).

The system validates account information based on the Bank ID - Italy table (F74030).

Italian banks assess a service charge when invalid account or bank identification numbers are included in the customer information that businesses remit for processing accounts receivable drafts (RiBa) and automatic payments.

Italian bank identification information consists of a transit code, which includes two 5-character segments:

- The Bank Code (ABI).
- The Bank Branch Code (CAB).

The ABI segment identifies the bank (for example, Banco di Napoli) and is followed by the CAB segment, which identifies the branch (for example, Banco di Napoli - Positano).

The Banca d'Italia maintains and updates valid bank identification numbers. Individual banks can provide their clients with the updated information on tape or diskette.

The JD Edwards EnterpriseOne system supports the COMIT format and ships the Bank ID - Italy table (F74030) with the localized software for Italy. You must upload the bank information that is provided by Banca d'Italia to this table. After you upload the information, you can make your own revisions to the bank table as needed.

To validate bank identification information, the system validates bank codes and branch codes when you:

- Set up bank account information.

- Enter accounts receivable drafts.
- Generate pre-authorized accounts receivable drafts.
- Create the accounts receivable drafts remittance table.

The system validates the customer bank information against the valid bank identification information in the F74030 table.

The programs that validate account information and bank identification information are described in this table:

| Program | Function |
|--|--|
| Bank Account Information (P0030G) | The system issues an error on the Revise Bank Information form if bank information is missing or invalid. |
| Bank Account Cross-Reference (P0030A) | If the Localization Country Code field in the User Profile Revisions form is not blank and the customer, supplier, or employee country code on the Address Book Revision form is IT (Italy), the system issues an error on the Set Up Bank Accounts By Address form if bank information is missing or invalid. |
| Enter Our Drafts or Enter Customer Drafts (P03B602) | The system issues an error on the Draft Entry form if bank information is invalid. |
| Pre-Authorized Drafts (R03B671) | The system prints an error report that lists customers with missing or invalid bank information. You can review the list to correct or update the bank information before you generate the drafts. |
| A/R Magnetic RIBA Draft Remittance Tape Format (R03B672IT) | When you remit drafts, the system validates bank information again and includes the drafts for all of the specified customers in the electronic bank file. The system prints an error report that lists the customers with missing or invalid bank information. |

Understanding Tax ID Validation

The system validates tax IDs for certain countries.

See *JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide*, “Setting Up Tax Information,” (Europe) Setting Up Intracommunity VAT.

Understanding European Union Reporting

Countries that are members of the European Union (EU) observe the Single European Act of 1987. The Single European Act is an agreement that opens markets to an area without internal boundaries, where free movement of goods, persons, services, and capital is assured in accordance with the provisions of the Treaty of Rome.

Because of the Single European Act, businesses in EU countries must adhere to EU requirements. For example, to help monitor the trade among members of the EU, businesses that exceed the limit of intraunion trade must submit the these reports to the customs authorities:

- Intrastat Report
- European Community (EC) Sales List

Detailed statistical information regarding merchandise trade between members of the EU is used for market research and sector analysis. To maintain the statistics on trade between EU members, the statistical office of the EU and the statistical departments of member countries developed the Intrastat system.

In compliance with the Intrastat system, information on intraunion trade is collected directly from businesses. If you do business in a country that belongs to the EU, and you use the JD Edwards EnterpriseOne Sales Order Management and JD Edwards Enterprise One Procurement systems, you can set up the system to extract all of the necessary information to meet EU Intrastat reporting requirements.

Intrastat Requirements

Customs formalities and controls at the internal borders between member states of the EU disappeared in 1993 with the creation of the single European market. With the elimination of custom formalities, the traditional systems for collecting statistics on trade between EU member states also disappeared.

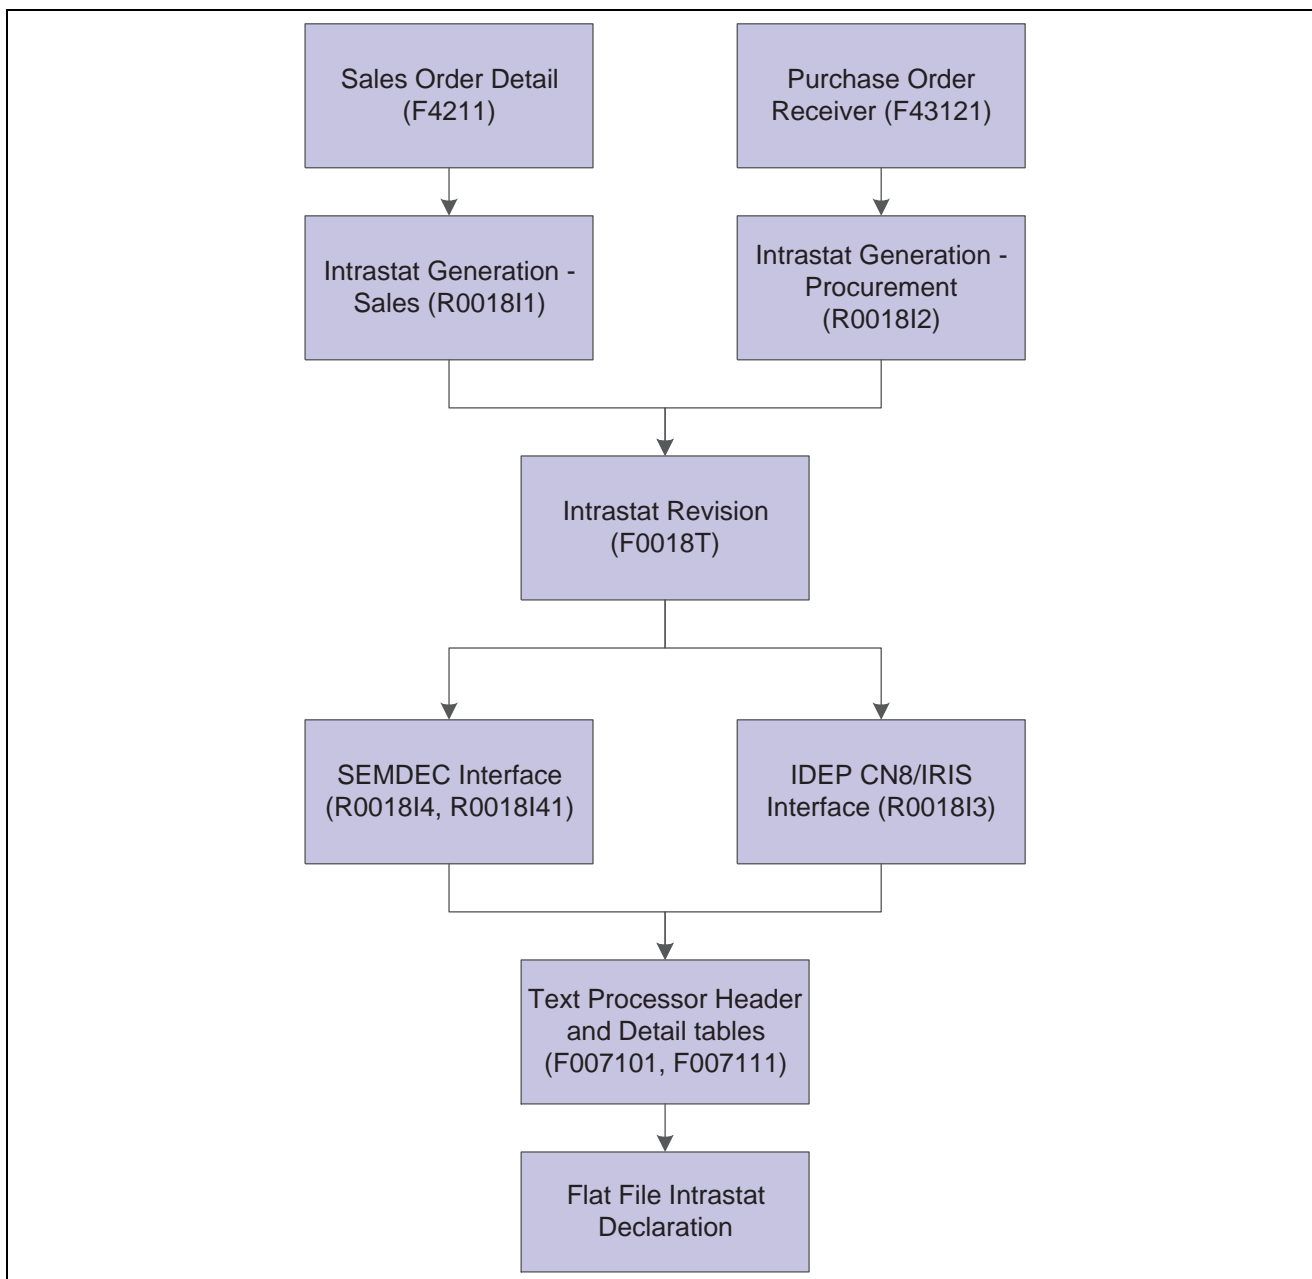

Detailed statistical information regarding merchandise trade between members of the EU is important for market research and sector analysis. To maintain the statistics on trade between EU members, the statistical office of the EU and the statistical departments of member countries developed the Intrastat system.

In compliance with the Intrastat system, information on intraunion trade is collected directly from businesses. Periodically, businesses are required to send a statistical declaration or, in some member states, a combined statistical and fiscal declaration that gives detailed information regarding their intraunion trade operations of the previous period. The frequency with which you are required to submit these declarations depends on national requirements.

The major features of the Intrastat system are common in all member states, but the system can take national specifications into account. If you do business in a country that belongs to the EU and you use the JD Edwards EnterpriseOne Sales Order Management and JD Edwards EnterpriseOne Procurement systems, you can extract all of the information that is necessary to meet Intrastat reporting requirements.

Note. The information that is tracked by the Intrastat system is based strictly on the actual physical movement of goods between member countries of the EU. Intrastat information does not apply to the movement of monetary amounts or the placement of orders between member countries.

This flowchart illustrates the Intrastat reporting process:

Intrastat Reporting process

Note. JD Edwards EnterpriseOne software does not provide country-specific Intrastat reports.

Intrastat Reporting and the Euro

With the introduction of the euro, the Statistical Office of the European Communities (Eurostat) and the national Statistical Offices of the Economic and Monetary Union (EMU) member nations have changed their Intrastat reporting requirements. Each EMU member nation, however, continues to determine its own Intrastat requirements.

Regardless of whether the company has converted its base currency to the euro, you can handle the Intrastat reporting requirements for the country in which you do business. These examples describe situations that might apply to the company:

- The company has not converted its base currency to the euro, but the Statistical Office of the EMU member nation in which you do business requires that you submit Intrastat reports in the euro.
- The company has converted its base currency to the euro, but the Statistical Office of the EMU member nation in which you do business requires that you submit reports in an alternate currency.

For Intrastat reporting, the as-if currency processing options in the Intrastat generation programs (R0018I1 and R0018I2) provide a simplified approach to reviewing and printing amounts in a currency that is different from the base currency.

Considerations for Creating Intrastat Reports

Before you create Intrastat reports, determine:

- The base currency of each of the companies.
- The currency in which you must submit Intrastat reports for each of the companies.

If the business has multiple companies with multiple currencies, you should approach the Intrastat reporting carefully. You should always be aware of each company's base currency, and whether Intrastat reports must be in the euro or an alternate. This information helps to ensure that you convert currencies for Intrastat reporting only if necessary.

Based on the Intrastat reporting requirements for the companies and the countries in which you do business, you can use the processing options and data selection to create different versions of Intrastats - Tax Update - Sales (R0018I1) and Intrastats - Tax Update - Purchasing (R0018I2).

Prerequisites

Before you can collect information for European Union reporting, you must perform these tasks:

- Set up tax information for Accounts Payable and Accounts Receivable records.

See *JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide*, "Setting Up Tax Information," Setting Up Tax Rate Areas.

- Set up user-defined codes for Intrastat reporting.
- Set up commodity codes.
- For the JD Edwards EnterpriseOne Sales Order Management system, set up country codes for the selling business unit (header business unit), shipping business unit (detail business unit), and customer in the JD Edwards EnterpriseOne Address Book system.

See *JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide*, "Entering Address Book Records" and *JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide*, "Updating and Purging Address Book Records".

- For the JD Edwards EnterpriseOne Procurement system, set up country codes for the branch/plant and supplier in the JD Edwards EnterpriseOne Address Book system, or enter countries of origin in the Intrastat Item/Supplier Cross Reference program (P744101).

See [Chapter 65, "\(Europe\) Setting Up European Union Functionality," Entering Cross-References for Items and Suppliers, page 1231](#).

Understanding EC Sales List Reports for European Reporting

If they perform the following functions, businesses in the European Union (EU) that exceed the local limit of intra-union trade must submit the EC Sales List to their customs authorities on a quarterly basis:

- Supply goods to an entity that is registered for value-added tax (VAT) in another EU-member country.
- Send goods for processing to an entity that is registered for VAT in another EU-member country.
- Return processed goods to an entity that is registered for VAT in another EU-member country.
- Transfer goods from one EU-member country to another EU-member country in the course of business.

Note. If a sales or purchase transaction is arranged between EU members, but the goods are not shipped, the transaction must still be reported to the government.

You can use either of two EC Sales List programs (R0018L or R0018S) to generate the EC Sales List. Refer to this table to determine which EC Sales List program you should use:

| EC Sales List (R0018L) | EC Sale List - AR (R0018S) |
|---|--|
| Retrieves trade information from Supply Chain. | Retrieves trade information from Financials. |
| Bases results on information in the Intrastat Revision table (F0018T). | Bases results on information in the Taxes table (F0018). |
| Reports trade triangulation in summary and detail mode. You can report triangulation for interbranch transactions, direct ship transactions, or both. | Uses tax rates from the Triangulation Tax Rates UDC (00/VT) to identify trade triangulation. |
| Can exclude nonstock items. Use data selection on the Intrastat generation programs (R0018I1 and R0018I2) to exclude nonstock items. | Cannot distinguish between stock and nonstock items; use this report only if the business does not provide services. |
| Does not net trade amounts based on credit memos, discounts, and write-offs. | Nets trade amounts based on credit memos, discounts, and write-offs. |

Trade Triangulation

Trade triangulation occurs when one EU member makes a sale or purchase with another EU member, but the goods represented by the transaction are physically shipped from a third EU member. Statistical reports that are submitted to EU authorities must identify trade triangulation transactions. Both the R0018L and R0018S programs identify trade triangulation transactions.

Printing Invoices with an Attached International Payment Instruction

This section provides an overview of International Payment Instructions and discusses how to:

- Run the Invoice Print with International Payment Instruction program.
- Set processing options for Invoice Print with International Payment Instruction (R03B5053).

Understanding International Payment Instructions

You use International Payment Instructions (IPIs) for cross-border invoice settlements. When you originate invoices in the JD Edwards EnterpriseOne Accounts Receivable system, you can select to print invoices with an attached IPI form. To print invoices with attached IPI forms, you must use preformatted invoices that contain the IPI form. The system processes and formats data from JD Edwards EnterpriseOne tables, and prints the information in the appropriate places on the IPI form.

IPIs must be printed in English, but they can also contain a second language. Some countries require that you print IPI forms with a secondary language; for some countries, the use of a secondary language is optional. The European Committee for Banking Standards publishes the requirements for IPIs. You specify the secondary language by choosing a value in the IPI - Languages and Countries UDC table (00/IL).

The IPI form contains these four sections:

- **Ordering Customer**

This section contains the name, address, and account number of the customer. The system uses the name, address, and account number (CBNK) that are associated with the invoice to which the IPI is attached. The customer sends the IPI to the bank for processing, and the bank credits the account with the specified amount.

- **Beneficiary**

This section contains the company name, and the bank name and account number that you specify in processing options.

- **Amount to be paid**

This section contains the amount and currency of the transaction, as well as a code to indicate who is responsible for paying the bank fees that are associated with the transaction. You specify the code for the bank fees in a processing option; the system uses the amount and currency from the transaction.

- **Signature**

The system does not print the signature.

Data Selection

When you set the data selection for the Invoice Print with International Payment Instruction program (R03B5053), you should filter out credit memos and other non-positive invoices. You can filter out these invoices by specifying that the Amount Open (AAP) is greater than zero. You should also designate in the Payment Instrument UDC table (00/PY) the code to use for invoices with attached IPIs, and then select that payment type in the data selection.

Note. The Invoice Print with International Payment Instruction program does not write error messages to the Work Center; however, you can view error messages in the UBE log if you use UBE logging. If the Invoice Print with International Payment Instruction program encounters errors, it prints a blank invoice.

Prerequisites

Set up required UDCs for IPIs.

See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.

Running the Invoice Print with International Payment Instruction Program

Select Statement Reminder Processing (G03B22), Invoice Print with International Payment Instruction.

Setting Processing Options for Invoice Print with International Payment Instruction (R03B5053)

Processing options enable you to specify the default processing for programs and reports.

Defaults

- 1. Invoice Print Date** Specify the date that the system prints on the invoices. If you leave this processing option blank, the system uses the current date.
- 2. Customer Bank Account Type** Specify the type of bank account of the ordering customer. The system uses this account type code to retrieve the bank account number of the ordering customer. The code you enter must exist in the Bank Type Code UDC (00/BT) table. If you leave this processing option blank, the system uses bank type *D*.
- 3. Customer Address Format** Specify the IPI - Address Line Sequencing code (UDC 00/IA). This code determines the combination of the values for the Postal Code, City, and Country that the system includes as the second address line of the ordering customer's address on the IPI. The code that you enter must exist in the IPI - Address Line Sequencing (00/IA) UDC table. If you leave this processing option blank, the system uses *00* (Postal Code City).
- 4. Beneficiary Bank Account** Specify the beneficiary's G/L bank account number on the IPI. The system uses this account number to locate the corresponding bank account information from the Bank Transit Master table (F0030), including the IBAN (International Bank Account Number) and SWIFT bank identification code. If you leave this processing option blank, the system uses the account associated with AAI item RB.
- 5. Beneficiary Bank Account Format** Use this processing option to define the beneficiary's bank account format on the IPI. Typically, you use the IBAN from the Bank Transit Master table (F0030). In some cases you can use a national account number (CBNK) from the Bank Transit Master table instead of the IBAN. Values are:

 Blank: Use the IBAN as the bank account format.
I: Use the CBANK as the bank account format.
- 6. Beneficiary Bank Name** Use this processing option to define the beneficiary's bank name on the IPI. The IPI allows you to present the bank name in one of two formats. You can either use the SWIFT Bank Identification Code (BIC), stored as SWFT in the Bank Transit Master table (F0030), or you can use the name of the bank. Values are:

 Blank: Use the BIC code.
I: Use the bank name.
- 7. Details of Payment** Specify the data that appears in the Details of Payment section on the IPI. You select a hard-coded value from the IPI - Details of Payment UDC table (00/IP). If you leave this processing option blank, the system uses *00*. Values are:

00: Unstructured - DOC. The system writes the value from the DOC field in the Customer Ledger (F03B11) table to the Details of Payment section of the IPI.

01: Unstructured - DOC, DCT, & CO. The system concatenates the values in the DOC, DCT, and CO fields in the F03B11 table and writes the concatenated string to the Details of Payment section of the IPI.

02: Unstructured - DOC & AN8. The system concatenates the values in the DOC and AN8 fields in the F03B11 table and writes the concatenated string to the Details of Payment section of the IPI.

8. Charges Paid By

Specify the entity responsible for paying the bank charges associated with the International Payment Instruction (IPI). The value that you enter must exist in the IPI - Charges Paid By UDC table (00/IC). If you leave this processing option blank, the system uses *0* (Ordering Customer). Values are:

0: Ordering Customer

1: Beneficiary

2: Shared/Both

9. IPI Form Type

Specify the type of preformatted form to use. The value that you enter must exist in the IPI - Form Types UDC table (00/IF). If you leave this processing option blank, the system uses *03* (Black - Unstructured). Values are:

00: Blind Colour - Structured

01: Blind Colour - Unstructured

02: Black - Structured

03: Black - Unstructured

04: Drop Out - Structured

05: Drop Out - Unstructured

1. Tax Amounts

Specify whether tax amounts appear on the invoices. Values are:

Blank: Tax amounts do not appear on invoices.

1: Tax amounts appear on invoices.

2. Attachments

Specify whether generic text that is associated with the invoice appears on the invoice. Values are:

Blank: Do not include generic text attachment.

1: Include generic text attachment.

3. Customer Bank Account Number

Specify whether the customer's bank account number appears on the IPI portion of the invoice. Values are:

Blank: Do not include the customer's bank account number.

1: Include the customer's bank account number.

4. Customer Name and Address

Specify whether the name and address of the customer appears on the IPI portion of the invoice. Values are:

Blank: Do not include the customer's name and address.

1: Include the customer's name and address.

- 5. Details of Payment** Specify whether the system completes the payment details section on the IPI portion of the invoice. Values are:
Blank: Do not complete the payment details section.
I: Complete the payment details section. The system prints in the payment details section the data that you specified in the Details of Payment processing option on the Defaults tab.
- 6. Charges To Be Paid By** Specify whether the system completes the charges to be paid section on the IPI portion of the invoice. Values are:
Blank: Do not complete the charges to be paid section.
I: Complete the charges to be paid section.
- 7. IPI Currency and Currency Amounts** Specify whether the currency and amount appear on the IPI portion of the invoice. Values are:
Blank: Do not print the currency and amount.
I: Print the currency and amount.
- 1. Maximum IPI Amount** Specify the maximum amount allowed for an IPI. If the IPI is greater than this amount, the system will not generate an IPI. If you leave this field blank, the system uses 999,999.99 as the maximum IPI amount.

Print

- 1. Tax Amounts** Specify whether tax amounts appear on the invoices. Values are:
Blank: Tax amounts do not appear on invoices.
I: Tax amounts appear on invoices.
- 2. Attachments** Specify whether generic text that is associated with the invoice appears on the invoice. Values are:
Blank: Do not include generic text attachment.
I: Include generic text attachment.
- 3. Customer Bank Account Number** Specify whether the customer's bank account number appears on the IPI portion of the invoice. Values are:
Blank: Do not include the customer's bank account number.
I: Include the customer's bank account number.
- 4. Customer Name and Address** Specify whether the name and address of the customer appears on the IPI portion of the invoice. Values are:
Blank: Do not include the customer's name and address.
I: Include the customer's name and address.
- 5. Details of Payment** Specify whether the system completes the payment details section on the International Payment Instrument portion of the invoice. Values are:
Blank: Do not complete the payment details section.
I: Complete the payment details section. The system prints in the payment details section the data that you specified in the Details of Payment processing option on the Defaults tab.

- 6. Charges To Be Paid By** Specify whether the system completes the charges to be paid section on the International Payment Instrument portion of the invoice. Values are:
- Blank: Do not complete the charges to be paid section.
- I*: Complete the charges to be paid section.
- 7. IPI Currency and Currency Amounts** Specify whether the currency and amount appear on the International Payment Instruction portion of the invoice. Values are:
- Blank: Do not print the currency and amount.
- I*: Print the currency and amount.

Process

- 1. Maximum IPI Amount** Specify the maximum amount allowed for an IPI. If the IPI is greater than this amount, the system will not generate an IPI. If you leave this processing option blank, the system uses 999,999.99 as the maximum IPI amount.

Populating the Intrastat Workfile

This section provides an overview of workflow generation for Intrastat and discusses how to:

- Generate the workfile for sales.
- Set processing options for the Intrastat Workfile Generation - Sales program (R0018I1).
- Generate the workfile for procurement.
- Set processing options for the Intrastat Workfile Generation - Procurement program (R0018I2).

Understanding Work Table Generation for Intrastat

Intrastat reporting is based on the Intrastat Revision table (F0018T). This workfile is populated with information from the JD Edwards EnterpriseOne Sales Order Management, JD Edwards EnterpriseOne Procurement, and other systems. You run Intrastat reports based on the company's sales and procurement transactions for the reporting period. When you do this action, the update process writes all of the required information from the tables in the JD Edwards EnterpriseOne Sales Order and JD Edwards EnterpriseOne Procurement systems to the F0018T table.

This table shows the programs you use to update the F0018T table:

| Program | Description |
|---|---|
| Intrastat Workfile Generation - Sales (R0018I1) | Updates the F0018T table with sales information based on these tables: <ul style="list-style-type: none"> • Sales Order Header File (F4201) • Sales Order Detail File (F4211) |
| Intrastat Workfile Generation - Procurement (R0018I2) | Updates the F0018T table with purchase information based on these tables: <ul style="list-style-type: none"> • Purchase Order Header File (F4301) • Purchase Order Detail File (F4311) • Purchase Order Receiver File (F43121) |

In addition, the update programs collect information from these tables:

- Intrastat Supplier/Item Cross Reference Table (F744101).
- Inventory Constants (F41001).
- Business Unit Master (F0006).
- Company Constants (F0010).
- Currency Codes (F0013).
- Currency Restatement Rates File (F1113).
- Item Master (F4101).
- Item Branch File (F4102).
- Address Book Master (F0101).
- Address by Date (F0116).
- Order Address Information (F4006).
- Item Units of Measure Conversion Factors (F41002).
- Unit of Measure standard conversion (F41003).
- User-Defined Codes (F0005).

When you run the update programs, you use processing options and data selections to select transactions that are based on a number of different criteria in the sales and procurement tables. Depending on the structure of the company and country-specific reporting requirements, you can specify that the system write records at cost, cost plus markup, or at the taxable purchase price. If you want to report the quantity actually shipped rather than the quantity ordered, you can use data selection to select order lines from the sales and procurement tables that are based on the order activity rule which corresponds to the shipped status. The system verifies that the transactions meet the selection criteria and qualify for Intrastat reporting before writing the required information from the sales and procurement tables, and any other applicable information from the additional tables, to the Intrastat Revision table.

To ensure that table F0018T contains the most current information, you should periodically update the information in table F0018T. The update program for sales accesses the detail for the sales transactions in table F4211. If you automatically purge the sales details to the Sales Order History File table (F42119) when you run the Sales Update program (R42800), run the Intrastat generation program for sales after you confirm shipments and before you update sales information. You should update table F0018T at least once per reporting period, after all sales order and purchase order transactions are entered and finalized.

Note. If you change sales order or purchase order information after you generate table F0018T, the changes are not reflected in the F0018T table unless you regenerate the table or manually edit the table using the Intrastat Revision program (P0018T). See Revising Intrastat Information in this Global Solutions guide for information about manually editing the Intrastat Revision table.

Transaction Eligibility

Sales order transactions are *not* eligible for Intrastat reporting if either the Sold To country or the Ship To country is the same as the Declarant country, or if any of these countries (Sold To, Ship To, or Declarant) is not in the European Union.

Procurement transactions are *not* eligible for Intrastat reporting if either the Supplier country or the Ship From country is the same as the Declarant country, or if any of these countries (Supplier, Ship From, or Declarant) is not in the European Union.

The system retrieves the Ship To country from the Order Address Information table (F4006), if a record exists. Otherwise, the system retrieves the Ship To country from the Sales Order Detail File table (F4211).

The system retrieves the Ship From country by searching these tables in sequence:

1. Country (CTR) in the Address by Date table (F0116), using the supplier's address book record
2. Country (CTR) in the Order Address Information table (F4006)
3. Country of Origin (ORIG) in the Intrastat Supplier/Item Cross Reference table (F744101)

In table F744101, the Country of Origin (ORIG) is used to determine transaction eligibility for Intrastat reporting. The Original Country of Origin (ORGO) is for information only. The Original Country of Origin field is populated by the Country of Origin (ORIG) field in the Item Branch File table (F4102) when you generate table F0018T.

You must include codes for all European Union countries as valid values on UDC 74/EC (European Community Members).

Important! Changes to transaction eligibility that occur *after* you generate table F0018T are *not* recognized when you regenerate table F0018T using the processing option to refresh it. It is recommended that you generate table F0018T only after you have completed all relevant changes to shipping and receiving information for the reporting period. If you must override addresses and change the transaction eligibility after generating table F0018T, you should clear and completely regenerate table F0018T.

Triangulation

The Intrastats - Tax Update - Sales program (R0018I1) includes processing options for triangulation. However, the program has no logic to identify triangulation. Rather, the processing options allow you to indicate how to process interbranch records. If you use the processing options, the header branch/plant from table F4211 is written to table F0018T as the declaring company. Using the processing options also affects the document type and the taxable amount. Three separate taxable amounts can be written to the TAXA field in the Intrastat Revision table:

- The amount extended price (AEXP).

- The amount original cost (ECST).
- The amount total extended cost (TCST).

The amounts are retrieved for the header or detail branch/plant, depending on the processing option fields that you choose.

If you do not use the triangulation processing options, the detail branch/plant from table F4211 is always written to table F0018T as the declaring company; and the document type is always the type that is entered on the sales order.

For the Intrastats - Tax Update - Purchase program, you can specify the actual Ship From in table F4006. For example, suppose that the purchase order specifies the branch/plant (declarant) as Italy, and the supplier as Switzerland. However, when the goods are received, the customs note indicates that the goods were shipped from France. You should specify the actual Ship From in the Order Address table as France to ensure that the transaction is included in the Intrastat Revision table correctly.

Multicurrency Environments

In multicurrency environments, the system creates records in table F0018T based on the base currency of the Sales branch/plant or the Purchasing branch/plant for each transaction.

You might need to restate the domestic amounts of foreign transactions at an official exchange rate or a monthly average exchange rate. To do this restatement, use the processing options on the Currency tab to indicate the exchange rate type and the date for the exchange rate. The system recalculates the domestic amount based on the rate and date that are indicated in the processing options. The exchange rate is taken from table F1113.

"As-If" Currency Processing

To use as-if currency processing for the Intrastats - Tax Update - Sales and Intrastats - Tax Update - Purchasing programs, you must set processing options. These programs, unlike other programs that use as-if currency processing, write amounts to a table. Other programs display or print as-if currency amounts, but do not write amounts to a table.

If you use as-if currency processing, you lose the direct audit trail for the amount fields between table F0018T and the original tables in the JD Edwards EnterpriseOne Sales Order Management and JD Edwards EnterpriseOne Procurement systems.

Example of Company and Intrastat Reporting in Different Currencies

The corporate office is located in England and has three branch companies, each with a different base currency. You must submit all Intrastat reports in British pounds (GBP). This table shows the companies and base currencies:

| Company | Base Currency | Intrastat Reporting Currency |
|-----------|---------------|------------------------------|
| Company 1 | GBP | GBP |
| Company 2 | EUR | GBP |
| Company 3 | CAD | GBP |

For Intrastat reporting purposes, consider these guidelines:

- For company 1, do not run the Intrastats - Tax Update - Sales (R0018I1) and Intrastats - Tax Update - Purchasing (R0018I2) programs. The company base currency and Intrastat reporting currency are the same.

- For company 2, run the Intrastats - Tax Update - Sales and Intrastats - Tax Update - Purchasing programs to update EUR amounts to GBP.
- For company 3, run the Intrastats - Tax Update - Sales and Intrastats - Tax Update - Purchasing programs to update CAD amounts to GBP.

For companies 2 and 3, run the programs to load information in the Intrastat Revision table (F0018T) and update the amounts. Do this one company at a time, creating a separate version for each company. For both companies, specify GBP and the exchange rate date in the processing options for "as-if" currency.

Performance Considerations

Depending on the data selection and the number of transactions stored in the JD Edwards EnterpriseOne Sales Order Management and JD Edwards EnterpriseOne Procurement systems, the time that is required to run the Intrastat Generation programs varies. Complete these tasks to minimize the impact that these programs have on system performance:

- Specify the data selection as carefully as possible so that only the necessary records are written to table F0018T.
- Update table F0018T as part of the nightly operations.

Generating the Intrastat Workfile for Sales

Select Periodic Processing (G74STAT2), Intrastat Workfile Generation - Sales.

Setting Processing Options for Intrastat Workfile Generation - Sales (R0018I1)

Processing options enable you to specify the default processing for programs and reports.

Transaction

- | | |
|---|---|
| 1. Reporting Code Method | Specify the Sales Reporting Code (1-5) which contains the Nature of Transaction if you wish to use the reporting code method. Alternatively, you can use the User-Defined Code method. |
| 1. System Code and User-Defined Code | Specify the system code or the user-defined code for the UDC table which contains the Nature of Transaction. If no values are entered in these processing options, the system uses UDC table 74/NT. |
| 2. Enter '1' to refresh transactions that already exist in the Intrastat Work File (F0018T). | Specify whether the system refreshes transactions that already exist in the Intrastat Work File (F0018T). If left blank, only new transactions will be written. |

Defaults

- | | |
|---|--|
| 1. Enter a value to update all records written during this execution for VAT Regime. | Specify whether the system updates all records for VAT Regime written during this execution. Alternatively, enter a UDC table which contains the value to be used in the following processing options. |
|---|--|

- | | |
|---|--|
| 1. System Code and User-Defined Codes | Specify the system code or the user-defined code for the UDC table which contains the Nature of Transaction. If no values are entered in these processing options, the system uses UDC table 74/NT. |
| 2. Enter a value to indicate if the Statistical Value Calculation is required. | Specify whether the statistical value calculation is required. Values are: Blank: Not Required 1: Required |
| 3. Enter the constant value per Kg to be used for Statistical Value Calculation. | Specify the constant value per kilogram to use for the statistical value calculation. (Statistical Amount = Constant * Net Mass in KG + Taxable Amount). |
| 3. To use the percentage method, enter the percentage to be used. (for example, 105 = 105% of actual value). | Specify the percentage to use for the percentage method. For example, 105 = 105 percent of actual value. If no values are entered in these options, the statistical value will be equal to the actual value. (FRA) In France, this is the nominal costs covering the transport and insurance costs of a shipment to the exit point of the country. Traditionally, the statistical value is a fixed cost per order or a percentage of the order amount. This value is commonly required for value-added tax (VAT) reporting in France. Countries other than France might use a statistical value and might define it differently. For European Union tax reporting purposes, the user supplies this data. You can update the value by using the Intrastat Workfile Revision program (P0018T). |

Currency

- | | |
|--|--|
| 1. Enter the currency code for as-if currency reporting. | Specify the currency code for as-if currency reporting. This option enables the system to print amounts in a currency other than the currency they are stored in. Amounts will be translated and print in this as-if currency. If left blank, amounts will print in their database currency. |
| 2. Enter the As-Of date for processing the current rate for the as-if currency. | Specify the as-of date to use for processing the current rate for the as-if currency. If left blank, the system date will be used. |
| 3. Rate - Type | Enter the rate type value from UDC 11/RT in conjunction with the date effective to restate domestic amounts of foreign transactions at an official or monthly average exchange rate. |
| 3. Date - Effective | Enter the effective date in conjunction with the rate type to restate domestic amounts of foreign transactions at an official or monthly average exchange rate. |

Process

These processing options specify the triangulation records the system creates. Enter the value to be used followed by the document type for the record. Values are:

Blank: Record not created

1: Price

2: Cost

3: Transfer Cost

Leave the document type blank to use the original document type.

For example:

3SI: Specifies Transfer Cost, Document Type SI

2: Specifies Cost, Original Document Type

| | |
|---|--|
| 1. Export from Header to Customer | Specify the value and document type for the export from header to customer process when the header branch and customer in the same country and the detail branch are in a different country. |
| 1. Export from Detail to Customer | Specify the value and document type for the export from detail to customer process when the header branch and customer in the same country and the detail branch are in a different country. |
| 1. Export from Detail to Header | Specify the value and document type for the export from detail to header process when the header branch and customer in the same country and the detail branch are in a different country. |
| 1. Import from Header to Detail | Specify the value and document type for the export from header to detail process when the header branch and customer in the same country and the detail branch are in a different country. |
| 2. Export from Header to Customer | Specify the value and document type for the export from header to customer process when the header branch and detail branch in the same country and the customer is in a different country. |
| 2. Export from Detail to Customer | Specify the value and document type for the export from detail to customer process when the header branch and detail branch in the same country and the customer is in a different country. |
| 3. Export from Header to Customer, 3. Export from Detail to Customer, 3. Export from Detail to Header, and 3. Import to Header from Detail | Specify the value and document type for the export from header to customer process when the header branch, detail branch, and customer are in a different countries. |

Generating the Intrastat Workfile for Procurement

Select Periodic Processing (G74STAT2), Intrastat Workfile Generation - Purchase.

Setting Processing Options for Intrastat Workfile Generation - Procurement (R0018I2)

Processing options enable you to specify the default processing for programs and reports.

Process

| | |
|---|---|
| 1. Enter the Purchasing Report Code (1-5) which contains the Nature of Transaction | Specify the purchasing report code that contains the nature of transaction OR use the System Code and User-Defined Codes processing options to enter the user-defined code table that contains the Nature of Transaction. |
|---|---|

1. System Code and 1. User-Defined Codes

Specify the UDC table that contains the Nature of Transaction. Use these processing options in conjunction with the User-Defined Codes processing option or the System Code processing option. If no values are entered in this option, the system uses UDC 74/NT.

2. Enter '1' to refresh transactions that already exist in the Intrastat Work File (F0018T).

Specify whether the system updates transaction records that exist in the Intrastat Work File (F0018T). If left blank, the system writes new transactions only.

3. Use this processing option to specify how the system enters the country of origin (ORIG).

Specify how the system enters the country of origin (ORIG). Values are:

Blank: Enters the country of origin based on the address number of the supplier from the Address by Date table (F0116).

I: Enters the country of origin based on the Intrastat Supplier/Item Cross Reference table (F744101).

Note. Any country that is specified in the Order Address Information table (F4006) takes precedence over all other countries of origin.

4. Enter a '1' to use the Intrastat Supplier/Item Cross-Reference Table (F744101) for Original Country of Origin.

Specify how the system enters the country of origin (ORIG). Values are:

Blank: Enters the country of origin based on the address number of the supplier from the Address by Date table (F0116). country of origin in the Item Branch File table (F4102). If no value exists in the F4102 table, the system uses the address number of the supplier from the Address by Date table (F0116).

I: Enters the original country of origin based on the Intrastat Supplier/Item Cross Reference table (F744101).

Note. Any country that is specified in the Order Address Information table (F4006) takes precedence over all other countries of origin.

Defaults**1. Enter a value to indicate if the Statistical Value Calculation is required.**

Specify whether the Statistical Value Calculation is required. Values are:

Blank: Not Required

I: Required

2. Enter a percent to use for calculating Statistical Value.

Specify the percent the system uses to calculate Statistical Value. For example, 105 = 105 percent of actual value) OR use the following processing option to enter the constant value per kilogram.

2. Enter the constant value per KG to be used.

Specify the constant value per kilogram that the system uses to calculate Statistical Value. For example, Statistical Amount = Constant * Net mass in Kg + Taxable Amount

(FRA) In France, this is the nominal costs covering the transport and insurance costs of a shipment to the exit point of the country. Traditionally, the statistical value is a fixed cost per order or a percentage of the order amount. This value is commonly required for VAT reporting in France.

Countries other than France might use a statistical value and might define it differently. For European Union tax reporting purposes, the user supplies

3. Enter a value to Statistical Procedure to update all records with.

this data. You can update the value by using the Intrastat Workfile Revision program (P0018T).

Specify a code from the INTRASTAT Regime Code UDC table (00/NV). This code is similar to the Nature of Transaction code (NAT) and is applicable only to certain countries. The system does not automatically supply this data. You enter the data using the Intrastat Workfile Revision program (P0018T).

(FRA) Nature of VAT Regime is commonly used in France.

Instead of using this processing option, you can use the System Code and User-Defined codes processing options to enter the user-defined code table which contains the value to be used.

3. System Code and 3. User-Defined Codes

Specify the system code or the user-defined code of the UDC table that contains the desired value. If no values are entered in these processing options, the system uses UDC 74/NT.

Currency**1. Enter the currency code for as-if currency reporting.**

Specify the currency code for as-if currency reporting. This option enables the system to print amounts in a currency other than the currency stored. Amounts will be converted and printed in this as-if currency.

2. Enter the As-Of date for processing the exchange rate for the As-If currency.

Specify the as-of date for processing the exchange rate for the as-if currency. If left blank, the system date will be used.

3. Exchange Rate Type

Use this processing option in conjunction with the Date Exchange Rate Effective processing option to restate domestic amounts of foreign transactions at an official or monthly average exchange rate.

3. Date Exchange Rate Effective

Use this processing option in conjunction with the Exchange Rate Type processing option to restate domestic amounts of foreign transactions at an official or monthly average exchange rate.

Revising Intrastat Information

You can revise existing data in the Intrastat Revision table (F0018T). You might need to do this revision to correct missing or inaccurate information, to add a specific transaction, to update the process indicator, or to enter information in fields that are required by the authorities but are not populated by the system. You can also use the Intrastat Revision program (P0018T) to update sales order or purchase order information that has changed since you generated table F0018T.

Prerequisite

Run the Intrastats - Tax Update - Sales (R0018I1) and Intrastats - Tax Update - Purchasing (R0018I2) programs to build the Intrastat Revision table (F0018T).

See [Chapter 66, “\(Europe\) Working With European Union Functionality,” Revising Intrastat Information, page 1258.](#)

Form Used to Revise Intrastat Information

| Form Name | FormID | Navigation | Usage |
|-----------------------------|---------|--|---|
| Intrastat Tax File Revision | W0018TE | <p>Periodic Processing (G74STAT2), Intrastat Workfile Revision</p> <p>On the Work with Intrastat Tax File - 1993 EEC form, click Add, or select a record and click Select.</p> | Revise Intrastat information that resides in the Intrastat Revision table (F0018T). |

Revising Intrastat Information

Access the Intrastat Tax File Revision form.

Branch/Plant

Enter an alphanumeric code that identifies a separate entity within a business for which you want to track costs. For example, a business unit might be a warehouse location, job, project, work center, branch, or plant.

You can assign a business unit to a document, entity, or person for purposes of responsibility reporting. For example, the system provides reports of open accounts payable and accounts receivable by business unit to track equipment by responsible department.

Business unit security might prevent you from viewing information about business units for which you have no authority.

Ship To/From

Enter a number that identifies an entry in the JD Edwards EnterpriseOne Address Book system, such as employee, applicant, participant, customer, supplier, tenant, or location.

Document Company

Enter a number that, with the document number, document type, and general ledger date, uniquely identifies an original document, such as invoice, voucher, or journal entry.

If you use the Next Numbers by Company/Fiscal Year feature, the Automatic Next Numbers program (X0010) uses the document company to retrieve the correct next number for that company.

If two or more original documents have the same document number and document type, you can use the document company to locate the desired document.

Document Number

Enter a number that identifies the original document, such as a voucher, invoice, or journal entry. On entry forms, you can assign the document number or let the system assign it using the Next Numbers program (P0002). Matching document numbers (DOCM) identify related documents in the JD Edwards EnterpriseOne Accounts Receivable and JD Edwards EnterpriseOne Accounts Payable systems. Examples of original and matching documents are:

Accounts Payable

Original document - voucher

Matching document - payment

Accounts Receivable

Original document - invoice

Matching document - receipt

Note. In the JD Edwards EnterpriseOne Accounts Receivable system, these transactions simultaneously generate original and matching documents: deductions, unapplied receipts, chargebacks, and drafts.

Document Type

Enter a user-defined code (00/DT) that identifies the origin and purpose of the transaction. The system reserves several prefixes for document types, such as vouchers, invoices, receipts, and timesheets. The reserved document type prefixes for codes are:

P: Accounts payable

R: Accounts receivable

T: Time and pay

I: Inventory

O: Purchase order

S: Sales order

Line Type

Enter a code that controls how the system processes lines on a transaction. It controls the systems with which the transaction interfaces, such as the JD Edwards EnterpriseOne General Accounting, JD Edwards EnterpriseOne Job Cost, JD Edwards EnterpriseOne Accounts Payable, JD Edwards EnterpriseOne Accounts Receivable, and JD Edwards EnterpriseOne Inventory Management systems. It also specifies the conditions under which a line prints on reports, and it is included in calculations. Codes include:

S: Stock item

J: Job cost

N: Nonstock item

F: Freight

T: Text information

M: Miscellaneous charges and credits

W: Work order

G/L Date (general ledger date)

Enter a date that identifies the financial period to which the transaction is to be posted.

The company constants specify the date range for each financial period. You can have as many as 14 periods. Generally, period 14 is used for audit adjustments. The system validates this field for PBCO (posted before cutoff), PYEB (prior year ending balance), PACO (post after cutoff), and WACO (post way after cutoff) messages.

Invoice Date

Enter the date the invoice was printed. The system updates this date when you run the invoice print program in the JD Edwards EnterpriseOne Sales Order Management system.

| | |
|---|--|
| Actual Ship | Enter the date on which the shipment to the customer is confirmed as shipped. During shipment confirmation, the system updates the Sales Order Detail table (F4211) with this date. |
| Receipt Date | Enter the date you received this purchase order line. |
| Net Mass in KG (net mass in kilograms) | Enter the net mass of the product as expressed in kilograms. The system extracts this value from the Sales Order Detail File (F4211) table or the Purchase Order Receiver File (F43121) table. |
| Base Currency | Enter a code that identifies the currency of a transaction. |
| Taxable Amount | Enter the amount on which taxes are assessed. |
| Statistical Value Amount | <p>(FRA) In France, enter the nominal costs covering the transport and insurance costs of a shipment to the exit point of the country. Traditionally, the statistical value is a fixed cost per order, percentage, or both of the order amount. This value is commonly required for VAT reporting in France.</p> <p>Countries other than France might use a statistical value and might define it differently. For European Union tax reporting purposes, the user supplies this data. You can update the value by using the Intrastat Workfile Revision program (P0018T).</p> |
| Transaction Currency | Enter a code that identifies the domestic (base) currency of the company on a transaction. |
| Foreign Taxable Amount | Enter that portion of the sale that is subject to tax in foreign currency. |
| Foreign Statistical Value | <p>(FRA) The statistical value is commonly required for VAT reporting in France. Although it may be used in other countries, France defines the statistical value to be the nominal costs covering the transport and insurance of a shipment to the exit point of the country. Traditionally it is a fixed cost per order, percentage, or both of the order amount. For EU tax reporting purposes, the user supplies this data. It can be updated using the Intrastat Workfile Revision program (P0018T).</p> |
| Supplementary Units | Enter the total number of items on a purchase or sales order. This total is updated in the Intrastat Revision table (F0018T) only if the primary weight is zero. |
| Country of Origin | Enter a code (00/CN) that identifies the country in which an item originates. This information is useful to organizations that must periodically separate their inventory by source. |
| Original Country of Origin | Enter a code (00/CN) that indicates the original country of origin of goods. For example, you are a German company that places a purchase order with a French supplier for goods that are manufactured in France but are warehoused in and delivered from Belgium. The country of origin is Belgium, but the original country of origin is France. |
| Region of Origin or Destination | For EU VAT reporting, certain countries require the region of origin or destination information. The region of origin is taken from the region code (state code) in the address book record of either the ship-to address (in the case of a dispatch) or the supplier (in the case of arrivals). |

| | |
|--------------------------------|---|
| Mode of Transport | Enter a user-defined code (00/TM) that describes the nature of the carrier being used to transport goods to the customer. For example, by rail, by road, and so on. |
| Conditions of Transport | <p>The conditions of transport (or terms of delivery) are taken from the Sales Order Header File table (F4201) or the Purchase Order Header table (F4301). The Terms of Delivery field (FRTH) in the header file is only one character. To obtain the required three-character explanation for EU VAT reporting, the second explanation of category code 42/FR is used. Set up a user-defined code 00/TC to correspond to the three-character explanation.</p> <p>Sample codes include:</p> <p><i>EXW</i>: Ex Works</p> <p><i>FOB</i>: Free On Board</p> <p><i>CIF</i>: Cost, Insurance, and Freight</p> <p><i>DUP</i>: Delivered Duty Paid</p> <p><i>DDU</i>: Delivered Duty Unpaid</p> <p>xxx: Others</p> |
| Nature of Transaction | Defines whether the movement of goods is for sale, lease, and so on. For European Union VAT reporting, you can input the nature of transaction codes using one of the user-defined codes on the Sales Order Detail Revisions form or the Order Detail form (for Procurement). For Procurement, use UDCs 41/P1 through 41/P5. For Sales, use UDC 40/S1 through 40/S5. The Intrastat Workfile Generation - Sales program (R0018I1) and Intrastat Workfile Generation - Purchase program (R0018I2) update the information in the Intrastat Revision table (F0018T) if you specify the UDC you are using (41/P1 through 41/P5 or 40/S1 through 40/S5) in the appropriate processing option on the generation program. You can also enter the data directly in the Intrastat Workfile Revision program (P0018T). |
| Port of Entry or Exit | Enter the port from which or to which the goods were shipped. For VAT reporting, certain countries require information about the port of exit or entry. This information is not available in the system at the present time. You specify the port of entry or exit when creating a purchase order by using the PO Receipts program (P4312), when creating a sales order by using the Sales Order Entry program (P4210), when confirming shipments by using the Shipment Confirmation program (P4205), or by using the Intrastat Revision program (P0018T). Set up values in UDC 40/PE. |
| Nature of VAT Regime | <p>Enter a code from the INTRASTAT Regime Code UDC table (00/NV). This code is similar to the Nature of Transaction code (NAT) and is applicable only to certain countries. The system does not automatically supply this data. You enter the data using the Intrastat Workfile Revision program (P0018T).</p> <p>(FRA) Nature of VAT Regime is commonly used in France.</p> |
| Nature Code | Enter an indicator for European Union VAT reporting. The system cannot supply this data automatically. If this information is required for VAT reporting in the country, enter the data using the Intrastat Workfile Revision program (P0018T). |
| Process Indicator | Enter an indicator for European Union VAT reporting. Values are: |

Blank: Record not processed

1: Record processed

2: No processing required The Intrastat reports select only unprocessed records (Process Indicator = Blank). You enter a value of 2 to exclude a specific record from the Intrastat report. For instance, if a supplier in the European Union ships a specific order from a country outside of the European Union, the order needs to be excluded from Intrastat reporting. The system does not supply this data automatically. For VAT reporting, you enter data using the Intrastat Workfile Revision program (P0018T).

Commodity Code

Enter the commodity code number for the item.

Purging Records from the Intrastat Table (F0018T)

This section provides an overview of the purge process and discusses how to:

- Run the Intrastat Workfile Purge Program.
- Set processing options for the Intrastat Workfile Purge Program (R0018TP).

Understanding the Purge Process

The Intrastat Revision table (F0018T) is a temporary workfile that stores information that is used to generate monthly or quarterly Intrastat declarations. After the declarations have been accepted by the tax authority, the data in this file continues to accumulate. You do not need to store this data.

You can purge records from table F0018T. You can use data selection to purge all of the records in the file or purge only selected records. You can specify selection criteria based on the invoice date, general ledger date, procurement date, or shipment date. For example, you might purge records with shipment dates between March 1, 2005 and May 1, 2005.

You can run Intrastat Workfile Purge (R0018TP) in proof mode or final mode. Run the program in proof mode to review which records will be deleted. No records are deleted until you run the report in final mode.

Running the Intrastat Workfile Purge Program (R0018TP)

Select Periodic Processing (G74STAT2), Intrastat Workfile Purge.

Setting Processing Options for the Intrastat Workfile Purge Program (R0018TP)

Processing options enable you to specify the default processing for programs and reports.

Defaults

Use these processing options to specify whether to run the program in proof or final mode, and to specify the dates to use to select transactions.

1. Proof or Final Mode

Specify the mode in which you want to run this report. Final mode deletes all selected records from the Intrastat Revision table (F0018T). Values are:

Blank: Proof mode.

I: Final mode.

**2. From Date (Required)
and 3. Thru Date
(Required)**

Specify the beginning date or the last date of the records you want to purge. These dates are used with the date specified for comparison. The system purges records whose comparison date is greater than or equal to the From Date and less than or equal to the Thru Date.

**4. Compare Date
(Required)**

Specify which date to use for comparison. Values are:

Blank: Invoice date

I: General ledger date

2: Receipt date

3: Ship date

Using the IDEP/IRIS Interface for Intrastat Reporting

This section provides an overview of the IDEP/IRIS interface and discusses how to:

- Run the IDEP/IRIS Interface (R0018I3) program.
- Set processing options for the IDEP/IRIS Interface program (R0018I3).

Understanding the IDEP/IRIS Interface for Intrastat Reporting

IDEP/IRIS is an abbreviation for Intrastat Data Entry Package/Interactive Registration of the International Trade Statistics. Use the IDEP/IRIS Interface program (R0018I3) to generate an electronic Intrastat declaration in the format required for each country. This table illustrates the countries that are associated with each format:

| Format | Where Used |
|----------|---|
| IDEP/CN8 | France, Italy, Spain, Austria, Belgium, Sweden, Denmark, Finland, Portugal, Greece, Ireland, and Luxembourg |
| CBS-IRIS | Holland |
| CBS-IRIS | Germany |

Intrastat declarations are based on the information in the Intrastat Revision table (F0018T). Although the information that is required to appear on the Intrastat report is common for most EU members, reporting requirements vary by country.

Note. Neither the IDEP/CN8 format nor the CBS-IRIS format requires a specific file layout.

IDEP/CN8 - France, Italy, Spain, Austria, Belgium, Sweden, Denmark, Finland, Portugal, Greece, Ireland, and Luxembourg

IDEP/CN8 includes an option to import the data that is necessary for the statistical declaration from an external administrative and financial system. IDEP/CN8 does not require a fixed record layout for the import file. You need to define the format of the data to be imported in IDEP/CN8. IDEP/CN8 can automatically perform the required conversions and validations of the data, and produce the declaration.

In IDEP/CN8, you can import this information:

- Detail lines.
- Good codes for the provider of statistical information.
- VAT registration numbers of trading partners.
- Exchange rates.

Although you can import all of the information above, the interface with IDEP/CN8 provides the ability to import only the detail lines and the VAT registration numbers or the trading partners. For sales transactions, the VAT registration number of the customer is based on the declaration type. For statistical declarations, the system uses the value in the Ship To - Address Number field. For fiscal or complete declarations, the system uses the Sold To - Address Number. Because the default declaration type is complete, the VAT registration number uses the Sold To - Address Number. For procurement transactions, the system uses the VAT registration number of the supplier.

Grouping Transactions

To group transactions for sales, purchases, and adjustment declarations, set up versions of the IDEP/IRIS Interface program (R0018I3) that have data selection for sales orders, purchase orders, adjustments for sales orders, and adjustments for purchase orders based on document type.

Electronic Format

Use the IDEP/IRIS Interface program (R0018I3) to create a flat file in the IDEP/IRIS message format, which you can then submit to the proper tax authorities in an electronic format.

The IDEP/IRIS Interface program generates one record for each declaring company.

When you run the IDEP/IRIS Interface program, the system creates a batch for review by the Text File Processor program (P007101). The batch is stored in these tables:

- F007101 - Text Processor Header
- F007111 - Text Processor Detail Table

You must run the Text File Processor program to convert the batch to a flat file that you can submit to the different countries' customs authorities, statistical offices, or both.

The Text File Processor program assigns the batch number and interchange from the seventh field of next numbers for system 00. The Text File Processor assigns the message number from the fifth field of next numbers for system 74.

Prerequisites

Before you complete the tasks in this section:

- Run the Intrastats - Tax Update - Sales (R0018I1) and Intrastats - Tax Update - Purchasing (R0018I2) programs to build the Intrastat Revision table (F0018T).

- Set up the layouts that you need.

Running the IDEP/IRIS Interface Program (R0018I3)

Select Statistical Reports (G74STAT3), IDEP/IRIS Interface.

Setting Processing Options for the IDEP CN8/IRIS Interface Program (R0018I3)

Processing options enable you to specify the default processing for programs and reports.

Defaults

- 1. Tax ID**
Specify which tax ID to use for the company and the customer. You can retrieve the tax ID from either the Additional Tax ID field (ABTX2) or the Tax ID field (ABTAX) in the Address Book Master table (F0101). Values are:
Blank: Tax ID (date item ABTAX)
1: Additional Tax ID (date item ABTX2)
- 2. Country Code**
Specify which format to use for the country code. Values are:
Blank: Two-character ISO code. You must enter a two-character ISO code that is defined in UDC 00/CN.
1: Three-digit GEONOM code. You must enter a three-digit GEONOM code that is defined in the Special Handling Code field of UDC 00/CN.
- 3. Declaration Type (UDC 74/IT)**
Specify the Intrastat declaration type (required for IDEP). Values are:
1: Fiscal
2: Statistical
3: Complete
The codes that correspond to these declaration types are maintained in the Intrastat Declaration Type UDC (74/IT).
For IDEP, the code specified in the special handling code for the UDC is written to the text field in the Text Processor Detail table (F007111). This special handling code is also used to determine the VAT registration number for sales transactions. For statistical declarations, the system uses the Ship To - Address Number. For fiscal or complete declarations, the system uses the Sold To - Address Number.

Process

- 1. Interface Type**
Specify the interface type for which the data should be formatted. Values are:
Blank: IDEP
1: Dutch version of IRIS
2: German version of IRIS
- 2. Commodity Flow**
Specify the direction of the movement of goods.
Values for Holland are:

6: Arrivals

7: Dispatches

For values for Germany, consult the CBS-IRIS documentation.

Note. This option is required only for the IRIS interface.

3. Level of Detail

Specify whether the program should be run in detail or summary mode. In detail mode, the system reports on all transactions. In summary mode, the system summarizes the transactions according to the version you set up. Values are:

Blank: Detail mode

1: Summary mode

Note. The level of summarization is determined by the version sequencing. If any sequenced field value changes, a level break occurs and a summarized record is written to the text file.

4. Proof or Final Mode

Specify the mode in which you want to process the IDEP/IRIS Interface. Final mode updates the Text Processor Header table (F007101) and the Text Processor Detail table (F007111). Values are:

Blank: Proof mode.

1: Final mode.

Currency

1. As-if Processing

Specify whether the invoice amount and statistical amount are reported to IRIS in the domestic currency or in the as-if currency. Values are:

Blank: Domestic currency

1: As-if currency

Note. The as-if values can be used only if the Intrastat Revision table (F0018T) has been generated using as-if processing. If you generate the Intrastat Revision table using as-if currency, both the domestic and the as-if amounts are stored in the F0018T table.

2. Number of digits to truncate from monetary amounts

Specify how the system determines how many digits are truncated from monetary amounts. For example, if the value entered is 3, the monetary amount 123456 is truncated to 123.

Values are 0 - 9.

Rounding

1. Round Rules

Specify the method to round both domestic and foreign taxable amounts. Values are:

Blank: No rounding. For example: 14.66=14.66

1: Round to the nearest whole amount. For example: 14.66=15 (no decimals).

2: Round down to the nearest whole amount. For example: 14.66=14 (no decimals).

3: Round up to the nearest whole amount. For example: 14.66=15 (no decimals).

4: Round to the nearest half. For example: 14.66=14.5 (one decimal place).

5: Round to the nearest tenth. For example: 14.66=14.7 (one decimal place).

6: Divide by one hundred and then round. For example: 1674=17.

7: Divide by one thousand and then round. For example: 1674=2.

Statistical Amount

Specify the method to round both domestic and foreign statistical amounts.

Supplementary UOM

Specify the method to round the supplementary unit of measure.

Net Mass UOM

Specify the method to round the net mass unit of measure.

Print

1. Reporting Period

Year (Required)

Specify the reporting year.

Period (Required)

Specify the reporting period.

(GBR) Using the SEMDEC Interface for Intrastat Reporting

This section provides an overview of the SEMDEC interface and discusses how to:

- Run the UK SEMDEC Interface program (R0018I4).
- Set the processing options for UK SEMDEC Interface (R0018I4).

Understanding the SEMDEC Interface for Intrastat Reporting

SEMDEC is the acronym for Single European Market Declaration.

Intrastat reports are based on the information in the Intrastat Revision table (F0018T). Although the information that is required to appear on the Intrastat report is common for most EU members, report formats vary from country to country.

As of January 1, 1999, businesses in the United Kingdom have the option of submitting Intrastat information to HM Customs and Excise in any of three formats:

- Electronic (using diskette, magnetic tape, or electronic mail).
- Preprinted government form (paper).
- Government form posted on the internet.

Electronic Format

Use the UK SEMDEC Interface program (R0018I4) to create a flat file in the SEMDEC (Single European Market Declaration) message format, which can be submitted to HM Customs and Excise on a diskette.

Note. The SEMDEC message format combines the information from the Intrastat Revision table that is required for the declaration of Intra EC Trade Statistics and the EC Sales List.

Businesses in the United Kingdom do not need to submit the EC Sales List report.

When you submit the UK SEMDEC Interface program (R0018I4) to create the EC Sales List, the system submits the SEMDEC Interface - Intra EC Trade Statistics program (R0018I41) to create the Intra EC Trade Statistics report.

You must use the Text File Processor tool to create a flat file in the SEMDEC message format that contains the EC Sales List and Intra EC Trade Statistics information. Text File Processor information is stored in these files:

- F007101 - Text Processor Header
- F007111 - Text Processor Detail

You must use the Text File Processor program (P007101) to copy the text batch that is generated by the SEMDEC Interface programs (R0018I4 and R0018I41) to a flat file that you can submit to HM Customs and Excise.

HM Customs and Excise provides these file names for the flat file in the SEMDEC message format:

- KEDCSD.TRX - use for live data.
- KEDCSD.TST - use for test data.

You should use these names when you copy the SEMDEC text batch in the Text File Processor.

Important! HM Customs and Excise rejects any submission that contains lowercase letters. Verify that the company name has been entered in all uppercase letters in the Companies program (P0010), or enter the company name in the processing options of the SEMDEC Interface program (R0018I4).

Data Selection

You can run the UK SEMDEC Interface program (R0018I4) for a single declaring company, or you can consolidate multiple companies to declare their information under a single company's VAT registration number.

Use data selection to list the company or companies for which you are declaring Intrastat information. If you list more than one company in the data selection, the system consolidates the statistical information for these companies on the report.

If you list only one company in the data selection, that company's name appears in the header of the report as the reporting company. If you list multiple companies in the data selection, you must enter the address book number of the declaring company in the processing options of the UK SEMDEC Interface program. If you list multiple companies in the data selection but do not complete the processing option, the system prints the name, address, and VAT registration number of company 00000 in the header of the report.

You must use matching data selection for Company on UK SEMDEC Interface and SEMDEC Interface - Intra EC Trade Statistics (R0018I41) programs. You should also use data selection on UK SEMDEC Interface to select sales transaction only. You do not need to include corresponding data selection for sales transactions on SEMDEC Interface - Intra EC Trade Statistics.

Government Forms

JD Edwards EnterpriseOne software does not provide a printed version of the Intrastat report on government forms.

Submission Deadlines

Intra EC Trade Statistics must be submitted monthly by the tenth working day of the following month to HM Customs and Excise, although you can submit them more frequently. HM Customs and Excise combines submissions from the same month to produce a monthly total.

In contrast, the EC Sales List is required quarterly within six weeks of the calendar quarter end, but it can also be submitted monthly. When you submit the EC Trade Statistics and EC Sales List together, they must be submitted monthly to meet the EC Trade Statistics due date. You must advise the local VAT office if you intend to submit the electronic EC Sales List monthly.

Prerequisites

Before you complete the tasks in this section:

- Set up user-defined code 74/TD for arrivals and dispatches.
- Run the Intrastats - Tax Update - Sales (R0018I1) and Intrastats - Tax Update - Purchasing (R0018I2) programs to build the Intrastat Revision table (F0018T).
- Set up next numbers for the Text File Processor.

The Text File Processor assigns the batch number and interchange from line 7 of Next Numbers System 00. The Text File Processor assigns the message number from line 5 of Next Numbers System 74.

Running the UK SEMDEC Interface Program (R0018I4)

Select Statistical Reports (G74STAT3), UK SEMDEC Interface.

Setting Processing Options for UK SEMDEC Interface (R0018I4)

Processing options enable you to specify the default processing for programs and reports.

Defaults

These processing options let you specify information about the declaring company and the agency submitting the declaration.

| | |
|-----------------------------------|---|
| 1. Company Name | Specify the company name of the Declarant. If left blank, the system uses the description for company 00000. |
| | <hr/> <p>Warning! You must enter the company name using all uppercase letters. HM Customs and Excise will reject any submission that contains lowercase letters.</p> <hr/> |
| 2. VAT Registration Number | Specify the VAT registration number of the Declarant. If left blank, the system uses the tax ID from the address book record for company 00000. |
| 3. Agent Reference | Specify the reference code associated with the agency submitting the declaration. Complete this processing option in conjunction with the Submission Type processing option on the Process tab. |

Process

These processing options let you specify whether to run the report in test or live format, and whether the declarant or an agency is submitting the declaration.

1. **Mode** Specify the format in which you want to run this report. You can run the report in test format to verify data. However, you must submit the report in live format to HM Customs and Excise. Values are:
Blank: Test format
I: Live format
2. **Submission Type** Specify who is submitting the declaration. Values are:
Blank: Declarant submission
I: Agent/agency submission
Complete this processing option in conjunction with the Agent Reference processing option on the Defaults tab.

Currency

This processing option lets you report amounts in either the domestic currency or the currency of the Intrastat Revision table (F0018T).

1. **Currency** Specify whether amounts are reported in the as-if currency. Values are:
Blank: Domestic currency.
I: Currency used in the Intrastats workfile (F0018T).

Note. This option is available only if the Intrastat workfile was created using as-if currency. You specify the as-if currency for the Intrastat workfile on the processing options for Intrastat Generation - Sales (R0018I1) and Intrastat Generation - Procurement (R0018I2).

Print

These processing options do not control the selection of records from the Intrastat work file. Complete these processing options to meet the HM Customs and Excise requirement that the submission include the reporting period and year.

1. **Reporting Period** Year
Enter the reporting year of the submission.
Period
Enter the reporting period.

Print

- Reporting Period: Year** Specify the year for the reporting period.
- Reporting Period: Period** Specify the accounting period for the report.

Version

- 1. Intra EC Trade Statistics Report Version (R0018I41)** Specify the Intra EC Trade Statistics Report Version (R0018I41) The default value is *XJDE0001*.

(DEU) Printing the German Intrastat Report

This section provides an overview of the German Intrastat report and discusses how to:

- Run the Germany Electronic Submission (R0018IGF).
- Set processing options for the Germany Electronic Submission (R0018IGF).

Understanding the German Intrastat Report

You print Intrastat reports based on the information in the Intrastat Revision table (F0018T). Although the information that is required to appear on the Intrastat report is common for most EU members, report formats vary from country to country.

The Germany Electronic Submission program (R0018IGF) creates a flat file that can be copied to a magnetic tape that is sent to the German Statistical Office.

When you run the Germany Electronic Submission program, the Process Indicator field in table F0018T is updated to the value 1 to indicate that the record has been processed. You can use the processing options to specify that this value not be updated.

Running the Germany Electronic Submission (R0018IGF)

Select Statistical Reports (G74STAT3), Germany Electronic Submission.

Setting Processing Options for the Germany Electronic Submission (R0018IGF)

Processing options enable you to specify the default processing for programs and reports.

Identification

- 1. Enter the Branch ID to print on the Report.** Specify the branch identification number that prints on the report.
- 2. Enter the Region Code of the Tax Authority.** Specify a user-defined code (00/S) that identifies the tax authority. This code is usually a postal service abbreviation.

Shipping

- 1. Shipping Type** Specify whether the system imports or exports the file. Values are:
- Blank: Exports
- I*: Imports

Label

- 1. Diskette Label** Specify whether the diskette label is required. Values are:
Blank: Not required
/ : Required
- 2. Object Library Name** Specify the file name.
- 2. Member ID** Specify the library of the file.

Tax Number

- Enter the Tax Number of the Registrar.** Specify the tax number of the registrar. If left blank, the Tax Number from the address book record for the company will be used. If the registrar is a third-party, enter their Tax Number here.

Report Period

- Report Period: Period** Specify the report period to print on the report heading.
- Report Period: Year** Specify the year to print on the report heading.

Printing the EC Sales List Report (R0018L)

This section provides an overview of the EC Sales List program and discusses how to:

- Run the EC Sales List report (R0018L).
- Set processing options for EC Sales List (R0018L).

Understanding the EC Sales List

You can print the EC Sales List (R0018L) in summary or detail mode. Detail mode provides information for auditing.

If you print in summary mode, the EC Sales List provides this information about customers:

- VAT number.
- Country of destination.
- Total amount in reporting currency.
- Triangulation.

If you print in detail mode, the EC Sales List provides this information about customers in addition to the information above:

- Company order number
- Order type
- Country of sale
- Country of shipment

Triangulation

Triangulation can be reported in summary and detail mode in either of the methods illustrated in this table:

| Method | Description |
|-------------|--|
| Interbranch | Identifies as trade triangulation a transaction between two EU member countries in which the goods are shipped from a branch/plant of the supplier who is located in a third EU member country |
| Direct Ship | Identifies as trade triangulation a transaction between two EU member countries in which the goods are shipped directly from a third company that is located in a third EU member country |

Data Selection

You must run the EC Sales List separately for each VAT-registered company in the organization.

If you have interbranch shipments from branch/plants that are located in countries other than the country of the headquarters organization, you must submit the EC Sales List for each country within which you operate.

For example, if a German company has three branch/plants in Germany, one branch/plant in France, and one branch/plant in Denmark, that company must run the EC Sales List three times:

- For the three branch/plants in Germany.
- For the branch/plant in France.
- For the branch/plant in Denmark.

To run the EC Sales List for the branch/plants in each country, set up data selection with Document Company (KCO) equal to the company number of the headquarters company, and Company (CO) equal to the companies that are associated with each branch/plant.

Note. The companies that are associated with the branch/plants must be set up with the country code that corresponds to the location of the branch/plant.

In the example above, you would run the EC Sales list with this data selection:

For branch/plants in Germany:

- Document Company (KCO) = German company.
- Company (CO) = company for German branch/plant 1.
- Company (CO) = company for German branch/plant 2.
- Company (CO) = company for German branch/plant 3.

For the branch/plant in France:

- Document Company (KCO) = German company.
- Company (CO) = company for French branch/plant.

For the branch/plant in Denmark:

- Document Company (KCO) = German company.

- Company (CO) = company for Danish branch/plant.

Prerequisites

Before you complete the tasks in this section:

- Enter VAT registration numbers for each customer.
- Enter country codes for each customer.
- Run the Intrastats - Tax Update - Sales (R0018I1) and Intrastats - Tax Update - Purchasing (R0018I2) programs to build the Intrastat Revisions table (F0018T).

Running the EC Sales List Report (R0018L)

Select Statistical Reports (G74STAT3), EC Sales List.

Setting Processing Options for the EC Sales List Report (R0018L)

Processing options enable you to specify the default processing for programs and reports.

Process

Use these processing options to specify whether to print the report in summary or detail mode, and to specify the triangulation method to use.

- | | |
|---------------------------|---|
| 1. Reporting Level | Specify whether to run the program in summary or detail mode. If you run the program in detail mode, the report displays information that can be used for auditing. Values are: Blank: Summary <i>1</i> : Detail |
| 2. Triangulation | Specify which triangulation method to use. Trade triangulation occurs when one EU member makes a sale or purchase with another EU member but the goods are physically shipped from a third EU member. If the goods are not shipped from an EU member then the transaction is not required to be reported to the government. This terminology is used specifically in the EU for Intrastat. Values are: Blank: No triangulation <i>1</i> : Direct Ship and Interbranch <i>2</i> : Direct Ship <i>3</i> : Interbranch |

Print

Use these processing options to specify the reporting period for the report.

- | | |
|----------------------------|--|
| 1. Reporting Period | From month Specify the beginning month of the period for which you are submitting the EC Sales List. From year |
|----------------------------|--|

Specify the beginning year of the period for which you are submitting the EC Sales List.

To month

Specify the ending month of the period for which you are submitting the EC Sales List.

To year

Specify the ending year of the period for which you are submitting the EC Sales List.

Currency

Specify the currency code for as-if currency processing.

1. As-if Processing

Specify whether the invoice amount is reported in the domestic currency or in the as-if currency. Values are:

Blank: Domestic currency

I: As-if currency

Note. The as-if values can be used only if the Intrastat Revision table (F0018T) has been generated using as-if processing. If you generate the Intrastat Revision table using as-if currency, both the domestic and the as-if amounts are stored in the F0018T table.

Printing the EC Sale List - AR Report (R0018S)

This section provides an overview of the EC Sale List - AR (R0018S) program and discusses how to:

- Run the EC Sale List - AR report (R0018S).
- Set processing options for EC Sale List - AR (R0018S).

Understanding the EC Sales List - AR Report (R0018S)

You can print the EC Sale List - AR (R0018S) in summary or detail mode. If you print in summary mode, the EC Sale List - AR provides this information about customers:

- Country of destination.
- Customer VAT registration number.
- Total value of supplies.
- Triangulation (yes or no).
- (Optional) Customer name and address.

If you print in detail mode, the EC Sale List - AR also includes the document number.

The EC Sale List - AR includes this information in the report header:

- Reporting company VAT registration number.
- Reporting company currency code.

- Company name and address.

The report header can also include the approval code of the EC authority to whom the report will be submitted.

Information on the report is sequenced by company, address book number, tax ID, and document number. Line numbering and page numbering restart for each reporting company.

Prerequisites

Before you complete the tasks in this section:

- Enter VAT registration numbers for each customer.
- Enter country codes for each customer.
- Set up tax rules for both the JD Edwards EnterpriseOne Accounts Receivable and JD Edwards EnterpriseOne Accounts Payable systems with these options selected:
 - Tax on Gross Including Discount
 - Discount on Gross Including Tax

See *JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide*, “Setting Up Tax Information,” Setting Up Tax Rules by Company.

- Set the processing options in the General Ledger Post Report program (R09801) to automatically update the Taxes table (F0018).
- Set up the user-defined code for Triangulation Tax Rates (00/VT).

Running the EC Sales List - AR Report (R0018S)

Select Statistical Reports (G74STAT3), EC Sale List - AR.

Setting Processing Options for EC Sales List - AR (R0018S)

Processing options enable you to specify the default processing for programs and reports.

Select

Use these processing options to specify the branch ID and the date range for the report.

- | | |
|--|---|
| 1. Branch ID | Specify the branch ID for the reporting company. The branch ID is displayed in the report heading; it is not used for data selection. |
| From month (1-12) and To month (1-12) | Specify the first calendar month or the last calendar month of the reporting period. This information is used for data selection. |
| From year (4 digits) and To year (4 digits) | Specify the first four-digit calendar year or the last four-digit calendar year of the reporting period (for example, 2001). This information is used for data selection. |

Process

Use this processing option to specify whether to print the report in detail or summary mode.

1. Report Mode

Specify whether to run the report in summary mode or detail mode. If you select detail mode, the document number of each transaction is displayed on the report. Values are:

Blank: Detail mode

I: Summary mode

Display

Use this processing option to specify whether to display the name and address on the report.

1. Name and Address

Specify whether to include the name and address of each customer on the report. Values are:

Blank: Do not print.

I: Print.

As-If-Currency

Use these processing options to specify the as - if currency and the date to use to select the exchange rate.

1. As-If-Currency Code

Specify the currency code for as-if-currency reporting. This option lets you print amounts in a currency other than the currency in which they are stored. Amounts are converted and are displayed in the currency you specify. If you leave this processing option blank, amounts are displayed in the reporting company's base currency.

2. Exchange Rate Date

Specify the as-of date for determining the exchange rate for the as-if-currency conversion. If you leave this processing option blank, the system uses the current date.

Approval Code

Use this processing option to specify the approval code for the reporting authority.

**Reporting Authority
Approval Code**

Enter the Reporting Authority Approval Code. This code is displayed in the report heading. This code is required in Germany.

Chapter 69

(FRA) Working With French Functionality

CHAPTER 67

(FRA) Understanding Country-Specific Functionality for France

This chapter provides an overview of France-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

France-Specific Setup and Processes

This table lists the country-specific setup and functionality for France.

| Setup or Process | Description |
|--|---|
| UDCs (user-defined codes) | <p>Setting up France-specific UDCs enables you to use France-specific functionality. You also set up some base software UDCs with France-specific values. Set up these UDCs to work with functionality for France:</p> <ul style="list-style-type: none">• Set up UDCs for European Union reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221.• Set up UDCs to print invoices with an attached International Payment Instruction (IPI). See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.• Set up these UDCs for companies:<ul style="list-style-type: none">- Affiliated Companies (74/AC)- Code Number (74/30) See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for European Companies, page 1230. |
| AAIs (automatic-accounting instructions) | <p>Set up base software AAIs before processing taxable transactions.</p> <p>See Chapter 68, “(FRA) Setting Up Country-Specific Functionality for France,” Setting Up AAIs for France, page 1293.</p> |

| Setup or Process | Description |
|-------------------|---|
| Bank accounts | <p>To work with bank accounts in France:</p> <ul style="list-style-type: none"> Review the overviews about bank account validation. See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding Bank ID and Bank Account Validation, page 1238. See Chapter 69, “(FRA) Working With French Functionality,” Understanding Bank Account Validation, page 1301. Review the overview about using international bank account numbers (IBAN). See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding International Bank Account Numbers, page 1237. Use the Bank Account Exception Report (R00314) to list any drafts with an invalid bank transit number, customer bank account number, or control digit. See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (FRA) Reports for France, page 1836. <p>Before you assign bank accounts to customers, verify that your customers have a country code that is equal to FR (France) or a blank with FR in the second description of the 00/CN UDC table. The validation of the online bank account information validation is activated based on the R.I.B. key.</p> <p>For electronic funds transfer, the Banque de France assigns a sender’s number that you enter in the Reference/Roll field when setting up supplier master information.</p> <p>See <i>JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide</i>, “Setting Up Bank Accounts,” Setting Up Customer Bank Accounts.</p> |
| Chart of accounts | <p>France requires a chart of accounts that is different from the standard chart of accounts provided.</p> <p>See Chapter 68, “(FRA) Setting Up Country-Specific Functionality for France,” Understanding the Alternate Chart of Accounts for France, page 1291.</p> |

| Setup or Process | Description |
|----------------------------|--|
| Closing accounting periods | <p>In addition to the standard processes for closing an accounting period, France-specific processes exist for generating these reports:</p> <ul style="list-style-type: none"> • Sequential Number Report - Tax File (R74099A). • Sequential Number Report - A/P Ledger (R74099B). • Sequential Number Report - AR (R74099C and R74099D). • T/B by Object and Subsidiary (R7409C3). • T/B by Category Code (R70472). <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (FRA) Reports for France, page 1836.</p> |
| Closing a fiscal year | <p>Additional processes exist for closing a fiscal year in France.</p> <p>See Chapter 69, “(FRA) Working With French Functionality,” Closing Accounting Periods and a Fiscal Year in France, page 1303.</p> |
| Automatic debit processing | <p>To work with automatic debits for France:</p> <ul style="list-style-type: none"> • Review the overview of working with draft remittance. <p>See Chapter 69, “(FRA) Working With French Functionality,” Understanding Draft Remittance for France, page 1301.</p> <ul style="list-style-type: none"> • On the Revise BACS Information (revise bank automated clearing system information) form, enter the sender’s bank ID in the Bank User Number field to process electronic funds transfers for France. • Set the processing options for the Automatic Debits French Format (R03B575FD) program. <p>See Chapter 69, “(FRA) Working With French Functionality,” Setting Processing Options for Automatic Debits French Format (R03B575FD), page 1307.</p> |
| Payment processing | <p>Set up payment formats to process payments for France.</p> <p>See Chapter 68, “(FRA) Setting Up Country-Specific Functionality for France,” Setting Up Payment Formats for France, page 1294.</p> |

| Setup or Process | Description |
|------------------------------------|---|
| Invoice processing | <p>In addition to standard invoice processing, you can print invoices with an attached International Payment Instructions (IPI). To print these invoices and attachments:</p> <ul style="list-style-type: none"> • Set up UDCs for IPIs. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220. • Set processing options for the invoice print program. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Invoice Print with International Payment Instruction (R03B5053), page 1247. • Print invoices with attached IPIs. See Chapter 66, “(Europe) Working With European Union Functionality,” Printing Invoices with an Attached International Payment Instruction, page 1245. <p>When posting invoices in France:</p> <ul style="list-style-type: none"> • It is recommended that users in France use offset method Y because it maintains the correct separate debit and credit balances, even if positive documents (invoices) and negative documents (credit memos) are included in the same batch. • It is recommended that if offset method B is used to post transactions in France, procedures are established to control the entry of different types of transactions, such as invoices and debit notes, in the same batch for posting. <p>See <i>JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide</i>, “Processing Invoices,” Understanding the Invoice Post Process.</p> |
| Bad debts and unrecoverable losses | <p>You must use specific accounts to process bad debts and unrecoverable debts in France.</p> <p>See Chapter 69, “(FRA) Working With French Functionality,” Managing Bad Debts for France, page 1307.</p> |

| Setup or Process | Description |
|-----------------------|--|
| VAT (value-added tax) | <p>In addition to the standard setup for tax processing, before processing transactions that are subject to VAT, set up:</p> <ul style="list-style-type: none"> UDCs. <p>See Chapter 68, “(FRA) Setting Up Country-Specific Functionality for France,” Setting Up UDCs for Tax Processing for France, page 1293.</p> <ul style="list-style-type: none"> AAIs. <p>See Chapter 68, “(FRA) Setting Up Country-Specific Functionality for France,” Setting Up AAIs for Tax Processing for France, page 1293.</p> <ul style="list-style-type: none"> Processing options for the General Ledger Post Report (R09801) program. General ledger accounts for VAT. <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Setting Up Tax Information,” (FRA) Setting Up the System for VAT Reporting.</p> |
| Fixed assets | <p>In addition to the standard processes for fixed assets, this functionality exists for France:</p> <ul style="list-style-type: none"> Use the French Derogatory Depreciation program (R7412855A) to calculate the difference between the French Declining Balance ledger and the French Straight Line ledger. <p>See Chapter 68, “(FRA) Setting Up Country-Specific Functionality for France,” Setting Up AAIs for Depreciation Reporting for France, page 1293.</p> <p>See Chapter 69, “(FRA) Working With French Functionality,” Running the French Derogatory Depreciation Report, page 1304.</p> <ul style="list-style-type: none"> France-specific depreciation methods. <p>See <i>JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide</i>, “Understanding International Depreciation Methods”.</p> |

| Setup or Process | Description |
|--------------------------------|--|
| Financial reporting for France | <p>In addition to standard financial reports, you can produce reports for France:</p> <ul style="list-style-type: none">• Report the different types of fees that are paid during the fiscal year. <p>See Chapter 69, “(FRA) Working With French Functionality,” Working with the D.A.S. 2 Report, page 1309.</p> <ul style="list-style-type: none">• Use provided programs and the ETAFI (<i>Etats Financiers</i>) interface to produce the <i>Liasse Fiscale</i> reports that are required by French authorities. <p>See Chapter 69, “(FRA) Working With French Functionality,” Working with the ETAFI Interface, page 1310.</p> |

| Setup or Process | Description |
|---------------------|---|
| Intrastat reporting | <p>To set up and use Intrastat reporting:</p> <ul style="list-style-type: none"> Review the overview about European Union reporting. See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding European Union Reporting, page 1241. Set up UDCs. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221. Set up commodity codes. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up Commodity Code Information, page 1230. Set up cross-references between suppliers and items to show the country of origin. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Entering Cross-References for Items and Suppliers, page 1231. Set the processing options for the Intrastat workfiles programs. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Sales (R0018I1), page 1254. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Procurement (R0018I2), page 1256. Populate the workfiles. See Chapter 66, “(Europe) Working With European Union Functionality,” Populating the Intrastat Workfile, page 1250. Revise the workfiles as necessary. See Chapter 66, “(Europe) Working With European Union Functionality,” Revising Intrastat Information, page 1258. |

| Setup or Process | Description |
|---------------------------------|---|
| Intrastat reporting (continued) | <p>To print and purge Intrastat records:</p> <ul style="list-style-type: none"> • Use the IDEP/IRIS Interface program (R0018I3) to generate an electronic Intrastat declaration in the format required for France. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Using the IDEP/IRIS Interface for Intrastat Reporting, page 1264.</p> <ul style="list-style-type: none"> • Purge records from the Intrastat table (F0018T). <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Purging Records from the Intrastat Table (F0018T), page 1263.</p> |
| Other European Union reporting | <p>In addition to Intrastat reporting, you can generate these reports:</p> <ul style="list-style-type: none"> • EC Sales List Reports • EC Sales A/R Report <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding EC Sales List Reports for European Reporting, page 1245.</p> <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sales List Report (R0018L), page 1273.</p> <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sale List - AR Report (R0018S), page 1276.</p> |

| Setup or Process | Description |
|-------------------|--|
| Integrity reports | <p>JD Edwards EnterpriseOne software provides these integrity reports for France:</p> <ul style="list-style-type: none"> • G/L by Category Code (R70470). • T/B by Category Code R70472). • Debit/Credit T/B by Object (R09473). • A/R Inventory Book (R7403B926). • A/P Inventory Book (R7404026). • Sequential Number Report - Tax File (R74099A). • Sequential Number Report - A/P Ledger (R74099B). • Sequential Number Report - A/R (R74099C). • G/L by Object and Subsidiary (R7409C1). • T/B by Object and Subsidiary (R7409C3). • General Journal (R7409C5). <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (FRA) Reports for France, page 1836.</p> |
| Rapid Start | <p>The JD Edwards EnterpriseOne Rapid Start solution from Oracle is available for France, as well as other countries. The preconfigured data that are part of the Rapid Start solution is based on business processes that have been designed according to the best business practices for a specific country and industry.</p> <p>See <i>JD Edwards EnterpriseOne Rapid Start 8.12 Documentation</i></p> |

CHAPTER 68

(FRA) Setting Up Country-Specific Functionality for France

This chapter provides an overview of the alternate chart of accounts for France and discusses how to set up:

- User-defined codes (UDCs).
- Automatic accounting instructions (AAIs).
- Payment formats.

Understanding the Alternate Chart of Accounts for France

In France, local businesses are required to use a legal, or statutory, chart of accounts (PCG82 - Plan Comptable Général). The French statutory chart of accounts uses a decimal-based numbering system with 10 account classes:

| Account | Classes |
|------------------|---|
| Balance Sheet | <p>These account classes are included on the balance sheet:</p> <ul style="list-style-type: none">• Class 1: Capital Accounts and Borrowings and Long-Term Debt• Class 2: Fixed Assets and Long-Term Investments and Assets• Class 3: Inventories• Class 4: Receivables, Payables, and Related Accounts with third parties• Class 5: Cash and Marketable Securities |
| Income Statement | <p>These account classes are included on the income statement:</p> <ul style="list-style-type: none">• Class 6: Expenses• Class 7: Income and Revenue |
| Other | <p>These account classes are reserved for other reporting purposes:</p> <ul style="list-style-type: none">• Class 8: Special Accounts - Extra account commitments that are not recorded on the balance sheet.• Class 9: Analytical Accounts - Contribute to the calculation of a certain number of assets that determine the result.• Class 0: Currently not used. |

Accounts are subtotaled using leading digits. France's statutory chart of accounts uses the first three digits in the account:

- The first digit defines the account category, such as capital, fixed asset, or stock.
- The second digit defines the account type within the account category, such as tangible assets.
- The third digit further defines the account, such as land accounts.

If you specify three leading digits, then the program subtotaals accounts each time one of the three leading digits changes.

Classes and Subclasses

Accounts are organized in classes, subclasses, sub-subclasses, and so on. For example:

- Class: 4 - Receivables and Payables
- Subclass: 40 - Payables; 41 - Receivables
- Sub-subclass: 419 - Advances Received from Customers, Discounts, and Refunds
- Sub-sub-subclass: 4191 - Advances Received on Orders

Setting Up UDCs for France

Setting up French-specific UDCs enables you to use French-specific functionality. You also set up some base software UDCs with French-specific values.

Setting Up UDCs for Annual Reporting for France

Set up this UDC to identify fee categories for annual reports.

Category Code 07 (01/07)

Set up the Category Code 07 UDC (01/07) to identify fee categories for the Yearly Declaration of Payments of Commissions, Broking, and Fees (*Declaration Annuelle Des Commissions, Courtage, Honoraires, Verses* [D.A.S. 2]) reporting. Set up these codes:

- AUT - Miscellaneous fees
- COM - Commissions
- COU - *Courtage*
- DAU - Author fee
- DIN - Copyright fee
- HON - Fees
- IRE - Expense reimbursements
- JDP - *Jeton de présence*
- RIS - Discount
- ZZZ - Not applicable

You can select any value for the fees, but the descriptions are the official descriptions of the fees to be used for D.A.S. 2 reporting.

Setting Up UDCs for Tax Processing for France

Set up this UDC before processing transactions for value-added tax (VAT).

VAT on Receipts/Payments (74/TX)

Set up UDCs to identify the tax rates codes that are applicable to VAT on receipts and VAT on payments. You can use these codes to associate different VAT rates with transactions that are subject to the VAT Deductible on Payment and VAT Collectable on Receipt regimes.

Important! You should define only the tax codes used for VAT on Receipts and Payments in the VAT on Receipts/Payments UDC table (74/TX), not the tax codes for the VAT on Debits regime. Defining codes for VAT on Debits in this UDC table results in unpredictable errors.

Setting Up AAls for France

Set up these base software AAls before processing taxable transactions.

Setting Up AAls for Tax Processing for France

Define these AAls for the receivables and payables tax accounts using the GL offsets that are defined for the tax rates:

- RTCOL, 44571.DEBIT
- RTENC, 44571.ENC
- PTDED, 44551.DEBIT
- PTDEC, 44551.DEC

Setting Up AAls for Depreciation Reporting for France

Set up these AAls to accurately create journal entries when you calculate the difference between the French Declining Balance ledger and the French Straight Line ledger:

- FF101 - Use this AAI to specify the account to which the system records the expense amount.
The system records to this account when the difference between the French Declining Balance ledger and the French Straight Line ledgers is positive.
- FF102 - Use this AAI to specify the account to which the system records the derogatory depreciation amount.
This account is the offset account.
- FF103 - Use this AAI to specify the account to which the system records depreciation reversal amounts.
The system records to this account when the difference between the French Declining Balance ledger and the French Straight Line ledgers is negative.

Setting Up Payment Formats for France

This section provides an overview of payment formats for France and discusses how to set up processing options for:

- Create A/P Bank Tape - France (R04572F1).
- Print Automatic Payments - Check - France (R04572F2).
- Create A/P Bank Tape - France EFT International (R04572F3).

Understanding Payment Formats for France

JD Edwards EnterpriseOne software provides these payment formats for France:

| Format | Description |
|----------|---|
| R04572F1 | Domestic electronic funds transfer (EFT) or paper transfers For paper transfers the program P04572F1B is called by P04572F1. |
| R04572F3 | Foreign EFT payments. |
| R04572F2 | Check letters. |
| R04572N | Drafts. |

Required Setup for EFT Payments

To use the French EFT International payment format, set up your company and suppliers according to these instructions:

- Use the Additional Individual Tax ID field for the company's SIRET (*système informatique pour le répertoire des établissements*) number in the company's address book information.

You can override the SIRET number from the address book record on the processing options for the French EFT International payment format (R04572F3).

- When setting up the company's bank account information, use the SWIFT Code field for the BIC (bank identifier code) for the issuing bank, and set up IBAN (International Bank Account Number) information to include that information in the flat file.
- When setting up the supplier's address book information, use one of the thirty available Address Book Category Codes for each of these fields:
 - Economic Reason Code.
 - Country Code for BDF Declaration.
 - Fees Distribution Code.
- When setting up the supplier's bank account information, use the SWIFT Code field for the BIC Code for the beneficiary's bank, and set up IBAN information to include that information in the flat file.

Considerations for Create A/P Bank Tape - France (R04572F1)

The Create A/P Bank Tape - France format for domestic payment transfers consists of a fixed length record that includes 160 characters. The information included in the EFT table includes:

- Header record (03): Information about the company that is ordering the payment.
- Detail record (06): Information about the suppliers who are to receive the payment and about the payment amount.

The EFT table can include as many detail records as there are payments in the payment group.

- Total record (08): Total amount of the transfer.

The Create A/P Bank Tape - France program also includes the sender's bank identification number on the header, detail, and total records, as required by the Bank of France. You can specify this identification number in the processing options for the generation program or enter the number in the Bank User Number field (BACS) on the Revise BACS Information form of the G/L Bank Accounts program (P0030G).

Specifying a Different Version

You can specify different versions of the print program and the register program that you set up for your payment instrument default values. To do this, access the processing options for the Work With Payment Groups program (P04571). Enter the versions that you want to use in processing option 1 on the Print tab and processing option 1 on the Update tab.

For example, if your company needs to create electronic and paper payment transfer orders, you should set up these versions of Create A/P Bank Tape - France:

- Electronic payment transfer orders
- Paper payment transfer orders

You would also need to create two versions of Automatic Payment Groups to call the appropriate version of the print program.

G/L Payment Date

The system writes the GL payment date to the electronic funds transfer table in the DDMMYY format, where Y is the last digit of the year. For example, July 07, 2005 is written to the table as 07075.

Bank Transit Codes

The system writes the bank transit number of your company to the header record and the bank transit number of the suppliers to the detail records of the EFT table. In both records, the bank transit number is split into the Bank Identification Number (5 digits) and the Branch Identification Number (5 digits).

Considerations for Print Automatic Payments - Check - France (R04572F2)

You can specify that Print Automatic Payments - Check - France (R04572F2) prints the check amount in words when you set the Translation processing option. The Translation processing option lets you specify whether the system uses a translation routine that you have attached to the Currency Codes table (F0013).

You associate translation routines with currency codes in the Currency Codes program (P0013). For example, to create an association between the euro and a routine that prints the amount in French text, you specify that the system uses translation routine X005005EF when you set up a currency code for the euro.

The processing options on the Translation tab follow a hierarchy to determine which translation routine the system uses for printing the check amount in words on the check.

1. If the processing option is completed with a valid translation routine, the system uses that routine.
2. If the processing option is blank or contains an invalid routine, the system reads the Currency Codes table (F0013) to determine if a translation routine is associated with the currency. If a translation routine exists, the system prints the check amount in words, according to the routine that is specified.
3. If the F0013 table does not contain a translation routine for the currency, the system does not print the check amount in words on the check.

Considerations for Create A/P Bank Tape - France EFT International (R04572F3)

This information is included in the EFT flat file that is created by the Create A/P Bank Tape - France EFT International payment format:

- Header record (03): Information about the company that is ordering the payment and the company's bank.

The system populates this record with the International Bank Account Number (IBAN) of the GL Bank Account of the Company ordering the payment if the IBAN exists in the Bank Transit Master table (F0030). If no IBAN exists, the system prints the transit bank account plus the bank account number from table F0030. You specify in a processing whether the system uses the IBAN.

- Operation detail record (04): Information about the suppliers who are to receive the payment and the payment amount.

The EFT table can include as many detail records as payments in the payment groups. The system populates this record with the IBAN number if it exists in table F0030. If no IBAN number exists, the system prints the transit bank account plus the bank account number from table F0030.

- Beneficiary's bank record (05) - Information about the beneficiary's bank.

This information is ignored if the payer asks for a check payment.

- Intermediary bank record (06): Information about the bank that is being used as an intermediary.

This section enables the payer to indicate a bank through which the funds must transit. JD Edwards EnterpriseOne software does not directly support this functionality; a customization is required to implement this functionality.

- Supplemental information record (07): Supplemental information about the payment. JD Edwards EnterpriseOne software supports only these fields for record 07:

- Record Code
- Operation Code
- Sequential Counter
- Reason

- Total record (08): The total amount of the transfer.

You must customize the Create A/P Bank Tape - France EFT International program to implement these fields:

- Currency Bought
- Exchange Contract Reference
- Date Bought
- Exchange Rate
- Instruction

You can use the Bank Accounts by Address program (P0030A) to add IBAN information to the Bank Transit Master table (F0030). The Create A/P Bank Tape - France EFT International format supports IBAN; the output records contain the IBAN number and other related IBAN information if you set up IBAN information for your company and your supplier.

Setting Processing Options for Create A/P Bank Tape - France (R04572F1)

Processing options enable you to specify the default processing for programs and reports.

Processing

Mode Enter *1* to print a paper Funds Transfer Order. If you leave this processing option blank, the system creates an EFT file.

Tape

Tape Information Enter *1* to write the vendor number to the reference field of the detail record. Leave this processing option blank to write the payment document number to the detail record.

City Specify the city that the system writes to the payment record.

Tape (more)

Sender Bank Specify the sender's bank ID number. You can enter up to 6 characters. If you leave this processing option blank, the system uses the Bank Account Bank System User Number (BACS). You must complete this processing option for the tape to be accepted by the bank clearing house.

Sender's Fiscal Specify the sender's fiscal identification (15 positions). This can be either the SIRET code (1 + 14 digits) or another code (2 + code).

Bank and Bank (More)

Use these processing options to specify the default values for the bank tape.

Devise Name Enter the devise name.

Tape Density Enter the tape density.

Label Name Enter the label name.

Block Size Enter the block size.

New Volume Name Enter the new volume name.

New Owner ID Enter the new owner ID.

File Name Enter the file name.

Currency

Currency Specify the currency code that is used in your system to identify the euro.

Setting Processing Options for Print Automatic Payments - Check - France (R04572F2)

Processing options enable you to specify the default processing for programs and reports.

Address Format

Address Format ID (FUTURE USE) This processing option is not used.

Payment Info

Purchase Order Number Enter *1* to print the purchase order number on the check stub instead of printing the supplier invoice number.

Payment Remark Enter *1* to print the payment remark on the check stub.

City Enter the city to print on the payment.

Print Info

Forms Type (FUTURE USE) This processing option is not used.

Translation

Translation Program Specify which translation program to use to translate the payment amount into words. The value that you enter must exist in the Check Translation (98/CT) UDC table. If you leave this processing option blank, the system uses the translation program associated with the payment currency.

Setting Processing Options for Create A/P Bank Tape - France EFT International (R04572F3)

Processing options enable you to specify the default processing for programs and reports.

Tape Header

- 1. Sender's SIRET** Enter the issuing SIRET (*système informatique pour le répertoire des établissements*) number to print in the header record. In France, the SIRET number is the unique registration number of a company in the chamber of commerce. If you leave this processing option blank, the system uses the value in the Additional Individual Tax ID field (TX2) from the Address Book Master table (F0101).
- 2. Payment Reference (Required)** Enter the value to populate the Payment Reference field in the header record. This field is manually populated and is mandatory.
- 3. Debit Account ID Type (Future)** This processing option is not used.
Specify the ID Type segment of the Debit Account field in the header record. Values are:
0: Other (default)

| | |
|--|---|
| | 1: IBAN |
| | 2: BBAN |
| 4. Customer ID | Specify a value for the Customer ID segment in the header record. You determine the code in accordance with the bank. This is an optional field in the header record. |
| 5. Debit for Bank Fees Account ID Type (Future) | <p>This processing option is not used.</p> <p>Specify a value for the ID Type segment of the header record for the account to be debited for bank fees. Values are:</p> <p>0: Other (Default value)</p> <p>1: IBAN</p> <p>2: BBAN</p> |
| 6. Debit for Bank Fees Account | Specify the account to be debited for bank fees that the system writes to the ID segment of the header record. Generally, you enter the IBAN number. If you leave this processing option blank, the system uses the general ledger bank account. |
| 7. Currency Code of Bank Fee Account | Specify the currency code that the system writes to the Currency Code of the Account to be Debited for Bank Fees field in the header record. The value that you enter must exist in the Currency Codes table (F0013). If you leave this processing option blank, the system uses the general ledger bank account. |
| 8. ID Payment Debit Type (Required) | <p>Specify a value to populate the ID Payment Debit Type field in the Header record. Values are:</p> <p>1: One debit for the entire payment group.</p> <p>2: One debit for each payment.</p> <p>3: One debit for each currency code.</p> |
| 9. Payment Type ID | <p>Specify a value for the ID Payment Type segment in the header record. Values are:</p> <p>1: Process payments using a single execution date and single currency.</p> <p>2: Process payments using a single execution date and multicurrency.</p> <p>3: Process payments using multiple execution dates and single currency.</p> <p>4: Process payments using multiple execution dates and multicurrency (default value).</p> <p>If you enter 1, 2, or 3, the system stores the execution date or currency in the header record. If you enter 4, the system stores the execution date or currency in each detail record.</p> |
| 10. Preferred Processing Date | Specify the value for the Preferred Processing Date segment in the header record. The system uses the value you enter when the Payment Type ID segment of the header record has a value of 1 or 2. If the Payment Type ID segment has a value other than 1 or 2, the system date is used. |

Tape Detail

Use these processing options to specify information for the detail records in the flat file.

- | | |
|--|---|
| 1. Category Code Number for Economic Reason Code (Required) | Specify the address book category code that you use to store the Economic Reason Code for the Operation Detail record for the supplier. For example, if you set up category code 30 for the Economic Reason Code, enter <i>30</i> in this processing option. Values are 01 through 30. |
| 2. Category Code Number for Country Code for BDF Declaration | Specify the address book category code that you set up to store the Country Code for BDF Declaration for the Operation Detail record in the flat file. For example, if you set up Category Code 30 for the Country Code for BDF Declaration, enter <i>30</i> in this processing option. |
| 3. Payment Mode (Required) | <p>Specify a value for the Payment Mode segment of the Operation Detail record. The system inserts the value into the Operation Detail record of the flat file. Values are:</p> <p><i>0</i>: Other.</p> <p><i>1</i>: By check of the payer's bank.</p> <p><i>2</i>: By check of the beneficiary's bank.</p> |
| 4. Category Code Number for Fees Distribution Code (Required) | Specify the address book category code that you set up to store the Fees Distribution Code for the Operation Detail record in the flat file. For example, if you set up category code 30 for the Fees Distribution Code, enter <i>30</i> in the processing option. Values are 01 through 30. |

Bank

Use these processing options to specify the default values for the bank tape.

| | |
|------------------------|----------------------------|
| Devise Name | Enter the devise name. |
| Tape Density | Enter the tape density. |
| Label Name | Enter the label name. |
| Block Size | Enter the block size. |
| New Volume Name | Enter the new volume name. |
| New Owner ID | Enter the new owner ID. |
| File Name | Enter the file name. |

CHAPTER 69

(FRA) Working With French Functionality

This chapter provides an overview of bank account validation and draft remittance, and discusses how to:

- Closing accounting periods and a fiscal year.
- Run the French Derogatory Depreciation report.
- Work with automatic debits.
- Manage bad debts.
- Work with the D.A.S. 2 report.
- Work with the ETAFI interface.

Understanding Bank Account Validation

To process bank transactions for France, the account information that you enter must be accurate to avoid service charges from the bank and possible rejection of electronic funds transfers. Electronic funds transfers can be rejected for payments; receipts can be rejected because of incomplete or incorrect account information.

The system automatically validates the *Rélevé d'Identité Bancaire* (R.I.B.), including the bank account and transit numbers, according to the standards set by the French banking authority. You must enter the R.I.B. key in the Control Digit field for the account information to be validated. The Modulus97 algorithm checks the R.I.B. key.

Note. In addition to online validation, you can run the Bank Account Exception Report (R00310) to verify that your account information is correct. When you run this report, the system verifies the account numbers based on a control digit (R.I.B. key) and the bank transit number.

Understanding Draft Remittance for France

In France, drafts can be remitted to the bank on paper or electronically. When a draft is remitted to the bank, the bank charges a commission fee for processing the draft. The commission fee is subject to VAT (value added tax). If the draft is discounted, the bank calculates an additional fee that is based on the actual due date. The fee for discounting is also subject to VAT. You must create manual journal entries for these VAT entries.

Types of Drafts

These drafts must be accepted by the customer before they can be remitted to the bank:

- LCR - The supplier prints the draft with bank account information.
- LCC - The supplier prints the draft with bank name only.
- BOR - The customer prints the draft with bank account information.
- BOC - The customer prints the draft with the bank name only.

Automatic drafts, called *Lettre de Change Magnétique (LCR Magnétique)*, do not require customer acceptance.

Référence Tiré

The *référence tiré* is a customer draft reference number that the company accepting the draft needs to enter on its draft record. This number must be included when the draft is remitted electronically because the bank uses the number to match the draft with the customer reference.

When you use electronic drafts, you should indicate a 10-character *référence tiré* on the draft file that is remitted to the bank. According to French banking standards, this reference must always be right-justified. If it is fewer than 10 characters, the remaining character spaces must be filled with zeroes. The system updates the *référence tiré* in the detail record of the bank file (record 06) in positions 21 to 30.

Use the Reference field to input the *référence tiré*. The Reference field is alphanumeric and cannot include any blanks, special characters, or punctuation marks. Although the Reference field is a generic field that can contain as many as 25 characters, only ten characters can be used for the French *référence tiré*. When the field is not used, it should remain blank.

The Reference field is included in these programs:

- Enter Our Drafts (P03B602, version ZJDE0001)
- Enter Customer Drafts (P03B602, version ZJDE0002)
- Draft Inquiry (P03B602, version ZJDE0001)
- A/R Draft Remittance Magnetic Tape Format program (R03B672T)

To access the Reference field, select Additional Information from the Form menu on the Drafts Entry form.

Draft Remittance Formats

You can use the Draft Remittance program (R03B672) to remit drafts in print or tape formats, depending on the program that you select in the appropriate processing option.

When you use the A/R Draft Remittance Magnetic Tape Format (R03B672T), the program generates the Drafts Standard Formatted Tape File table (F03B67OW). This table conforms to the French banking standards (AFB) for magnetic drafts (LCR Magnétiques). These standards are compatible with ETEBAC communication protocols.

The French LCR Magnétiques AFB standard bank file is 160 characters long and structured as follows:

- Header records - 03
- Detail records - 06
- Total records - 08

Table F03B67OW contains a 1500-character field that is labeled REAPTA; this field contains information that should be sent to the bank, formatted according to AFB standards.

You need to create a utility program to copy the appropriate information from table F03B67OW to a medium (diskette, email, or other) that can be sent to the bank.

Bank Input Code

Processing option 4 of the A/R Draft Remittance Magnetic Tape Format (R03B672T) enables you to indicate the Bank Input Code (*Code Entrée*) for the header record of the bank file (record 03) in position 79.

Sender's Bank ID

You enter the sender's bank ID in the Bank User Number field on the Revise BACS Information form. This number is updated in the header record (record 03) in positions 13 to 18.

You can access the Revise BACS Information form by choosing GL Bank Accounts from the Automatic Debiting menu (G03B131), and then selecting a bank account and choosing BACS Info from the Row menu.

Closing Accounting Periods and a Fiscal Year in France

This section provides an overview of the tasks necessary to close a fiscal year in France and discusses how to:

- Running sequential number reports
- Running trial balance reports

Understanding Tasks for Closing a Fiscal Year

In France, in addition to performing the tasks to close a fiscal year, businesses must run the General Journal report in final mode to perform a final annual close. In final mode, the system includes records that have been flagged by the Trial Balance report to indicate that they have been printed in final mode. Flagging the records prevents the records from being printed again in final mode. An error message is printed on the report if any records have been printed in a previous final mode report. The word *Final* is printed on every page of a report that is run in final mode.

JD Edwards EnterpriseOne General Accounting 8.12 Implementation Guide, “JD Edwards EnterpriseOne General Accounting Reports,” General Journal Reports

Running Sequential Number Reports

This table includes a description of additional reports that companies should run before they close an accounting period:

| Task | Report | Description |
|---|---|--|
| Verify that document numbers are in sequence. | Sequential Number Report - Tax File (R74099A) Sequential Number Report - A/P Ledger (R74099B) Sequential Number Report - AR (R74099C and R74099D) | Identifies any interruption in the document number sequence and general accounting registration date sequence. |

See [Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” \(FRA\) Reports for France, page 1836.](#)

Running Trial Balance Reports

This table includes a description of additional reports that French and Italian companies should run before they close an accounting period:

| Task | Report | Description |
|---|--|---|
| Verify the accuracy of transactions in account ledgers. | T/B by Object and Subsidiary (R7409C3) and T/B by Category Code (R70472) | R7409C3 prints trial balances by object.subsidiary and R70472 prints trial balances by category code 21, 22, or 23. |

See [Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” \(FRA\) Reports for France, page 1836.](#)

Running the French Derogatory Depreciation Report

This section provides an overview of the French Derogatory Depreciation report, lists prerequisites, and discusses how to set processing options for French Derogatory Depreciation (R7412855A).

Understanding the French Derogatory Depreciation Report

The French Derogatory Depreciation program (R7412855A) calculates the difference between the French Declining Balance ledger and the French Straight Line ledger, and posts entries to the general ledger when you run the report in final mode. The French Declining Balance ledger must be associated with an alternate tax ledger, such as the D1 ledger. The French Straight Line ledger is typically associated with the AA ledger, although another ledger might be used.

The report accurately creates journal entries only when these AAIs are set up:

- FF101 - Use this AAI to specify the account to which the system records the expense amount.
The system records to this account when the difference between the French Declining Balance ledger and the French Straight Line ledgers is positive.
- FF102 - Use this AAI to specify the account to which the system records the derogatory depreciation amount.
This account is the offset account.
- FF103 - Use this AAI to specify the account to which the system records depreciation reversal amounts.

The system records to this account when the difference between the French Declining Balance ledger and the French Straight Line ledgers is negative.

The French Derogatory Depreciation program calculates the difference between the French Declining Balance ledger and the French Straight Line ledger by subtracting the amount in the French Straight Line ledger from the amount in the French Declining Balance ledger. If the resulting amount is greater than 0 (zero), the report shows a debit for the depreciation expense account in the amount of the resulting amount and a credit for the derogatory depreciation account in the amount of the resulting amount. If the result of subtracting the amount in the French Straight Line ledger from the amount in the French Declining Balance ledger is less than 0 (zero), the report shows a debit for the derogatory depreciation account in the amount of the resulting amount and a credit for the depreciation reversal account in the amount of the resulting amount.

If you complete the G/L Post (R09801) processing option with a valid version of the General Ledger Post Report program (R09801), the system posts the associated journal entries when the report is run in final mode. The system also produces an additional report that shows amounts that the system posts to the accounts.

See Also

JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide, “Understanding Fixed Assets,” User-Defined Depreciation

Prerequisites

Before running this report:

- Verify that the French Straight Line depreciation method (Method 19) is associated with the AA ledger.
- Verify that the Declining Balance depreciation method (Method 20) is associated with an alternate tax ledger, such as the D1 ledger.
- Verify that these AAIs are set up:
 - FF101
 - FF102
 - FF103
- Compute depreciation on the fixed assets for the current period.

Setting Processing Options for French Derogatory Depreciation (R7412855A)

Set these processing options to specify how the system runs and prints the report and the information it uses.

Processing

Use these processing options to specify the mode in which to run this program, how to summarize information, and the dates, document types, and ledger types to use.

1. Process mode

Specify the mode in which to run this program. Values are:

Blank: Run the program in preliminary mode.

You should run the program in preliminary mode before running it in final mode. If the system finds an error, you will see an error message on the preliminary report. You should correct errors that appear on the report and rerun the program in preliminary mode.

Running this program in preliminary mode does not create journal entries or update any tables. You can run this program in preliminary mode as many times as required.

/: Run the program in final mode.

When you run this program in final mode, the system posts accumulated depreciation and depreciation expense journal entries to the Asset Account Balances File table (F1202) and creates journal entries in the Account Ledger table (F0911). The system also submits the depreciation journal entries to the General Ledger Post Report program (R09801) based on the version that you specify in the G/L Post (R09801) processing option.

Note. This processing option retains the value previously specified. For example, if you ran this program in final mode the last time you used it, the program will run in final mode again unless you change the value of this processing option.

- | | |
|---|---|
| 2. Fiscal Year | Specify the fiscal year for the period specified in the Period Number processing option. Enter a four-digit fiscal year in this field. If you leave this processing option blank, the system uses the date pattern established for the default company 00000. |
| 3. Period Number | Specify the current accounting period for the report. If you leave this processing option blank, the system uses the current period of the default company 00000. |
| 4. Date - For G/L Journal Entry | Specify the date that the system uses as the GL date for journal entries. |
| 5. Document Type to use for entry | Specify the document type that the system uses to create journal entries for this report. If you do not complete this processing option, the system uses document type JE. |
| 6. Ledger Type to use for Straight-line Ledger | Specify the ledger type that is associated with the French Straight Line ledger. You associate a ledger type with the ledger by using the Depreciation Default Coding program (P12002). If you leave this processing option blank, the system assumes that the ledger type is AA. |
| 7. Ledger Type to use for Declining Balance Ledger | Specify the ledger type that is associated with the French Declining Balance ledger. You associate a ledger type with the ledger by using the Depreciation Default Coding program (P12002). |
| 8. Summarize Transactions | Specify whether the system summarizes accumulated depreciation and depreciation expense account information. Values are: Blank: The system does not summarize account information. <i>/</i> : The system summarizes account information. |

Note. If you summarize the accumulated depreciation and depreciation expense account information, the system does not record transaction detail by asset number. In the Asset Account Balances File table (F1202), the system uses the transaction detail information from the transactions in the Account Ledger table (F0911). Consequently, if you summarize account information, you will not be able to use the Fixed Asset Repost program (R12910).

Versions

Use this processing option to specify the version of G/L Post to use.

- | | |
|-----------------------------|---|
| 1. G/L Post (R09801) | Specify the version of the General Ledger Post Report program (R09801) that the system runs when you run the French Derogatory Depreciation Entries program (R7412855A) in final mode. This processing option works only if you enter a valid version and if the Manager Approval of Input option in the JD Edwards EnterpriseOne General Accounting system constants is not turned on. |
|-----------------------------|---|

Print

Use this processing option to specify how the asset number is printed.

- | | |
|-------------------------------|--|
| 1. Asset Number Format | Specify how you want the asset number printed on the report. Values are: <i>1</i> : Asset Number. <i>2</i> : Unit Number. <i>3</i> : Serial Number. |
|-------------------------------|--|

Working With Automatic Debits for France

The JD Edwards EnterpriseOne system provides Automatic Debits French Format (R03B575FD) for French automatic debits. This program generates a bank file that corresponds to the French banking standards for automatic debits.

Setting Processing Options for Automatic Debits French Format (R03B575FD)

Processing options enable you to specify the default processing for programs and reports.

- | | |
|------------------------|---|
| Statement Print | Specify whether the system prints invoices that are included in the automatic debits batch as customer statements. Values are: Blank: Print customer statements only when the number of invoice detail lines exceeds the maximum number that is allowed by the format. <i>1</i> : Print statements. |
|------------------------|---|

Managing Bad Debts for France

This section provides an overview of bad debts and discusses how to enter an unrecoverable loss.

Understanding Bad Debts

When an Accounts Receivable (A/R) trade account becomes a solvency risk (for example, legal rectification), the A/R trade account is recognized as a Doubtful A/R trade account, regardless of the invoice due date. You create an entry in a Doubtful A/R trade account every time that a posted invoice, or several invoices, represents a risk.

In the French chart of accounts, a special account exists in class 4 as a subset of account 411000 - Trade Accounts Receivable, and is used for doubtful clients and client accounts in litigation.

When you recognize a client account as a bad debt, you transfer the receivable amount, including any value added tax (VAT), to account 416000 - Bad Debts. You also create the necessary accounting entries between account 416000 - Bad Debts and account 411000 - Trade Accounts Receivable. In addition, you must create the necessary accounting entry in account 491000 - Provision for Doubtful Trade Account.

G/L Offset Transfer Method

Use the G/L Offset Transfer method to transfer invoices from the Trade Accounts Receivable account to the Bad Debts account. To do this transfer, use the chargeback procedure in the receipts entry program. When you use the chargeback procedure, you close the invoice by opening a new document (document type RB). You can manually change the G/L offset for the new document to the Bad Debts account (416000).

You can use this method to create one new document per invoice or one new document for all the invoices that you want to transfer to the Bad Debts account.

If you create one document for multiple invoices, you can associate bad debts with document type RB. Otherwise, remembering that document type RB might identify other types of chargebacks, in addition to bad debts, is important.

To further identify clients with bad debts, you can specify the credit message D (for bad debts) on the customer master record for the client.

Note. The disadvantage of the G/L Offset Transfer method is that the system does not include the original data relative to that client's invoices on any A/R reports that you print. However, this situation might not be a disadvantage if you are accustomed to tracking this information by using online inquiries.

Payment Status Modification Method

You can modify the payment status for invoices that are considered bad debts. For this action, you must create a specific payment status code, such as *X*, for bad debts. To further identify clients with bad debts, you can specify credit message *D* (bad debts) on the client's Customer Master record.

If you use the payment status modification method and indicate the credit message *D* on the Customer Master record, you must:

- Modify the data selection for the A/R Open Detail and Summary reports so that invoices identified as bad debts (payment status *X*) are excluded.
- Create report versions to report on clients who are identified as bad debts.
- Manually enter a reversing journal entry at the end of the month to offset the difference between the A/R Trade Accounts and the Doubtful A/R Trade Account. You can print this information on the Trial Balance report by G/L Offset. Use data selections to include only records with the payment status for bad debts (*X*).

Note. The advantage of the Payment Status Modification method is that you can maintain the information in the system relative to the original invoice, and you can easily access and update bad debt information. The disadvantages are that the setup phase is more complex and you are required to make a monthly manual entry. This solution is recommended if you need to keep the original invoice information to process delinquency notices.

After you have made the entries to the A/R trade account as a doubtful account, you must enter an A/R Doubtful Provision.

A/R Doubtful Provision Method

Use the Customer Ledger Inquiry program (P03B2002) to enter the negative provision. You must set the G/L Offset code to this account:

491000 - *Provisions pour créances douteuses* (A/R doubtful provision).

Note. The advantage of the A/R Doubtful Provision method is that you can maintain the information in the A/R Trade accounts as required by French law.

If the invoice is paid after you enter the doubtful provision, you must void the invoice for that doubtful provision using the Customer Ledger Inquiry program.

If the invoice will never be paid, you must enter an unrecoverable A/R loss.

Forms Used to Enter an Unrecoverable Loss

| Form Name | FormID | Navigation | Usage |
|-----------------------------------|-----------|---|-----------------------------|
| Work with Customer Ledger Inquiry | W03B2002A | Customer Invoice Entry (G03B11), Standard Invoice Entry | Enter unrecoverable losses. |

Entering an Unrecoverable Loss

Access the Work With Customer Ledger Inquiry form.

To enter an unrecoverable loss:

1. Cancel the original revenue by entering a loss (and corresponding VAT) in account 654000 - *Pertes sur créances irrécouvrables* (unrecoverable loss).
2. Close the A/R Doubtful Trade account (416000) by entering the correct G/L Offset code.

Important! Do not forget to void the A/R Doubtful Trade account (416000) and then calculate the net.

Working with the D.A.S. 2 Report

Businesses in France must prepare the *Declaration Annuelle Des Commissions, Courtage, Honoraires, Verses* (Yearly Declaration of Payments of Commissions, Broking and Fees [D.A.S. 2] report to declare the different types of fees that are paid during the fiscal year. The report lists fees for legal and consulting services, sales commissions, and so on. Businesses in France are required to declare these fees on an official form every fiscal year.

You can use JD Edwards EnterpriseOne software to identify the voucher pay items that represent the fees that you must declare on the D.A.S. 2 report. For this process, define values for Category Code 7 that represent the different types of fees that the company pays. When you enter vouchers for fees, use Category Code 7 to identify each type of fee.

When you are required to declare the fees for the French authorities, you can use JD Edwards EnterpriseOne Enterprise Report Writer to create a custom report to analyze the vouchers. The report should list this information for each type of fee:

- Supplier
- Total gross amount paid
- Detail amount

For suppliers whose fees are to be declared in the D.A.S. 2 report, you assign a code in the JD Edwards EnterpriseOne Address Book system that identifies the category of the fee for D.A.S. 2 reporting. The User-Defined Codes table for Category Code 7 (01/07) should be used for this purpose. The value that is assigned in the Supplier Master is used as a default value in voucher entry.

Note. Category Code 7 cannot be entered on a voucher when using the Payment Without Voucher Match program (P0411). In this case, the system assigns the Category Code 7 value that is assigned at the Supplier Master level.

If blank is not a valid value in the user-defined codes table 01/07, it is recommended that you enter a dummy value, such as ZZZ, so that you can enter a voucher without a D.A.S. 2 fee code, if needed.

If different types of fees are on the same voucher, you can enter different D.A.S. 2 codes by pay item. You might need to change the default value to do this entry.

You can use JD Edwards EnterpriseOne Report Design Aid to customize reports that:

- Print the detail of the vouchers with a D.A.S. 2 value in Category Code 7 that have been paid in the selected fiscal year and periods. The vouchers should be sorted by company, supplier, and D.A.S. 2 value.
- Print the same information as above but without voucher details. This summary version includes a total by supplier and D.A.S. 2 value.

Working with the ETAFI Interface

This section provides an overview of the ETAFI interface and describes how to:

- Run the ETAFI Interface.
- Set processing options for the ETAFI Interface program (R7409FI).

Understanding the ETAFI Interface

You can use localization software and the PC package ETAFI (Etats Financiers) [Financial Reports] to generate all of the *Liasse Fiscale* reports that are required by French authorities. These reports include Balance Sheet and Income Statements, and many other reports that can be printed directly on the official certified forms.

JD Edwards EnterpriseOne software provides a program that creates a table containing all of the information that is required for the Liasse Fiscale reports. Based on criteria that are specified in the processing options and data selection, the ETAFI Interface reads the account balance information from the General Ledger tables and builds a worktable that is used to import the account balances into the ETAFI PC software. The program also prints a report that shows the number of accounts that were created in the ETAFI table.

The ETAFI Interface - OneWorld ONLY table (F7409FOW) includes this information, where N is the date that you specify in the program's processing options:

- Account number.
- Account description.
- Balance at fiscal year begin (N).
- Debit and credit amounts.
- Balance forward, plus debits and minus credits.
- Balance at N-1.
- Balance at N-2.
- Balance at N-3.

If you want to process ledgers in addition to ledger type AA, you can specify up to three ledger types in the processing options.

If you define multiple companies in the data selection, the program creates balances that are consolidated by account across companies.

Note. The record identifier that you specify in the processing options is created if it does not already exist. If you do not specify a record identifier in the processing options, the program uses F7409FOW. Regardless of the record identifier that you specify, if the identifier exists, the data for that identifier is cleared at the beginning of the ETAFI process and then repopulated with the new data.

The first time that you use the ETAFI Interface program, either of these scenarios is possible:

- The company has historical data for multiple fiscal years in the account transaction table.
When you run the ETAFI Interface program, you select the transactions of the previous fiscal years by specifying the fiscal year and period in the processing options. You can also specify the number of previous fiscal years to process in the processing options. By default, only the specified fiscal year is taken into account. When the program runs, the balance forward amounts of the previous fiscal years are updated directly into ETAFI.
- The company does not have historical data for multiple fiscal years in the account transaction table.
When you run the ETAFI Interface program, you can import only the balances of the previous fiscal year that are specified in the processing options.

If you already have the own custom interface for fiscal reporting and want to implement the interface program that is provided by JD Edwards EnterpriseOne software, consider these possibilities:

- You select up to three previous fiscal years.
In this case, all of the adjustments need to have been made on both the JD Edwards EnterpriseOne software and ETAFI sides. If this situation is not the case, you should expect unbalanced accounts and differences in the data.
- You select only the current period using the JD Edwards EnterpriseOne interface.

The previous fiscal years have already been uploaded into ETAFI through the custom interface.

Running the ETAFI Interface Program (R7409FI)

Select French Reports (G093151), ETAFI Interface.

Setting Processing Options for ETAFI Interface (R7409FI)

Processing options enable you to specify the default processing for programs and reports.

Dates

These processing options specify the date OR the accounting period and fiscal year the system uses to select the data. If left blank, the system uses the current accounting period and fiscal year.

- | | |
|-------------------------|---|
| 1. Date | Specify the date that the system uses to select the data. |
| 1. Period Number | Use this processing option in conjunction with the Fiscal Year. |
| 1. Fiscal Year | Use this processing option in conjunction with the Period Number. |

Ledger Types

These processing options specify a user-defined code (09/LT) that indicates the type of ledger, such as *AA* (Actual Amounts), *BA* (Budget Amount), or *AU* (Actual Units). You can set up multiple, concurrent accounting ledgers within the general ledger to establish an audit trail for all transactions. You can specify up to three ledger types. If left blank, the system uses ledger type *AA*.

- 1. Ledger Type 1, 1. Ledger Type 2, and 1. Ledger Type 3** Specify the first, second, or third ledger type.

Accounts

- | | |
|---|---|
| 1. Beginning Profit Loss Account | Use this processing option in conjunction with the Ending Profit Loss Account to enter the range of profit and loss accounts the system selects. If left blank, the automatic accounting instructions GLG6 and GLG12 will be used as defaults. |
| 1. Ending Profit Loss Account | Use this processing option in conjunction with the Beginning Profit Loss Account to enter the range of profit and loss accounts the system selects. If left blank, the automatic accounting instructions GLG6 and GLG12 will be used as defaults. |
| 2. French Chart of Accounts | Specify a value that indicates where the chart of accounts is defined. Values are: 1: In object 2: In object subsidiary 21, 22, 23: In category code |

Business Unit

- 1. Model Business Unit** Specify the model business unit the system uses to retrieve the account description.

Balance

- 1. Beginning Balance** Specify the number of fiscal years for which the beginning balance needs to be loaded (maximum 3 years). By default, no previous year beginning balance will be retrieved.

Zero Balance

- 1. Accounts with Zero Balance** Specify whether to avoid processing accounts with zero balances. Values are:
Blank: Process all accounts.
I: Process only accounts with an active balance.

File

- File Identifier** Specify the identifier the system uses when creating the F7409FOW ETAFI Interface records. If left blank, the system uses F7409FOW as the default identifier.

CHAPTER 70

(DEU) Understanding Country-Specific Functionality for Germany

This chapter provides an overview of German-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Germany-Specific Setup and Processes

This table lists the country-specific setup and functionality for Germany.

| Setup or Process | Description |
|---------------------------|--|
| UDCs (user-defined codes) | <p>Set up base-software UDCs with Germany-specific values, and set up Germany-specific UDCs for:</p> <ul style="list-style-type: none">• Bank accounts <p>See Chapter 71, “(DEU) Setting Up Country-Specific Functionality for Germany,” Setting Up UDCs for Germany, page 1323.</p> <ul style="list-style-type: none">• Set up UDCs for European Union reporting. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221.</p> <ul style="list-style-type: none">• Set up UDCs to print invoices with an attached International Payment Instruction (IPI). <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.</p> <ul style="list-style-type: none">• Set up these UDCs for companies:<ul style="list-style-type: none">- Affiliated Companies (74/AC)- Code Number (74/30) <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for European Companies, page 1230.</p> |

| Setup or Process | Description |
|--|---|
| AAIs (automatic accounting instructions) | <p>Set up AAIs to work with encashments.</p> <p>See Chapter 73, “(DEU) Working With Other German Functionality,” Understanding Encashments for Germany, page 1355.</p> |
| Next numbers | No country-specific setup for next numbers exists for Germany. |
| Bank accounts | <p>When you set up bank accounts in Germany:</p> <ul style="list-style-type: none"> Review the overview about using international bank account numbers (IBAN). <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding International Bank Account Numbers, page 1237.</p> <ul style="list-style-type: none"> Enter country-specific values when you enter supplier bank account information. <p>See <i>JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide</i>, “Setting Up Bank Accounts,” (CAN, DEU, FIN, GBR, NOR, SWE, and USA) Setting Up Country-Specific Supplier Bank Account Information.</p> <ul style="list-style-type: none"> Enter additional information required for foreign payments. <p>See Chapter 71, “(DEU) Setting Up Country-Specific Functionality for Germany,” Setting Up Bank Information in Germany, page 1325.</p> |
| Voucher processing | <p>Enter required voucher information for foreign payments.</p> <p>See Chapter 73, “(DEU) Working With Other German Functionality,” Understanding Vouchers for Z1 Payments for Germany, page 1355.</p> |

| Setup or Process | Description |
|----------------------------|---|
| Payment processing | <p>Before processing payments in Germany, set up the payment formats.</p> <p>See Chapter 71, “(DEU) Setting Up Country-Specific Functionality for Germany,” Setting Up Payment Formats for Germany, page 1328.</p> <p>To work with Z1 payments in Germany:</p> <ul style="list-style-type: none"> • Modify information at the payment group level or payment detail level for Z1 payments. <p>See Chapter 73, “(DEU) Working With Other German Functionality,” Processing Z1 Payments for Germany, page 1356.</p> <ul style="list-style-type: none"> • Run the Create A/P Bank Diskette - Germany program (R04572G5). |
| Automatic debit processing | <p>Before processing automatic debits in Germany, set up the debit format.</p> <p>See Chapter 71, “(DEU) Setting Up Country-Specific Functionality for Germany,” Setting Up Automatic Debit Formats for Germany, page 1330.</p> |
| Invoice processing | <p>In addition to standard invoice processing, you can print invoices with an attached International Payment Instruction (IPI). To print these invoices and attachments:</p> <ul style="list-style-type: none"> • Set up UDCs for IPIs. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.</p> <ul style="list-style-type: none"> • Set processing options for the invoice print program. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Invoice Print with International Payment Instruction (R03B5053), page 1247.</p> <ul style="list-style-type: none"> • Print invoices with attached IPIs. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing Invoices with an Attached International Payment Instruction, page 1245.</p> |
| Encashments | <p>You can process encashments for Germany using one of three methods.</p> <p>See Chapter 73, “(DEU) Working With Other German Functionality,” Understanding Encashments for Germany, page 1355.</p> |

| Setup or Process | Description |
|------------------|--|
| Tax processing | <p>You can electronically submit files for tax audits in Germany.</p> <p>See Chapter 72, “(DEU) Working With Electronic Tax Reporting for Germany,” page 1333.</p> <p>To process value-added tax (VAT) in Germany:</p> <ul style="list-style-type: none">• Use the standard setup for tax processing.• Consider German-specific factors when processing VAT. <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Working With VAT Processing,” (DEU) Processing German VAT.</p> |

| Setup or Process | Description |
|---------------------|--|
| Intrastat reporting | <p>To set up and use Intrastat reporting:</p> <ul style="list-style-type: none"> Review the overview about European Union reporting. See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding European Union Reporting, page 1241. Set up UDCs. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for European Companies, page 1230. Set up commodity codes. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up Commodity Code Information, page 1230. Set up cross-references between suppliers and items to show the country of origin. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Entering Cross-References for Items and Suppliers, page 1231. Set the processing options for the Intrastat workfiles programs. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Sales (R0018I1), page 1254. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Procurement (R0018I2), page 1256. Populate the workfiles. See Chapter 66, “(Europe) Working With European Union Functionality,” Populating the Intrastat Workfile, page 1250. Revise the workfiles as necessary. See Chapter 66, “(Europe) Working With European Union Functionality,” Revising Intrastat Information, page 1258. Set up the German-specific CBS-IRIS report layout. See Chapter 66, “(Europe) Working With European Union Functionality,” Using the IDEP/IRIS Interface for Intrastat Reporting, page 1264. |

| Setup or Process | Description |
|---------------------------------|--|
| Intrastat reporting (continued) | <p>To print and purge Intrastat records:</p> <ul style="list-style-type: none"> • Print the Intrastat report in the German-specific format. See Chapter 66, “(Europe) Working With European Union Functionality,” (DEU) Printing the German Intrastat Report, page 1272. • Purge records from the Intrastat table (F0018T). See Chapter 66, “(Europe) Working With European Union Functionality,” Purging Records from the Intrastat Table (F0018T), page 1263. |
| Other European Union reporting | <p>In addition to Intrastat reporting, you can generate these reports:</p> <ul style="list-style-type: none"> • EC Sales List Reports See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding EC Sales List Reports for European Reporting, page 1245. See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sales List Report (R0018L), page 1273. • EC Sales A/R Report See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sale List - AR Report (R0018S), page 1276. |
| Legal reporting | <p>You must collect and report data to the Deutsche Bundesbank (German Federal Bank) outstanding payables and receivables with foreign entities.</p> <p>See Chapter 73, “(DEU) Working With Other German Functionality,” Working with the Z5a Sheet 2 Report for Germany, page 1361.</p> |
| Fixed assets | <p>German-specific reports for fixed assets include:</p> <ul style="list-style-type: none"> • Asset Master List (R741201A) • Asset Master Acquisitions (R741201B) • Value Adjustments (R741202A2) • Acquisition Cost (R741202A1) <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (DEU) Reports for Germany, page 1854.</p> <p>A German-specific depreciation method exists.</p> <p>See <i>JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide</i>, “Understanding International Depreciation Methods”.</p> |

CHAPTER 71

(DEU) Setting Up Country-Specific Functionality for Germany

This chapter discusses how to set up:

- User-defined codes (UDCs)
- Bank information
- Payment formats
- Automatic debit formats

Setting Up UDCs for Germany

Setting up German-specific UDCs enables you to use German-specific functionality. You also set up some base software UDCs with German-specific values.

Setting Up UDCs for Bank Accounts for Germany

Before you set up bank accounts in Germany, set up these UDCs.

Special Handling Code - A/P Payment (00/HC)

You must set up a value of *W* (services or capital movements) in this UDC to process foreign payments for Germany.

LZB Country Code (74/LA)

You must set up UDC 74/LA with valid *Bundesbank Landerschlüssel* Codes (German Federal Bank Country Codes) and descriptions. The Description 02 field should be set up with abbreviated country descriptions, and the Special Handling Code field should contain the three-digit bank code. The Bundesbank provides you with these country codes. For example, you might set up these values:

| Codes | Description 01 | Description 02 | Special Handling |
|-------|----------------------------|----------------|------------------|
| AD | Andorra | Andorr | 043 |
| AE | United Arab Emirates (UAE) | A Emir | 647 |
| AF | Afghanistan | Afghan | 660 |

| Codes | Description 01 | Description 02 | Special Handling |
|-------|---------------------|----------------|------------------|
| AG | Antigua and Barbuda | Antigu | 459 |
| AI | Anguilla | Anguil | 446 |

The system uses the value in the Description 02 field and the Special Handling Code field in multiple fields in the Z1 output file. You must obtain valid bank values from the Bundesbank (German Federal Bank).

Cost Settlement Code (74/28)

Set up cost settlement codes to indicate the party who is responsible for the transaction fee. For example, you might set up these values:

- 00: Trans/3rd party fees to principal.
- 01: All fees debited to principal.
- 02: All fees debited to recipient.

Label for Payment (74/29)

Set up labels for payment types to indicate the payment method used by the bank. For example, you might set up these values:

- 00: Standard transmission (for example, letter, normal SWIFT message)
- 10: Telex payment or urgent SWIFT message
- 20: Check drawing, any form of dispatch
- 21: Check drawing, sent by registered mail
- 22: Check drawing, sent by special delivery
- 23: Check drawing, sent by registered mail or special delivery
- 30: Check drawn on principal, any form of dispatch
- 31: Check drawn on principal, sent by registered mail
- 32: Check drawn on principal, sent by special delivery
- 33: Check drawn on principal, sent by registered mail or special delivery
- 34–49: Reserved for intercompany purposes
- 50–99: In-house

Setting Up the Replaced Character (04/RC) UDC

The Replaced Character (04/RC) UDC table lets you specify acceptable characters that the system uses to replace unacceptable characters in a text file.

When you set the Character Replacement processing option in the German Bank File Format and Statement Diskette program (R03B575DD) or the Create A/P Bank Diskette - Germany program (R04572G5) to use UDC 04/RC, the system scans the text file for the characters that are specified in the Description 01 field in the 04/RC UDC table. It then replaces those characters with the alternate characters that you specify in the Description 02 field. Thus, the system deletes the unacceptable characters from the text file and replaces them with acceptable characters. For example, if your bank does not recognize letters with umlauts, you can replace them with the two-letter equivalent, such as *ae* for *ä*, *oe* for *ö*, and so on.

Note. The system replaces a single character with multiple characters only for the German programs German Bank File Format and Statement Diskette, and Create A/P Bank Diskette - Germany. When you use the Replaced Character UDC for other programs, the system replaces the character that is identified in the Description 01 field with only the first character in the Description 02 field.

You can specify that the system replace a single character with one alternate character or with multiple alternate characters. When you specify multiple alternate characters, the length of the string that is being altered does not change; if the original string is three characters, the modified string is three characters. The system drops certain characters from the string if inserting all of the alternate characters will result in the modified string exceeding the allowed length of the string.

These examples illustrate how the system replaces a single character with multiple characters:

Example 1: Replacing A with FG

Original string is ABC

Modified string is FGB

To retain field length of three, the system drops the C from the string.

Example 2: Replacing A with FG

Original string is ABC__ (where _ is blank)

Modified string is FGBC__

To retain the field length of six, the system drops the last blank from the string.

Example 3: Replacing B with FGHI

String is ABC

Result is AFG

To retain the field length of three, the system replaces only the first two letters.

Chapter 71, “(DEU) Setting Up Country-Specific Functionality for Germany,” Setting Processing Options for German Bank File Format and Statement Diskette (R03B575DD), page 1331

Setting Up Bank Information in Germany

This section provides overviews of German bank information setup and German UDC bank setup and discusses how to set up additional German bank information.

Understanding German Bank Information Setup

Foreign payment formats require more detailed information than is provided in the Bank Transit Master table (F0030).

You should set up this detailed information for your suppliers, both foreign and domestic. This information is stored in the Germany-Bank Transit Number Master - Addtl Information table (F74030G).

You can designate multiple bank accounts for a single supplier when the supplier is associated with a unique payment handling code.

Note. At this point, if either a Swift Code or a Routing Transit Code is not provided, a warning message is issued on an inquiry, add, or change. Users must ensure that the Swift Code or Routing Transit Code is provided before the payment process is completed. If the information is not provided, then the file is filled with zeros.

JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide, “Setting Up Bank Accounts,” Setting Up GL Bank Accounts

JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide, “Setting Up Bank Accounts,” (CAN, DEU, FIN, GBR, NOR, SWE, and USA) Setting Up Country-Specific Supplier Bank Account Information

Prerequisite

Verify that UDCs for bank accounts are set up.

See Chapter 71, “(DEU) Setting Up Country-Specific Functionality for Germany,” Setting Up UDCs for Bank Accounts for Germany, page 1323.

Form Used to Set Up German Bank Information

| Form Name | FormID | Navigation | Usage |
|--|----------|--|---|
| German Bank Account / Additional Information | W74030GB | German Localization (G74D), German Bank Account On the Work With German Bank Account Cross Reference form, click Add. | Set up additional bank account information for Germany. |

Setting Up Additional German Bank Account Information

Access the German Bank Account / Additional Information form.

Many of the fields on this form are the same as those on the Revise Bank Information form.

See *JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide*, “Setting Up Bank Accounts,” Setting Up GL Bank Account Information.

These fields are specific to Germany:

SWIFT Code

The JD Edwards EnterpriseOne system does not provide the ability to enter a supplier’s bank address and name in the German foreign payment file.

Instruction code 1, Instruction code 2, Instruction code 3, Instruction code 4

Enter a code from UDC table 74/27 that identifies the payment instructions for a German foreign payment.

Note. You must set Instruction Code 3 or Instruction Code 4 to zero.

Cost Settlement Code

Enter a code from UDC table (74/28) that identifies the type of cost settlement the system uses for a German foreign payment. Values are:

| | |
|--|--|
| | <p><i>00</i>: Transfer or third-party fees debited to principal.</p> <p><i>01</i>: All fees debited to principal.</p> <p><i>02</i>: All fees debited to recipient.</p> |
| Label for Payment | <p>Enter a code from UDC table 74/29 that identifies the label for payment for a German foreign payment. Values are:</p> <p><i>10</i>: Telex payment.</p> <p><i>20</i>: Check drawing.</p> <p><i>21</i>: Check drawing, sent by registered mail.</p> <p><i>22</i>: Check drawing, sent by special delivery.</p> <p><i>23C</i>: Check drawing, sent by registered mail or special delivery.</p> <p><i>30</i>: Check drawn on principal, any form of dispatch.</p> <p><i>31</i>: Check drawn on principal, sent by registered mail.</p> <p><i>32</i>: Check drawn on principal, sent by special delivery.</p> <p><i>33</i>: Check drawn on principal, sent by registered mail or special delivery.</p> <p><i>34-49</i>: Reserved for intercompany purposes.</p> <p><i>50-99</i>: In house.</p> |
| Code Number | <p>Enter a code from UDC table 74/30 that identifies the code number for a German foreign payment according to the services index (annex to Foreign Trade and Payments Orders).</p> |
| Transaction concerned | <p>Enter a value that identifies the type of transaction for a German foreign payment. Values are:</p> <p><i>2</i>: Services, transfers or other expenditures.</p> <p><i>4</i>: Capital movements and capital gains.</p> <p>This field is required if the payment handling code for the pay item is W.</p> |
| Additional Instruction Code Information | <p>Enter additional information for the instruction codes.</p> |
| Instruction to Principal's Bank | <p>Enter additional instructions for the Principal's bank.</p> |
| Reporting Code | <p>Enter a reporting code that indicates whether the paying bank is to report the contents of the T record to the Federal Bank.</p> <p>Values are:</p> <p><i>0</i>: The paying bank reports the contents (default)</p> <p><i>1</i>: The paying bank does not report the contents.</p> |
| Contact Name and Telephone Number | <p>Enter a value that provides the ability to add the name and number of the person to contact at the principal company if the paying bank has questions about the payment order.</p> |

Setting Up Payment Formats for Germany

This section provides an overview of payment formats for Germany and discusses how to set up processing options for:

- Create A/P Bank Tape - Germany (R04572G1).
- Create A/P Bank Diskette - Germany (R04572G2).
- Print Automatic Payments - Check - Germany (R04572G3).
- Create A/P Bank Diskette - Germany (R04572G5).

Understanding Payment Formats for Germany

JD Edwards EnterpriseOne software supports these country-specific automatic payment formats for Germany:

| Format | Description |
|----------|---|
| R04572G1 | Bank tape format. |
| R04572G2 | Diskette format. |
| R04572G3 | Check format. |
| R04572G5 | <p>Z1 diskette format. This format supports IBAN; the output records contain the IBAN number and other related IBAN information if you set up IBAN information for your suppliers. The system uses IBAN information for the standard EU transfer type for foreign payments.</p> <p>Note. The R04572G5 format calls the R04573G application, which creates a paper attachment to accompany the electronic submission (form Z4).</p> |

If you print German checks, you must specify the German translation program (X00500D). To specify, access the processing options for the Print Automatic Payments - Check - Germany program (R04572G3). Enter *X00500D* in the Translation processing option.

Setting Processing Options for Create A/P Bank Tape - Germany (R04572G1)

Processing options enable you to specify the default processing for programs and reports.

Transfer

City of Origin Enter the city of origin.

Tape

Devise Enter the devise name.

Tape Density Enter the tape density.

| | |
|-----------------------|----------------------------|
| Label Name | Enter the label name. |
| New Volume | Enter the new volume name. |
| New Owner ID | Enter the new owner ID. |
| Tape File Name | Enter the tape file name. |

Setting Processing Options for Create A/P Bank Diskette - Germany (R04572G2)

Processing options enable you to specify the default processing for programs and reports.

Transfer

| | |
|-----------------------|---------------------------|
| City of Origin | Enter the city of origin. |
|-----------------------|---------------------------|

Tape

| | |
|---------------------|--------------------------|
| Devise | Enter the devise name. |
| Tape Density | Enter the tape density. |
| Label Name | Enter the label name. |
| Block Size | Enter the block size. |
| New Volume | Enter the new volume ID. |

Tape (more)

| | |
|---------------------|-------------------------|
| New Owner ID | Enter the new owner ID. |
| File Name | Enter the file name. |

Currency

| | |
|-----------------|---|
| Currency | Enter the currency code that is used in your system to identify the euro. |
|-----------------|---|

Setting Processing Options for Print Automatic Payments - Check - Germany (R04572G3)

Processing options enable you to specify the default processing for programs and reports.

Translation

| | |
|-------------------------------|---|
| 1. Translation Program | Specify which translation program to use to translate the payment amount into words. The value that you enter must exist in the Check Translation (98/CT) UDC table. If you leave this processing option blank, the system uses the translation program associated with the payment currency. |
|-------------------------------|---|

Address

Address Format (FUTURE) This processing option is not used.

Print

Form Type (FUTURE) This processing option is not used.

Setting Processing Options for Create A/P Bank Diskette - Germany (R04572G5)

Processing options enable you to specify the default processing for programs and reports.

G5 Format

| | |
|------------------------------|--|
| City of Origin | Enter the city of origin to be printed on the waybill (<i>Begleitzettel</i>). |
| Label Name | Enter the label name to be printed on the <i>Begleitzettel</i> as the volume number of the disk. |
| Q Record Information | Enter the Regional Bank Area Code, Company Code, and Industrial Classification Code. This information is printed in the Q record on the Z1 file to provide the respective Regional Federal Bank (LZB) with the proper regional information. You should obtain these codes from the Bundesbank (German Federal Bank). |
| Character Replacement | <p>Enter <i>I</i> for the system to replace characters in the flat file as specified in the Replaced Character (04/RC) UDC table.</p> <p>See Chapter 71, “(DEU) Setting Up Country-Specific Functionality for Germany,” Setting Up the Replaced Character (04/RC) UDC, page 1324.</p> |

Setting Up Automatic Debit Formats for Germany

This section provides an overview of automatic debit formats for Germany and discusses how to set processing options for the German Bank File Format and Statement Diskette program (R03B575DD).

Understanding Automatic Debit Formats for Germany

You can specify the type of agreement that you have with customers regarding automatic debits. In Germany, businesses can enter into these automatic debit agreements:

- Direct Debit Authority

An agreement between the business (supplier) and the customer that allows the customer to dispute the automatic debit charge within six weeks.

- Transfer Instruction

An agreement between the business (supplier) and the bank. In this case, the customer does not have the right to protest the bank charges.

To specify the type of automatic debit agreement for the payment group, access the processing options for the German format program that you are using. Enter *I* in the processing option if you have a transfer instruction with the bank. Leave the processing option blank if you have Direct Debit Authority with customers. In both cases, the system writes the information to the correct field on the bank file for the bank to read.

The JD Edwards EnterpriseOne system provides these German automatic debit formats:

- R03B575DD (German Bank File Format and Statement Diskette).
- R03B575DD1 (German Bank Cover Sheet).

Note. The German Bank File Format and Statement Diskette program calls the German Bank Cover Sheet program automatically.

The payment format programs generate a bank table that adheres to the German banking standards for automatic debits.

Setting Processing Options for German Bank File Format and Statement Diskette (R03B575DD)

Processing options enable you to specify the default processing for programs and reports.

Defaults

- | | |
|-------------------------------------|---|
| 1. German Format | Specify whether the system creates <i>Abbuchungen</i> or <i>Lastschriften</i> records. Values are: Blank: Create <i>Abbuchungen</i> records. <i>I</i> : Create <i>Lastschriften</i> records. |
| 2. Print Customer Statements | Specify whether the system prints customer statements for automatic debits. Values are: Blank: Print customer statements only when the number of invoice detail lines exceeds the maximum number that is allowed by the format. <i>I</i> : Print customer statements. |
| 3. Tape Density | Specify the density of the tape. |
| 4. Character Replacement | Specify whether the system replaces special characters according to the values that are set up in the Replaced Characters UDC (04/RC). Values are: Blank: Character replacement is not enabled. <i>I</i> : Character replacement is enabled. The system searches each alpha field for special characters in the order in which they are set up in the UDC. The system searches each alpha field separately. |

Currency

- | | |
|------------------------------|---|
| 1. Euro Currency Code | Specify the currency code for the euro. For example, <i>EUR</i> . |
|------------------------------|---|

CHAPTER 72

(DEU) Working With Electronic Tax Reporting for Germany

This chapter provides an overview of electronic tax reporting , lists prerequisites, and discusses how to:

- Create or modify extraction programs.
- Run the extraction programs.
- Modify the Index.XML file.

Understanding Electronic Tax Reporting for Germany

The German Federal Agency of Finance (*Bundesamt für Finanzen*) requires businesses operating in Germany to provide electronic access to copies of accounting data according to an audit process detailed in the document *Grundsätze zum Datensugriff und zur Prüfbarkeit digitaler Unterlagen* (GDPdU). Data from live data processing systems must be extracted and provided to tax auditors on industry-standard digital media such as a CD-ROM or DVD.

JD Edwards EnterpriseOne software provides the tools that enable businesses to extract relevant tax data from JD Edwards EnterpriseOne tables and write the data to text files. You send the text files, along with an index that explains the data and a copy of the DTD (document type definition) that is used with the index, to the tax auditors. Table extraction programs are provided to extract data from the Customer Ledger table (F03B11), the Accounts Payable Ledger table (F0411), the Account Ledger table (F0911), and the Taxes table (F0018). Additionally, an XML-formatted index that you must modify to meet reporting requirements, and a copy of the gdpdu-01-08-2002 DTD are provided on the Oracle | PeopleSoft Customer Connection web site.

Note. Search for the Index.XML and DTD files on the Oracle | PeopleSoft Customer Connection web site by selecting Region and navigating to Localizations for JD Edwards EnterpriseOne for Europe, or by selecting Release and navigating to Localizations for JD Edwards EnterpriseOne.

Important! The provided solution might not provide the needed data for every situation. For example, if the tax authority requests information that does not reside in the F03B11, F0411, F0911, or F0018 tables or you have customized your installation to store tax data in alternate fields in these tables or other tables, you must create your own table conversions to extract data from other JD Edwards EnterpriseOne tables, or modify the data extraction programs provided to alter the output produced by the programs.

You can use the provided data extraction programs as models for new data extraction programs. However, you must refer to official government publications for the requirements of the data and formatting required.

See *JD Edwards EnterpriseOne Tools 8.96 Development Tools: Data Access Tools Guide*.

To generate and review the data to submit to the tax authority:

- Run the data extraction programs to create text files.

The data extraction programs create a file that is semicolon (;) delimited and which has double-quote (") text encapsulation. The system saves the text files to the Export folder for your JD Edwards EnterpriseOne installation. JD Edwards EnterpriseOne software provides data conversion programs for some tables; you might need to create your own programs if you need to report on data that resides in other tables. Additionally, you might need to modify the provided data extraction programs prior to running them to create the text files.

See Chapter 72, "(DEU) Working With Electronic Tax Reporting for Germany," Running the Data Extraction Programs, page 1336.

- Review the text files as necessary.

You can open the text files in any program that reads .txt files. If you need to add or delete columns in the text files due to customizations, consider modifying the data extraction programs and then run the programs again.

- Modify the Index.XML file to include relevant data about the data submission, your company, the dates for which you generated the text files, and records that are not included in the sample Index.XML provided.

You can open and modify the Index.XML file in any program that reads .XML files. However, they are easier to read and modify in an XML editor.

In addition to the information about your company and the reporting dates, you must modify the XML file to include information about additional data if the provided data extraction programs are modified or if you create additional data extraction programs that produce new .txt files.

See Chapter 72, "(DEU) Working With Electronic Tax Reporting for Germany," Modifying the Index.XML File, page 1351.

- Submit the text files, your modified version of the Index.XML file, and an unmodified version of the gdpdu-01-08-2002 DTD to the tax audit authority on industry-standard digital media such as a CD-ROM or DVD.

This graphic illustrates the process flow for extracting data and submitting files:

Process flow for extracting data and submitting files

Prerequisites

Before completing the tasks in this section:

- Verify that an Export folder exists in the installation directory for the version of the software that you use.

If you run the data extraction programs from a FAT client installation on a PC, the Export folder must exist in the installation directory on the PC. For example, your installation directory with the Export folder might be C:\B10\PD10\Export.

If you run the data extraction programs from a web client on a PC or from a server, the Export folder must exist in the installation directory on the server.

- Verify that the user running the report has write privileges for the Export folder.

Creating or Modifying Data Extraction Programs

Because your company might have modified the delivered base software, and because the audit authority might request different data from time to time, the software cannot be programmed to determine the exact data that might be required for an audit. The provided solution is meant to provide you with the tools and examples to produce the data and data descriptions that might be required. You must modify the data extraction programs and the .XML file provided to meet the requirements of data reporting. Additionally, you might need to create other data extraction (table conversion) programs to produce required data.

Note. Whenever you make a modification to a data extraction program or create a new program, you change the text files that you submit to the tax authority. Because the Index.XML file describes the text files, you must also modify the Index.XML file to reflect any changes to the text files.

If creating new program or modifying a provided data extraction program, consider these factors:

- File formats can be variable length or fixed length.

Variable length fields can be formatted as alphanumeric, numeric, or as a date.

The data extraction programs provided are variable length.

- In variable length files, text files can be encapsulated.

The text files produced by the provided data extraction programs are encapsulated with double quotes (“”). The text files are semi-colon (;) delimited.

- For each table for which you provide data, you must include in the Index.XML file a description of the data, including:

- URL
- Name of the table.
- Description of the table.
- Date range of the data extracted.
- Date format.
- Decimal separator.
- Digit grouping symbol.

This symbol defines the thousand-separator.

- Description of the variable length or fixed length text, including whether the fields are alphanumeric, numeric, or a date.

Refer to the official government publication for details of the data to include in your text and Index.XML files.

See *JD Edwards EnterpriseOne Tools 8.96 Development Tools: Data Access Tools Guide*.

Running the Data Extraction Programs

This section provides an overview of the extraction programs and discusses how to:

- Run the F0018 GDPdU Data Extract program (R89F0018G).
- Run the F03B11 GDPdU Data Extract program (R89F03B11G).
- Run the F0411 GDPdU Data Extract program (R89F0411G).
- Run the F0911 GDPdU Data Extract program (R89F0911G).

Understanding the Data Extraction Programs

Most tax-relevant data resides in the F0911, F0411, F03B11, and F0018 tables. When you run the extraction programs for these tables, the system generates a text file that it writes to the Export folder of the installation directory. The system does not generate a report when you run these programs. The text files are semi-colon (;) delimited with double quote (") text encapsulation.

Information about transactions that might be subject to review by the tax authority might be written to more than one table. For example, the taxable amount of a transaction (data item ATXA) might be written to both the F0411 and the F0018 tables. The system extracts all data in a table, even when that data is duplicated in another table.

Note. If data requested by the tax authority does not reside in the F0911, F0411, F03B11, or F0018 tables, you must create custom table conversion programs to extract the additional data and modify the Index.XML file to describe the additional data.

Data Selection

The XJDE0001 versions of the R89F03B11G, R89F0411G, and the R89F0018G data extraction programs do not include any data selection. You can use any of the fields that reside in the table for which you generate the text file to specify the records that the system includes in the text file that you generate. At a minimum, specify the dates for which the system selects records to process. Record in the Index.XML file the date range for which you extract data.

The XJDE0001 version of the R89F0911G data extraction program is set to select records with the ledger type of AA. Tax information and Accounts Payable and Accounts Receivable accounting information resides in the AA ledger. As with the other data extraction programs, at a minimum, specify the dates for which the system selects records to process. Record in the Index.XML file the date range for which you extract data.

F0018 GDPdU Data Extraction Program (R89F0018G)

When you run the F0018 GDPdU Data Extraction program, the system generates a text file named F0018GDPDU.txt, and writes the file to the Export directory for your installation. The system writes data for the selected records for the data items listed in this table, in the order listed.

| Fields | Description of Values |
|-----------------|--|
| DCT | Document type. |
| DCT description | Document type value description. The extraction program calls GetUDC (X0005) for 00/DT UDC and writes the description to the text file. |
| DOC | Document number |
| KCO | Document company. |
| KCO description | Document company value description. The extraction program calls GetCompanyName (B0000051) and writes the description to the text file. |
| SFX | Document payitem number. |
| JELN | Line number. |

| Fields | Description of Values |
|------------------|---|
| UPMJ | Update date. |
| UPMT | Update time. |
| CO | Company |
| CO description | Company description The extraction program calls GetCompanyName (B0000051) and writes the description to the text file. |
| MCU | Business unit. |
| MCU description | Business unit value description. The extraction program calls IsColumnInBusinessUnitTable (ISCOLBU) and writes the description to the text file. |
| OBJ | Object |
| SUB | Subsidiary |
| AN8 | Address number |
| AN8 description | Address number value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| ECST | Amount extended cost. |
| AEXP | Amount extended price. |
| ATXA | Amount – taxable. |
| ATXN | Amount – nontaxable. |
| NRTA | Amount – nonrecoverable tax. |
| STAM | Amount – tax. |
| TXA1 description | Tax rate/area 1 value description. The extraction program calls EditTaxRateArea (B0000140) and writes the description to the text file. |
| EXR1 | Tax explanation 1. |
| EXR1 description | Tax explanation 1 value description. The extraction program calls GetUDC (X0005) for the Tax Explanation Code (00/EX) UDC and writes the description to the text file. |
| EXR2 | Tax explanation 2. |

| Fields | Description of Values |
|-------------------|---|
| EXR2 description | Tax explanation 2 value description. The extraction program calls GetUDC (X0005) for the Tax Explanation Code (00/EX) UDC and writes the description to the text file. |
| TRDJ | Transaction date. |
| DGL | Date – G/L date. |
| DSVJ | Service/tax date. |
| TX | Taxable Y/N |
| ITM | Item description. |
| ITM description. | Item description value description. The extraction program calls GetItemMasterByShortItem (X4101) and writes the description to the text file. |
| LITM | Second item number. |
| LITM description | Second item number value description. The extraction program calls GetSecondItemDescription (B4100321) and writes the description to the text file. |
| AITM | Third item number. |
| AITM description | Third item number value description. The extraction program calls GetThirdItemDescription (B4100322) and writes the description to the text file. |
| LNTY | Line type. |
| LNTY description | Line type value description. The extraction program calls GetLineTypeConstants (B4000260) and writes the description to the text file. |
| UORG | Units – order/transaction quantity. |
| UOM | Unit of measure. |
| UOM description | Unit of measure value description. The extraction program calls GetUDC (X0005) for the Unit of Measure (00/UM) UDC and writes the description to the text file. |
| FVTY | Factor value – type. |
| FVTY description. | Factor value – type value description. The extraction program calls GetUDC (X0005) for H00/FV UDC and writes the description to the text file. |

| Fields | Description of Values |
|-----------------|--|
| TA1 | Tax authority 1 |
| TA1 description | Tax authority 1 value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| TXR1 | Tax rate 1. |
| TA2 | Tax authority 2 |
| TA2 description | Tax authority 2 value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| TXR2 | Tax rate 2. |
| TA3 | Tax authority 3 |
| TA3 description | Tax authority 3 value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| TXR3 | Tax rate 3. |
| TA4 | Tax authority 4 |
| TA4 description | Tax authority 4 value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| TXR4 | Tax rate 4. |
| TA5 | Tax authority 5. |
| TA5 description | Tax authority 5 value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| TXR5 | Tax rate 5. |
| STA1 | Tax amount 1. |
| STA2 | Tax amount 2. |
| STA3 | Tax amount 3. |
| STA4 | Tax amount 4. |
| STA5 | Tax amount 5. |

| Fields | Description of Values |
|------------------|---|
| OVTX | Tax override. |
| TXVA | Amount – tax variance. |
| TXVR | Percent – tax variance. |
| POST | G/L posted code. |
| GDVL | Amount – goods value. |
| CRCO | Currency code – from |
| CRCO description | Currency code value description The extraction program calls F0013GetCurrencyDescription (B03B0103) and writes the description to the text file. |
| CRR | Currency conversion rate |
| SQNO | Sequence number. |
| AG | Amount – gross. |
| APD | Amount – paid. |
| TAXE | Amount – sales tax exempt. |
| DOC | Document number. |
| PROCFL | Tax processing flag. |
| ADJFL | VAT adjustment flag. |
| TOFL | Transaction origin flag. |

F03B11 GDPdU Data Extraction Program (R89F03B11G)

When you run the F03B11 GDPdU Data Extraction program, the system generates a text file named F03B11GDPDU.txt, and writes the file to the Export directory for your installation. The system writes data for the selected records for the data items listed in this table, in the order listed.

| Fields | Description of Value |
|-----------------|--|
| DOC | Document number |
| DCT | Document type. |
| DCT description | Document type value description. The extraction program calls GetUDC (X0005) for 00/DT UDC and writes the description to the text file. |
| KCO | Document company. |

| Fields | Description of Value |
|------------------|---|
| KCO description | Document company value description. The extraction program calls GetCompanyName (B0000051) and writes the description to the text file. |
| SFX | Document payitem number. |
| AN8 | Address number |
| AN8 description | Address number value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| DGJ | Date – G/L. |
| DIVJ | Date – invoice. |
| FY | Fiscal year |
| CTRY | Century |
| PN | Period number |
| CO | Company |
| CO description | Company description The extraction program calls GetCompanyName (B0000051) and writes the description to the text file. |
| PA8 | Address number – parent. |
| PA8 description | Address number – parent value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| AN8J | Address number – alternate payee. |
| AN8J description | Address number – alternate payee value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| PYR | Address number – payor. |
| PYR description | Address number – payor value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| POST | G/L posted code |
| ISTR | A/R post status |

| Fields | Description of Value |
|------------------|---|
| PST | Pay status code |
| PST description | Pay status code value description. The extraction program calls GetUDC (X0005) for the Payment Status (00/PS) UDC and writes the description to the text file. |
| AG | Amount – gross |
| AAP | Amount – open |
| ATXA | Amount – taxable |
| ATXN | Amount – non-taxable |
| STAM | Amount – tax |
| BCRC | Currency code – base. |
| BCRC description | Currency code – base value description. The extraction program calls F0013GetCurrencyDescription (B03B0103) and writes the description to the text file. |
| CRCD | Currency code – from |
| CRCD description | Currency code value description The extraction program calls F0013GetCurrencyDescription (B03B0103) and writes the description to the text file. |
| CRR | Currency conversion rate |
| ACR | Amount – foreign |
| FAP | Amount – foreign open |
| CTXA | Amount – foreign taxable |
| CTXN | Amount – non-foreign taxable. |
| CTAM | Amount – foreign tax. |
| TXA1 | Tax rate/area 1 |
| TXA1 description | Tax rate/area 1 value description. The extraction program calls EditTaxRateArea (B0000140) and writes the description to the text file. |
| EXR1 | Tax explanation. |

| Fields | Description of Value |
|------------------|---|
| EXR1 description | Tax explanation value description. The extraction program calls GetUDC (X0005) for the Tax Explanation Code (00/EX) UDC and writes the description to the text file. |
| DSVJ | Date – service/tax. |
| GLBA | G/L bank account. |
| GLBA description | G/L bank account value description. The extraction program calls RetrieveAccountMasterInfoGLPost (B0900104) and writes the description to the text file. |
| RSCO | Write-off reason code. |
| RSCO description | Write-off reason code value description. The extraction program calls GetUDC (X0005) for the Reason Code (03B/RC) UDC and writes the description to the text file. |
| VLDT | Date – cleared/value. |
| RMK | Name – remark. |
| ALPH | Name – alpha. |
| RYIN | Payment instrument. |
| RYIN description | Payment instrument value description. The extraction program calls GetUDC (X0005) for the Payment Instrument (00/PY) UDC and writes the description to the text file. |
| VDGJ | Void date. |
| VOD | Void flag. |
| JCL | Date – invoice close. |
| DDEX | Deduction reason code. |
| DDEX description | Deduction reason code value description. The extraction program calls GetUDC (X0005) for the Deduction Reason Code (03B/CR) UDC and writes the description to the text file. |
| DTXS | Deferred tax status - VAT. |
| ATAD | Amount – to distribute. |
| CTAD | Amount – foreign to distribute. |
| NRTA | Amount – nonrecoverable tax. |

| Fields | Description of Value |
|--------|--------------------------------------|
| FNRT | Amount – foreign nonrecoverable tax. |
| SOTF | Sales order tax flag. |
| ERDJ | Date – for exchange rate. |
| AJCL | Date – actual invoice closed. |

F0411 GDPdU Data Extraction Program (R89F0411G)

When you run the F0411 GDPdU Data Extraction program, the system generates a text file named F0411GDPDU.txt, and writes the file to the Export directory for your installation. The system writes data for the selected records for the data items listed in this table, in the order listed.

| Fields | Description of Value |
|------------------|--|
| DOC | Document number |
| DCT | Document type. |
| DCT description | Document type value description. The extraction program calls GetUDC (X0005) for 00/DT UDC and writes the description to the text file. |
| KCO | Document company. |
| KCO description | Document company value description. The extraction program calls GetCompanyName (B0000051) and writes the description to the text file. |
| SFX | Document payitem number |
| SFXE | Payitem extension number |
| DCTA | Document type – adjusting |
| DCTA description | Document type – adjusting value description. The extraction program calls GetUDC (X0005) for the Document Type (00/DT) UDC and writes the description to the text file. |
| AN8 | Address number |
| AN8 description | Address number value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| PYE | Address number – payee |

| Fields | Description of Value |
|------------------|---|
| PYE description | Address number – payee value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| DIVJ | Date – invoice |
| DSVJ | Date – service/tax |
| DGL | Date – G/L |
| FY | Fiscal year |
| CTRY | Century |
| PN | Period number |
| CO | Company |
| CO description | Company description The extraction program calls GetCompanyName (B0000051) and writes the description to the text file. |
| PST | Pay status code |
| PST description | Pay status code value description. The extraction program calls GetUDC (X0005) for the Payment Status (00/PS) UDC and writes the description to the text file. |
| AG | Amount – gross |
| AAP | Amount – open |
| ATXA | Amount – taxable |
| ATXN | Amount – non-taxable |
| STAM | Amount – tax |
| TXA1 | Tax rate/area 1 |
| TXA1 description | Tax rate/area 1 value description. The extraction program calls EditTaxRateArea (B0000140) and writes the description to the text file. |
| EXR1 | Tax explanation |
| EXR1 description | Tax explanation value description. The extraction program calls GetUDC (X0005) for the Tax Explanation Code (00/EX) UDC and writes the description to the text file. |

| Fields | Description of Value |
|------------------|---|
| CRCD | Currency code – from |
| CRCD description | Currency code value description The extraction program calls F0013GetCurrencyDescription (B03B0103) and writes the description to the text file. |
| CRR | Currency conversion rate |
| ACR | Amount – foreign |
| FAP | Amount – foreign open |
| CTXA | Amount – foreign taxable |
| CTXN | Amount – non-foreign taxable. |
| CTAM | Amount – foreign tax. |
| GLBA | G/L bank account. |
| GLBA description | G/L bank account value description. The extraction program calls RetrieveAccountMasterInfoGLPost (B0900104) and writes the description to the text file. |
| POST | G/L posted code. |
| VOD | Void flag. |
| VINV | Supplier invoice number. |
| RMK | Name – remark. |
| PYIN | Payment instrument. |
| PYIN description | Payment instrument value description. The extraction program calls GetUDC (X0005) for the Payment Instrument (00/PY) UDC and writes the description to the text file. |
| TXA3 | Tax rate/area 3 – withholding. |
| TXA3 description | Tax rate/area 3 – withholding value description. The extraction program calls EditTaxRateArea (B0000140) and writes the description to the text file. |
| EXR3 | Tax explanation 3 – withholding. |
| EXR3 description | Tax explanation 3 – withholding value description. The extraction program calls GetUDC (X0005) for the Tax Explanation Code (00/EX) UDC and writes the description to the text file. |

| Fields | Description of Value |
|------------------|--|
| AC07 | Category code – address book 07. |
| AC07 description | Category code – address book 07 value description. The extraction program calls GetUDC (X0005) for the Address Book Category Code 07 (01/07) UDC and writes the description to the text file. |
| TNN | Flag for 1099. |
| DTXS | Deferred tax status – VAT. |
| BCRC | Currency code – base. |
| BCRC description | Currency code – base value description. The extraction program calls F0013GetCurrencyDescription (B03B0103) and writes the description to the text file. |
| ATAD | Amount – to distribute. |
| CTAD | Amount – foreign to distribute. |
| NRTA | Amount – nonrecoverable tax. |
| FNRT | Amount – foreign nonrecoverable tax. |
| TAXP | Purchasing taxable Y/N. |

F0911 GDPdU Data Extraction Program (R89F0911G)

When you run the F0911 GDPdU Data Extraction program, the system generates a text file named F0911GDPDU.txt, and writes the file to the Export directory for your installation. The system writes data for the selected records for the data items listed in this table, in the order listed.

| Field | Description of Value |
|-----------------|--|
| DCT | Document type. |
| DCT description | Document type value description. The extraction program calls GetUDC (X0005) for 00/DT UDC and writes the description to the text file. |
| DOC | Document number |
| KCO | Document company. |
| KCO description | Document company value description. The extraction program calls GetCompanyName (B0000051) and writes the description to the text file. |
| DGJ | G/L date. |

| Field | Description of Value |
|------------------|---|
| JELN | Journal entry line number. |
| LT | Ledger type. |
| LT description | Ledger type value description. The extraction program calls IsColInLedgerTypeTable (B0000378) and writes the description to the text file. |
| EXTL | Line extension code. |
| POST | G/L posted code. |
| CO | Company. |
| CO description | Company description. The extraction program calls GetCompanyName (B0000051) and writes the description to the text file. |
| MCU | Business unit. |
| MCU description | Business unit value description. The extraction program calls IsColumnInBusinessUnitTable (ISCOLBU) and writes the description to the text file. |
| OBJ | Object |
| SUB | Subsidiary |
| PN | Period number |
| CTRY | Century |
| FY | Fiscal year |
| CRCO | Currency code – from |
| CRCO description | Currency code value description The extraction program calls F0013GetCurrencyDescription (B03B0103) and writes the description to the text file. |
| CRR | Currency conversion rate |
| AA | Amount |
| EXA | Name – alpha explanation |
| EXR | Name – remark explanation |
| AN8 | Address number |

| Field | Description of Value |
|-------------------|---|
| AN8 description | Address number value description. The extraction program calls GetAddressBookDescriptionA7 (GETABDA7) and writes the description to the text file. |
| CN | Payment number |
| ALTX | Consumption tax cross reference. |
| DSVJ | Date service/tax |
| BCRC | Currency code – base |
| BCRC description | Currency code – base value description. The extraction program calls F0013GetCurrencyDescription (B03B0103) and writes the description to the text file. |
| TXA1 | Tax rate/area 1 |
| TXA1 description | Tax rate/area 1 value description. The extraction program calls EditTaxRateArea (B0000140) and writes the description to the text file. |
| EXR1 | Tax explanation |
| EXR1 description | Tax explanation value description. The extraction program calls GetUDC (X0005) for the Tax Explanation Code (00/EX) UDC and writes the description to the text file. |
| TXITM | Tax – short item number |
| TXITM description | Tax – short item number value description. The extraction program calls GetItemMasterByShortItem (X4101) and writes the description to the text file. |
| ACR | Amount currency |

Running the F0018 GDPdU Data Extract Program (R89F0018G)

Select GDPdU Data Extraction (G74D1), F0018 Data Extraction.

Running the F03B11 GDPdU Data Extract Program (R89F03B11G)

Select GDPdU Data Extraction (G74D1), F03B11 Data Extraction.

Running the F0411 GDPdU Data Extraction Program (R89F0411G)

Select GDPdU Data Extraction (G74D1), F0411 Data Extraction.

Running the F0911 GDPdU Data Extract Program (R89F0911G)

Select GDPdU Data Extraction (G74D1), F0911 Data Extraction.

Modifying the Index.XML File

The Index.XML file that you must send to the tax authority is provided on the Oracle | Peoplesoft Customer Connection web site. The text files that you generate using the data extraction programs do not modify the Index.XML file. Rather, the Index.MXL provides information about the data in the text files that you generate using the table conversion programs provided with this solution. For example, the Index.XML file includes information about the values in the text file.

Note. Index.XML files that describe the fields in the F0911, F03B11, F0411, and F0018 table are provided on the Oracle | Peoplesoft Customer Connection web site. An XML file is provided for each release for which data conversion programs are supported. Be sure to download and modify the Index.XML file that corresponds to your release of JD Edwards EnterpriseOne.

The Index.XML file includes a header area in which you complete this information:

- Version

Complete this field with the version number of the medium used to submit the text files, Index.XML file, and DTD.

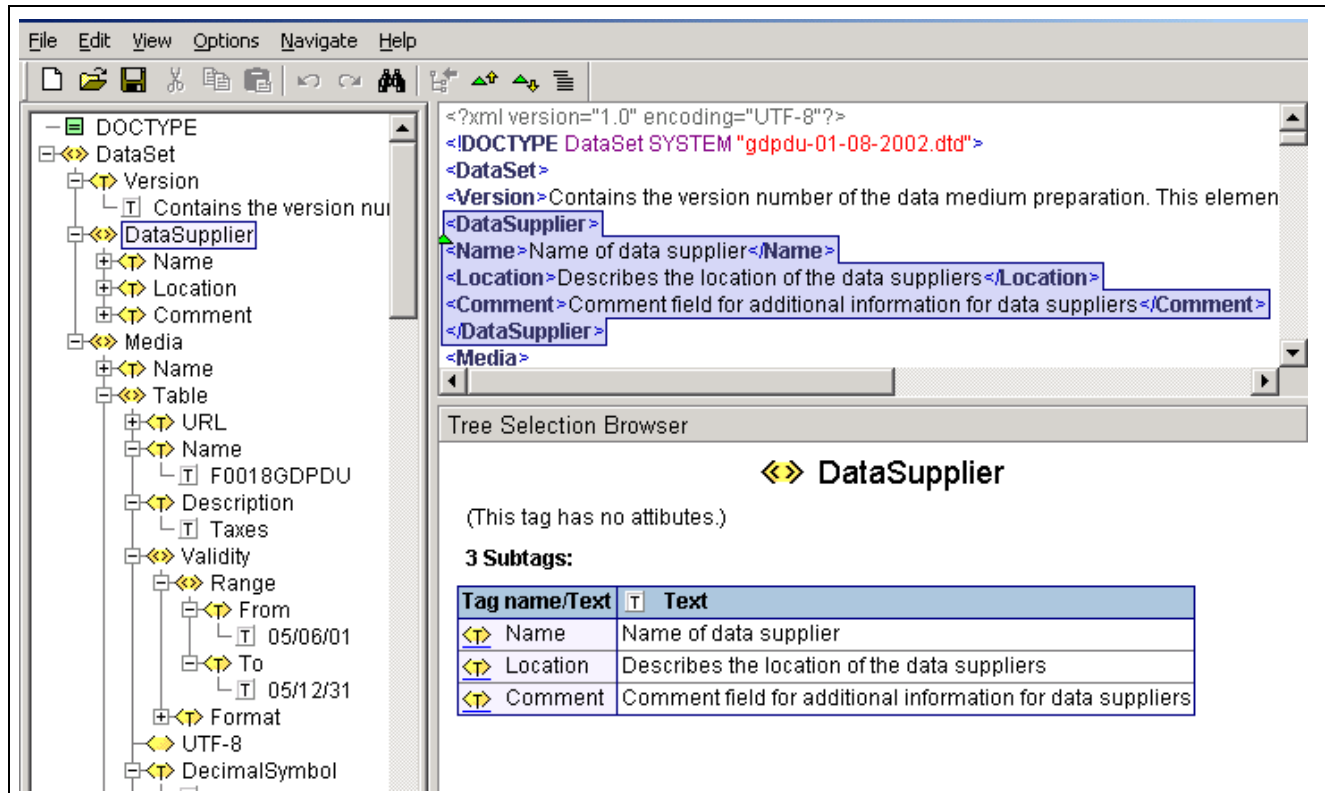

- DataSupplier

Complete these fields with the name and location of the company supplying the data. A Comment field is also provided in which you can enter additional information.

- Media

Complete the Media fields with the name and the dates of the media that you send to the tax audit authority.

This image shows the DataSupplier fields as displayed in an XML viewer. Depending on the text file viewer or XML viewer that you use, the data set might look different. However, the content of the fields is the same.

Example of DataSupplier fields

For each table for which you extract data, complete:

- URL
Enter the physical file name of the text file.
- Name
Enter the name of the table.
- Description
Enter a description of the table.
- Date range and date format
- Decimal symbol
Complete this field with the decimal separator that you use.
- Digit grouping symbol.
Complete this field with the symbol used to separate thousands.
- Variable length

The data included in the VariableLength section of the Index.XML file includes a listing of the fields included for the specified table as shipped with the software. If you have modified the F0911, F03B11, F0411, or F0018 tables, you must modify the listing of the fields and the descriptions provided. The data further specifies whether a field is alphanumeric, numeric, or a date, and the maximum length of the field.

Review the entire Index.XML file before you send it to the tax audit authority to assure that the data in the Index.XML file accurately describes your submission.

This image shows some of the data items for the F0018 table, as displayed in an XML viewer. Depending on the text file or XML viewer that you use, the data set might look different. However, the content of the fields is the same.

CHAPTER 73

(DEU) Working With Other German Functionality

This chapter provides an overview of vouchers for Z1 payments and encashments, and discusses how to:

- Process Z1 payments.
- Work with the Z5a Sheet 2 report.

Understanding Vouchers for Z1 Payments for Germany

Specify the Create A/P Bank Diskette - Germany program (R04572G5) as the payment instrument for vouchers for foreign payments. Payment instruments are set up using the Payment Instrument Defaults program (P0417). The payment instrument can be entered at the time of voucher entry, the system might use a default value from the supplier master, or it can be changed by using speed release before the payment group is created.

In addition, each pay item must include detail about the purchase. The system uses the detail information to determine if record type W is used with the detail record (T) in the Z1 output file. This information is essential for reporting to the Bundesbank (German Federal Bank). The system creates a W record if the voucher (and, therefore, the payment) is related to services transactions or capital movements.

You must enter *W* from UDC 00/HC in the Payment Handling Code field (CRC) for each pay item. The system creates a W record only if the payment handling code is W.

Note. It is recommended that you enter *W* when entering the voucher. However, the payment handling code can be added or changed in the speed release program before the payment group is created.

Understanding Encashments for Germany

Encashment, a common business practice in Germany, is a process by which a third-party receives payments from the customers of a business and then disburses the payment to the business. You can process encashment by using these methods:

Parent/Child Method

When you use the parent/child method to process encashments, a parent company processes all the receipts for its child companies. To use the parent/child encashment method, you must specify the number of the parent company or the special payee for each customer that you set up.

Process parent/child encashment invoices as you would process normal cash receipts. You can use the Parent Number or Factor/Special Payee fields on the Customer Ledger Inquiry form to select only the invoices that the parent company is going to pay.

Factoring Method

When you use the factoring method to process encashments, customers remit the payment for their invoices to an encashment company, which then processes the payments and invoices. You receive the payment for the invoices, minus a predetermined commission, from the encashment company.

To process encashments using the factoring method, you write off the receipts that you know will be paid by the encashment company using the receipts entry programs.

See *JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide*, “Processing Manual Receipts,” Understanding Invoice Match with Write-Off (TI Codes 10 and 15).

You must set up a reason code (user defined code 03/AR) and a general ledger account for the receipts that you plan to write off for encashment. The reason code that you associate with the receipts determines which general ledger account that the system debits when you post the receipts.

You set up the reason codes in the AAIs. For example, you set up AAI item RAXx (where xx is the two-character reason code) to associate the reason codes to the general ledger accounts.

Processing Z1 Payments for Germany

This section provides an overview of processing Z1 payments, lists prerequisites, and discusses how to:

- Modify information at the payment group level.
- Modify information at the payment detail level.

Understanding Z1 Payments

When issuing a foreign payment, German companies are required to submit a paper or electronic form that provides information to the Bundesbank (German Federal Bank) for statistical purposes. The electronic form (form Z1) must be accompanied by an attachment report (form Z4).

The A/P Payments - Z1 Diskette format (R04572G5) provides a means to create foreign payments and the corresponding electronic form.

Z1 processing produces a specific foreign payment output file with the following records:

- Q record: Header information.
- T record: Detail payment information.
- W record: Detail report information for service transactions or capital movements (to be reported to the Bundesbank).
- Z record: Trailer information.

Note. The Z1 output file does not include the V record. You cannot create automatic payments that relate to merchant trade because this information is related to the V record. If a payment is created for such purposes, you must write out the payment manually on a Z1 form.

Z1 processing uses the following tables, in addition to the standard AP payment processing tables such as F04571, F04572, and F04573:

| Table | Descriptions |
|---|--|
| F74030G (Germany-Bank Transit Number Master Addtl Information) | This table holds additional bank account information for each supplier's bank account. Each address book record can have only one record in the F74030G table. |
| F7404572 (Detail Payment Instructions for German Payments) | This table holds the same information as the F74030G table, except that it is used to enter or update bank information at the payment control group level. |
| F7404573 (Detail Payment Instructions EXT. for German Payments) | This table holds the same information as the F7404572 table, except that it is used to enter or update bank information at the pay item level. |

Creating Payment Groups for Z1 Payments

Each time that you run the Create Payment Control Groups program (R04570) for Germany, the system calls the German country server (X045704DE). The country server creates a new record in the F7404572 table for each pay item. The record in table F7404572 is an exact copy of the equivalent record in the F74030G table.

Note. The Create Payment Control Group program does not enable you to combine multiple currencies.

Special considerations exist when you use the Work With Payment Groups program (P04571) in Germany.

Before using the program, you should set the processing options as follows:

- Enter version *XJDE0001* in the Print Program Version processing option.
- When using the Z1 format for foreign payments, enter 2 in the Payment Control Group Output processing option on the Print tab. This action creates one file for all control groups. In addition, the system creates one file for each bank account and currency.

Modifying Information in a Payment Group

After the group is created (but before it is written), the additional bank information can be changed for each individual payment group or pay item. To change the detail payment instructions for payments, you must access the payment group using Work With Payment Groups program.

The Work with Payment Group program provides the ability to display group or detailed payment instructions using the Detail Payment Instructions - German (P744572) and the A/P Payment Detail Extension File - Z1 Format (P744573) programs. The default bank account information for German foreign payments is displayed upon inquiry. The F74030G table provides the supplier's group and detail information. The information can be modified only before the payment is written. You can change any single code or all codes.

Writing Payment Groups for Z1 Payments

To combine two or more payment groups into one payment file to be sent to the bank, you need to perform the following steps when writing the group:

- Set the Payment Control Group Output processing option on the Print tab of the Work With Payment Groups program to *1*.

This processing option enables you to write several groups into one file while separating the groups by the bank account number.

- Because the system writes all of the groups simultaneously, select all of the groups in the detail area and then select Write from the Row menu.

Important! If groups are written simultaneously, take special care to ensure that the groups are not reset or undone separately. It is recommended that immediately after writing groups, you review and then update the groups together to ensure that no vouchers are paid twice.

After you update, verify, or correct all of the details, you write the payment groups that create the Z1 file. The Z1 file is created only if the Create A/P Bank Diskette - Germany program (P04572G2) is specified as the payment instrument.

Key Notes Regarding the Fields for the Z1 Format

Consider these fields when processing payments using the Z1 format:

- Q Record

- Field 9

This field indicates whether the file includes statistical information to send to the Federal Bank. This field is set to *J* if a W record exists. Otherwise, it shows an *N*.

- Fields 10 and 11

You must indicate the Regional Centre Bank area code for the Create A/P Bank Diskette - Germany program (R04572G5). Additionally, you must indicate the Principal's Company code and Principal's Industrial code. This processing option is mandatory because field Q9 is equal to *J*. If the processing option is blank, then the Bundesbank (German Federal Bank) rejects the file.

- T Record

- Field 8: SWIFT Address/BLZ

This field contains either the SWIFT address or the BLZ code of the beneficiary's bank. You must enter one of these values, or the Bundesbank does not accept the file. If the SWIFT or BLZ code does not exist for the supplier, it is recommended that you submit the Z1 foreign payment format using a paper copy. You must complete this field in the F0030 table or the bank will reject the file.

- Fields 16 through 19: Instruction Code 1 – 4

The system completes these fields with the values that you enter for Instruction Codes 1 through 4 on the German Bank Account / Additional Information form in the Bank Account Cross Reference - Germany (P74030G) program, unless the value in Field 22 (Label to type of Payment) is *13*. If the value in Field 22 is *13*, the system completes fields 16 through 19 with *0* (zero).

- Field 20: Additional Instruction Code Information.

This field enables you to provide additional information for the instruction codes. You can enter this information in the Bank Account Cross Reference - Germany (P74030G) program.

- Field 21: Cost Settlement Code

This field contains the cost settlement code. You can enter this information using the Cost Settlement Code UDC (74/28) in the Bank Account Cross Reference - Germany program.

- Field 22: Label for type of Payment

This field contains the label for type of payment. You can enter this information using the Label for Payment UDC (74/29) in the Bank Account Cross Reference - Germany program.

- Field 23 - Additional Instruction to Principal's Bank

This field enables you to add instructions to the principal's bank account. You can enter this information in the Bank Account Cross Reference - Germany program.

- Field 24: Contact Name and Telephone Number

This field enables you to add the contact name and telephone number of the person to contact at the principal's company if the paying bank has questions that are related to the payment order. You can enter this information in the Bank Account Cross Reference - Germany program.

- Field 25: Reporting Code

This field enables you to indicate whether to report the contents of the T record to the Federal Bank. You can enter this information in the Bank Account Cross Reference - Germany program.

• W Record

Field 3 - Type of Transaction Concerned

This field enables you to designate whether the transaction is for capital movements and capital gains, or for services or transfers. You can enter this information in the Bank Account Cross Reference - Germany program.

Prerequisites

Before you complete the tasks in this section:

- Verify that the Localization Country Code field in the User Profile Revisions form is set to *DE* (Germany).
- Verify that you have set up the UDCs for processing automatic payments in Germany.

See [Chapter 71, “\(DEU\) Setting Up Country-Specific Functionality for Germany,” Setting Up UDCs for Bank Accounts for Germany, page 1323.](#)

Forms Used to Process Z1 Payments

| Form Name | FormID | Navigation | Usage |
|---------------------------|----------|---|---|
| Find/Browse | W744572A | On the Work With Payment Group - Write Status form, select Regional Info from the Row menu. | Select the payment group. |
| Fix/Inspect | W744572B | On the Find/Browse form, click Select. | Revise information for the payment group. |
| Find/Browse | W744573A | On the Work with Payment Detail form, select Regional Info from the Row menu. | Select a pay item. |
| Work With Pay Item Detail | W744573B | On the Find/Browse form, click Select. | Revise information for the pay item. |

Modifying Information at the Payment Group Level

Access the Fix/Inspect form.

Inst 01 (instruction 01) through **Inst 04** (instruction 04)

Enter a code from the Payment Instruction Code UDC table (74/27) that identifies the payment instructions for a German foreign payment.

Note. Either the Inst 03 or Inst 04 field must be zero.

| | |
|--|--|
| Cost Code | <p>Enter a code from the Cost Settlement Code UDC table (74/28) that identifies the type of cost settlement the system uses for a German foreign payment. Values are:</p> <p><i>00</i>: Transfer or third-party fees that are debited to principal.</p> <p><i>01</i>: All fees are debited to principal.</p> <p><i>02</i>: All fees are debited to recipient.</p> |
| Labl Paym (label payment) | <p>Enter a code from the Label For Payment UDC table (74/29) that identifies the label for payment for a German foreign payment. Values are:</p> <p><i>10</i>: Telex payment.</p> <p><i>20</i>: Check drawing.</p> <p><i>21</i>: Check drawing, sent by registered mail.</p> <p><i>22</i>: Check drawing, sent by special delivery.</p> <p><i>23C</i>: Check drawing, sent by registered mail or special delivery.</p> <p><i>30</i>: Check drawn on principal, any form of dispatch.</p> <p><i>31</i>: Check drawn on principal, sent by registered mail.</p> <p><i>32</i>: Check drawn on principal, sent by special delivery.</p> <p><i>33</i>: Check drawn on principal, sent by registered mail or special delivery.</p> <p><i>34-49</i>: Reserved for intercompany purposes.</p> <p><i>50-99</i>: In-house.</p> |
| Trans. Concern (transaction concern) | <p>Enter a code that identifies the type of transaction for a German foreign payment. Values are:</p> <p><i>2</i>: Services, transfers or other expenditures.</p> <p><i>4</i>: Capital movements and capital gains.</p> <p>This field is required if the payment handling code for the pay item is <i>W</i>.</p> |
| Code No. (code number) | <p>Enter a code from the Code Number UDC table (74/30) that identifies the code number for a German foreign payment as per the services index (annex to Foreign Trade and Payments Orders).</p> |
| Addtl. Inst. Code Info. (additional instruction code information) | <p>Enter additional information for the instruction codes.</p> |
| Instruction to Principal's Bank | <p>Enter additional instructions for the principal's bank</p> |
| Contact Name and Telephone Number | <p>Enter the name and number of the person to contact at the principal's company if the paying bank has questions relating to the payment order.</p> |
| R C (reporting code) | <p>Enter the code that indicates whether the paying bank reports the contents of the T record to the Federal Bank. Values are:</p> <p><i>0</i>: The paying bank is to report the contents.</p> <p><i>1</i>: The paying bank is not to report the contents.</p> |

Modifying Information at the Payment Detail Level

Access the Work With Pay Item Detail form.

| | |
|-------------------------------------|---|
| Payment Group Control Number | Enter a number to group all payments and payment detail together in the AP payments work files. This number identifies a group of payments that are run for the same bank account, payment instrument, DREAM Writer version, originator ID, and currency. |
| Check Control Number | Enter a number to group all AP payment transactions for each individual check. |
| Document Number | Enter the number that is associated with the original document, such as a voucher, invoice, or journal entry. |

Working with the Z5a Sheet 2 Report for Germany

This section provides an overview of the Z5a Sheet 2 report, lists prerequisites, and discusses how to:

- Run the Foreign Payables Table Generation program (R74900).
- Set processing options for Foreign Payables Table Generation (R74900).
- Run the Foreign Receivables Table Generation program (R74901).
- Set processing options for Foreign Receivables Table Generation (R74901).
- Run the German Z5a Sheet 2 Report - Summary (R74414) program.
- Setting Processing Options for German Z5a Sheet 2 Report - Summary (R74414).
- Run the German Z5a Sheet 2 Report - Detail (R74415) program.
- Setting Processing Options for German Z5a Sheet 2 Report - Detail (R74415).

Understanding the Z5a Sheet 2 Report

Some European countries require that the balance of outstanding payables and receivables with foreign entities be reported on a periodic basis. The Deutsche Bundesbank (German Federal Bank) requires that various reports be submitted on a monthly basis, including the Z5a sheet 2. The Z5a Sheet 2 report is used to collect data that you can transfer to the official form for the Deutsche Bundesbank (German Federal Bank). The Z5a sheet 2 report details of "Forderungen und Verbindlichkeiten gegenüber Gebietsfremden aus dem Waren-und Dienstleistungsverkehr or Claims on and liabilities to nonresidents arising from transactions in goods and services. Foreign payables and receivables are classified by country, and reported in thousands of euros.

The Z5a Sheet 2 reports the group's data by affiliated or nonaffiliated companies, by accounts payable or accounts receivable, by prepayments, short-term payments or long-term payments, and by country and currency.

The basic requirement of the Z5a Sheet 2 is to report the company's open accounts payable and open accounts receivable amounts that were transacted with a foreign entity. For the purpose of generating foreign payables tables, all WF - As Of Accounts Payable Ledger table (F0411A) records that are posted but not paid are considered open.

All records written to the Foreign Receivables and Payables - EMEA table (F74900) should:

- Relate to the reporting company.

For the Z5a Sheet 2 report, the value that is entered during data selection must be equal to the reporting company.

- Be posted.

All records in tables F0411A and F03B11 must have a status equal to *D*, where *D* equals the transactions that have been successfully posted or that have been processed through the cash entries programs with a one-to-one record relationship with the general ledger (for example, adjustments, journal entry from cash receipts, and so on).

- Have transaction dates falling on or before the report ending date.

The report ending date is the general ledger date.

- Have a customer country code that is different from the country code of the reporting company.
- Be identified for affiliation or nonaffiliation.
- Be identified for EMU membership.

For the program to determine which currencies to summarize as euro currencies, you must set up the user-defined code list for European Union Members (00/EU).

- Be identified as a prepayment, long-term obligation, or short-term payment.

A long-term obligation is normally defined as a payable that is due one year from the processing date of the transaction. The value that is entered in this processing option is added to the general ledger date (processing date) and is compared with the due date of the transaction. If the calculated date is equal to or beyond the due date, the transaction is considered a long-term obligation. The system writes a 2 to the Foreign Receivables and Payables - EMEA table (F74900) for long-term obligations. A short-term obligation is normally defined as the calculated date minus the due date. The system writes a 3 to table F74900 for short-term obligations.

Prepayments are determined by their general ledger offset for accounts receivable transactions and by their document type for accounts payable transactions.

The Z5a Sheet 2 Report - Summary (R74414) report provides totals of both accounts receivable and accounts payable records for prepayments, short-term payments, and long-term payments for affiliated companies and nonaffiliated companies. The totals are listed separately by country and currency.

The German Z5a Sheet 2 Report -Detail (R74415) is not required for reporting the accounts receivable and accounts payable totals to the Deutsche Bundesbank (German Federal Bank). This report contains transaction level detail, and can be used for review and audit of transactions.

Generating the Foreign Payables Table

The Foreign Payables Table Generation program (R74900) populates the Foreign Receivables and Payables - EMEA table (F74900), which supplies data to reporting programs. This program reads data from the WF - As Of Accounts Payable Ledger table (F0411A). The system uses the general ledger date to determine the records to process.

Generating the Foreign Receivables Table

The Foreign Receivables Table Generation program (R74901) populates the Foreign Receivables and Payables - EMEA table (F74900), which supplies data to reporting programs. The Foreign Receivables File Generation program is based on information in the Customer Ledger table (F03B11). The system uses the general ledger date to determine the records to process.

Prerequisites

Before you complete the tasks in this section:

- Run the Accounts Payable "as of" reports.
- Verify that affiliated companies are set up in user-defined code 74/AC.

Note. You can override the affiliated companies by using processing options for the Foreign Payables Table Generation - EMEA program (R74900) or the Foreign Receivables Table Generation - EMEA - Germany program (R74901).

Running the Foreign Payables Table Generation Program (R74900)

Select German Localization (G74D), Foreign Payables Table Generation.

Setting Processing Options for Foreign Payables Table Generation (R74900)

Processing options enable you to specify the default processing for programs and reports.

Defaults

Use these processing options to define the data selection that, in turn, processes data into the Foreign Receivables and Payables - EMEA table (F74900).

- | | |
|---|--|
| 1. Report Ending Date | Specify the date that the system compares to the processing date to select transaction records. The system selects records that are either previous to or equal to the date that you enter for this processing option. |
| 2. Long Term Obligation | Specify the number of days to add to the processing date to compare with the transaction due date for determining long-term and short-term obligations. Values are: <i>Long term:</i> Greater than or equal to the due date <i>Short term:</i> Less than the due date |
| 3. Processing Address | Specify which address to use for processing. The system uses this address to determine the location of the supplier. The supplier address number is usually the purchased from address. The payee address number is usually the shipped from address. Values are: Blank: Supplier Address Number I: Payee Address Number |
| <hr/> | |
| Note. These addresses may be the same. | |
| 4. A/P Prepayment | Specify the document type for accounts payable prepayments. |
| 5. Affiliated Suppliers | Product Code Specify the system code of the user-defined code list for affiliated suppliers. In the event that there are multiple reporting companies, you can create additional lists of affiliated suppliers using user-defined system code 55. User-Defined Code |

Specify the user-defined code of the user-defined code list for affiliated suppliers.

Running the Foreign Receivables Table Generation Program (R74901)

Select German Localization (G74D), Foreign Receivables Table Generation.

Setting Processing Options for Foreign Receivables Table Generation (R74901)

Processing options enable you to specify the default processing for programs and reports.

Defaults

Use these processing options to define the data selection that, in turn, processes data into the Foreign Receivables and Payables - EMEA table (F74900).

- | | |
|---|---|
| 1. Report Ending Date | Specify the last date to include in the report. The system uses the G/L Date of the invoice to recalculate amounts as of the date that you specify in this processing option. |
| 2. Long Term Claim | Specify the number of days to add to the processing date to compare with the transaction due date for determining long-term and short-term claims. Values are: <i>Long term:</i> Greater than or equal to the due date <i>Short term:</i> Less than the due date |
| 3. Processing Address | Specify which address to use for processing. The system uses this address to determine the location of the customer. The customer address number is usually the sold to address. The payor address number is usually the shipped to address. Values are: Blank: Customer Address Number 1: Payor Address Number |
| <hr/> | |
| Note. These addresses may be the same. | |
| <hr/> | |
| 4. A/R Prepayment | Specify the general ledger offset for accounts receivable prepayments. |
| 5. Affiliated Customer | Product Code Specify the system code of the user-defined code list for affiliated customers. In the event that there are multiple reporting companies, you can create additional lists of affiliated customers using user-defined system code 55. User-Defined Codes Specify the user-defined code of the user-defined code list for affiliated customers. |

Running the German Z5a Sheet 2 Report - Summary (R74414) Program

Select German Localization (G74D), Z5a Sheet 2 Report - Summary.

Setting Processing Options for German Z5a Sheet 2 Report - Summary (R74414)

Processing options enable you to specify the default processing for programs and reports.

Defaults

- 1. Reporting Currency** Specify the reporting currency for Z5a reporting. Values are:
EUR: Euro
- 2. Date used for reporting** Specify the date used for reporting.

Running the German Z5a Sheet 2 Report - Detail (R74415) Program

Select German Localization (G74D), Z5a Sheet 2 Report - Detail.

Setting Processing Options for the German Z5a Sheet 2 Report - Detail (R74415)

Processing options enable you to specify the default processing for programs and reports.

Defaults

- 1. Processing Address** Specify which address to use for accounts payable or accounts receivable processing. Values are:
Blank: Address Number
I: Payee or Payor Number

Note. The value in this processing option must match the value for the processing address in the Foreign Payables File Generation report (R74900) or the Foreign Receivables File Generation report (R74901) if you want the report to reflect the same information.

CHAPTER 74

(GBR) Understanding Country-Specific Functionality for Great Britain

This chapter discusses Great Britain-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Great Britain-Specific Setup and Processes

This table lists the country-specific setup and functionality for Great Britain:

| Setup or Process | Description |
|-----------------------------------|--|
| Supplier bank account information | <p>Country-specific values are required when you enter supplier bank account information.</p> <p>See <i>JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide</i>, “Setting Up Bank Accounts,” (CAN, DEU, FIN, GBR, NOR, SWE, and USA) Setting Up Country-Specific Supplier Bank Account Information.</p> |
| Next numbers | <p>Set up next numbers for the Text File Processor program (P007101).</p> <p>When you run the SEMDEC interface for Intrastat reporting, the Text File Processor program assigns the batch number and interchange from line 7 of Next Numbers System 00. The Text File Processor assigns the message number from line 5 of Next Numbers System 74.</p> |

| Setup or Process | Description |
|---------------------------|--|
| User-defined codes (UDCs) | <p>In addition to the base software UDCs:</p> <ul style="list-style-type: none"> Set up UDCs to work with CIS (construction industry scheme). See Chapter 75, “(GBR) Setting Up Functionality for Great Britain,” Setting Up UDCs for CIS, page 1375. Set up UDCs to work with ACM (application and certificate management). See Chapter 75, “(GBR) Setting Up Functionality for Great Britain,” Setting Up UDCs for ACM for Great Britain, page 1376. Set up UDCs for European Union reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221. Set up UDCs to print invoices with an attached International Payment Instruction (IPI). See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220. Set up these UDCs for companies: <ul style="list-style-type: none"> Affiliated Companies (74/AC) Code Number (74/30) See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for European Companies, page 1230. |
| AAIs | No country-specific AAI setup exists for Great Britain. |
| Payment processing | <p>To work with payment processing in Great Britain:</p> <ul style="list-style-type: none"> Set up suppliers, bank accounts, and payment instrument defaults for BACS (Bankers Automated Clearing System) processing. See Chapter 75, “(GBR) Setting Up Functionality for Great Britain,” Setting Up the System for BACS Payments for Great Britain, page 1376. Set up payment formats. See Chapter 75, “(GBR) Setting Up Functionality for Great Britain,” Setting Up Payment Formats for Great Britain, page 1379. |

| Setup or Process | Description |
|-------------------------|--|
| Invoice processing | <p>In addition to standard invoice processing, you can print invoices with an attached International Payment Instructions (IPI). To print these invoices and attachments:</p> <ul style="list-style-type: none"> • Set up UDCs for IPIs. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220. • Set processing options for the invoice print program. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Invoice Print with International Payment Instruction (R03B5053), page 1247. • Print invoices with attached IPIs. See Chapter 66, “(Europe) Working With European Union Functionality,” Printing Invoices with an Attached International Payment Instruction, page 1245. |
| Automatic debit formats | <p>Before working with automatic debits for Great Britain, set the processing options for the Bank File and Statement Diskette (R03B575GB) format for automatic debits.</p> <p>See Chapter 75, “(GBR) Setting Up Functionality for Great Britain,” Setting Up Automatic Debit Formats for Great Britain, page 1383.</p> |

| Setup or Process | Description |

CHAPTER 75

(GBR) Setting Up Functionality for Great Britain

This chapter discusses how to:

- Set up user-defined codes (UDCs).
- Set up the system for BACS payments.
- Set up payment formats for Great Britain.
- Set up automatic debit formats for Great Britain.

Setting Up UDCs for Great Britain

Setting up Great Britain-specific UDCs enables you to use Great Britain-specific functionality. You also set up some base software UDCs with Great Britain-specific values.

Setting Up UDCs for CIS

Set up these UDCs before you process vouchers for the construction industry scheme (CIS).

CIS Validation Hierarchy Codes (74U/CL)

Use CIS validation hierarchy codes to prioritize CIS documents for subcontractors who hold more than one CIS document. Documents with a higher classification code are given priority. For example, if a tax certificate has a classification code of 1 and a registration card has a classification code of 9, the system uses the tax certificate during CIS processing for a subcontractor who holds both documents. The highest possible value is 1 and the lowest possible value is 9.

CIS Taxable Status Codes (74U/TS)

Use CIS taxable status codes to indicate whether a line item on a voucher is subject to withholding tax.

CIS Voucher Status Codes (74U/VS)

The system assigns CIS status codes at various stages of CIS processing to identify the current status of a document. Some processes require that a document be at a specific status.

CIS Voucher Type Codes (74U/VT)

Use CIS voucher type codes to identify the types of payment vouchers that are used in the CIS. Values are:

- CIS23: Construction Gross Payment Voucher.

The contractor generates this voucher each time that a payment is made to a subcontractor who holds a Construction Tax Certificate (CIS5). The contractor keeps a copy and sends a copy to the Inland Revenue Service.

- CIS24: Subcontractors Gross Payment Voucher.

The contractor receives this voucher from the subcontractor after the contractor has paid a subcontractor who holds a Subcontractors Tax Certificate (CIS6). The contractor adds his or her CIS tax reference, returns a copy to the subcontractor, keeps a copy, and sends a copy to the Inland Revenue Service.

- CIS25: Tax Payment Voucher.

The contractor generates this voucher each time that a payment is made to a subcontractor who holds a registration card. The contractor keeps a copy, and sends a copy to both the Inland Revenue Service and the subcontractor.

Setting Up UDCs for ACM for Great Britain

Before you enter and print certificates for application and certificate management (ACM), set up these UDCs.

ACM Status Codes (74U/AS)

Application and Certificate Management (ACM) status codes are assigned by the system at various stages of ACM processing to identify the current status of an ACM document. Some processes require that an ACM document be at a specific status.

ACM Voucher Return Codes (74U/VR)

You use ACM voucher return codes to indicate whether a CIS24 tax payment voucher has been returned for a payment.

Setting Up the System for BACS Payments for Great Britain

The following subsections describe the setup that is required for BACS processing.

Supplier Master

Set up suppliers with payment instrument B for EFT in the BACS format.

Payment Instrument Defaults (P0417)

Set up payment instrument B to use these programs:

| Format | Program |
|------------------|---|
| Payments | P04572B (Produce Bank Tape - BACS) |
| Payment Register | P04576 (Payment Register - Standard) |
| Attachments | P4573U (Print Attachments - UK) |
| Debit Statements | P04574 (Print Dbt Statement - Standard) |

Bank Accounts by Address

Set up bank account information according to this example:

| Field | Description |
|-----------------------------|---|
| Record Type | Choose Supplier. |
| Bank Transit Number | Enter the sorting code (six digits without spaces or dashes). |
| Bank Account Number | Enter eight to ten digits without spaces or dashes. |
| Control Digit | Enter 00 (two zeros). |
| Description | Enter the name of the bank account. |
| Checking or Savings Account | Enter the type of account (optional). |
| Swift Code | This field is optional. |
| Reference/Roll Number | This field is required if the payment is made to a building society. All customers of a building society have the same sort code and account number. The value that is entered in the Reference/Roll Number field specifies which actual account is used. |

This example shows how the values that are entered on the Set Up Bank Accounts By Address form populate the Bank Transit Master (F0030) and Bank Account/Supplier Number Worktable (F0030W) tables.

| Field | Description |
|-----------------------------|-------------|
| Record Type | Supplier |
| Bank Transit Number | 601613 |
| Bank Account Number | 31926819 |
| Control Digit | 00 |
| Description | Lloyds |
| Checking or Savings Account | Blank |
| SWIFT Code | Blank |
| Reference/Roll Number | Blank |

The system populates the F0030 table like this:

| AYBKTP | AYTNST | AYBNK | AYAN8 | AYDL01 |
|--------|--------|----------|-------|--------|
| V | 601613 | 31926819 | 22699 | Lloyds |

The system populates table F0030W like this:

| AXAN8 | AXBKTP |
|-------|--------|
| 22699 | V |

Note. When you import bank account information directly into the F0030 table, you must also populate the F0030W table.

Bank Account Information (P0030G)

Set up the bank account from which BACS payments are made.

BACS payments and paper check payments can be made from the same bank account. However, the Next Payment Number field on the Set Up G/L Bank Account form is used only for paper check payments.

From the Set Up G/L Bank Account form, select Bank Info from the Form menu, and then enter this information on the Revise Bank Information form:

| Field | Description |
|---------------------------------|--|
| Address Book Number | You can set up the bank account in the address book record. This value is optional. |
| Override Supplier Pre-Note Code | Clear this option. This option is not used for BACS payments. |
| Float Days | You can calculate the float days by subtracting the deposit date from the check date. The system adds the float days to the check date to populate the Date - Cleared/Value field (VLDT) in the F0413 table. |

From the Set Up G/L Bank Account form, select BACS Info from the Form menu, and then enter this information on the Revise BACS Information form:

| Field | Description |
|-----------------------|--|
| Bank User Number | Enter the six-digit number that was supplied by BACS. |
| Reference/Roll Number | Enter the reference number that was supplied by BACS. |
| Bank Reference Name | Enter the description that you want to appear on the recipient's bank statement. |

Important! These fields must be completed correctly for the BACS payment to process successfully.

This example illustrates how the values that are entered on the Revise BACS Information form populate the F0030 table.

| Field | Description |
|------------------|--------------------------|
| G/L Bank Account | 1.1110.BEAR |
| Description | Bear Creek National Bank |

| Field | Description |
|-----------------------|-------------|
| Bank User Number | 777777 |
| Reference/Roll Number | 88888888 |
| Bank Reference Name | MIDLAND |

The system populates the F0030 table like this:

| AYBKTP | AYTNST | AYBNK | AYDL01 | AYRLN | AYBACS | AYRFNM |
|---------|--------|----------|------------|----------|--------|---------|
| AYBACSG | 555555 | 66666666 | Bear Creek | 88888888 | 777777 | Midland |

Setting Up Payment Formats for Great Britain

This section provides an overview of payment formats for Great Britain and discusses how to:

- Write payments using the BACS format.
- Set processing options for Create A/P Bank Tape - BACS - UK (R04572B).
- Print Automatic Payment - Cheque - UK (R04572UI).
- Print A/P Payment Attachment - UK (R04573U).

Understanding Payment Formats for Great Britain

JD Edwards EnterpriseOne software provides these payment formats for Great Britain:

| Format | Description |
|----------|---|
| P04572B | Electronic funds transfer (EFT) in the Bankers Automated Clearing System (BACS) format (tape or diskette) |
| P04572U1 | Checks in the Association for Payment Clearing Services (APACS) format. |

Note. All dates for the BACS table are written in a *BYDDDD* format, according to the standards required by BACS. In this required format, *B* represents one blank space, *YY* is the last two digits of the year, and *DDD* is the Julian date (the number of days that have passed since noon on January 1) in the year.

For example, December 31, 2005, is written to the table as 05365 because December 31 is the 365th day of the year.

Working with the APACS Check Format

APACS is the governing body for check printing standards in Great Britain. Businesses in Great Britain are required to issue checks according to the most current APACS standards.

You can use JD Edwards EnterpriseOne localized software to print checks that are formatted to APACS standards. As required by APACS, when you use the localized Print Automatic Payments - Cheque - UK program (R04572U1), you can use processing options to specify:

- Whether the payee name prints above or below the amount in words.
- Whether to print or omit the payee's address on the check, such as for use in a window envelope.
- Whether to print the amount (in words) in boxes or as one string.
- The translation program that you want the system to use to print the amount in words.

In addition, the checks that you print comply with these APACS standards:

- The payee name field is completed by a string of asterisks.
- The amount printed in figures is prefixed and suffixed by asterisks.
- A hyphen prints in place of the decimal character.
- Thousands separators are omitted from the amount that is printed in figures.

Technical Considerations for the APACS Check Format

When you write APACS checks, verify that processing options 5 and 6 of the Print Automatic Payments - Cheque - UK program (R04572U1) correspond to each other.

JD Edwards EnterpriseOne software supplies these translation programs, which you can specify in processing option 5:

- *X00500U1*: Prints numeric values as words in boxes.
- *X00500U*: Prints numeric values as words in a string.

For example, if you enter translation program *X00500U1* in processing option 5, leave processing option 6 blank to print the check amount in boxes. Similarly, if you enter translation program *X00500U* in processing option 5, enter a *1* in processing option 6 to print the check amount in a string.

Working with the BACS Format

When you write payments using the BACS format from the Work with Payment Groups program, the system populates the A/P Payment Tape table (F04572OW) as shown in this table:

| Field | Description |
|--------|---|
| KNMID | The member ID. The system populates this field using the next number for system 04, line 6. |
| KNLNID | The line number. |
| KNFNAM | The file name. For BACS processing, this is F04572B. |

The KNAPTA field includes this payment information:

- Line 1: VOL 1 (volume header label).
- Line 2: HRD 1 (first file header label).
- Line 3: HRD 2 (second file header label).
- Line 4: UHL 1 (user header label).

- Line 5: Account information, one line per account.
- Line 6: Account information, one line per account.
- Line 7: EOF 1 (first end-of-file).
- Line 8: EOF 2 (second end-of-file).
- Line 9: UTL 1 (user trailer label).

Note. This description of the KNAPTA is based on a nine-line payment file. An actual payment file will be a different length, based on how many account information lines it has.

Writing Payments Using the BACS Format

When you write payments using the BACS format, use the following guidelines when completing the Write Payments form:

| Field | Value |
|------------------------------|--|
| Next Payment | This field does not apply to BACS payments; it is used only for paper check payments. The system supplies this value from the Setup G/L Bank Account form. |
| Proc Date (Processing Date) | Enter the date that the file will be sent to the bank and processed by the BACS system. |
| Expir Date (Expiration Date) | Enter the date after which the file is out-of-date and should not be processed. |

Setting Processing Options for Create A/P Bank Tape - BACS - UK (R04572B)

Processing options enable you to specify the default processing for programs and reports.

Transfer

- File ID** (file identification) Specify a number from 1 to 9 for the system to use for the File ID modifier. This number is used to distinguish among multiple files created on the same date. If you leave this processing option blank, the system uses the default value of 1.

BACS

- BACS Bureau Number (FUTURE)** This processing option is not used.
- Euro Currency Code** Specify the currency code that represents the euro in your system. When the payment currency code equals the currency code specified in this processing option, the user header label in spaces 20 and 21 is populated with 01 to indicate that the currency is euro. If the payment currency code does not equal the currency code specified in this processing option, the user header label is populated with 00.

Tape

- 1. Device Name** Specify the tape dump device. Enter a valid dump device name from UDC 97/DD.

Remittance

This processing option is reserved for future use.

- 1. Address Format ID (FUTURE)** This processing option is not used.

Setting Processing Options for Print Automatic Payments - Cheque - UK (R04572U1)

Processing options enable you to specify the default processing for programs and reports.

Payee

- Payee Name** Enter 1 to print payee name above the amount in words. If you leave this processing option blank, the system prints the payee name below the amount in words.

- Payee Address** Enter the override address format. If you leave this processing option blank, the system uses the country format associated with the country in the address book record for the payee.

Address

- Address Format ID (FUTURE)** This processing option is not used.

Print

- Forms Type (FUTURE)** This processing option is not used.

Amount

- Program ID** Enter the program name to translate payment amounts from numbers to words. the value that you enter must exist in UDC 98/CT. If you leave this processing option blank, the system uses the translation program associated with the payment currency code.

- String or Boxes** Enter 1 to print the amount in words in one string (X00500U). If you leave this processing option blank, the system prints the words in separates boxes (X00500U1).

Setting Processing Options for Print A/P Payment Attachment - UK (R04573U)

Processing options enable you to specify the default processing for programs and reports.

Purchase Order

Invoice or Purchase Order Enter 1 to print the purchase order number on the stub instead of the supplier invoice number.

Print Option

Remark Enter 1 to print the supplier name. Enter 2 to print the supplier invoice number. Leave this processing option blank to print the remark on the pay stub.

Setting Up Automatic Debit Formats for Great Britain

This section provides an overview of automatic debits for Great Britain and discusses how to set processing options for Great Britain Bank File and Statement Diskette (R03B575GB).

See Also

JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide, “Processing Automatic Debits”

Understanding Automatic Debits for Great Britain

Businesses in Great Britain automatically debit customer bank accounts using EFT. Transfers must adhere to the standards that are set by the BACS. Businesses can send transfer information to the bank using modem, tape, or diskette.

You can use the standard automatic debit process to meet the requirements of Great Britain.

The JD Edwards EnterpriseOne system provides Great Britain Bank File and Statement Diskette (R03B575GB) format for automatic debits.

The program generates a bank table that adheres to the banking standards for automatic debits in Great Britain.

To process the automatic debit, the BACS processing date and the expiration date of the debit must be actual workdays. In addition, common business practice is to:

- Send statement reports to customers regarding the debit.
- Identify customers who have agreed to the automatic debit process.
- Select invoices that are due to customers.
- Validate the processing and expiration dates against a workday calendar.
- Assign each debit a sequential number that is based on the Accounts Receivable Next Auto Debit number in the Next Auto Debit Number table (F7460).
- Generate debit information in the BACS format.
- Generate statement reports for applicable customers.
- Update customer accounts after collecting the appropriate funds.

When creating and processing automatic debit batches for Great Britain, the system validates the BACS processing date against the workday calendar that you specify in the processing options. If the date is not a workday, the system searches for a valid workday, based on the workday calendar that you specify in the processing options, and increments the date by one day until it reaches the next valid workday.

The system issues a warning message to indicate that the day you entered is not a workday.

Note. If you do not set up and specify a workday calendar, the system uses the BACS processing date without performing the necessary validation.

The system calculates the BACS expiration date, based on the value that you enter in processing option 15 on the BACS tab of the Process Automatic Debits program. To calculate the expiration date, the system uses the BACS processing date that is written to the BACS table and then adds the number of days that you specify in the processing option.

Note. You must use the Supplier Master program (P04012) to create supplier master records for the customers for whom you submit automatic debits.

The first time that you submit automatic debits for a specific customer, you submit a first claim rather than a standard claim. The first-claim status indicates to the bank that you are verifying the bank account information for the automatic debit. No transfer of funds occurs with a first claim. After you have verified the bank account information for a customer, you submit automatic debits for that customer as standard claims.

To submit a first-claim automatic debit for a customer, select the Pre-Note Code option on the Supplier Master Revision form. Selecting the Pre-Note Code option for a customer indicates that any electronic funds transfer, including automatic debits, should be processed as a first claim.

Important! After you have processed the first claim automatic debits and the bank has approved the customer for automatic debits, you must clear the Pre-Note Code option on the Supplier Master Revision form for that customer so that Great Britain Bank File and Statement Diskette program can correctly process automatic debits.

Setting Processing Options for Great Britain Bank File and Statement Diskette (R03B575GB)

Processing options enable you to specify the default processing for programs and reports.

Default

| | |
|---------------------------------|---|
| Print Customer Statement | Specify whether the system prints customer statements for automatic debits. Values are: Blank: Print customer statements only when the number of invoice detail lines exceeds the maximum number that the format allows. 1: Print customer statements for automatic debits. |
| Tape Density | Specify the tape density. |

CHAPTER 76

(GBR) Setting Up CIS

This chapter provides an overview of setup for CIS processing and discusses how to:

- Set up CIS constants.
- Set up CIS company constants.
- Set up CIS payment voucher constants.
- Set up CIS document types.
- Set up CIS subcontractor documents.

See Also

Chapter 78, “(GBR) Processing CIS Vouchers,” Understanding the CIS, page 1403

Understanding Setup for CIS Processing

To set up the system for CIS processing, you must:

- Set up these category codes:
 1. An address book category code (01/01–30) to identify subcontractors.
 2. An account category code (09/01–23) to identify GL accounts that fall within CIS.

The system uses these values when you set up CIS constants.

- Set up CIS constants.
- Update the Account Master record with the category code value that you specify on CIS Constants for all GL accounts that fall within the CIS.

See *JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide*, “Creating the Chart of Accounts,” Revising Accounts.

You must update the Account Master record *after* you set up the CIS constants.

- Update the address book records with the category code value that you specify on CIS Constants for all subcontractors within the scheme.
- Set up two address book records for suppliers for which you want to include only selected vouchers.

Set up one address book record with the subcontractor category code value and one without it.

- Set up this information for companies before you set up CIS company constants:

- Set up the company in the Companies program (P0010).

See *JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide*, “Setting Up Organizations,” Setting Up Companies.

- Set up the company’s mailing address in the Address Book Revisions program (P01012).

See *JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide*, “Entering Address Book Records,” Entering Address Book Records.

- Set up CIS company constants by using the CIS Company Constants program (P74U0101).
- Set up CIS payment voucher constants.
- Set up CIS document types.
- Before you set up subcontractor documents, set up your subcontractors:
 - Set up address book records for CIS card holders (subcontractors) using a search type of S (subcontractors) or V (suppliers) and the category code that you set up in the CIS System Constants program (P74U0100) to identify them as subcontractors.
 - If an authorized user is representing a subcontractor, verify that the subcontractor’s trading name exists in the JD Edwards EnterpriseOne Address Book system, has a search type of V (supplier), and is identified in the category codes as a subcontractor.
 - Set up a supplier master record for each subcontractor for which you set up an address book record.

See *JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide*, “Entering Supplier Information,” Entering Supplier Master Information.

On the Tax Information tab of the Supplier Master Revision form, specify the address book number for Inland Revenue in the Tax Authority field and specify the withholding tax percentage for subcontractors in the Percent field.

Setting Up CIS Constants for Great Britain

This section provides an overview of CIS constants, lists a prerequisite, and discusses how to set up CIS constants.

Understanding CIS Constants

CIS system constants provide the basic framework for how the CIS operates for your business needs. These parameters enable you to:

- Activate the scheme.
- Define how to identify subcontractors within the scheme.
- Define which GL accounts fall within the scheme.
- Provide system process default values and warning and error message settings.

Important! After you set up CIS Constants, you must update the Account Master record with the category code value that you specify on CIS Constants for all GL accounts that fall within the CIS. You must also update the address book records with the category code value that you specify on CIS Constants for all subcontractors within the scheme.

Note. To include only selected vouchers from a specific supplier in the CIS, you must set up two address book records for that supplier: one with the subcontractor category code value and one without it. For example, you might label the suppliers Supplier 1 - CIS and Supplier 1 - No CIS. You must then train your accounts payable and purchasing clerks on when to use each supplier record.

Prerequisite

Set up these category codes:

- An address book category code (01/01–30) to identify subcontractors.
- An account category code (09/01–23) to identify GL accounts that fall within CIS.

See Also

JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide, “Entering Supplier Information,” Entering Supplier Master Information

Form Used to Set Up CIS Constants

| Form Name | FormID | Navigation | Usage |
|--|-----------|---|---|
| Construction Industry Scheme Constants | W74U0100B | System Setup (G74U0240), CIS System Constants | Set up CIS constants. Activate the Construction Industry Scheme. To prevent payments to CIS6 subcontractors when they have not returned CIS24 payment vouchers for previous payments, select the Subcontractor CIS24 Voucher Returned check box. |

Setting Up CIS Constants

Access the Construction Industry Scheme Constants form.

Construction Industry Scheme Constants form

| | |
|---|--|
| CIS Default Pay Status | Enter a code from the Payment Status Code (00/PS) UDC. The system uses the code that you enter as the default pay status for CIS subcontractor vouchers that are entered through Voucher Entry (P0411), Speed Voucher Entry (P0411SV), or Voucher Match (P4311). |
| Subcontractor CIS24 Voucher Returned | Select to specify that payments are allowed to CIS6 subcontractors who have not returned payment vouchers (CIS24) for previous payments. If you select this check box, the system does not allow payments where payment vouchers have not been returned. If you do not select this check box, the system issues a warning but allows payments where payment vouchers have not been returned. |
| Note. CIS Pre Withholding Validation (R74U0130) uses this field during its validation. | |
| A/B Category Code (address book category code) | Select one of the address book category codes to identify CIS subcontractors. This option is used in conjunction with the Designated Flag A/B field. |
| Designated Flag A/B (designated flag address book) | Specify the value that exists in the category code you selected in the A/B Category Code field that indicates that a subcontractor is subject to CIS. |
| O/A Category Code (object account category code) | Select one of the object account category codes to identify taxable GL accounts that are used to pay CIS subcontractors' labor. This field is used in conjunction with the value in the Designated Flag O/A field. |
| Designated Flag O/A (designated flag object account) | Specify the value that exists in the category code you selected in the O/A Category Code field that identifies the taxable G/L accounts that are used to pay CIS subcontractors' labor. |
| No CIS Document | Select to determine the error that occurs when you enter a voucher for a CIS subcontractor for whom no registration card or tax certificate exists in the system. |

If you select this check box, you receive a hard error on voucher entry and cannot create the voucher. If you do not select this check box, you receive a warning on voucher entry, but can create the voucher.

Note. Voucher input includes the Voucher Entry (P0411) program, the Speed Voucher Entry (P0411SV) program, and the Voucher Match (P4314) program.

CIS Document Invalid

Select to determine the error that occurs when you enter a voucher for a CIS subcontractor whose registration card or tax certificate is invalid or has expired.

If you select this check box, you receive a hard error message on voucher entry and cannot create the voucher. If you do not select this check box, you receive a warning on voucher entry, but are able to create the voucher.

Note. Voucher input includes the Voucher Entry (P0411) program, the Speed Voucher Entry (P0411SV) program, and the Voucher Match (P4314) program.

Invalid Tax Certificate Valid Reg. Card (invalid tax certificate valid registration card)

Select to determine the error that occurs when you enter a voucher for a CIS subcontractor whose tax certificate is invalid, but who has a valid registration card.

If you select this check box, you receive a hard error message on voucher entry and cannot create the voucher. If you do not select this check box, you receive a warning on voucher entry, but can create the voucher.

Note. Voucher input includes the Voucher Entry (P0411) program, the Speed Voucher Entry (P0411SV) program, and the Voucher Match (P4314) program.

CIS Document has Future Start Date

Select to determine the error that occurs when you enter a voucher for a CIS subcontractor whose registration card or tax certificate has an invalid start date. If you select this check box, you receive a hard error on voucher entry and cannot create the voucher. If you do not select this check box, you receive a warning on voucher entry, but are able to create the voucher.

Note. Voucher input includes the Voucher Entry (P0411) program, the Speed Voucher Entry (P0411SV) program, and the Voucher Match (P4314) program.

Setting Up CIS Company Constants

This section lists prerequisites and discusses how to set up CIS company constants.

Use CIS Company Constants to enter the contractor CIS tax reference number for each company that operates within the scheme.

Prerequisites

Before you complete the tasks in this section:

- Set up the company's mailing address in the Address Book Revisions program (P01012).
- Set up the company in the Companies program (P0010).

Setting Up CIS Payment Voucher Constants

This section provides an overview of CIS payment voucher constants, lists a prerequisite, and discusses how to set up CIS Payment Voucher constants.

Understanding CIS Payment Voucher Constants

Use CIS payment voucher constants to set up these payment vouchers:

- CIS23: Construction Gross Payment Voucher.

The contractor generates this voucher each time that a payment is made to a subcontractor who holds a Construction Tax Certificate (CIS5). The contractor keeps a copy and sends a copy to the Inland Revenue Service.

- CIS24: Subcontractors Gross Payment Voucher.

The contractor receives this voucher from the subcontractor after the contractor has paid a subcontractor who holds a Subcontractors Tax Certificate (CIS6). The contractor adds his or her CIS tax reference, returns a copy to the subcontractor, keeps a copy, and sends a copy to the Inland Revenue Service.

- CIS25: Tax Payment Voucher.

The contractor generates this voucher each time that a payment is made to a subcontractor who holds a registration card. The contractor keeps a copy and sends a copy to both the Inland Revenue and the subcontractor.

You must set up payment voucher constants separately for each company that operates within the scheme.

Prerequisite

Set up the company's mailing address in the Address Book Revisions program (P01012).

Form Used to Set Up CIS Payment Voucher Constants

| Form Name | FormID | Navigation | Usage |
|-------------------------------|-----------|---|--|
| Tax Payment Voucher Revisions | W74U0102B | System Setup (G74U0240), CIS Payment Voucher Constants | Specify tax voucher payment information. |

Setting Up CIS Payment Voucher Constants

Access the Tax Payment Voucher Revisions form.

| | |
|--|---|
| CIS Voucher Type | Enter a value that exists in the CIS Voucher Type (74U/VT) UDC table. Use this value to identify the voucher code for the tax payment that distinguishes the types of payment vouchers that are used in the scheme. |
| Voucher Serial Number | Enter the serial number that is recorded on CIS25 and CIS23 tax payment vouchers. |
| Payment Voucher Seq No (payment voucher sequence number) | Enter the unique, sequential voucher number. This number is included on the Tax Payment Voucher CIS25 report (R74U0135) when the report is run in final mode. |

Setting Up CIS Document Types

This section provides an overview of CIS document types and discusses how to set up CIS document types.

Understanding CIS Document Types

Use CIS Documents to set up the CIS document types that enable subcontractors to carry out construction work within the CIS. Valid document types include:

- CIS4T: Temporary Registration Card.
- CIS4P: Permanent Registration Card.
- CIS5: Construction Tax Certificate.
- CIS: Subcontractors Tax Certificate.

For each document type, you can specify which fields are required, determine the priority for searching and validating documentation for a subcontractor who holds multiple documents, and indicate whether tax is deductible for subcontractors who hold the document type.

This table indicates the fields that are required for each document type:

| Field | CIS4T | CIS4P | CIS5 | CIS6 |
|-----------------------------|-------|-------|-------|-------|
| Company Registration Number | blank | blank | X | blank |
| Insurance Number | blank | X | blank | X |
| Start Date | blank | blank | X | X |
| Expiry Date | X | blank | X | X |
| Acting For | blank | blank | blank | X |
| Trading As | X | X | X | X |
| CIS Voucher Returned | blank | blank | blank | X |

Document Type **Required Fields**

CIS Document Type CIS6

CIS Document Description Subcontract Tax Certificate

CIS Document Classification 1 Highest

☐ Withholdings Deduction (Y/N)

CIS Document Information Revisions form

CIS Document Classification

Enter a value that exists in the CIS Validation Hierarchy (74U/CL) UDC table to give priorities to subcontractors' CIS documents if a subcontractor holds more than one CIS document. Documents with a higher classification code are given priority. For example, if a tax certificate has a classification code of 1 and a registration card has a classification code of 9, the system uses the tax certificate during CIS processing for a subcontractor who holds both documents. The highest possible value is 1 and the lowest possible value is 9.

Warning! Use document classification 9 for Registration Cards (CIS4P and CIS4T). Use document classification 1 for Tax Certificates (CIS5 and CIS6). Using other document classifications produces unpredictable results.

Withholdings Deduction (Y/N)

Select to withhold taxes from any payments that are made to a subcontractor who holds a CIS document of the specified type.

Company Registration Number

Select to require a user to enter a company registration number for the specified CIS document type. For example, you might require a company registration number for CIS5 documents. If you select this check box, the Company Registration Number field is required on the CIS Subcontractor Document Revisions form. If you do not select this check box, the Company Registration Number field is hidden.

Insurance Number

Select to require a user to enter a national insurance number for the specified CIS document type. For example, you might require a national insurance number for CIS4 documents. If you select this check box, the National Insurance Number field is required on the CIS Subcontractor Document Revisions form. If you do not select this check box, the National Insurance Number field is hidden.

| | |
|-----------------------------------|--|
| Start Date | Select to require a user to enter a start date for the specified CIS document type. For example, you might require a start date for CIS5 and CIS6 documents. If you select this check box, the Start Date field is required on the CIS Subcontractor Document Revisions form. If you do not select this check box, the Start Date field is hidden. |
| Expiry Date | Select to require a user to enter an expiry date for the specified CIS document type. For example, you might require an expiration date for CIS5, CIS6, and CIS4 documents. If you select this check box, the Expiry Date field is required on the CIS Subcontractor Document Revisions form. If you do not select this check box, the Expiry Date field is hidden. |
| Acting For | Select to specify that the Acting For field is available for the specified CIS document type. For example, you might display the Acting For field for CIS4 and CIS6 documents. If you select this check box, the Acting For field appears on the CIS Subcontractor Document Revisions form. If you do not select this check box, the Acting For field is hidden. |
| Trading As | Select to require a user to complete the Trading As field for the specified CIS document type. For example, you might require the Trading As field for CIS4, CIS5, and CIS6 documents. If you select this check box, the Trading As field is required on the CIS Subcontractor Document Revisions form. If you do not select this check box, the Trading As field is hidden. |
| CIS Voucher Returned (Y/N) | Select to allow payments to CIS6 subcontractors who have not returned payment vouchers (CIS24) for previous payments. If you select this check box, the system does not allow payments where payment vouchers have not been returned. If you do not select this check box, the system issues a warning, but allows payments where payment vouchers have not been returned. |

Note. The CIS Pre Withholding Validation (R74U0130) program uses this field during its validation.

This check box determines whether the CIS Voucher Returned (Y/N) option is available for the specified CIS document type. For example, you might display this option for CIS6 documents. If you select this check box, the CIS Voucher Returned (Y/N) option appears on the CIS Subcontractor Document Revisions form. If you do not select this check box, the option is hidden.

Setting Up CIS Subcontractor Documents

This section provides an overview of CIS subcontractor documents, lists prerequisites, and discusses how to set up CIS subcontractor documents.

Understanding CIS Subcontractor Documents

Enter CIS subcontractor documents to record the registration cards (CIS4) or tax certificates (CIS5 and CIS6) that are held on behalf of each subcontractor. These cards and certificates authorize subcontractors to work in the construction industry. No payments are allowed to any subcontractors who do not hold one of these cards or certificates.

The system enables you to enter multiple authorized users and the CIS documents that are held by each on behalf of a subcontractor.

Important! Under the CIS, you must see the authorized user's original CIS document before making a payment to a subcontractor. A copy is not acceptable.

Related Tasks

You can access the Work With CIS Subcontract Documents form to add or revise CIS subcontractor documents by selecting Regional Info from the Row or Form menu on any of these forms:

- Work With Addresses
- Address Book Revision
- Supplier Master Information
- Supplier Master Revision

For you to access the Work With CIS Subcontractor Documents form, the selected address book or supplier master record must be for a supplier (search type V) and have the appropriate category code for CIS subcontractors.

Prerequisites

Before you complete the tasks in this section:

- Set up CIS card holders in the JD Edwards EnterpriseOne Address Book system using a search type of S (subcontractors) or V (suppliers) and the category code that you set up in the CIS System Constants program (P74U0100) to identify them as subcontractors.
- Set up the CIS card holders that you set up in the JD Edwards EnterpriseOne Address Book system in the Supplier Master Information program (P04012).

On the Tax Information tab of the Supplier Master Revision form, specify the address book number for Inland Revenue in the Tax Authority field and specify the withholding tax percentage for subcontractors in the Percent field.

- If an authorized user is representing a subcontractor, verify that the subcontractor's trading name exists in the address book record, has a search type of V (supplier), and is identified in the category codes as a subcontractor.
- Set up CIS document types.

- Authorized User/Issued To** Enter the address book number of the authorized user. In the Construction Industry Scheme (CIS), the authorized user is an employee who represents the subcontracting company, usually a senior manager.
- CIS Document Number** Enter the 13-digit CIS subcontractor's registration card or tax certificate number. This number is issued by the Inland Revenue and provides a unique CIS document reference number.
- Company Registration Number** Enter the 8-digit subcontractor's U.K. company registration number.
- Insurance Number** Enter the subcontractor's U.K. National Insurance number. The format is xxxxxxxx, where x represents a letter and y represents a number.

CHAPTER 77

(GBR) Setting Up ACM

This chapter provides an overview of Application and Certificate Management (ACM) status codes and discusses how to:

- Set up ACM constants.
- Set up order activity rules for ACM.

Understanding ACM Status Codes

Subcontractors in the construction industry can submit an application for partial payment to the contractor when the job is partially completed. The subcontractor indicates on the application what portion of the job has been completed. The contractor then sends a site engineer to the work site to certify the amount of work that has been completed.

Use Application and Certificate management (ACM) within the procure-to-pay system to manage applications and certificates.

When you enter a subcontractor's application for payment, the system creates a record in the F74U0141 table and assigns a blank ACM status to the record. As the record progresses through the ACM process, the system updates the ACM status of the record in the F74U0141 table.

This table describes the ACM status flow for application and certificate entry:

| Status Code | Status Description | Event Causing Status Change |
|-------------|-------------------------|---|
| (blank) | Application Entered | Application entered. |
| S | Application Superseded | A new application is entered that replaces an uncertified application. This step is optional. |
| N | Pre-Certificate Printed | Pre-Certificate Document (R74U0150) run. |
| C | Certificate Entered | Certificate information entered. |

This table describes the ACM status flow for non-evaluated receipts:

| Status Code | Status Description | Event Causing Status Change |
|-------------|---------------------------------|--|
| I | Non-Evaluated Certificate Print | ACM Certificate Print (R74U0152) run for non-evaluated receipts. |
| V | Voucher Created | Voucher matched to open receipt. |
| P | Payment | Payment generated. |

This table describes the ACM status flow for evaluated receipts:

| Status Code | Status Description | Event Causing Status Change |
|-------------|-----------------------------|--|
| V | Voucher Created | Evaluated Receipt Settlement (R43800) run. |
| P | Payment | Payment generated. |
| F | Evaluated Certificate Print | ACM Certificate Print (R74U0152) run for evaluated receipts. |

This table describes the ACM reverse status flow:

| Status Code | Status Description | Event Causing Status Change |
|-------------|---------------------|---|
| P | Payment | (blank) |
| V | Voucher Created | Payment voided. |
| C | Certificate Entered | Voucher reversed. |
| R | Reverse Receipt | Receipts reversed using Purchase Receipts Inquiry (P43214), version ZJDE7002. |
| (blank) | Application Entered | Certificate reversed. |

Setting Up ACM Constants

This section provides an overview of ACM constants setup, lists prerequisites, and discusses how to set up ACM constants.

Understanding ACM Constants Setup

You set up ACM constants to activate ACM processing, to set up default statuses for ACM processing, and to set up constants for business unit category codes.

You use business unit category codes to indicate whether purchase orders that are entered for a specific business unit are eligible for partial payment (measured progress), require applications for payment (application required), and are eligible to be certified for more than the application amount (over-certification). For each category (Measured Progress, Application Required, and Over Certification Allowed), you specify the business unit category code that holds the constant for that category at the default value of the constant. For example, if you want to apply Measured Progress to all business units that have a *Y* in category code 16, you would specify category code 16 for Measured Progress and *Y* as the default value.

Prerequisites

Before you set up ACM constants, you must set up UDC 74U/AS to specify ACM status codes. Also, set up Business Unit category codes (00/01-20) to identify the jobs or business units that:

- Are eligible for measured progress.
- Require ACM applications.
- Are eligible for over-certification.

Form Used to Set Up ACM Constants

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|-----------------------|
| Application Certificate Company Constants | W74U0140A | System Setup (G74U0140), ACM Constants | Set up ACM constants. |

Setting Up ACM Constants

Access the Application Certificate Company Constants form.

ACM System

Select the ACM System tab.

| | |
|--|---|
| Application Certificate Active? | Select this option to enable ACM processing. |
| A/P Voucher Generated (accounts payable voucher generated) | Enter a value from the ACM Status (74U/AS) UDC that indicates that an A/P voucher has been generated for a certificate. |
| Reverse Receipt | Enter a value from the ACM Status (74U/AS) UDC that indicates that the receipt has been reversed for a certificate. |
| Certificate Entered | Enter a value from the ACM Status (74U/AS) UDC that indicates that a certificate has been entered for an ACM record. |
| Payment Generated | Enter a value from the ACM Status (74U/AS) UDC that indicates that payment has been generated for a certificate. |

Measured Progress

Select the Measured Progress tab.

| | |
|---|--|
| M/P Category Code (measured progress category code) | Select the option that corresponds to the business unit category code that you use to indicate whether jobs, business units, or purchase orders are eligible for measured progress in ACM processing. When a job or business unit is eligible for measured progress, the subcontractor can apply for partial payment when the job is partially completed. This option is used in conjunction with the Default Measured Progress Code field. |
| Default Measured Progress Code | Enter a value from the Division (00/01) UDC to identify jobs or business units that are eligible for measured progress (partial payment) in ACM processing. The category code value corresponds to the M/P Category Code that you select. For example, if you select M/P Category Code 16 and enter a default value of <i>Y</i> , the system identifies all business units with a value of <i>Y</i> in Category Code 16 as being eligible for measured progress. |

Application Required

Select the Application Required tab.

| | |
|---|---|
| A/R Category Code (accounts receivable category code) | Select the option that corresponds to the business unit category code that you use to indicate whether jobs, business units, or purchase orders that are entered for the business unit require applications for partial payment. When a job or business unit requires an application, the subcontractor must submit an application stating the portion of the job that has been completed in order to be paid. This option is used in conjunction with the Default Application Required Code field. |
| Default Application Required Code | Enter a value from the Division (00/01) UDC to identify jobs or business units that require an application in ACM processing. The category code value corresponds to the A/R Category Code that you select. For example, if you select A/R Category Code 17 and enter a default value of <i>Y</i> , the system identifies all business units with a value of <i>Y</i> in Category Code 17 as requiring applications. |

Over Certification Allowed

Select the Over Certification Allowed tab.

| | |
|---|--|
| O/C Category Code (over certification category code) | Select the option that corresponds to the business unit category code that you use to identify jobs or business units that are eligible for over-certification. Purchase orders entered for business units with a specific value in this category code can be certified for more than the application amount. This option is used in conjunction with the Default Over Certification Code field. |
| Default Over Certification Code | Enter a value from the Division (00/01) UDC to identify jobs or business units that are eligible for over certification in ACM processing. The category code value corresponds to the O/C Category Code that you select. For example, if you select O/C Category Code 18 and enter a default value of <i>Y</i> , the system identifies all business units with a value of <i>Y</i> in Category Code 18 as being eligible for over certification. |

Setting Up Order Activity Rules for ACM

For ACM processing, you must distinguish construction purchase orders from other documents and set up specific order activity rules for those purchase orders. For these actions, you must create a special document type in UDC 00/DT for construction purchase orders. You must also set up the line type for nonstock items with a value of *A* in the Inventory Interface (IVI) field so that the system stores the GL account number for construction industry scheme (CIS) processing.

You set up order activity rules for the special document type and nonstock line type to include the application/certificate status (381). You do not need to include a receipt status because the system generates receipts automatically when you add certificate information.

You should set up order activity rules as shown in this table:

| Order Type | Line Type | Last Status | Description | Next Status | Other 1 | Ledger (Y/N) |
|------------|-----------|-------------|---------------------------|-------------|---------|--------------|
| OC | N | 220 | Enter Purchase Order | 280 | na | N |
| OC | N | 280 | Print Purchase Order | 381 | na | N |
| OC | N | 381 | Application / Certificate | 999 | 381 | N |
| OC | N | 999 | Complete - Ready to Purge | na | na | N |

CHAPTER 78

(GBR) Processing CIS Vouchers

This chapter provides an overview of the construction industry scheme (CIS) and discusses how to:

- Enter CIS vouchers.
- Process CIS vouchers for payment.
- Complete the CIS23 and CIS25 payment vouchers.
- Maintain CIS voucher history.
- Work with the CIS tag table.

Understanding the CIS

The economic environment in Great Britain construction industry is diverse and complex. A business owner or main contractor can employ many subcontractors to complete a contract. To meet statutory requirements, especially in the area of taxation, contractors must maintain careful records of the subcontractors whom they employ and the withholding tax that the contractor is required to pay.

Withholding tax for subcontractors in the construction industry is administered under the Construction Industry Scheme (CIS). Under CIS, subcontractors must be registered with the Inland Revenue Service and hold a valid tax certificate or card.

Subcontractors who hold registration cards are subject to a withholding tax deduction from qualifying payments. The withholding tax is deducted before value-added tax (VAT) is calculated. For these payments, the contractor must produce a tax payment voucher to accompany the tax remittance.

Payments to subcontractors who hold certificates can be made without deduction. Depending on the type of certificate that is held by the subcontractor, the contractor must either produce a construction gross payment voucher or receive a gross payment voucher from the subcontractor.

At the end of each tax month, any withholding tax that was deducted under the rules of the scheme, as well as the payment vouchers (that is, those that were created by the contractor and those that were received from the subcontractor), must be remitted to the Inland Revenue Service. At the end of the tax year, all payments must be reported to the Inland Revenue Service.

Consult the Inland Revenue Service for information about current rules and regulations, including current withholding tax rates.

CIS Rules

The CIS covers payments that are made to these types of subcontractors who work in the construction industry:

- CIS4 Registration Card holders, usually individuals.

- CIS5 Certificate holders, usually large multinational corporations.
- CIS6 Certificate holders, usually teams of subcontractors who work with other subcontractors.

No payments are allowed to subcontractors who do not hold one of these cards or certificates.

Any payments that are made to holders of valid CIS4 Registration Cards are subject to a withholding tax deduction on labor costs and on certain categories of expenses, such as those incurred during the provision of labor. All payments to CIS5 and CIS6 Certificate holders can be made without deduction if the subcontractor's certificate is valid at the time of payment.

The CIS imposes these obligations at the time of payment:

- CIS4 Registration Card holders.

The contractor must send an accompanying CIS25 Tax Payment Voucher to the subcontractor at the time of payment.

- CIS5 Certificate holders.

The contractor must create a CIS23 Construction Gross Payment Voucher, but does not need to send this document to the subcontractor with the payment.

- CIS6 Certificate holders.

The subcontractor must complete a CIS24 Gross Payment Voucher and return that document to the contractor who is making the payment. The contractor might not make any subsequent payments until the CIS24 is received.

At the end of each tax month, the contractor must remit any withholding tax that the contractor has deducted to the Inland Revenue Service along with any CIS23, CIS24, and CIS25 documents that the contractor created or received during the tax month.

At the end of the tax year, the contractor must submit CIS36 End of Year Returns for all payments that are made within the scheme to the Inland Revenue Service.

Entering CIS Vouchers

This section provides an overview of entering CIS vouchers and discusses how to enter vouchers for subcontractors.

Understanding Voucher Entry for the CIS

When you enter CIS subcontractor vouchers through the Standard Voucher Enter (P0411), the Speed Voucher Entry program (P0411SV), or through the Match Voucher - Application Certificate Management (P0411), version ZJDE7002) program, the system creates a record in the F0411 CIS Tag Table (F74U0116) and assigns the CIS Default Status that is defined in CIS Constants to the record. As the record progresses through the CIS payment process, the system updates the CIS status of the record in the F74U0116 table.

The following table describes typical status codes:

| Status Code | Status Description | Event Causing Status Change |
|-------------|--------------------|-----------------------------|
| (blank) | (blank) | Voucher entered. |

| Status Code | Status Description | Event Causing Status Change |
|-------------|---------------------|-----------------------------------|
| C | Validation Complete | CIS Payment Validation run. |
| W | Withholdings | Calculate Withholdings - UK run. |
| Q | Checks/BACS Run | Update Payments. |
| P | CIS25/23 Printed | CIS Payment Vouchers printed. |
| R | CIS24 Received | Gross Payment Voucher received. |
| Z | CIS36 Raised | End-of-Year Return generated. |
| D | F0411 Deleted | Originating F0411 record deleted. |

Note. Running the CIS Pre Withholding Validation (R74U0130) program changes the value in the Pay Status field (data item PST) of records that require withholdings to be applied from H (Held) to % (Withholding Applies), and the pay status of records that do not require withholdings to be applied from H (Held) to A (Approved for Payment).

Note also that because the CIS system does not support alternate currency payments and because CIS reports must display amounts in British pounds (GBP), the system supports only CIS transactions with a domestic currency of GBP.

Entering Vouchers for Subcontractors

When you receive a subcontractor's application for payment, you must create a voucher before you can issue payment. The payment amount and the pay item information that you enter are typically based on the application and certification process.

Contractors are required to withhold certain amounts from a subcontractor's payment, depending on the type of tax regulations that apply to the subcontractor. To determine the total amount of the payment that is eligible for withholding, the contractor must distinguish between the taxable and nontaxable portions of each voucher.

You can enter vouchers for subcontractors using any of these programs:

- Standard Voucher Entry (P0411).
- Speed Voucher Entry (P0411SV).
- Match Voucher - Application Certificate Management (P0411, version ZJDE7002).

If you use the Standard Voucher Entry or the Speed Voucher Entry program, you indicate whether each line is a taxable supply within the scope of the scheme. If you use the Match Voucher - Application Certificate Management program, the system identifies taxable supplies automatically, based on the Object Account category code that is specified in CIS Constants.

The system marks all voucher pay items with a status that is specified in the CIS Constants, usually H (Held). When you run the Construction Industry Payment Validation (R74U0130) program, the system marks pay items that you specified as eligible for withholding tax with a pay status of %. Only vouchers with a pay status of % are processed by Calculate Withholding - Great Britain (R74U04580).

Working with Logged CIS Vouchers

If you do not know to which GL account to distribute a voucher, you can enter a logged (preliminary) voucher. This action is useful to quickly enter a voucher when you receive the supplier's invoice so that you can maintain accurate accounts payable information.

When you enter a logged voucher, the system distributes the total amount of the voucher to a GL suspense account. Later, you review and redistribute the voucher to the correct GL accounts.

To view those vouchers that are assigned to a suspense account, print a report from the Voucher Detail Report program (P04428). These reports show transaction totals from the F0411 table.

When you enter a logged voucher, the system:

- Creates a voucher with a voucher number and document type of PL.
- Distributes the total amount of the voucher to a GL suspense account.

The default value for this suspense account is specified in AAI item PP.

- Records the offset amount, based on the AP trade account (AAI item PC) or the AP trade suspense account (AAI item PQ), depending on which method is designated on in the Company Numbers and Names program.

Information about logged vouchers is maintained in the F0411 and F0911 tables.

You run the CIS Pre Withholding Validation (R74U0130) program for logged vouchers *after* you have distributed the vouchers to the correct GL accounts.

Setting Up Logged CIS Vouchers

Logged vouchers are processed through the CIS system like other vouchers except that they must be redistributed to the correct GL accounts before they are validated for withholding.

Omitting Undistributed Vouchers from Withholding Validation

To ensure that logged vouchers that have not been distributed are not selected by the CIS Pre Withholding Validation (R74U0130) program, you must set the data selection on CIS Pre Withholding to *exclude* vouchers with an A/R - A/P - Cash Rcpts/Inv Reg Code of P.

Setting Up Distributed Vouchers for Withholding Validation

Running the CIS Pre Withholding Validation program (R74U0130) changes the value in the Pay Status field (data item PST) of records that require withholdings to be applied from H (Held) to % (Withholding Applies), and the pay status of records that do not require withholdings to be applied from H (Held) to A (Approved for Payment). Therefore, vouchers must have a pay status of H before they can be processed by the CIS Pre Withholding Validation program. You can ensure that logged vouchers have a pay status of H by setting the following processing options:

- On Voucher Match (P4314), set the Pay Status Code processing option on the Logs tab to *H*.
On the Voucher Match tab of the processing options for Match Voucher to Open Receipt (P0411), specify the version of Voucher Match on which you set the Pay Status Code processing option.
- For the A/P Voucher Journal Entry Redistribution program (P042002), set the pay status processing option (processing option 2 on the Defaults tab) to *H*.

Selecting Receipt Records to Match to a Voucher

Prerequisites

Before you complete the tasks in this section:

- Verify that the Localization Country Code field in the User Profile Revision program is set to *UK* (Great Britain).
- Set up supplier master records for your subcontractors.
You must use a category code to identify subcontractors.
- Activate the Use Suspense Account option in the Company Names and Numbers program (optional).
- Set up AAI item PP and, if you use the trade suspense account, item PQ.
- Assign an approver number to each supplier (optional).
- Run Update Approver/Category Code 7 (optional).

Form Used to Enter Vouchers for Subcontractors

| Form Name | FormID | Navigation | Usage |
|---------------------------|-------------------|---|---|
| Withholdings Confirmation | W0411SVA & W0411G | Supplier & Voucher Entry (G74U0211), Speed Voucher Entry or Standard Voucher Entry. | <p>If you are entering a standard voucher, the system displays the Withholdings Confirmation form for each pay item.</p> <p>If you are entering a speed voucher, the system displays the Withholdings Confirmation form for the entire voucher.</p> |

Entering Vouchers for Subcontractors

Access the Withholdings Confirmation form.

Processing CIS Vouchers for Payment

This section provides an overview of the processing CIS vouchers for payment and discusses how to:

- Run the CIS Pre Withholding Validation program.
- Set processing options for CIS Pre Withholding Validation (R74U0130).
- Run the CIS Calculate Withholding program.
- Set data selection for CIS Calculate Withholding.
- Set processing options for CIS Calculate Withholding (R74U04580).

Understanding Payment of CIS Vouchers

To process withholding amounts for subcontractors, you must first determine whether withholding tax applies to your subcontractor's vouchers, and then create the journal entries for the amount that is to be withheld from the total payment to the subcontractor.

The system determines whether withholding tax is applicable, based on the country-specific rules that are associated with a subcontractor's tax certificate. After vouchers are evaluated for withholding tax eligibility, the system calculates the actual withholding tax amounts for each voucher.

The purpose of CIS is to calculate any withholding tax liability at the point of payment, not at the point of voucher entry. Therefore, you must run the CIS Pre Withholding Validation program (R74U0130) and the CIS Calculate Withholding program (R74U04580) as part of the prepayment cycle.

When you have processed the withholding amounts for your subcontractor, you can run the create payment groups process to process payments as usual.

Running the CIS Pre Withholding Validation

Before you make any payments to CIS subcontractors, you must run the CIS Pre Withholding Validation program (R74U0130) to evaluate each voucher. The program selects and validates any open AP vouchers that are due for payment, based on the pay-through date that is specified in the processing options and that have a CIS status of blank in the F74U0116 table. The program then determines whether a valid card or certificate exists for the subcontractor as of the current date.

The program produces a report of all processed vouchers, sequenced by subcontractor, that includes:

- Warning messages that are associated with the validation of a subcontractor's card or certificate.
- Information about tax that is being withheld.

You can use the processing options for the CIS Pre Withholding Validation program to:

- Process transactions in proof or final mode.
- Enter a pay-through date that the system uses to select vouchers that are due for payment.
- Specify whether to make payments to or withhold tax from a subcontractor whose card or certificate meets any of several invalidation conditions.

Running the CIS Pre Withholding Validation program in proof mode produces a report only. Running the program in final mode produces a report and updates the pay status for individual pay items in the F0411 table:

- Pay items that can be paid and that should have no tax withheld are assigned a pay status of A.
- Pay items that can be paid and that should have tax withheld are assigned a pay status of %.

Running the CIS Pre Withholding Validation program in final mode also updates the CIS status of vouchers in the F74U0116 table to C (Validation Complete).

Calculating Withholding

You must withhold applicable tax amounts when you make a payment to a subcontractor.

You must withhold applicable tax amounts from payments to subcontractors and remit that amount to the Inland Revenue Service. After you validate vouchers for withholding tax eligibility, you use the CIS Calculate Withholding program (R74U04580) to calculate applicable withholding tax amounts. This program:

- Selects any open AP vouchers that have a pay status of %.

- Calculates the amount of tax to withhold, based on the withholding tax percentage from the subcontractor's record in the F0401 table.
- Calculates withholdings on a net basis (before VAT) or on the gross amount, based on the processing options.
- Updates the pay status of the original voucher pay item in the F0411 table from % to the value that you specify in the processing options.
- Creates a negative pay item for the withholding amount with the same payee, pay status, and due date as the original voucher pay item.
- Creates a positive pay item for the withholding amount with the tax authority that is associated with the subcontractor in the F0401 table as the alternate payee, with the same due date as the original voucher pay item.

The net effect of the two pay items is zero, but the subcontractor's payment is reduced by the negative pay item.

The CIS Calculate Withholding program produces a report that lists the new pay items and the pay status of each item. If applicable, the program also produces an error report that lists the vouchers that were not released for payment, and the error that is associated with each voucher or pay item.

Note. The abbreviation "PS" on the Calculate Withholding Status Report stands for pay status.

Options for Paying Withholding Tax to the Revenue Authorities

You can pay withholding tax that you have deducted from subcontractors' payments using either of the following methods:

- Accounts Payable
- General Accounting

Processing withholding tax payments through the JD Edwards EnterpriseOne Accounts Payable system normally means that you pay your withholding tax as a separate payment to the Inland Revenue Service. The withholding tax payment is not included with your monthly PAYE (Pay As You Earn) payment.

To process withholding tax payments through the JD Edwards EnterpriseOne Accounts Payable system:

1. Accumulate withholdings (tax deductions) for your subcontractors under the tax authority payee (Inland Revenue Service) with a pay status of H (hold).
2. Release your pay items using the Speed Release program (P0411S) when you are ready to make a payment run.
3. Run the Create Payment Control Groups (R04570) program with the Payee processing option on the Process By tab set to *I* to create payment groups by payee.
4. Write and update a payment using a UK cheque (P04572U1 or P04572U2), a BACS payment (P04572B), or another payment print program to create your payment to the Inland Revenue Service.
5. Send this payment to the Inland Revenue Service.

Processing withholding tax payments through the JD Edwards EnterpriseOne General Accounting system enables you to include your withholding tax in your monthly PAYE payment to the Inland Revenue Service. This method is a common practice in Great Britain.

To process withholding tax payments through the JD Edwards EnterpriseOne General Accounting system:

1. Accumulate withholdings (tax deductions) for your subcontractors under the tax authority payee (Inland Revenue Service) with a pay status of H (hold) and an alternate bank account, such as a withholding tax account.

2. Release your pay items using the Speed Release program (P0411S) and change your bank account to a withholding tax account when you are ready to make a payment run, if you have not already done so.
3. Run the Create Payment Control Groups program (R04570) and select your withholding tax account as the bank account and the Inland Revenue Service as a special payee.
4. Use the Work With Payment Groups program (P04571) to write and update the withholdings payment, but do not print or send the AP payment.
5. Process your normal Inland Revenue Service payment through the general ledger by creating a journal entry to debit your tax withholdings account and your PAYE account and crediting your normal bank account with the sum of all payments to the Inland Revenue Service.
6. Create a physical payment to the Inland Revenue Service outside of the system, such as by writing a cheque manually.
7. Send this payment to the Inland Revenue Service.

Prerequisites

Before you complete the tasks in this section:

- Identify the tax withholding rate and the tax authority for each subcontractor.

See *JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide*, “Entering Supplier Information,” Entering Supplier Master Information.

- Set up a GL account for withholding tax, if required.
- Set up a nonblank GL offset in AAI item PCyyyy for withheld credits.

Running CIS Pre Withholding Validation

Select Automatic Payment Processing (G74U0213), CIS Pre Withholding Validation.

Setting Processing Options for CIS Pre Withholding Validation (R74U0130)

Processing options enable you to specify the default processing for programs and reports.

Date

- | | |
|----------------------------|---|
| 1. Pay Through Date | Enter the date that the payment is due to receive a discount or, if no discount is offered, the net due date. |
|----------------------------|---|

Process

- | | |
|----------------|---|
| 1. Mode | Enter <i>1</i> to run the program in final mode. Leave this processing option blank to run the program in proof mode. |
|----------------|---|

Defaults

- | | |
|----------------------------|--|
| 1. No CIS Documents | Enter <i>1</i> to enable payments with deductions. Enter <i>2</i> to enable payments without deductions. Leave this processing option blank if there is no payment made. |
|----------------------------|--|

- | | |
|--|--|
| 2. CIS Document Invalid | Enter <i>1</i> to enable payments with deductions. Enter <i>2</i> to enable payments without deductions. Leave this processing option blank if there is no payment made. |
| 3. Invalid Tax Certificate but Valid Registration Card | Enter <i>1</i> to enable payments without deductions. Leave this processing option blank to enable payments with deductions. |
| 4. CIS Document Has Future Start Date | Enter <i>1</i> to enable payments with deductions. Enter <i>2</i> to enable payments without deductions. Leave this processing option blank if there is no payment made. |
| 5. Future Certificate Start Date, Valid Registration Card | Enter <i>1</i> to enable payments without deductions. Leave this processing option blank to enable payments with deductions. |
| 6. CIS Voucher Status | Enter a value that exists in the CIS Voucher Status (74U/VS) UDC table to specify the current status of the record in CIS processing. |

Running CIS Calculate Withholding

Select Automatic Payment Processing (G74U0213), CIS Calculate Withholding.

Setting Data Selection for CIS Calculate Withholding

You can modify the data sequence of your version of the CIS Calculate Withholding program so that the output more closely matches your reporting needs. For example, you might want to list document numbers before document types.

Setting Processing Options for CIS Calculate Withholding (R74U04580)

Processing options enable you to specify the default processing for programs and reports.

Pay Status

| | |
|------------------------|--|
| Pay Status Code | Enter the pay status to assign to the voucher to be released for payment. If you leave this processing option blank, the system assigns the default value from the data dictionary. If the data dictionary default value is blank, the system assigns <i>A</i> . |
|------------------------|--|

| | |
|------------------------|---|
| Pay Status Code | Enter the pay status to assign to the withheld pay item. If you leave this processing option blank, the system assigns <i>H</i> . |
|------------------------|---|

G/L Offset

| | |
|-------------------|--|
| G/L Offset | Enter the GL offset account for AAI PC that the system assigns to the withheld pay item. This offset account should represent the withholding account. You must complete this processing option. |
|-------------------|--|

| | |
|-------------------|---|
| Account ID | Enter the GL account for the zero balance records, if any are created. This must be the short account number and is required. |
|-------------------|---|

Tax Authority

Tax Authority for A/P Withholding

Enter an override tax authority to be assigned to the Alternate Payee field in the withholding entry. Leave this processing option blank to retrieve the tax authority from the supplier's address book record.

Process

G/L Bank Account Override

Enter an override GL bank account.

Net Or Gross Amount

Enter *1* to process records based on the net amount. Leave this processing option blank to process records based on the gross amount.

CIS Voucher Status

Enter a code that exists in the CIS Voucher Status (74U/VS) UDC table.

Completing the CIS23 and CIS25 Payment Vouchers

This section provides an overview of completing the CIS23 and CIS25 payment vouchers and discusses how to:

- Run the Gross Payment Voucher CIS23 report.
- Set processing options for Gross Payment Voucher CIS23 (R74U0136).
- Run the Tax Payment Voucher CIS25 report.
- Set processing options for Tax Payment Voucher CIS25 (R74U0135).

Understanding Completion of the CIS23 and CIS25 Payment Vouchers

The following reports provide the information that is necessary to complete your construction gross payment vouchers and your tax payment vouchers, both of which you must submit to the Inland Revenue Service on a monthly basis:

- The Gross Payment Voucher CIS23 report (R74U0136).
- The Tax Payment Voucher CIS25 report (R74U0135).

Gross Payment Voucher CIS23 Report

Print the Gross Payment Voucher CIS23 report (R74U0136) to list gross payment details that relate to subcontractors who hold construction tax certificates (CIS5). This listing provides the information that is necessary to complete your construction gross payment vouchers.

The listing covers the tax month from the 6th of one month to the 5th of the next month. You should complete your construction gross payment vouchers from the report, send copies of the payment vouchers to the Inland Revenue Service, and keep a copy.

The processing options for the Gross Payment Voucher CIS23 report control the selection date, the gross payment voucher type, company number, and the processing mode (proof or final). Running the report in proof mode produces the report only. Running the report in final mode produces the report and updates the CIS status of selected vouchers.

Tax Payment Voucher CIS25 Report

Print the Tax Payment Voucher CIS25 report (R74U0135) to list tax payment details that relate to subcontractors who hold registration cards (CIS4). This listing provides the information that is necessary to complete your tax payment vouchers.

The listing covers the tax month from the 6th day of one month to the 5th day of the next month. You should complete your tax payment vouchers from the report, send copies of the payment vouchers to the Inland Revenue Service and to the subcontractors, and keep a copy.

The processing options for the Tax Payment Voucher CIS25 report control the selection date, the gross payment voucher type, company number, and the processing mode (proof or final). Running the report in proof mode produces the report only. Running the report in final mode produces the report and updates the CIS status of selected vouchers.

When you run the report in final mode, the voucher sequence number from the CIS Tax Payment Voucher Constants (P74U0102) is included on the report.

Running the Gross Payment Voucher CIS23 Report

Select Accounts Payable Reports (G74U0214), Gross Payment Voucher CIS23.

Setting Processing Options for Gross Payment Voucher CIS23 (R74U0136) and Tax Payment Voucher CIS25 (R74U0135)

Processing options enable you to specify the default processing for programs and reports.

Date

Month Enter the month for which you process records.

Century/Year Enter the four-digit year for which you process records.

Process

Mode Enter *I* to process records in final mode. Leave this processing option blank to process records in proof mode.

CIS Voucher Type Enter a code from the CIS Voucher Type (74U/VT) UDC table to identify the type of payment vouchers that the system processes.

Company Enter the company that the system uses to select records to process.

CIS Voucher Status Enter a value that exists in the CIS Voucher Status (74U/VS) UDC table to specify the voucher status that the system uses to select records to process.

Running the Tax Payment Voucher CIS25 Report

Select Accounts Payable Reports (G74U0214), Tax Payment Voucher CIS25.

Maintaining CIS Voucher History

This section provides an overview of maintaining voucher history and discusses how to:

- Review CIS voucher history.
- Review payments to subcontractors.
- Enter CIS voucher details.

Understanding CIS Voucher History Maintenance

You can view the CIS purchase voucher history, including all of the status changes that each purchase voucher has passed through in the CIS system. You can also review payments that are made to subcontractors.

When you receive a CIS24 gross payment voucher from a subcontractor, you enter information from the CIS24 voucher. You should not make additional payments to a CIS6 certificate holder until you have received a CIS24 voucher for the previous payment.

Reviewing CIS Voucher History

Use the CIS History Revision program (P74U0118) to view the CIS purchase voucher history that is held in the Payment Voucher Status History table (F74U0118). This table contains an audit record of all of the status changes that each purchase voucher has passed through in the CIS system.

Reviewing Payments to Subcontractors

You use the CIS Tax Payment Vouchers program (P74U0119) to review payments made to subcontractors.

You can view all payments, only those payments that require the return of a CIS24 voucher, or only those payments that do not require a CIS24 voucher.

Entering CIS24 Voucher Details

CIS6 certificate holders are required to complete and return a CIS24 gross payment voucher upon receipt of payment. A contractor should not make additional payments to a CIS6 certificate holder until a CIS24 voucher for the previous payment has been received.

When you receive a CIS24 gross payment voucher from a subcontractor, you use the CIS Tax Payment Voucher program (P74U0119) to enter information from the CIS24 voucher.

Important! The CIS system does not handle partial payments to subcontractors. If any subcontractor vouchers have been partially paid, they should be voided and reentered with the payment amount. Similarly, if any partial payments are recorded, they should be voided and reapplied to a voucher that corresponds to the total payment amount.

Forms Used to Maintain CIS Voucher History

| Form Name | FormID | Navigation | Usage |
|--|-----------|--|---|
| Work with CIS Voucher Status History | W74U0118A | Advanced & Technical Operations (G74U0230), CIS History Revision | Review CIS voucher history. |
| Work With Tax Payment Voucher | W74U0119C | Automatic Payment Processing (G74U0213), CIS Tax Payment Vouchers | Review payments to subcontractors. |
| Payment Review | W74U0119A | On the Work With Tax Payment Voucher form, select a record and click Select. | Review the vouchers that were paid by a specific payment, select the payment, and click Select. |
| Tax Payment Voucher Returned Revisions | W74U0119B | On the Work With Tax Payment Voucher form, click the Voucher Returns option, select the payment to which the CIS24 voucher applies, and then select Voucher Returns from the Row menu. | Enter details for the CIS voucher. |

Setting Processing Options for CIS Tax Payment Vouchers (P74U0119)

Processing options enable you to specify the default processing for programs and reports.

Default

- 1. Payment Cover Date** Enter *1* to set a soft error. Leave this processing option blank to set a hard error.
- 2. CIS Voucher Status** Enter a value that exists in the CIS Voucher Status (74U/VS) UDC table to specify the current status of the record in CIS processing.

Reviewing CIS Voucher History

Access the Work with CIS Voucher Status History form.

- | | |
|--------------------------------|---|
| Pay Itm (pay item) | Displays the pay item for a voucher or an invoice. If the voucher or invoice has multiple pay items, the numbers are sequential. |
| Pay Ext (pay extension) | Displays a code that designates an adjusting entry to a pay item on a voucher or invoice. This field is required so that each record is unique. |
| Begin Date | Enter the first day in a range of dates that the system uses to select records to process. |
| Pay Stat (pay status) | Enter a value that exists in the Pay Status (00/PS) UDC table that indicates the current payment status for a voucher or an invoice. |
| CIS Voucher Status | Enter a value that exists in the CIS Voucher Status (74U/VS) UDC table to identify the current status of the record in CIS processing. |
| Ending Date | Enter the last day in a range of dates. |

Reviewing Payments to Subcontractors

Access the Work With Tax Payment Voucher form.

| | |
|---------------------------|---|
| All | Select to display all vouchers. |
| Voucher Returns | Select to display vouchers that require that a CIS24 voucher is returned. |
| No Voucher Returns | Select to display vouchers that do not require a CIS24 voucher. |
| Payee Number | Enter the address book number of the recipient of the payment. |
| Payment ID | Enter a payment ID. |
| G/L Bank Account | Enter the GL bank account number. |

Entering CIS Voucher Details

Access the Tax Payment Voucher Returned Revisions form.

| | |
|----------------------------------|--|
| Voucher Serial Number | Enter the serial number that is recorded on CIS25 and CIS23 tax payment vouchers. |
| National Insurance Number | Enter the U.K. National Insurance number for the subcontractor. The format is <i>xyyyyyyyx</i> , where <i>x</i> represents a letter and <i>y</i> represents a number. |
| Gross Payment | Enter the total amount of the invoice or voucher pay item. The gross amount might include the tax amount, depending on the tax explanation code. The system does not decrease the gross amount when payments are applied. When you void a transaction, the system clears the gross amount field. |
| Reference Number | Enter the first 10 characters of the CIS document number. |
| Payment Cover | Enter the date of the returned CIS24 tax payment voucher. This date must be greater than or equal to the date of the payment that was made to the subcontractor. |

Working with the CIS Tag Table

This section provides an overview of the CIS tag table and discusses how to:

- Add CIS document information to the F74U0116 tag.
- Correct the CIS tag table.
- Update the CIS status for one voucher.
- Update the CIS status for multiple vouchers.

Understanding the CIS Tag Table

The F74U0116 table contains detailed information about CIS subcontractor vouchers, including information from the subcontractor's registration card or certificate, and whether a pay item should have tax deducted and the CIS voucher status. You should not revise the F74U0116 table for any reason other than correction.

Adding CIS Document Information to the CIS Tag Table

The F74U0116 table includes detailed information about CIS subcontractor vouchers, including information from the subcontractor's registration card or certificate. You can enter information from the subcontractor's registration card or certificate directly into the F74U0116 table if that information was not available when you entered the voucher.

Important! Only authorized personnel should have access to change the F74U0116 table. Changes to the F74U0116 table might produce unpredictable results.

Correcting the CIS Tag Table

The F74U0116 table includes detailed information about CIS subcontractor vouchers, including whether a pay item should have tax deducted and the CIS voucher status. The F74U0116 table is populated automatically during various stages of CIS processing. However, you can have cause to correct the F74U0116 table.

The system enables you to record the return of a CIS24 gross payment voucher and change the taxable status of pay items. You should not revise the F74U0116 table for any reason other than correction.

Important! Only authorized personnel should have access to change the F74U0116 table. Changes to the F74U0116 table might produce unpredictable results.

Updating the CIS Status for Multiple Vouchers

You can use the CIS Tag File History Change program (R74U0134) to globally update records in the F74U0116 table with a new CIS voucher status code. Valid CIS status codes are stored in UDC 74U/VS.

You should use this program to correct errors or discrepancies in CIS vouchers.

This program produces a report that provides detailed information about all selected vouchers. You can run this process in proof to generate the report only, or in final mode to generate the report and update the tag file.

Forms Used to Work with the CIS Tag Table

| Form Name | FormID | Navigation | Usage |
|--------------------------------------|-----------|--|--|
| F0411 Tag File Revisions | W74U0115A | Advanced & Technical Operations (G74U0230), CIS Tag File Revision. On the Work With F0411 Tag File Data form, select a record and select Tag File Update from the Row menu. | Add CIS document information |
| F0411 Tag File Detail Revisions | W74U0115C | Advanced & Technical Operations (G74U0230), CIS Tag File Revision. On the Work With F0411 Tag File Data form, select a record and click Select. | Enter corrections for the CIS tag table. |
| CIS Voucher Status History Revisions | W74U0118A | Advanced & Technical Operations (G74U0230), CIS Tag File Revision. On the Work With F0411 Tag File Data form, select a record and select Status Change from the Row menu. | Update the CIS status for one voucher. |

Adding CIS Document Information to the CIS Tag Table

Access the F0411 Tag File Revisions form.

| | |
|------------------------------------|--|
| Trading As | Enter the name of the subcontracting company. |
| Authorized User/Issued To | Enter the employee who represents the subcontracting company, usually a senior manager. |
| CIS Document Number | Enter the 13-digit CIS subcontractor's registration card or tax certificate number. This number is issued by the Inland Revenue Service and provides a unique CIS document reference number. |
| CIS Document Type | Enter the type of CIS document that is held by a subcontractor. CIS documents enable subcontractors to carry out construction work within the Construction Industry Scheme. |
| National Insurance Number | Enter the U.K. National Insurance number for the subcontractor. The format is <i>xyyyyyyyx</i> , where <i>x</i> represents a letter and <i>y</i> represents a number. |
| Company Registration Number | Enter the 8-digit subcontractor's U.K. Company Registration number. |
| Acting For | Enter the name of the employee who acts for the subcontracting company, such as an accountant who receives payment on behalf of the company. |

Correcting the CIS Tag Table

Access the F0411 Tag File Detail Revisions form.

| | |
|--|--|
| T/P Voucher Returned (tax payment voucher returned) | Enter the code that indicates whether a CIS24 tax payment voucher has been returned for the payment. Values are: <i>0</i> : The CIS24 voucher has not been returned. <i>1</i> : The CIS24 voucher has been returned. |
| Taxable Status | Enter the code that indicates whether the line item is subject to withholding tax. Values are: <i>0</i> : The line is not subject to withholding tax. <i>1</i> : The line is subject to withholding tax. |

Updating the CIS Status for One Voucher

Access the CIS Voucher Status History Revisions form.

| | |
|---------------------------|--|
| CIS Voucher Status | Enter a value that exists in the CIS Voucher Status (74U/VS) UDC table to identify the current status of the record in CIS processing. |
|---------------------------|--|

Running the CIS Tag File History Change Report

Select Advanced & Technical Operations (G74U0230), CIS Tag File History Change.

Setting Processing Options for F0411 - CIS Tag File Status History Change (R74U0134)

Processing options enable you to specify the default processing for programs and reports.

CIS Status

| | |
|------------------------------|--|
| 1. CIS Voucher Status | Enter a value that exists in the CIS Voucher Status (74U/VS) UDC table to identify the current status of the record in CIS processing. |
|------------------------------|--|

Process

| | |
|-------------|---|
| Mode | Enter <i>1</i> to run the program in final mode. Leave this processing option blank to run the program in proof mode. |
|-------------|---|

CHAPTER 79

(GBR) Using ACM

This chapter provides an overview of Application and Certificate Management (ACM) and discusses how to:

- Enter an application for payment.
- Print pre-certificates.
- Enter certification information.
- Work with non-evaluated certificates.
- Work with evaluated certificates.
- Print evaluated certificates.
- Correct uncertified applications.
- Supersede uncertified applications.
- Reverse certificates.

Understanding Application and Certificate Management

Subcontractors in the construction industry can submit an application for partial payment to the contractor when the job is partially completed. The subcontractor indicates on the application what portion of the job has been completed. The contractor then sends a site engineer to the work site to certify the amount of work that has been completed.

You can use Application and Certificate Management (ACM) within the JD Edwards EnterpriseOne Procurement system to manage applications and certificates. To work with ACM, complete these steps:

1. Enter a purchase order for the subcontracted work.
2. When you receive an application from the subcontractor, enter the amount of the application against the purchase order.
3. Print a precertificate that the site engineer uses to indicate the amount that is to be certified.
4. After the inspection, enter the certificate information against the purchase order.
5. Print a certificate for the subcontractor to notify him or her of the amount that was certified.

You can create either an evaluated certificate or a non-evaluated certificate. For evaluated certificates, the system automatically generates a payment voucher. For nonevaluated certificates, the subcontractor must submit an invoice.

6. For non-evaluated certificates, enter a voucher after you receive the invoice.
7. Pay the voucher.

Entering an Application for Payment

This section provides an overview of applications for payment, lists a prerequisite, and discusses how to enter applications.

Understanding Applications for Payment

When a subcontractor has completed a portion of a contracted job, the subcontractor can submit an application for partial payment. On the application, the subcontractor indicates the amount of work completed as a flat monetary amount, a percentage, or as a number of units. You can enter either the cumulative quantity or amount that has been completed for the purchase order, or the quantity or amount that has been completed during the period.

When you enter an application, you create a subcontractor document with a blank ACM status. Subcontractor documents are stored in the F74U0141 table and are associated with purchase orders.

Prerequisite

Enter and print a purchase order for the contracted job.

Forms Used to Enter an Application for Payment

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|---|
| Work with Application/Certificate Information | W74U0141A | Daily Processing (G74U0110), Enter Application/Certificate | Work with applications for payment and certificate information. |
| Add Application Information | W74U0141B | Select a purchase order and line item on the Work with Application/Certificate Information form, and then select Add Applications from the Row menu. | Add application information. |

Entering Applications for Payment

Access the Work with Application/Certificate Information form.

Enter Application / Certificate - Work with Application / Certificate Information

Select Find Close Row Tools

|-----------|----------|---------|-------------|-----------|-----------|------------|------------|---------|-----------------|---------------------|---------------|

Work With Application/Certificate Information

Printing Pre-certificates for ACM

This section provides an overview of pre-certificates and discusses how to print a pre-certificate.

Understanding Pre-certificates

You print a pre-certificate after you have received and entered a subcontractor's application. The pre-certificate shows details about the application and the purchase order. The site engineer uses the pre-certificate as a turnaround document to record the actual amount that is certified for the application.

Printing a pre-certificate advances the subcontractor document from the incoming status to the outgoing status that you specify in the processing options. The default incoming status is blank (Application Entered), and the default outgoing status is *N* (Pre Certificate Print).

Printing a Pre-certificate

Select Daily Processing (G74U0110), Pre Certificate Print.

Entering Certification Information

This section provides an overview of certification information and discusses how to enter information about certification.

Understanding Certification Information

After the site engineer has visited the work site and verified the amount of work that has been done, you enter the amount that the site engineer has certified. This amount is used to generate a receipt and can be cross-referenced when you create a voucher to pay the subcontractor.

When you enter certification information, the system automatically creates a receipt for the work that is completed.

Entering certificate information advances the subcontractor document to Certificate Entered status that you set up in the ACM - Work With Application Certificate Constants program (P74U140). The default status is C (Certificate Entered).

Form Used to Enter Certification Information

| Form Name | FormID | Navigation | Usage |
|-----------------------------|-----------|--|------------------------------|
| Add Certificate Information | W74U0142C | Daily Processing (G74U0110), Enter Application/Certificate Select a subcontractor document and line item on the Work with Application/Certificate Information form, and then select Add Certificates from the Row menu. | Add certificate information. |

Entering Certification Information

Access the Add Certificate Information form.

G/L Date

Specify a date that identifies the financial period to which the transaction is to be posted.

The company constants specify the date range for each financial period. You can have as many as 14 periods. Generally, period 14 is used for audit adjustments. The system validates this field for PBCO (posted before cutoff), PYEB (prior year ending balance), PACO (post after cutoff), and WACO (post way after cutoff) messages.

Certificate/Receipt Date

Specify the date when you received this purchase order line.

Receipt Document

Specify a number that identifies the original document, such as a voucher, invoice, or journal entry. On entry forms, you can assign the document number or let the system assign it using the Next Numbers program (P0002). Matching document numbers (DOCM) identify related documents in the JD Edwards EnterpriseOne Accounts Receivable and JD Edwards EnterpriseOne Accounts Payable systems. Examples of original and matching documents are:

- Accounts Payable
- Original document - voucher
- Matching document - payment
- Accounts Receivable
- Original document - invoice
- Matching document - receipt

In the JD Edwards EnterpriseOne Accounts Receivable system, the following transactions simultaneously generate original and matching documents: deductions, unapplied receipts, chargebacks, and drafts.

| | |
|--|---|
| Certificate Cumulative Qty (certificate cumulative quantity) | Specify the number of units that the site engineer has certified as complete for a specific line item on a purchase order. If the site engineer has certified more than one application, this number is the total number of units that the site engineer has certified for the line item. |
| Certificate Cum Amount (certificate cumulative amount) | Specify the amount of payment (in base currency) that the site engineer has certified for a specific line item on a purchase order. If the site engineer has certified more than one application, this amount is the total amount of all the certifications for the line item. |

Working with Non-Evaluated Certificates

This section provides an overview of non-evaluated certificates and discusses how to print non-evaluated certificates.

Understanding Non-Evaluated Certificates

You print non-evaluated certificates for subcontractors who want to verify the certificate and submit an invoice before being paid. The system creates an open receipt for the amount of the certificate when you print a non-evaluated certificate. When you receive an invoice for the certified work, you enter a voucher and match it to the open receipt.

You print certificates after the site engineer has inspected the work site and you have entered the certificate information. You give the certificate document to the subcontractor as a record of the certified value that is due for payment.

You print nonevaluated certificates for subcontractors who want to verify the certificate and submit an invoice before being paid. The system creates an open receipt for the amount of the certificate when you print a non-evaluated certificate. When you receive an invoice for the certified work, you enter a voucher and match it to the open receipt.

Printing a non-evaluated certificate advances the subcontractor document from the incoming status to the outgoing status that you specify in the processing options. The default incoming status is *C* (Certificate Entered), and the default outgoing status is *I* (Non-Evaluated Certificate Print).

Important! Do not use the Speed Status Change program (P0411S) for ACM processing.

Printing Non-Evaluated Certificates

Select Daily Processing (G74U0110), Certificate Print.

Working with Evaluated Certificates

This section provides an overview of evaluated certificates, lists a prerequisite, and discusses how to settle evaluated receipts.

Understanding Evaluated Certificates

Evaluated certificates are typically used for small subcontractors who are not able to produce their own invoices. You print evaluated certificates, also known as authenticated receipts, after you have processed the payment for the subcontractor. You give the certificate to the subcontractor as a record of the value of the certificate that is due to the subcontractor.

You print certificates after the site engineer has inspected the work site and you have entered the certificate information. Evaluated certificates are typically used for small subcontractors who are not able to produce their own invoices.

To create an evaluated certificate for a subcontractor, you must first settle the receipt that the system created when you entered certificate information. Settling the receipt generates a corresponding voucher in the F0411 table. You then generate a payment for the subcontractor and print an evaluated certificate to accompany the payment.

Important! Do not use the Speed Release program for ACM processing.

Settling evaluated receipts advances the subcontractor document from the Certificate Entered status to the A/P Voucher Generated status. You set up both statuses in the ACM - Work With Application Certificate Constants program (P74U0140).

Prerequisite

Use the Evaluated Receipt (AVCH) field in the Supplier Master to set up subcontractors to receive evaluated receipts.

Settling Evaluated Receipts

Select Receipts Matching and Posting (G43A15), Evaluated Receipt Settlement.

Printing Evaluated Certificates

This section provides an overview of evaluated certificate printing, lists a prerequisite, and discusses how to print an evaluated certificate.

Understanding Evaluated Certificate Printing

You print evaluated certificates, also known as authenticated receipts, after you have processed the payment for the subcontractor. You give the certificate to the subcontractor as a record of the value of the certificate that is due to the subcontractor.

Printing an evaluated certificate advances the subcontractor document from the incoming status to the outgoing status that you specify in the processing options. The default incoming status is *P* (Certificate Entered), and the default outgoing status is *F* (Evaluated Certificate Print).

Prerequisite

Process payments for the subcontractor.

Printing an Evaluated Certificate

Select Daily Processing (G74U0110), Certificate Print.

Correcting Uncertified Applications

This section provides an overview of uncertified application correction and discusses how to correct an uncertified application.

Understanding Uncertified Application Correction

If an application has not yet been certified, you can correct an application amount that was entered in error, or enter an updated application that the subcontractor has submitted. If you need to change an application that has been certified, if you need to change the certificate; or if you decide not to honor the certificate for some reason, you must reverse both the receipt and the certificate.

If you make a mistake when you enter an application amount, you can update the application amount if the application has not yet been certified.

Forms Used to Correct Uncertified Applications

| Form Name | FormID | Navigation | Usage |
|---|-----------|---|---|
| Work with Application/Certificate Information | W74U0141A | Daily Processing (G74U0110), Enter Application/Certificate | Work with applications for payment and certificate information. |
| Maintain Application Information | W74U0141D | Select a purchase order and line item on the Work with Application/Certificate Information form, and then select Maintain Applications from the Row menu. | Maintain application information. |

Correcting an Uncertified Application

Access the Work with Application/Certificate Information form.

Superseding Uncertified Applications

This section provides an overview of superseded applications and discusses how to supersede an uncertified application.

Understanding Superseded Uncertified Applications

If a subcontractor submits an updated application before the existing application is certified, you can add the updated application to the subcontractor document. The system maintains a record of the original application and assigns it an ACM status of *S* (Application Superseded). The new application replaces the superseded application.

Forms Used to Supersede Uncertified Applications

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|---|
| Work With Application/Certificate Information | W74U0141A | Daily Processing (G74U0110), Enter Application/Certificate | Work with applications for payment and certificate information. |
| Add Application Information | W74U0141B | Select a subcontractor document and line item on the Work With Application/Certificate Information form, and then select Add Applications from the Row menu. | Maintain application information. |

Superseding an Uncertified Application

Access the Work with Application/Certificate Information form.

Reversing Certificates

This section provides an overview of certificate reversal, lists prerequisites, and discusses how to reverse a certificate.

Understanding Certificate Reversal

When you enter certificate information, the system automatically creates a receipt for the work that has been completed. If you discover an error in the application or certificate, or if you decide not to honor the certificate for some reason, you must reverse both the receipt and the certificate. You can then perform any of these tasks:

- Delete the application.
- Correct the application.
- Delete the certificate.
- Correct the certificate.
- Close the purchase order.

Note. To change a certificate, you must reverse all certificates, receipts, and vouchers that are subsequent to the certificate that you are changing.

You must use version ZJDE7002 of the Purchase Receipts Inquiry program (P43214) to reverse receipts for subcontractor documents. You can access this version by following the steps shown. Do not access Purchase Receipts Inquiry from a menu.

Prerequisites

Here are the prerequisites for reversing a certificate:

- If you have created a voucher to pay the certified amount, delete or void the voucher.
- Set up the user preferences with a country preference code of *UK*.

Forms Used to Reverse Certificates

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|---|
| Work With Application/Certificate Information | W74U0141A | Daily Processing (G74U0110), Enter Application/Certificate | Work with applications for payment and certificate information. |
| Work With Purchase Receipts | W7470214A | Select a subcontractor document and line item on the Work with Application/Certificate Information form, and then select Open Receipts from the Row menu. | Work with purchase receipts. |
| Maintain Certificate Information | W74U0141D | Select a subcontractor document and line item on the Work With Application/Certificate Information form, and then select Cert/Rcpt Reversal from the Row menu. | Maintain certificate information. Note that if you leave the Rec Opt field blank for any line, the system deletes the certificate values for that line. |

Reversing a Certificate

Access the Work with Application / Certificate Information form.

PART 17

Ireland

Chapter 80

(IRL) Understanding Country-Specific Functionality for Ireland

Chapter 81

(IRL) Setting Up Functionality for Ireland

CHAPTER 80

(IRL) Understanding Country-Specific Functionality for Ireland

This chapter discusses Ireland-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Ireland-Specific Setup and Processes

This table lists the country-specific setup and functionality for Ireland:

| Setup or Process | Description |
|--|--|
| Automatic debit processing | To work with automatic debit processing, set up the automatic debit format for Ireland. See Chapter 81, “(IRL) Setting Up Functionality for Ireland,” Setting Up Automatic Debit Formats for Ireland, page 1435 . |
| Payment processing | To work with payment processing for Ireland, set up the payment formats for Ireland. See Chapter 81, “(IRL) Setting Up Functionality for Ireland,” (IRL) Setting Up Payment Formats for Ireland, page 1436 . |
| UDCs (user-defined codes) | No country-specific UDCs exist for Ireland. |
| Next numbers | No Ireland-specific next number setup exists. |
| AAIs (automatic accounting instructions) | No Ireland-specific AAI setup exists. |

CHAPTER 81

(IRL) Setting Up Functionality for Ireland

This chapter discusses how to:

- Set up automatic debit formats for Ireland.
- Set up payment formats for Ireland.

Setting Up Automatic Debit Formats for Ireland

This section provides an overview of automatic debit formats for Ireland and discusses how to set processing options for Ireland Domestic Bank Format (R03B575IE).

Understanding Automatic Debit Formats for Ireland

The JD Edwards EnterpriseOne system provides Ireland Domestic Debit Bank Format (R03B575IE) for Irish automatic debits. This program generates a bank table that adheres to the banking standards for automatic debits in Ireland.

(IRL) Setting Processing Options for Ireland Domestic Debit Bank Format (R03B575IE)

Processing options enable you to specify the default processing for programs and reports.

- | | |
|--|---|
| 1. Print Customer Statement | Specify whether the system prints a customer statement for the automatic debits. If you leave this processing option blank, the system prints a customer statement only when the number of invoice details exceeds the maximum number that can be included on the format. |
| 2. Tape Density | Specify the density of the tape. |
| 3. Enter the Authorized ID Number | Enter the payer identification number. The system prints the value that you enter in the Volume Header Label record. If you leave this processing option blank, the system prints the BACS number for the company account from the Bank Transit Master table (F0030). |
| 4. Enter the Volume Identifier | Enter the volume identifier. |
| 5. File Number | Specify an identifying number for the submission. |
| 6. Processing Date | Specify the date on which you create the flat file. You must enter the date in this format: <i>YYDDD</i> , where <i>YY</i> is equal to the last two digits of the year, and <i>DDD</i> is the Julian date. For example, for June 30, 2005, enter 05181. |

The system prints the date that you specify in the User Header Label record. If you leave this processing option blank, the system prints the BACS processing date that exists in the A/P Payment Processing - Summary table (F04572).

(IRL) Setting Up Payment Formats for Ireland

This section provides an overview of payment formats for Ireland and discusses how to:

- Set processing options for Electronic Funds Transfer - Bank of Ireland (R04572IE1).
- Set processing options for Electronic Funds Transfer - AIB (R04572IE).

Understanding Payment Formats for Ireland

JD Edwards EnterpriseOne software provides these payment formats for Ireland:

| Format | Description |
|-----------|---|
| R04572IE1 | The BOI EFT payment format (Bank of Ireland Electronic Funds Transfer). |
| R04572IE | The AIB EFT payment format (Allied Irish Bank Electronic Funds Transfer). |

The formats for Ireland create flat files in these tables:

- A/P Payment Tape table (F04572OW).
- Text Processor Header (F007101).
- Text Processor Detail Table (F007111).

Format for Allied Irish Bank

The text file includes:

| Section | Description |
|---------------------|---|
| Volume Header Label | One record of 80 characters that identifies the file and the owner. |
| File Header Label | One record of 80 characters that contains the creation and expiration dates. |
| User Header Label | One record of 80 characters that contains the payment date, identifying number of the receiving party, and the currency code. |
| User Trailer Label | 80 characters that contain the debit value, credit value, number of debits, and number of credits. |

| Section | Description |
|----------------|---|
| Credit records | <p>One of record of 100 character for each payment order. The record contains this information:</p> <ul style="list-style-type: none"> • Supplier's bank transit number, account number, and description. • Company's bank transit number and account number. • Payment amount. • Bank system reference number for the company's account. • BACS reference/roll number for the customer account. |
| Contra records | <p>One record of 100 characters for each of the company's accounts. The record contains this information:</p> <ul style="list-style-type: none"> • Company's bank transit number and account number. • Transaction code. • Sorting code number. • Sum of the payment amounts in the data records. • Bank system reference number for the company's account. |

Format for Bank of Ireland

The text file includes:

| Section | Contents |
|---------------------|--|
| Volume Header Label | One record of 80 characters that identifies the file and the owner. |
| File Header Label | One record of 80 characters that contains the creation date and record length. |
| User Header Label | One record of 80 characters that contains the payment processing date, the submission number, and the currency code. |
| Data records | <p>One record of 100 characters for each payment order. The record contains this information:</p> <ul style="list-style-type: none"> • Suppliers's bank transit number, account number, and description. • Company's bank transit number and account number. • Payment amount. • Bank system reference number for the company's account. • BACS reference/roll number for the customer account. |

| Section | Contents |
|--------------------|--|
| Contra records | <p>One record of 100 characters for each of the company's accounts. The record contains this information:</p> <ul style="list-style-type: none"> • Company's bank transit number and account number. • Transaction code. • Sorting code number. • Sum of the payment amounts in the data records. • Bank system reference number for the company's account. |
| User Trailer Label | 80 characters that contain the sum of the payment and debit amounts in the data records, and a count of the data records. |

Setting Processing Options for Electronic Funds Transfer - Bank of Ireland (R04572IE1)

Processing options enable you to specify the default processing for programs and reports.

General

- 1. Payment Processing Date** Enter a date in this processing option or leave it blank to use the BACS processing date from the payment group.

 Use this processing option to specify the date on which you create the flat file. You must enter the date in this format: *YYDDD*, where *YY* is equal to the last two digits of the year, and *DDD* is the Julian date. For example, for June 30, 2005, enter *05181*.

 The system prints the date that you specify in the User Header Label record. If you leave this processing option blank, the system prints the BACS processing date that exists in the A/P Payment Processing - Summary table (F04572).
- 2. Payer Identification** Enter the payer identification number. The system prints the value that you enter in the Volume Header Label record. If you leave this processing option blank, the system prints the BACS number for the company account from the Bank Transit Master table (F0030).

Transfer

- 1. Submission Number** Specify an identifying number for the submission. You use this number to distinguish among multiple files created on the same date. Enter a value between 1 and 968.

Tape

- 1. Device Name** Specify the device to which you copy the text file.

Setting Processing Options for Electronic Funds Transfer - AIB (R04572IE)

Processing options enable you to specify the default processing for programs and reports.

General

- 1. Payment Processing Date** Specify the date on which you create the flat file. If you leave this processing option blank, the system uses the BACS processing date from the payment group.

You must enter the date in this format: *YYDDD*, where *YY* is equal to the last two digits of the year, and *DDD* is the Julian date. For example, for June 30, 2005, enter *05181*.

The system prints the date that you specify in the User Header Label record.
- 2. Payer Identification** Enter the payer identification number. The system prints the value that you enter in the Volume Header Label record. If you leave this processing option blank, the system prints the BACS number for the company account from the Bank Transit Master table (F0030).
- 3. Payment Expiration Date** Enter the date on which the payment expires. You must enter the date in this format: *YYMMDD*. This processing option is optional.

Transfer

- 1. File Number** Specify an identifying number for the submission. You use this number to distinguish among multiple files created on the same date. Enter a value between 1 and 968.

Tape

- 1. Device Name** Specify the device to which you copy the text file.

Italy

Chapter 82

(ITA) Understanding Country-Specific Functionality for Italy

Chapter 83

(ITA) Setting Up Functionality for Italy

Chapter 84

(ITA) Working With Functionality for Italy

CHAPTER 82

(ITA) Understanding Country-Specific Functionality for Italy

This chapter provides an overview of Italy-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Italy-Specific Setup and Processes

This table lists the country-specific setup and functionality for Italy.

| Setup or Process | Description |
|--|---|
| UDCs (user-defined codes) | <p>Setting up Italy-specific UDCs enables you to use Italy-specific functionality. You also set up some base software UDCs with Italy-specific values.</p> <p>Set up UDCs for:</p> <ul style="list-style-type: none"> • Tax processing. See Chapter 83, “(ITA) Setting Up Functionality for Italy.” Setting Up UDCs for Tax Processing for Italy, page 1456. • Supplier withholding taxes. See Chapter 83, “(ITA) Setting Up Functionality for Italy.” Setting Up UDCs for Withholding Taxes for Italy, page 1457. • European Union reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality.” Setting Up UDCs for Intrastat Reporting, page 1221. • IPI to print invoices with an attached International Payment Instruction (IPI). See Chapter 65, “(Europe) Setting Up European Union Functionality.” Setting Up UDCs for International Payment Instructions, page 1220. • Companies: <ul style="list-style-type: none"> - Affiliated Companies (74/AC) - Code Number (74/30) See Chapter 65, “(Europe) Setting Up European Union Functionality.” Setting Up UDCs for European Companies, page 1230. |
| AAIs (automatic accounting instructions) | <p>In addition to the basic AAI setup, set up AAIs to work with the annual close process in Italy and to work with supplier withholding taxes.</p> <p>See Chapter 83, “(ITA) Setting Up Functionality for Italy.” Setting Up AAIs for Italy, page 1458.</p> |
| Next numbers | <p>No country-specific next numbering schemes are required for Italy.</p> |

| Setup or Process | Description |
|------------------|--|
| Bank accounts | <p>When setting up bank accounts for Italy:</p> <ul style="list-style-type: none"> Review the overview about bank account validation. See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding Bank ID and Bank Account Validation, page 1238. See Chapter 84, “(ITA) Working With Functionality for Italy,” Understanding Bank Account and Bank ID Validation, page 1473. Review the overview about using international bank account numbers (IBAN). See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding International Bank Account Numbers, page 1237. Upload Italian bank ID information. Revise Italian ID information manually. Convert Italian bank numbers. Set processing options for Italian Bank Number Conversion (R74800). <p>See Chapter 84, “(ITA) Working With Functionality for Italy,” Setting Up Bank Information in Italy, page 1479.</p> |

| Setup or Process | Description |
|----------------------|--|
| Supplier withholding | <p>To set up to process supplier withholding:</p> <ul style="list-style-type: none"> Set up UDC values. See Chapter 83, “(ITA) Setting Up Functionality for Italy,” Setting Up UDCs for Withholding Taxes for Italy, page 1457. Set up the data dictionary to track the status of the tax. See Chapter 83, “(ITA) Setting Up Functionality for Italy,” Setting Up the Data Dictionary for Withholding in Italy, page 1459. Enter withholding tax information for suppliers including the fiscal group code, withholding tax code, individual tax ID code, and the country. See Chapter 83, “(ITA) Setting Up Functionality for Italy,” Setting Up Supplier Withholding Tax Information for Italy, page 1465. Set up withholding tax codes to define withholding tax rates. See Chapter 83, “(ITA) Setting Up Functionality for Italy,” Setting Up Withholding Tax Codes, page 1467. <p>To work with supplier withholding:</p> <ul style="list-style-type: none"> Review the overview of Italian withholding tax and tax calculations. See Chapter 83, “(ITA) Setting Up Functionality for Italy,” Understanding Italian Withholding Tax, page 1453. See Chapter 84, “(ITA) Working With Functionality for Italy,” Understanding the Process for Calculating Italian Withholding Taxes, page 1471. Review and revise withholding taxes if necessary. See Chapter 84, “(ITA) Working With Functionality for Italy,” Revising Withholding Taxes in Italy, page 1482. |

| Setup or Process | Description |
|--------------------|---|
| Payment processing | <p>Before processing payments in Italy, set up the payment formats.</p> <p>See Chapter 83, “(ITA) Setting Up Functionality for Italy,” Setting Up Payment Formats for Italy, page 1461.</p> <p>To work with payment processing in Italy:</p> <ul style="list-style-type: none"> Review the overview of prepayment processing for VAT. <p>See Chapter 84, “(ITA) Working With Functionality for Italy,” Understanding Prepayments for Notula in Italy, page 1470.</p> <ul style="list-style-type: none"> Review the overview of manual payments. <p>See Chapter 84, “(ITA) Working With Functionality for Italy,” Understanding Manual Payments for Italy, page 1472.</p> |
| Invoice processing | <p>To work with invoice processing in Italy:</p> <ul style="list-style-type: none"> Set up invoice due dates. <p>See Chapter 83, “(ITA) Setting Up Functionality for Italy,” Setting Up the 30/60/90 End-of-Month Invoice Date for Italy, page 1459.</p> <ul style="list-style-type: none"> Enter invoices for free goods to enable accounting for VAT. <p>See Chapter 84, “(ITA) Working With Functionality for Italy,” Understanding Invoices for Free Goods, page 1472.</p> <p>In addition to standard invoice processing, you can print invoices with an attached International Payment Instructions (IPI). To print these invoices and attachments:</p> <ul style="list-style-type: none"> Set up UDCs for IPIs. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.</p> <ul style="list-style-type: none"> Set processing options for the invoice print program. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Invoice Print with International Payment Instruction (R03B5053), page 1247.</p> <ul style="list-style-type: none"> Print invoices with attached IPIs. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing Invoices with an Attached International Payment Instruction, page 1245.</p> |

| Setup or Process | Description |
|--------------------------------------|--|
| Accounts receivable draft processing | <p>Before working with accounts receivable drafts in Italy, set up draft remittance formats.</p> <p>See Chapter 83, “(ITA) Setting Up Functionality for Italy,” Setting Up Draft Remittance Formats for Italy, page 1463.</p> |
| Monthly and annual close | <p>Before you perform the standard processes to close accounts for a month, in Italy, verify the account balances.</p> <p>See Chapter 84, “(ITA) Working With Functionality for Italy,” Verifying Account Balances in Italy, page 1474.</p> <p>In addition to the base software processes for the annual close, in Italy:</p> <ul style="list-style-type: none"> • Set up AAI. <p>See Chapter 83, “(ITA) Setting Up Functionality for Italy,” Setting Up AAIs for Italy, page 1458.</p> <ul style="list-style-type: none"> • Complete the tasks necessary to prepare the year-end balance sheet. <p>See Chapter 84, “(ITA) Working With Functionality for Italy,” Closing a Fiscal Year in Italy, page 1476.</p> |
| Bank statements | <p>Use the Italian Statement Print program (R03B5002) to print statements for Italy.</p> <p>See <i>JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide</i>, “Processing Statements,” Generating Statements.</p> |

| Setup or Process | Description |
|------------------|--|
| Tax processing | <p>Before you work with VAT for Italy:</p> <ul style="list-style-type: none"> • Set up UDCs. See Chapter 83, “(ITA) Setting Up Functionality for Italy,” Setting Up UDCs for Tax Processing for Italy, page 1456. • Set up register types and classes for summary VAT. See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Setting Up Tax Information,” (ITA) Setting Up Register Types and Classes for Summary VAT. • Set up an initial VAT balance. See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Setting Up Tax Information,” (ITA) Establishing an Initial VAT Balance. <p>To work with VAT in Italy:</p> <ul style="list-style-type: none"> • Use the Petrol Card Expense reports for Italy to account for petrol purchases. See Chapter 84, “(ITA) Working With Functionality for Italy,” Understanding Accounting for Petrol Card Expense Reports for Italy, page 1469. • Work with the VAT ceiling, calculate taxes and generate reports. See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “(ITA) Processing VAT for Italy”. • See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (ITA) Reports for Italy, page 1859. |
| Fixed assets | <p>In addition to the base processes for fixed assets, in Italy:</p> <ul style="list-style-type: none"> • Use the Italy-specific depreciation method. See <i>JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide</i>, “Understanding International Depreciation Methods”. • Generate the Fixed Assets Legal Report. See Chapter 84, “(ITA) Working With Functionality for Italy,” Preparing the Fixed Assets Legal Report in Italy, page 1477. |

| Setup or Process | Description |
|---------------------|---|
| Intrastat reporting | <p>To set up and use Intrastat reporting:</p> <ul style="list-style-type: none"> Review the overview about European Union reporting. See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding European Union Reporting, page 1241. Set up UDCs. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221. Set up commodity codes. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up Commodity Code Information, page 1230. Set up cross-references between suppliers and items to show the country of origin. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Entering Cross-References for Items and Suppliers, page 1231. Set the processing options for the Intrastat workfiles programs. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Sales (R0018I1), page 1254. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Procurement (R0018I2), page 1256. Populate the workfiles. See Chapter 66, “(Europe) Working With European Union Functionality,” Populating the Intrastat Workfile, page 1250. Revise the workfiles as necessary. See Chapter 66, “(Europe) Working With European Union Functionality,” Revising Intrastat Information, page 1258. |

| Setup or Process | Description |
|---------------------------------|--|
| Intrastat reporting (continued) | <p>To print and purge Intrastat records:</p> <ul style="list-style-type: none">• Use the IDEP/IRIS Interface program (R0018I3) to generate an electronic Intrastat declaration in the format required for Italy. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Using the IDEP/IRIS Interface for Intrastat Reporting, page 1264.</p> • Purge records from the Intrastat table (F0018T). <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Purging Records from the Intrastat Table (F0018T), page 1263.</p> |

| Setup or Process | Description |
|--------------------------------|--|
| Other European Union reporting | <p>In addition to Intrastat reporting, you can generate these reports:</p> <ul style="list-style-type: none"> • EC Sales List Reports <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sales List Report (R0018L), page 1273.</p> <ul style="list-style-type: none"> • EC Sales A/R Report <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sale List - AR Report (R0018S), page 1276.</p> |
| Integrity reports | <p>Reports for Italy enable you to:</p> <ul style="list-style-type: none"> • Print a list of the general ledger transactions for each month in chronological and sequential order using the G/L Registration Report (R09404). • Verify the accuracy of transactions in individual account ledgers using the Debit/Credit T/B by Object program (R09473). • Validate information in legal reports and can be used as the basis for internal auditing using the G/L by Category Code program (R70470). • Verify the accuracy of transactions in individual account ledgers using the T/B by Category Code program (R70472). • Validate information in legal reports and can be used as the basis for internal auditing using the G/L by Object and Subsidiary program (R7409C1). • Verify the accuracy of transactions in individual account ledgers using the T/B by Object and Subsidiary program (R7409C3). • Generate a report of VAT by tax area code using the VAT Report by Tax Area program (R00400). • Print monthly reports to document accounts payable and accounts receivable VAT using the Monthly VAT Report (R004051). • Print a list of the suspended VAT invoices that still need to be paid using the Invoice List Control Report (R74079). • Review the total amount of VAT that is due to the Italian government using the Print VAT Summary Report (R74093). <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (ITA) Reports for Italy, page 1859.</p> |

CHAPTER 83

(ITA) Setting Up Functionality for Italy

This chapter provides an overview of Italian withholding taxes and discusses how to set up:

- User-defined codes (UDCs).
- Automatic accounting instructions (AAIs).
- Data dictionary for withholding.
- 30/60/90 end-of-month invoice date.
- Payment formats.
- Draft remittance formats.
- Supplier withhold tax information.
- Withholding tax codes.

Understanding Italian Withholding Tax

In Italy, businesses must withhold taxes from payments to certain types of suppliers, such as self-employed and contract suppliers. These withholding taxes are remitted directly to the government. Each year, businesses must submit the Model 770 (*Modello 770*) form to the tax authorities. The *Modello 770* form contains information about the suppliers from whom withholding tax has been collected.

In some cases, businesses can defer the recognition of accounts payable value-added tax (VAT) receivable (input) on vouchers for suppliers who are subject to withholding tax until the voucher is paid. The document used to defer the VAT is called *notula*.

Businesses must also give a certification of all of the amounts that are paid for their services, including detail of the tax withheld, to all their suppliers who are subject to withholding tax.

To track withholding tax records through the withholding tax process, refer to the Withholding Tax Status field. The system automatically updates this field for each tax record, based on the status of the record in the withholding tax process.

| Status | Description | Update Programs |
|--------|------------------------------------|--|
| 0 | Withholding tax amounts generated | A/P Standard Voucher Entry (P0411) A/P Speed Voucher Entry (P0411SV) Voucher Match (P4314) Store and Forward Voucher Batch Processor (R04110Z2) |
| 1 | Voucher paid to supplier | A/P Manual Payments (P0413M) Automatic Payments (P0457xx) |
| 2 | Withholding tax redistributed | Distribute W/T Amount Report (R7404530) |
| 3 | Withholding tax paid to government | Withholding Tax Payments (R7404500) |
| 4 | Certification printed | Withholding Tax Certification - Italy (R7404027) |
| 5 | 770 form printed | 770 Model - Italy (R74094) |
| 9 | Record deleted | |

1. Voucher Entry

This table describes the first step in the withholding process for Italy:

| Type | Document Number | Date | Amount | Taxable | W/H Tax | W/H Code | VAT |
|------|-----------------|----------|--------|---------|---------|----------|-----|
| PV | 1230 | 30/06/05 | 119 | 100 | 10 | AB | 19 |

Status Code: 0

AP Trade Amount: 119-

Expense Amount: 100

VAT Amount: 19-

2. Voucher Payment

This table describes the second step in the withholding process for Italy:

| Type | Document Number | Date | Amount | Taxable | W/H Tax | W/H Code | VAT |
|------|-----------------|----------|--------|---------|---------|----------|-----|
| PV | 1230 | 30/06/05 | 119 | 100 | 10 | AB | 19 |

Payment Date: 01/10/05

Status Code: 1

AP Trade Amount: 119

Expense Amount: 109-

VAT Amount: 10-

3. Payment to Fiscal Authorities

This table describes the third step in the withholding process for Italy:

| Type | Document Number | Date | Amount | Taxable | W/H Tax | W/H Code | VAT |
|------|-----------------|----------|--------|---------|---------|----------|-----|
| PV | 1230 | 30/06/05 | 119 | 100 | 10 | AB | 19 |

Withholding Paid Date: 15/10/05

Payment Number: 1031

Status Code: 2

Cash Amount: 10-

Withholding Payable Amount: 10

4. Fiscal Reports

The system generates these reports for withholding:

- Annual Declaration of Withholding Tax Information by Supplier.
- File Generated to Interface to Official 770 Form.

INPS Withholding Tax

In addition to the standard withholding tax, payment to certain types of contractors is subject to a social security (*Istituto Nazionale Previdenza Sociale* [INPS]) withholding tax. The INPS withholding tax is paid to the Italian social security office.

The company must withhold two-thirds of the withholding tax amount that is due to the contractor and pay this amount by the 20th day of every month. The supplier is liable for the remaining one third of the ten percent.

The base amount for the calculation of INPS withholdings can be 95 percent or 100 percent, depending on the type of contractor.

The company is liable for the debt to INPS from the time of payment to the contractor.

Notula

Notula is the document that is used by a company to defer VAT recognition until payment of a voucher is made. *Notula* is used for suppliers who are subject to withholding tax. You should use the prepayment process in the base software to process *notula*.

Setting Up UDCs for Italy

Setting up Italian-specific UDCs enables you to use Italian-specific functionality. You also set up some base software UDCs with Italian-specific values.

Setting Up UDCs for Tax Processing for Italy

Before you set up the system to process taxes for Italy, set up these UDCs.

VAT Codes for Year-End Proc. (00/IV)

Set up VAT codes to associate a tax rate to a transaction. For example, you might set up codes for:

- VAT rate 0 percent
- Excluded
- Nonrecoverable 50 percent
- Nonrecoverable 100 percent
- VAT 4 percent
- VAT 20 percent

VAT Register Class (74/01)

Set up register class codes to track and report VAT in a summarized format. For example, you might set up codes for these register classes:

- Purchases
- Correspondent
- No deduction
- Sales

VAT Register Type (74/02)

Set up register type codes to track and report VAT in a summarized format. For example, you might set up codes for these register types:

- Purchases (Tax Italy)
- Purchases (Tax CEE)
- Purchases (Tax extra CEE)
- Tax not deductible
- Sales (Tax Italy)
- Sales (Tax CEE)
- Sales (Tax extra CEE)
- Suspended VAT

Suspended VAT Document Types (74/DT)

Use UDC (74/DT) to set up a cross-reference between the document type for suspended VAT and the document type for suspended VAT-recognized. For example, to cross-reference document type Q9 (suspended VAT) with document type Q7 (suspended VAT - recognized), enter Q9 in the Code field and Q7 in the Description 01 field.

The system uses the document type that you enter in the Code field (Q9 in this example) when you generate suspended VAT amounts. When you receive payment for the invoice for which VAT was suspended and run the Suspended IVA - Receipts/Rebate Control Reports program (R74076C), the system uses the document type that you enter in the Description 01 field (Q7 in this example) to record the VAT that is recognized when full or partial payment is received for the original suspended VAT (Q9) document.

You must also set up the codes for both the suspended VAT and the suspended VAT-recognized document types on user-defined codes (00/DT) and (00/DI).

Suspended VAT Rates (74/SP)

Set up codes to identify the tax rate at which the system calculates suspended VAT amounts and to cross-reference the tax rate for suspended VAT with the VAT payable tax rate. For example, to cross-reference the tax rate SOSP20 (for suspended VAT) with the tax rate IVA20 (for VAT payable), enter SOSP20 in the Code field and IVA20 in the Description 01 field.

The system uses the GL Offset for the tax rate that you enter in the Code field (SOSP20 in this example) to post suspended VAT amounts to a suspense account. When you receive payment for the invoice for which VAT was suspended and run the Suspended IVA - Receipts/Rebate Control Reports program (R74076C), the system uses the offset for the tax rate that you enter in the Description 01 field (IVA20 in this example) to reclassify the recognized portion of the suspended VAT to a VAT payable account.

Setting Up UDCs for Withholding Taxes for Italy

Before you process withholding taxes for Italy, set up these UDCs.

Section of 770 Form (74/RA)

Set up codes to identify the information to use when you create your Model 770 form sections. For example, you might set up codes for this information:

- INPS withholding
- Self-employment revenues
- Sales commissions

Form 770 Information (74/70)

Set up codes to identify information for the 770 form. This code indicates whether the supplier is a resident of Italy and whether the supplier's revenue is partially, totally, or not subject to INPS withholding tax.

Set up these codes:

- 0: Resident
- 0A: Resident whose income is all subject to INPS.
- 0B: Resident whose income is partially subject to INPS.
- 0C: Resident whose income is not subject to INPS.
- 1: Nonresident whose income is all subject to INPS.
- 1A: Nonresident whose income is partially subject to INPS.

- 1: Nonresident whose income is not subject to INPS.
- 1C: Nonresident.

Country Codes for 770 Form (74/CN)

Set up the numeric country codes that have been defined by the fiscal authority for use on the 770 form. The Codes field must contain the same country codes as UDC 00/CN. The Description 01 field must contain the corresponding numeric code as defined by the fiscal authority. The system uses UDC 74/CN with UDC 00/CN to convert country codes to the proper numeric format for the 770 form.

Withholding Tax Government (74/IM)

Set up codes to further define withholding tax information for your suppliers. You specify the government withholding tax information for each code in the Special Handling Code field. The codes that you specify are for internal use to link the government information to withholding tax types (UDC 74/WT).

Valid values for the Special Handling Code field include:

- 1: Self-employed
- 2: Sales commissions

Withholding Tax Fiscal Code (74/WF)

Set up codes to identify the withholding taxes that you process for your suppliers. For example, you might set up withholding tax fiscal codes as follows:

- 103: Fiscal Code 1038
- 1040: Fiscal Code 1040

Specify a special handling code to indicate the conditions of the withholding tax. Values for the Special Handling Code field are:

- A: Code applies to persons in receipt of sums that are subject to withholding tax as advanced payment.
- B: Code applies to persons in receipt of sums that are subject to withholding tax by way of tax advance.

Withholding Type (74/WT)

In Italy, suppliers can be eligible for different types of withholding tax. For reporting and processing purposes, set up codes to identify the types of withholding tax that apply to your suppliers.

Set up these codes:

- E: Sales commissions withholding (ENASARCO)
- I: Social security withholding (INPS)
- R: Standard withholding tax

Withholding type codes are linked to an internal withholding tax code, which you set up in the Withholding Tax Codes - Italy program (P740405).

Setting Up AAls for Italy

This section discusses how to set up AAls to work with:

- The annual close process in Italy.
- Supplier withholding taxes.

Setting Up AAIs for the Annual Close Process

In addition to the standard AAI items, these AAI items must be set up in preparation for the annual close in Italy:

| AAI Item | Description |
|----------|--|
| GLG2 | Beginning asset account. |
| GLG3 | Beginning liability account. |
| GLG5 | Ending balance sheet account. This account is a non-posting account. |

See *JD Edwards EnterpriseOne General Accounting 8.12 Implementation Guide*, “Closing the Fiscal Year,” Understanding Setup Requirements and Common Tasks.

Setting Up AAIs for Withholding

To identify the Withholding Tax account in your chart of accounts, set up the PKD (Discounts Available) and PKL (Discounts Lost) AAIs with the same object account.

Setting Up the Data Dictionary for Withholding in Italy

When you process withholding tax, the system uses the data item IRSA (Withholding Tax Status) to track the status of the tax.

These values are hard-coded for the data item IRSA:

- 0: Voucher entered with withholding tax information.
- 1: Payment for voucher entered (debt to fiscal authority).
- 2: Withholding tax paid to fiscal authority.
- 9: Withholding tax canceled.

In addition, you can set up another user-defined value to indicate that a Withholding Tax Certification report has been generated for the tax.

Setting Up the 30/60/90 End-of-Month Invoice Date for Italy

In this example, a payment is split into three installments. The first installment is due 30 days after the end of the month of the invoice date. The second installment is due after 60 days, and the third installment is due after 90 days. No matter what the day of the month when the invoice was created, the due dates are always calculated from the end of that month.

| Field | Information |
|--------------------|-------------------------------------|
| Invoice Amount | 9.000,00 euros |
| Invoice Date | 15 July |
| Based on Date | End of month invoice date (31 July) |
| First Installment | 3.000,00 due 30 August |
| Second Installment | 3.000,00 due 29 September |
| Third Installment | 3.000,00 due 29 October |

To pay the invoice in this example, you must set up an installment payment term that is based on three equal payments. To determine the due dates of the payments, you must first set up the date range to calculate the end of the month of the invoice date. You then set up the first installment to be due 30 days after the calculated end of the month, the second installment to be due 30 days after the first installment, and the third installment to be due 30 days after that installment.

You set up due date rules for the 30/60/90 end-of-month invoice date as shown in the examples:

End of Month Rule Part 1

End of Month Rule Part 1 calculates the invoice date.

From the Due Date Rules Revision form:

| Field | Information |
|---------------|--------------------------|
| Due Date Rule | EOM1 |
| Description | End of Month Rule Part 1 |
| Based on Date | 1 (Invoice Date) |

Date Range for End of Month Rule Part 1

The system calculates the end of the month for the invoice date from the date range.

From the Date Range Revision form:

| Field | Information |
|-------------|-------------|
| From Day | 1 |
| To Day | 31 |
| Days to Add | 30 |

End of Month Rule Part 2

End of Month Rule Part 2 calculates a due date 30 days after the previous due date.

| Field | Information |
|---------------|--------------------------|
| Due Date Rule | EOM2 |
| Description | End of Month Rule Part 2 |
| Based on Date | 1 (Invoice Date) |
| Days to Add | 30 |

Example: Advanced Payment Terms

This example shows how to set up the end-of-month payment term:

| Field | Information |
|--------------|---------------------------|
| Payment Term | EOM |
| Description | End of Month Payment Term |

Example: Installments

This example shows how to set up the installment payments for the end-of-month payment term:

| Field | Information |
|------------------------|-------------|
| Sequence Number | 1.000 |
| Percent of Installment | 33.333 |
| Net Due Date Rule | EOM1 |
| Sequence Number | 2.000 |
| Percent of Installment | 33.333 |
| Net Due Date Rule | EOM2 |
| Sequence Number | 3.000 |
| Percent of Installment | 33.334 |
| Net Due Date Rule | EOM2 |

Setting Up Payment Formats for Italy

This section provides an overview of payment formats for Italy and discusses how to set up processing options for:

- Create A/P Bank Tape - Italy (R04572I1).

- Print Automatic Payment - Check - Italy (R04572I2).

Understanding Payment Formats for Italy

JD Edwards EnterpriseOne software provides these payment formats for Italy:

| Format | Description |
|----------|--|
| R04572I1 | Electronic funds transfer format (diskette). The EFT format for Italy accepts a maximum of five payment details because five is the maximum number of details that is enabled in a record 60 in the flat file. The P04572I1 format writes a detail record in each record 60 in the flat file. You must manually control the number of payments that you include in the payment control group. |
| R04572I2 | Check format. |
| R04576I | Payment register for EFT payments and checks. |

Setting Processing Options for Create A/P Bank Tape - Italy (R04572I1)

Processing options enable you to specify the default processing for programs and reports.

Date

Due Date or Value Date Enter 1 to print the value date. Leave this processing option blank to print the due date.

Tape

Devise Name Enter the tape name.

Tape Density Enter the tape density.

Label Name Enter the label name.

Block Size Enter the block size.

New Volume Name Enter the new volume name.

Tape (more)

New Owner ID Enter the new owner ID.

File Name Enter the file name.

Currency

Currency Enter the currency code that is used in your system to identify the euro.

Setting Processing Options for Print Automatic Payments - Check - Italy (R04572I2)

Processing options enable you to specify the default processing for programs and reports.

Translation

Translation Program Specify which translation program to use to translate the payment amount into words. The value that you enter must exist in the Check Translation (98/CT) UDC table. If you leave this processing option blank, the system uses the translation program associated with the payment currency.

Address

Address Format (FUTURE) This processing option is not used.

Print

Form Type (FUTURE) This processing option is not used.

Setting Up Draft Remittance Formats for Italy

This section provides an overview of draft remittance for Italy and discusses how to:

- Set processing options for A/R Magnetic RIBA Draft Remittance Tape Format (R03B672IT).
- Set processing options for A/R Magnetic RID Draft Remittance Tape Format (R03B672IR).

Understanding Italian Draft Remittance Formats

The JD Edwards EnterpriseOne system provides several country-specific formats for electronic accounts receivable drafts remittance. You specify the country-specific format that you want to use on the Paper/Tape tab of the processing options for the Draft Remittance program (R03B672).

Specify one of these formats for electronic accounts receivable drafts remittance for Italy:

| | |
|-----------|--|
| R03B672IP | AR Magnetic RIBA Draft Remittance Paper Format |
| R03B672IT | A/R Magnetic RIBA Draft Remittance Tape Format |
| R03B672IR | A/R Magnetic RID Draft Remittance Tape Format |

When you use the magnetic RIBA and RID remittance formats, the system creates text file processor batches that contain the remittance information.

Setting Processing Options for A/R Magnetic RIBA Draft Remittance Tape Format (R03B672IT)

Processing options enable you to specify the default processing for programs and reports.

Bank

- | | |
|---------------------------------|---|
| 1. Sequence Number | Specify the sequence number for the Riba tape format. |
| 2. Remittance Date | Specify the remittance date. |
| 3. Bank Search Type Code | Specify the search type code to identify the payor as a bank. |

Italian Tape

- | | |
|---------------------------------|--|
| Province | Specify the province for RiBa authorization. |
| Number | Specify the RiBa authorization number. |
| Date | Specify the date for RiBa authorization. |
| 5. Client Name | Specify the line number from the address book record for the customer name continuation. |
| 6. Client Street Address | Specify the address line number in the address book record that contains the street address of the client. |

Create

- | | |
|----------------------|--|
| Create Option | Specify the type of format being created. Values are: Blank: Create Tape Only (Final Mode) 1: Print RiBa on preprinted form. 2: Print RiBa and create tape (final mode only). |
|----------------------|--|

Setting Processing Options for A/R Magnetic RID Draft Remittance Tape Format (R03B672IR)

Processing options enable you to specify the default processing for programs and reports.

Tape

- | | |
|--|---|
| 1. Beginning Sequence Number of tape (Optional) | Specify the beginning sequence number of the RID (<i>Rapporti Interbancari Diretti</i>)(Direct Inter-Bank Relationship) tape file. You are not required to enter a value in this processing option. |
| 2. Remittance Date | Specify the remittance date of the RID tape file. |
| 3. Search Type Code | Specify the search type that identifies the payor as a bank. If the Address Book Search Type of the payor matches this code, the payor is a bank. |
| 4. RID Type | Specify the type of RID tape format being created. Values are: Blank: Commercial RID 1: Users RID |

5. Client Address Line Number

2: Speed RID

Specify the address line number in the address book record that contains the street address of the debtor for Record 40. Values are:

Blank: Address line 1

1: Address line 1

2: Address line 2

3: Address line 3

4: Address line 4

Create**1. Creation Option**

Specify the type of format being created. Values are:

Blank: Create tape only (final mode only).

1: Print RID on preprinted form.

2: Print RID and create tape (final mode only).

Setting Up Supplier Withholding Tax Information for Italy

This section provides an overview of supplier withholding tax information for Italy and discusses how to set up supplier withholding tax information for Italy.

Understanding Supplier Withholding Tax Information for Italy

Businesses in Italy are required to set up this information about any suppliers who are subject to withholding tax:

- Fiscal group code
- Withholding tax code
- Individual tax identification number
- Country

You are required to include this information in your withholding tax reports.

When you set up withholding tax information for your suppliers, you associate suppliers with specific withholding tax rates. When you enter vouchers for your suppliers, the system uses this default rate to calculate the withholding tax amounts. You can override default supplier information, if necessary.

The system displays the individual tax identification number and country of the supplier, based on the supplier's record in the F0101 table.

Forms Used to Set Up Supplier Withholding Tax Information

| Form Name | FormID | Navigation | Usage |
|--|----------|---|---|
| Work With Italian Suppliers | W0401ITB | Additional Italian Tax Processing (G002131), Setup A/B Additional Info | Locate suppliers for which you want to add withholding tax information. |
| Supplier Master Additional Information - Italy | W0401ITE | On the Work With Italian Suppliers form, click Select for an existing supplier or click Add for a new supplier. | Enter withholding tax information for a supplier. |

Setting Up Supplier Withholding Tax Information

Access the Supplier Master Additional Information - Italy form.

| | |
|---|---|
| Individual | Enter <i>Y</i> to indicate that the supplier is an individual. Enter <i>N</i> to indicate that the supplier is not an individual. |
| Gender | Specify the gender when the supplier is an individual. Values are: <i>M</i> : Male <i>F</i> : Female |
| Date of Birth | Enter the individual's date of birth. |
| Place of Birth | Enter the place of birth of the individual. |
| Province of Birth | Enter the province of the place of birth of the individual. |
| Fiscal Group Code | Enter a value that exists in the Form 770 Information (74/70) UDC table to specify the fiscal group to which a company belongs. For example, you could assign code 0A to suppliers that reside in Italy whose income is completely subject to the INPS withholding tax. Values are: <i>0</i> : Resident. <i>0A</i> : Resident whose income is all subject to INPS. <i>0B</i> : Resident whose income is partially subject to INPS. <i>0C</i> : Resident whose income is not subject to INPS. <i>1</i> : Nonresident whose income is all subject to INPS. <i>1A</i> : Nonresident whose income is partially subject to INPS. <i>1B</i> : Nonresident whose income is not subject to INPS. <i>1C</i> : Nonresident. |
| W/T Code - Internal (withholding tax code - internal) | Define withholding tax rates with the Withholding Tax Codes - Italy program (P740405). The system uses this information to calculate withholding tax when you enter supplier vouchers for suppliers that are subject to withholding tax. When you set up this internal withholding tax code, you establish links between: <ul style="list-style-type: none">• The withholding tax percentage.• The percentage of the base amount that is subject to withholding tax. |

- The type of withholding tax.
- The user-defined codes for Model 770 reporting.
- The withholding tax fiscal codes.

Add'l Ind Tax ID

(additional individual tax ID)

Enter the identification number assigned by a tax authority to an individual, in addition to the primary Tax ID number (TX1).

Setting Up Withholding Tax Codes

This section provides an overview of withholding tax codes for Italy, lists a prerequisite, and discusses how to set up withholding tax codes for Italy.

Understanding Withholding Tax Codes

If your suppliers are subject to withholding tax, define withholding tax rates so that the system can calculate the withholding tax when you enter supplier vouchers. To do this task, you set up withholding tax codes.

When you set up codes for withholding tax, you specify, among other parameters, the withholding tax type, the percentage, and the base of computation for the tax. For example, the type of withholding tax to which a supplier is subject is *Ritenuta d'acconto imposta*. Based on this type of withholding tax, vouchers for the supplier are subject to a withholding tax rate that is 20 percent of the total taxable amount.

You can also establish links between different withholding taxes and the codes that you set up for Model 770 reporting.

Prerequisite

Set up the codes for Model 770 reporting in the Section of 770 Form (74/RA) UDC table.

Forms Used to Set Up Withholding Tax Codes

| Form Name | FormID | Navigation | Usage |
|---|----------|---|----------------------------------|
| Withholding Tax Codes Revision - Italy | W740411A | Italian Tax Processing (G002131), Setup Withholding Tax Codes Click Add on the Work With Withholding Tax Code form. | Set up withholding tax codes. |

Setting Up Withholding Tax Codes

Access the Withholding Tax Codes Revision - Italy form.

Withholding Tax Code

Enter a tax code that exists in the F740405 table to define the withholding tax rate. The system uses this information to calculate withholding tax when you enter supplier vouchers for suppliers that are subject to withholding tax.

When you set up this internal withholding tax code, you establish links between:

- The withholding tax percentage.
- The percentage of the base amount that is subject to withholding tax.
- The type of withholding tax.
- The user-defined codes for Model 770 reporting.
- The withholding tax fiscal codes.

W/T Code - Fiscal
(withholding tax code -
fiscal)

Enter a code from the Withholding Tax Fiscal Code UDC table (74/WF) that is assigned by the government for printing on official forms.

Basis Percentage

Enter the percentage of the base invoice or voucher amount that is subject to withholding tax.

**Withholding Tax
Percentage**

Enter the withholding tax percent or rate.

Section of 770 Form

Enter a code from the Section of 770 Form (74/RA) UDC table.

You must complete this field when you define a new withholding tax code.

Withholding Type

Enter a code from the Withholding Type (74/WT) UDC table that specifies the type of withholding tax. The system uses the withholding type to distinguish between different types of withholding tax for reporting and processing purposes.

In Italy, there are different types of withholding tax on supplier's vouchers, such as standard withholding and INPS withholding. You link a withholding type to each internal withholding tax code that you define on the Withholding Tax Codes - Italy program (P740405).

Include in Balance

Enter whether to bypass the balance control when you enter a code for INPS withholding tax on the Withholding Tax Codes Revision form (P740405).

The balance control calculation for withholding tax entries is: gross amount (the amount not subject to withholding tax) plus the amount subject to withholding tax, plus the VAT amount.

Values are:

0: Amount excluded from balance

1: Amount included in balance

CHAPTER 84

(ITA) Working With Functionality for Italy

This chapter provides overviews of petrol card expenses, prepayments for Notula, the process for calculating withholding taxes, invoices for free goods, and bank account and bank ID validation; and discusses how to:

- Verify account balances.
- Close a fiscal year.
- Prepare the Fixed Assets Legal report.
- Enter bank account information.
- Revise withholding taxes.

Understanding Accounting for Petrol Card Expense Reports for Italy

In Italy, sales of petrol in petrol stations for cars and trucks do not have to be invoiced, even though petrol is VAT taxable. Every time that VAT subjects (professionals or companies) buy petrol for business purposes at a petrol station, they have to fill out a form called *scheda carburante* (petrol card) that documents the amount of the sale, including VAT.

Because petrol stations cannot issue invoices, the petrol card is the only document that enables VAT subjects to document the payable VAT. The card is also used when filing the annual tax declaration as proof of costs sustained by the subjects.

The petrol card is used when companies assign cars to employees. Every month employees who use company cars must attach the petrol card for the month to an expense report. The law requires the subjects to enter the kilometers traveled by each vehicle during the period on the petrol card for fiscal audit purposes. Use the Units field on the Journal Entry form to enter this amount.

The Accounts Payable employee who is responsible for expense reports management must enter all of the data that is contained on the petrol card for VAT and tax declaration purposes. Assign a specific document type when entering petrol cards in JD Edwards EnterpriseOne Accounts Payable system.

Many possible methods for accounting for petrol cards are used:

| Method | Description |
|------------------------------------|---|
| Enter the employee expense report. | Debit - Transit account. Credit - Payable to Employee account. |

| Method | Description |
|---|--|
| Post the petrol card in the JD Edwards EnterpriseOne Accounts Payable system. | Debit - Purchases (Petrol) account. Credit - Petrol Card (dummy supplier) account. |
| Close petrol debt. | To close the debt to the dummy supplier (Petrol Card account), use the manual payment process and replace the Bank account with the Transit account that you used when entering the employee expense report. Debit - Petrol Card (dummy supplier) account. Credit - Transit account. |

Understanding Prepayments for Notula in Italy

Notula is the document used to defer the VAT. You can use the system to process *notula* for specific stages in the prepayment process:

| Step in Prepayment Process | Description |
|----------------------------|--|
| Enter prepayment voucher | When you enter prepayment vouchers for <i>notula</i> , you: <ul style="list-style-type: none"> • Use a version of the Voucher Entry program for prepayments. • Use a special document type. • Enter a tax explanation code of E for exempt. • Enter a tax rate with a zero percent tax rate. |
| Record payment | To record the voucher as paid, you use manual payment with voucher match for the voucher without VAT. |
| Enter standard voucher | Enter a standard voucher with a normal tax explanation code and tax rate. When the system determines that the supplier for the voucher is subject to withholding, the system displays the withholding window. Use the form to select the matching <i>notula</i> document for the voucher. The system retrieves the VAT amount along with the withholding tax amount. Distribute as usual. When you post the voucher, the system updates the tax table. |
| Close the amounts | Enter a second payment to close the amounts in the Accounts Payable Ledger table (F0411). |

Note. The default document type value for *notula* is PF. You can set up a special document type for *notula* in the processing options for the Notula Browse - Italy (P7404074) program.

Understanding the Process for Calculating Italian Withholding Taxes

The system processes withholding tax at specific stages of the automatic payment process:

| Stage | Description |
|----------------------------------|--|
| Create payment control groups | When you create a payment control group that includes vouchers which are subject to withholding tax, the system updates the Discount Taken field in the A/P Payment Processing - Summary (F04572) table and the Payment Processing - Detail (F04573) table with the withholding tax amount from the Withholding Tax Detail - Italy (F74411) table. The system calculates the payment amount by subtracting the withholding tax (discount) from the gross amount. |
| Work with payment control groups | When you reset or remove individual vouchers from the payment control group, the system removes the withholding tax amount from the Discount Taken field in the F04572 table and the F04573 table. At this point in the process, the system does not update the Accounts Payable Ledger (F0411) table and does not impact the voucher records. |
| Update payment group | When you update the payment group, the system changes the payment status of the withholding tax to <i>1</i> (payment made to supplier) in the F74411 table. The system also updates the F0411 table with the amount in the Discount Taken field for the withholding tax amount. |

Technical Considerations for Processing Withholding Tax Payments

When processing withholding tax payments, consider:

| Feature | Description |
|------------------------------|--|
| Prompt payment discounts | You cannot use prompt payment discounts with withholding tax because the withholding tax amounts are stored in the prompt payment discount fields. Accounts Payable prompt payment discounts are not used in Italy. |
| Split payment control groups | You cannot split a payment control group to exclude part of a voucher because this action creates a new pay item on the voucher. |

Understanding Manual Payments for Italy

When you record a payment, the system determines whether the supplier is subject to withholding tax, based on the information that you set up for the supplier. If the supplier is subject to the tax, the system displays the voucher information and updates the Discount Taken field with the withholding tax amount.

The Discount Taken field should be blank at the time that you record the payment. If the Discount Available field contains an amount, the system replaces this amount with the withholding tax amount that is calculated at payment entry time.

Important! Italian companies that manage withholding tax within the JD Edwards EnterpriseOne system are not able to apply discounts on the invoice.

Understanding Draft Collection in Italy

In Italy, companies typically do not consider a draft paid until the bank sends verification of the actual payment. In this case, the preferred practice for collecting a draft is to set the processing options for the Draft Collection with Status Update program (R03B680) so that the program does not automatically create journal entries. Instead, it updates the payment instrument for the draft to an intermediate status. The intermediate status indicates that payment for the draft has been requested from the bank, but it has not actually been received. When the bank verifies the payment of the draft, you can create and post a manual journal entry for the payment. Then you run the Draft Collection with Status Update program for the draft again to update the payment instrument for the draft to a paid status.

Understanding Invoices for Free Goods

Invoices for free goods have a zero value. In Italy, invoices for free goods must be entered into the system for fiscal and VAT reporting purposes.

When you enter invoices for free goods into the system, the first pay item represents the taxable amount with the relevant tax rate. You enter this pay item with a tax explanation code of *V* (VAT). The second pay item represents the gross amount (negative). To calculate the gross amount, add the first pay item taxable amount and the VAT amount. Enter the second pay item with a tax explanation code of *E* (exempt) with a tax rate of zero.

This table provides an example of an invoice for free goods:

| Pay Item | Gross Amount | Taxable Amount | Tax Amount | Tax Rate Code | Tax Explanation Code |
|----------|--------------|----------------|------------|---------------|----------------------|
| 001 | | 1000 | 200 | IT20 | V |
| 002 | -1200 | | | IT00 | E |

The total invoice value is zero, and the invoice can be posted to update the Taxes table (F0018). The G/L distribution debits the Cost of Goods Sold account and credits a specific expense account for free goods.

To close the invoice, record a cash receipt through the Standard Receipt Entry program (P03B102).

Understanding Bank Account and Bank ID Validation

In Italy, businesses that remit incorrect or incomplete bank identification or account information to the bank are subject to fees. To avoid these charges, businesses must carefully validate bank identification and account information that is entered into the system during data entry.

You can set up your system to automatically validate account information when you use these programs:

- Bank Account Cross-Reference (P0030A).
- Bank Account Information (P0030G).
- Bank Revision - Italy (P7430IT).
- Enter Customer Drafts (P03B602).
- Pre-Authorized Drafts (R03B671).
- A/R Magnetic RIBA Draft Remittance Tape Format (R03B672IT).

The system validates account information based on the Bank ID - Italy table (F74030).

Italian banks assess a service charge when invalid account or bank identification numbers are included in the customer information that businesses remit for processing accounts receivable drafts (RiBa) and automatic payments.

Italian bank identification information consists of a transit code, which includes two 5-character segments:

- The Bank Code (ABI).
- The Bank Branch Code (CAB).

The ABI segment identifies the bank (for example, Banco di Napoli) and is followed by the CAB segment, which identifies the branch (for example, Banco di Napoli - Positano).

The Banca d'Italia maintains and updates valid bank identification numbers. Individual banks can provide their clients with the updated information on tape or diskette.

The JD Edwards EnterpriseOne system supports the COMIT format and ships the Bank ID - Italy table (F74030) with the localized software for Italy. You must upload the bank information that is provided by Banca d'Italia to this table. After you upload the information, you can make your own revisions to the bank table as needed.

To validate bank identification information, the system validates bank codes and branch codes when you:

- Set up bank account information.
- Enter accounts receivable drafts.
- Generate pre-authorized accounts receivable drafts.
- Create the accounts receivable drafts remittance table.

The system validates the customer bank information against the valid bank identification information in the F74030 table.

The programs that validate account information and bank identification information are described in this table:

| Program | Function |
|--|--|
| Bank Account Information (P0030G) | The system issues an error on the Revise Bank Information form if bank information is missing or invalid. |
| Bank Account Cross-Reference (P0030A) | If the Localization Country Code field in the User Profile Revisions form is not blank and the customer, supplier, or employee country code on the Address Book Revision form is IT (Italy), the system issues an error on the Set Up Bank Accounts By Address form if bank information is missing or invalid. |
| Enter Our Drafts or Enter Customer Drafts (P03B602) | The system issues an error on the Draft Entry form if bank information is invalid. |
| Pre-Authorized Drafts (R03B671) | The system prints an error report that lists customers with missing or invalid bank information. You can review the list to correct or update the bank information before you generate the drafts. |
| A/R Magnetic RIBA Draft Remittance Tape Format (R03B672IT) | When you remit drafts, the system validates bank information again and includes the drafts for all of the specified customers in the electronic bank file. The system prints an error report that lists the customers with missing or invalid bank information. |

Verifying Account Balances in Italy

This table lists the standard procedures that companies in Italy should perform before month-end reporting is completed.

| Procedure | Report | Description | Frequency |
|---|---|---|-----------|
| Verify that document numbers are in sequence. | Sequential Number Report (R74099A, R74099B, R74099C, and R74099D) | This report shows any interruption in the document number sequence and in the registration date sequence. | Daily |
| Print a list of all unposted batches. | Unposted Batches Integrity Test (R007011) | This report shows any unposted batches. Post all batches before you verify balances. | Weekly |

| Procedure | Report | Description | Frequency |
|--|---|---|---------------------|
| Verify that the batch detail and batch header information match. | Transactions to Batch Headers Integrity Test (R007021) | This report shows mismatches between batch headers and the individual transactions within the batch. Mismatches might include transactions for which no batch header or posted transactions exist. | Weekly |
| Balance the AR and GL ledgers. | A/R to G/L by Batch Integrity Test (R03B701) | <p>This report checks the balance between the F03B11 and F0911 tables by batch number.</p> <p>If the F03B11 and F0911 ledgers are out of balance, use the Supplier/Customer Totals by Account report (R09450) as an additional verification tool.</p> <p>The report also shows anomalous situations regarding the payment status.</p> | Weekly |
| Balance the AR and GL ledgers by accounting class. | A/R to G/L by Accounting Class Integrity Test (R03B7001A) | This report matches the F03B11 to the F0902 table by accounting class. | Weekly |
| Balance the AP and GL ledgers. | A/P Original Documents to G/L by Batch Integrity Test (R04701) | <p>This report checks the balance between the F0411 and F0911 tables by batch number.</p> <p>If the F0411 and F0911 tables are out of balance, use the Supplier/Customer Totals by Account report (R09450) as an additional verification tool.</p> <p>The report also shows anomalous situations regarding the payment status.</p> <p>Note. If the <i>Bolle Doganali</i> are entered as prepaid documents, the ledger and the Customs debit account might be out of balance.</p> | Weekly |
| Balance the AP and GL ledgers by accounting class. | A/P Originals to G/L by Batch Integrity Test (R047001A) | This report matches the F0411 and F0902 tables by offset account. | Weekly |
| Print trial balance reports. | <p>T/B by Object and Subsidiary (R7409C3)</p> <p>Trial Balance by category code 21, 22, 23 (R70472)</p> | These trial balance reports print by object.subsidiary and by category codes 21, 22, and 23. | Monthly |
| Print monthly VAT reports. | Monthly VAT Report (R004051) | Print a version of this report for EU VAT purchases to show the currency amounts of your invoices. Print other versions of the report to show the rest of the VAT ledgers. | Per tax regulations |

Closing a Fiscal Year in Italy

This section provides an overview of the tasks and the preparation necessary to close a fiscal year in Italy.

Understanding Tasks for Closing a Fiscal Year

In Italy, businesses must complete these tasks at the close of the fiscal year to prepare the year-end balance sheet:

- Adjust and integrate journal entries.
- Close profit and loss accounts for revenues and expenses that were recorded during the year without carrying over the balance.
- Calculate retained earnings.
- Close balance sheet accounts on a summary account ending balance sheet and reopen the same balance sheet accounts for the next fiscal year.

During the close of the fiscal year and the preparation of the balance sheet, Italian businesses must run these control reports:

- T/B by Object and Subsidiary (R7409C3) or T/B by Category Code (R70472)
- G/L Registration Report (R09404)
- G/L by Object and Subsidiary (R7409C1)
- G/L by Category Code (R70470)

You must run the Trial Balance report in final mode to perform a final annual close as well as to prevent users from entering transactions after a year-end close. In final mode, the records included in the report are flagged in the F0911 table to indicate that they have been printed in final mode. This prevents the records from being printed in final mode again. An error message is printed on the report if any records have been printed in a previous final mode report. New transactions are visible on the report because they are not flagged with the same date as older transactions, which have the date when the report was run in final mode for the closed year. The word *Final* is printed on every page of a report that is run in final mode.

Note. Because running the Trial Balance report in final mode flags the records as having been printed, you should run the Trial Balance report before the GL reports. Businesses print the GL reports at least once a year for all accounts, typically at the end of the fiscal year.

Preparing the Fixed Assets Legal Report in Italy

This section provides an overview of the Fixed Assets Legal report for Italy and discusses how to:

- Prepare the Fixed Assets Legal report.
- Set processing options for the Fixed Assets Legal (R7412100) report.

Understanding the Fixed Assets Legal Report

Italian law requires that companies submit Fixed Assets Legal Report - Italy (R7412100) (*Registro dei beni ammortizzabili*) prior to the final date for filing the tax report (*Dichirazione dei Redditi*) with the Fiscal Authority. The Fixed Assets Legal Report - Italy must be printed on prenumbered, stamped, and formatted paper.

The Fixed Assets Legal Report is a plain paper report that provides information that is needed to complete the official legal report. The Fixed Assets Legal Report does not comply with specific format requirements.

The Fixed Assets Legal Report includes this information for depreciable assets (both material and nonmaterial assets):

- Acquisition date.
- Original cost.
- Revaluation.
- Devaluation.
- Accumulated depreciation as of the end of the previous fiscal period.

The anticipated accumulated depreciation (*fondo ammortamento anticipato*) is displayed separately from the standard accumulated depreciation, when applicable.

- The actual depreciation coefficient applied during the fiscal period.
- The depreciation expenses for the fiscal period.
- The anticipated depreciation expenses for the fiscal period, when applicable.
- Disposals (sale or other).

Preparing the Fixed Assets Legal Report

Select Italian Reports (G093152), Legal Fixed Assets Report.

Setting Processing Options for the Fixed Assets Legal Report (R7412100)

Set these processing options to specify the default processing and printing for the report.

Processing

Use these processing options to specify how to process the report.

1. Enter the Legal Company

Specify the code that identifies a specific organization, fund, or other reporting entity. The company code must already exist in the Company Constants table (F0010) and must identify a reporting entity that has a complete balance sheet.

At this level, you can have intercompany transactions.

Note. You can use company 00000 for default values such as dates and automatic accounting instructions (AAIs). You cannot use company 00000 for transaction entries.

2. Enter the Ledger Type.
The default value is 'AA'

Specify the user-defined code (UDC) (09/LT) that identifies the type of ledger, such as *AA* (Actual Amounts), *BA* (Budget Amount), or *AU* (Actual Units). You can set up multiple, concurrent accounting ledgers within the general ledger to establish an audit trail for all transactions.

3. Period

Enter the number indicating the current accounting period. This number, used in conjunction with the Company Constants table (F0010) and the General Constants table (F0009), enables the user to define up to 14 accounting periods. The current period number is used to determine warning messages for posted before and posted after cut off. It is also used as the default accounting period in the preparation of financial reports.

Leave blank to use the current period.

4. Fiscal Year

Enter the number that identifies the fiscal year. You can either enter a number in this field or leave it blank to indicate the current fiscal year (as defined on the Company Setup form).

Specify the year at the end of the first period rather than the year at the end of the fiscal period. For example, a fiscal year begins October 1, 1998 and ends September 30, 1999. The end of the first period is October 31, 1998. Specify the year 98 rather than 99.

5. Enter the subledger type that indicates the appreciation of the fixed asset

Specify the UDC (00/ST) that is used with the Subledger field to identify the subledger type and how the system performs subledger editing. On the User Defined Codes form, the second line of the description controls how the system performs editing. This is either hard-coded or user-defined. Values include:

A: Alphanumeric field, do not edit.

N: Numeric field, right justify and zero fill.

C: Alphanumeric field, right justify and blank fill.

6. Object Account

Enter the object account for plus values.

This portion of a general ledger account refers to the division of the Cost Code (for example, labor, materials, and equipment) into subcategories. For example, you can divide the Cost Code for labor into regular time, premium time, and burden.

Note. If you use a flexible chart of accounts and the object account is set to 6 digits, it is recommended that you use all 6 digits. For example, entering *000456* is not the same as entering *456* because if you enter *456* the system enters three blank spaces to fill a 6-digit object.

7. Subsidiary

Enter the subsidiary for plus values.

This is a subset of an object account. Subsidiary accounts include detailed records of the accounting activity for an object account.

8. Object Account

Enter the object account for minus values.

This portion of a general ledger account refers to the division of the Cost Code (for example, labor, materials, and equipment) into subcategories. For example, you can divide the Cost Code for labor into regular time, premium time, and burden.

Note. If you use a flexible chart of accounts and the object account is set to 6 digits, it is recommended that you use all 6 digits. For example, entering *000456* is not the same as entering *456* because if you enter *456* the system enters three blank spaces to fill a 6-digit object.

9. Subsidiary

Enter the subsidiary for minus values.

This is a subset of an object account. Subsidiary accounts include detailed records of the accounting activity for an object account.

10. Report by parent

Enter *1* for a report by parent fixed asset. Enter *0* for a report by fixed asset code. The default value is *0*.

Printing

Use these processing options to specify how to print the report.

1. Enter the Fixed Asset code to print.

Specify which type of Fixed Asset code to print on the report. Values are:

1: Fixed Asset Code.

2: Unit Number.

3: Lot/serial Number.

The default value is *1*.

2. Enter '1' if you do not want to print program name, print date and page numbers

Specify whether to print the program name, print date, and page numbers. Values are:

1: Do not print program name, print date, and page numbers.

Blank: Print program name, print date, and page numbers.

Setting Up Bank Information in Italy

This section provides overviews of Italian bank ID information and bank number conversions and discusses how to:

- Upload Italian bank ID information.
- Revise Italian ID information manually.
- Convert Italian bank numbers.
- Set processing options for Italian Bank Number Conversion (R74800).

Understanding Bank ID Information

You can automatically update bank identification information from a tape or diskette to your system. To do so, you must first use a custom program to upload the bank tape or diskette to the Bank Upload - Italy table (F74301), which is a temporary work table. You then run the Bank ID Table Upload - Italy program (R74301) to upload the information from the F74301 table to the Bank ID - Italy table (F74030).

The Bank ID Table Upload - Italy program is based on the COMIT record layout. You might need to customize the program to meet your specific needs.

Understanding Italian Bank Number Conversions

You must run the Italian Bank Number Conversion program (R74800) to move the SIA code from the Bank User Number field to the Reference/Roll Number field in the Bank Transit Master table (F0030).

This conversion is necessary because the SIA code, which formerly was a numeric value, is now an alphanumeric code.

You can run the conversion program in proof or final mode. Proof mode prints a report of all selected GL bank accounts that shows the original value for the Bank User Number and Reference/Roll Number fields. Final mode clears the Bank User Number field, updates the Reference/Roll Number field, and prints the converted values on the report.

Enter the SIA code in the Reference/Roll Number field when entering bank account information in the Bank Account Cross-Reference program (P0030A) and the Bank Account Information program (P0030G).

Form Used to Set Up Bank Accounts

| Form Name | FormID | Navigation | Usage |
|-----------------------|----------|---|--|
| Bank Revision - Italy | W7430ITB | Italian Bank File Processing (G00215), Bank Revision - Italy On Work With Bank - Italy, select a bank code and click Select. | Revise bank identification information manually on an as-needed basis. |

Uploading Italian Bank ID Information

Select Italian Bank File Processing (G00215), Bank ID Table Upload - Italy.

Revising Italian Bank ID Information Manually

Access the Bank Revision - Italy form.

| | |
|----------------|--|
| Name | Enter the full name of the bank associated with a bank transit number (ABI/CAB). The value in this field is pre-loaded in the Bank ID - Italy table (F74030) and can be maintained in the Bank Revision - Italy program (P7430IT). |
| Address | Enter the address (street and number) of the bank. The value in this field is pre-loaded in the F74030 table and can be maintained with the Bank Revision - Italy program. |
| City | Enter the administrative division of the municipality where the bank is located. |

| | |
|-----------------------------|---|
| | The value in this field is pre-loaded in the F74030 table and can be maintained in the Bank Revision- Italy program. |
| Town | Enter the name of the town where the bank is located. The value in this field is pre-loaded in the F74030 table and can be maintained with the Bank Revision - Italy program. |
| Postal Code | Enter the postal code of the town where the bank is located. The value in this field is pre-loaded in the F74030 table and can be maintained with the Bank Revision - Italy program. |
| State | Enter a code from UDC table 00/S that specifies the state or province. This code is usually a postal service abbreviation. |
| Default CAB Location | Enter the default location of the bank branch code (Italian CAB code). The value in this field is pre-loaded in the F74030 table and can be maintained with the Bank Revision - Italy program. Examples of the location are: <i>CAB 1600:</i> Default Milano CAB <i>CAB 1601:</i> Milano Centro <i>CAB 1602:</i> Milano Duomo <i>CAB 1603:</i> Milano Scala |
| Short Name | Enter a user defined name or remark. |

Converting Italian Bank Numbers

Select Italian Bank File Processing (G00215), Italian Bank File Processing.

Setting Processing Options for Italian Bank Number Conversion (R74800)

Processing options enable you to specify the default processing for programs and reports.

Process

1. Enter '1' to process in final mode or leave blank for proof mode. Final mode will update selected G/L bank accounts in the Bank Transit Number Master (F0030). Proof mode will print the original values for review.

Specify the mode in which to run the report:

Proof mode: Prints the original values for review.

Final mode: Updates selected GL bank accounts in the F0030 table.

Revising Withholding Taxes in Italy

This section provides an overview of revising withholding tax and discusses how to revise withholding tax details.

Understanding Withholding Tax Revisions

You can revise the withholding tax information that the system stores in the Withholding Tax Detail - Italy table (F74411) by using the Withholding Tax Revisions program (P740411). You can also use the Withholding Tax Detail - Italy form to review all of the withholding tax information for a specific voucher.

Important! The information that you revise by using the Withholding Tax Detail - Italy form immediately updates the F74411 table. The system does not recalculate taxes and related amounts. You should revise withholding tax information only in exceptional cases, such as when you must adjust the withholding tax information manually.

If you are implementing the JD Edwards EnterpriseOne Accounts Payable system for the first time, you can use the Withholding Tax Detail - Italy form to load open withholding tax information from your previous system.

Form Used to Revise Withholding Tax

| Form Name | FormID | Navigation | Usage |
|--------------------------------|----------|---|---------------------------------|
| Withholding Tax Detail - Italy | W740411C | Italian Tax Processing (G002131), Withholding Tax Revisions On the Work With Withholding Tax - Italy form, select a record and click Select. | Revise withholding information. |

Revising Withholding Tax Information

Access the Withholding Tax Detail - Italy form.

| | |
|--|--|
| W/T Code (withholding tax code) | Enter the withholding tax code that defines the withholding tax rates. The system uses this information to calculate withholding tax when you enter supplier vouchers for suppliers that are subject to withholding tax. |
| Status | Enter the status of the withholding tax. The system stores the status in the F74411 table. Values are: 0: Withholding tax added during voucher entry. 1: Voucher paid to supplier (debt towards fiscal authority). 2: Withholding tax paid to fiscal authority. 9: Withholding tax canceled. |
| Taxable Amount Subject to W/T (taxable amount subject to withholding tax) | Enter the taxable amount of an invoice/voucher that is subject to withholding tax. |

| | |
|--|--|
| Withholding Tax Amount Paid | Enter the amount of the withholding tax paid. |
| Withholding Tax Foreign Amount Paid | Enter the foreign withholding tax amount paid in a given currency. You can maintain this field in the Withholding Tax Codes Italy (P740405) program. |
| Payment Date | Enter the date on which the withholding tax is paid to the government. |
| Government Date | Enter the date the withholding tax was remitted to the fiscal authority. |
| Withholding Tax Payment Reference | Enter the number of the payment made to the fiscal authority. This reference is entered in a processing option of the Generate Withholding Tax Payments program. |

Japan

Chapter 85

(JPN) Understanding Country-Specific Functionality for Japan

Chapter 86

(JPN) Setting Up Country-Specific Functionality for Japan

Chapter 87

(JPN) Working with Other Functionality for Japan

CHAPTER 85

(JPN) Understanding Country-Specific Functionality for Japan

This chapter provides overviews of the Wareki date format and the Japan-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Understanding the Wareki Date Format

In Japan, an era ends with the death of an emperor, and a new era begins with the reign of a new emperor. This table illustrates the Japanese eras since the year 1886:

| Era | Dates |
|------------|--------------|
| Meiji era | 1866-1912 |
| Taisho era | 1912-1926 |
| Showa era | 1926-1989 |
| Heisei era | 1989-present |

Although the date format YY/MM/DD is used in Japan, businesses often use a special date convention that shows the year of the current era. This date format is referred to as the *Wareki* date format.

The *Wareki* date format is HYY/MM/DD, where *H* is an optional character for the specific era, and *YY* is the sequential year since the start of the era. For example, in the current era, the *Wareki* equivalent of 99/01/31 (January 31, 1999) is H11/01/31, or January 31 of the eleventh year of the Heisei era. Businesses usually use the *Wareki* date format on outgoing documents; however, all dates on a bank tape must be represented in the *Wareki* format.

JD Edwards EnterpriseOne software uses the *Wareki* date format when you set up the Windows desktop settings to support this format.

Japanese-Specific Setup and Processes

This table lists the country-specific setup and functionality for Japan.

| Setup or Process | Description |
|---------------------------|---|
| User-defined codes (UDC)s | <p>Set up base-software UDCs with Japanese-specific values, and set up Japanese-specific UDCs for:</p> <ul style="list-style-type: none"> • Accounts Receivable transactions • Accounts Payable transactions • Bank accounts • Language preferences <p>See <i>JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide</i>, “Setting Up the Accounts Payable System,” Setting Up UDCs for Accounts Payable.</p> <p>See <i>JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide</i>, “Setting Up the JD Edwards EnterpriseOne Accounts Receivable System,” Setting Up UDCs for Accounts Receivable.</p> |
| Next numbers | No Japanese-specific setup for next numbers exists. |
| Bank accounts | <p>To work with bank accounts in Japan:</p> <ul style="list-style-type: none"> • Consider the bank ID and bank account validation routines. <p>See Chapter 87, “(JPN) Working with Other Functionality for Japan,” Understanding Bank ID and Bank Account Validation, page 1503.</p> <ul style="list-style-type: none"> • Upload bank information, revise bank and branch information, and enter bank charges. <p>See Chapter 87, “(JPN) Working with Other Functionality for Japan,” Processing Bank Information in Japan, page 1522.</p> <ul style="list-style-type: none"> • Work with Kagami statements. <p>See Chapter 87, “(JPN) Working with Other Functionality for Japan,” Working with Kagami Statements, page 1506.</p> |

| Setup or Process | Description |
|----------------------|---|

CHAPTER 86

(JPN) Setting Up Country-Specific Functionality for Japan

This chapter discusses Japan-specific setup and processes that you use in addition to the standard setup and processes provided in the base software, and discusses how to:

- Set up user-defined codes (UDCs).
- Set up supplier information.
- Set up withholding schedules for Japan.
- Set up *hankin hante* payments and drafts for Japan.
- Set up payment formats for Japan.

Setting Up UDCs for Japan

Setting up Japan-specific UDCs enables you to use Japan-specific functionality. You also set up some base software UDCs with Japan-specific values. This section discusses how to:

- Set up UDCs for Accounts Receivable transactions.
- Set up UDCs for Accounts Payable transactions.
- Set up UDCs for bank accounts.
- Set up UDCs for general purposes.

See *JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide*, “Setting Up the Accounts Payable System,” Setting Up UDCs for Accounts Payable.

Setting Up UDCs for Accounts Receivable Transactions for Japan

To use the JD Edwards EnterpriseOne Accounts Receivable system for Japan, set up UDCs for receipts and drafts.

Receipt Type - Japan (75/RE)

Set up UDCs to identify each type of receipt that you want to include in the summarized invoices (Kagami) that you print. For example, you can set up codes for these types of receipts:

- RA - A - Adjustment
- RC - C - Cash receipts
- RK - A - Cash receipts - check

- RO - A - Reversing or void
- RV - A - Insufficient funds
- RA - A - Chargeback
- R1 - D - Draft

Draft Status Code (75/PS)

Set up this user defined code to identify the status of Japanese drafts. Set up these codes:

- #: Selected
- D: Received
- G: Remitted
- P: Paid (discounted drafts)
- R: Updated (discounted drafts)

Setting Up UDCs for Accounts Payable Transactions for Japan

The JD Edwards EnterpriseOne Accounts Payable system for Japan requires that you set up UDCs for payment instruments and withholding tax.

Payment Instruments (00/PY)

To process discounted drafts in Japan, you must define a special payment instrument for discounted drafts. The system uses the special payment instrument with the RD3x automatic accounting instruction (AAI) to create the contingent liability transactions for discounted drafts.

For Japan, set up these values in UDC 00/PY:

- D - Draft by invoice (AR & AP).
- Q - Bank transfer - Japan.

You must also set up a payment instrument to calculate withholding for Japan.

Withholding Tax Category (75/WT)

Set up codes to identify each type of withholding tax category that your company uses. For Japan, set up codes for these withholding tax authority types:

- Blank: without calculation
- 1: Resident
- 2: Nonresident
- 3: Attorney

See *JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide*, “Setting Up the Accounts Payable System,” Setting Up UDCs for Accounts Payable.

Setting Up UDCs for Bank Accounts for Japan

You must set up Japanese-specific UDCs to identify bank transfers for accounts.

Bank Transfer Type (75/TT)

Set up UDCs to identify each type of bank transfer that your company uses. For Japan, set up codes for these bank transfer types:

- Blank: Default.
- *E*: Express bank transfer with bank charge.
- *L*: Letter bank transfer with bank charge.
- 7: Express bank transfer without bank charge.
- 8: Letter bank transfer without bank charge.

See *JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide*, “Processing Automatic Payments,” Understanding the Create Payment Control Groups Program.

Setting Up UDCs for Languages for Japan

In addition to setting up the standard UDCs for the JD Edwards EnterpriseOne Address Book system, you must set up these Japanese-specific UDCs for language preferences.

Language Preference Codes (01/LP)

Language preference codes specify the language for documents such as invoices and statements and reports. Before any translations become effective, a language code must exist at either the system level or in your user preferences.

The language preference codes work in conjunction with vocabulary overrides to select the correct language translation. Examples include:

DU: Dutch

E: English

F: French

For Japan, a 3 is required in the Special Handling Code field of UDC table 01/LP to enable the Secondary Alpha Name field of an address book record to allow Kana names. The 3 in the Special Handling Code field also enables searching the Description field on the Business Unit form.

Setting Up Supplier Information for Japan

This section provides an overview of the additional supplier information required for Japan, lists prerequisites, and discusses how to set up supplier information.

Understanding Supplier Information for Japan

In Japan, in addition to the standard supplier information, you must set up information that is required to process drafts and bank transfers. This additional information includes:

- Payee address number
- Bank transfer type
- Payment term

- Withholding tax category
- Draft ratio

| Table | Stored Information |
|----------------------------------|--|
| Supplier Master (F0401) | Includes supplier information. |
| Address by Date (F0116) | Includes mailing address information. |
| Bank Transit Master (F0030) | Includes bank account information. |
| Japanese A/B Tag Table (F750401) | Includes additional address book information that is maintained by the country server for Japan. |

You can access the additional information for a supplier from the Supplier Master Information form when you add a new supplier to the system or change the information for an existing supplier.

See *JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide*, “Entering Supplier Information,” (JPN) Setting Up Supplier Information for Japan.

Prerequisites

Before you complete the tasks in this section:

- Set up payment terms for drafts.

See *JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide*, “Setting Up Payment Terms,” Setting Up Standard Payment Terms.

- Set up values in the Bank Transfer Type (75/TT) UDC table for transfer types.

Form Used to Set Up Supplier Information for Japan

| Form Name | FormID | Navigation | Usage |
|-----------------------------|-----------|---|--|
| Work With Supplier Master | W04012D | Supplier & Voucher Entry (G0411), Supplier Master Information | Select an existing record. |
| Supplier Master Revisions | W04012A | Locate and select an existing record, then click Select. | Access the Japan-specific address book form. |
| Address Book Revision Japan | W01054JPA | Select Regional Info from the Form menu. | Enter the supplier information for Japan. |

Setting Up Supplier Information for Japan

Access the Address Book Revision Japan form.

| Address Book Revision Japan | | |
|---|------|-----------------------|
| <div> <div>OK</div> <div>Cancel</div> <div>Tools</div> </div> | | |
| Address Number | 4510 | SRM Japanese Supplier |
| Bank Transfer Type | 7 | Express Bank Transfer |
| Payment Terms | | Net 30 Days |
| Withholding Tax Category | 1 | Resident |
| Draft Ratio | .20 | |

Address Book Revision Japan form

Bank Transfer Type

Specify the type of bank transfer. You define bank transfer types in the Bank Transfer Type UDC (75/TT). Values are:

E: Express bank transfer with bank charge.

L: Letter bank transfer with bank charge.

7: Express bank transfer without bank charge.

8: Letter bank transfer without bank charge.

Payment Terms

Enter the code that is used as a default payment term to calculate a maturity date when you create draft payments.

Withholding Tax Category

Enter a tax category code that determines the withholding tax amount charged on professional services.

Draft Ratio

Enter the percentage of the *hankin hante* payment that is split to a draft payment by Japan's automatic split (*hankin hante*) process. This number is expressed as a whole decimal. For example, 20 percent would be expressed as .2000.

Setting Up Withholding Schedules for Japan

Use the Withholding Revisions - Japan program to set up schedules for withholding for suppliers. You set up schedules for the different types of suppliers. For example, you might set up a schedule for a resident supplier and one for a non resident supplier.

This section lists the forms used to set up withholding and discusses how to set up withholding schedules.

Form Used to Set Up Withholding

| Form Name | FormID | Navigation | Usage |
|-------------------------------|---------|---|-------------------------------|
| Enter Withholding Information | W75014A | Japanese Localization (G75J), Withholding Revisions - Japan Click Add on the Withholding Inquiry form. | Set up withholding schedules. |

Setting Up Withholding Schedules

Access the Enter Withholding Information form.

| | |
|----------------------------|--|
| Withholding Tax | Enter the tax category code that determines the withholding tax amount charged on professional services. |
| Currency Code | Enter the code that identifies the currency of a transaction. |
| Taxable Amount | Enter the amount on which taxes are assessed. |
| Percent Withholding | Enter the rate of withholding tax retained from a payment to a supplier. This number is expressed as a decimal. For example, 20 percent is expressed as .2000. |
| Deduction Amount | Enter the amount that is deducted before calculating withholding tax on administrative professional services. |

Setting Up the System for Hankin Hante Payments and Drafts for Japan

This section provides overviews of the required setup for *hankin hante* payments and the stamp tax table, lists prerequisites, and discusses how to:

- Set up payment split and draft split amounts.
- Set up the stamp tax table.

Understanding the Required Setup for Hankin Hante Payments

Before you automatically split *hankin hante* payments into drafts and bank transfer payments, or split drafts into smaller drafts, you must set up the Hankin Hante Split Amounts table (F75J04SA) with the split amounts for bank transfers and drafts. When you access the F75J04SA table using the Hankin Hante Split Amounts program (P75J0411), you select an option to specify whether to set up payment splits or draft splits. When you specify to set up payment splits, you create a list that the system uses to determine the amounts at which to split a *hankin hante* payment into a draft and a bank transfer. When you specify to set up draft splits, you create a list that the system uses to determine the amounts at which to split draft payments.

You must set up the F75J04SA table with a list of payment splits before you can run the Automatic Payment Split - Hankin Hante program (R75J04PS), and you must set up the F75J04SA table with a list of draft splits before you can run the Automatic Draft Split - Hankin Hante program (R75J04DS). If you do not set up the F75J04SA table with the appropriate lists, the Automatic Payment Split - Hankin Hante and Automatic Draft Split - Hankin Hante reports print an error message, and the programs do not split the payments or drafts.

Generally, you set up payment splits and draft splits once and modify them only when your company changes its *hankin hante* payment policy.

Understanding the Stamp Tax Table

When businesses in Japan issue drafts for payment, they are required to pay a stamp tax. The tax amount depends on the amount of the draft.

To calculate and report on the stamp tax for accounts payable drafts, you must set up and maintain the Stamp Tax - Japan table (F75013) through the Stamp Tax Revision - Japan program (P75013).

Note. The Stamp Tax Revisions form is not a multicurrency form. The system recognizes only your company currency for the records in the F75013 table.

Prerequisites

Before you complete the tasks in this section:

- Assign the same payment instrument to each supplier for which you want to split payments into drafts and bank transfers.

See *JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide*, “Setting Up the Accounts Payable System for Automatic Payment Processing,” Setting Up Payment Instruments and Print Programs.

- Assign a draft ratio to each supplier.

See Chapter 86, “(JPN) Setting Up Country-Specific Functionality for Japan,” Setting Up Supplier Information for Japan, page 1493.

Forms Used to Set Up Payment Split and Draft Split Amounts and the Stamp Tax Table

| Form Name | FormID | Navigation | Usage |
|-----------------------------------|-----------|--|--|
| Set Up Hankin Hante Split Amounts | W75J0411A | Japanese Localization (G75J), Hankin Hante Split Amounts | <p>Select Payments or Drafts.</p> <p>Select Payments to set up or modify the split amounts that the system uses to determine the levels at which to split Accounts Payable payments into bank transfers and drafts.</p> <p>Select Drafts to set up or modify the split amount that the system uses to determine the levels at which to split drafts into smaller drafts.</p> |
| Stamp Tax Revision - Japan | W75013A | Japanese Localization (G75J), Stamp Tax Revision - Japan | Revise the stamp tax table. |

Setting Up Payment Split and Draft Split Amounts

Access the Set Up Hankin Hante Split Amounts form.

Hankin Hante Split Amounts - Set Up Hankin Hante Split Amounts

OK Find Delete Cancel Tools

Type of Split Amounts

☒ Payments ☐ Drafts

| Records 1 - 5 | | Customize Grid |
|--------------------------|----------------|--------------------|
| | Split Amount * | Description |
| <input type="checkbox"/> | 1,000,000 | Split at 1,000,000 |
| <input type="checkbox"/> | 2,000,000 | Split at 2,000,000 |
| <input type="checkbox"/> | 3,000,000 | Split at 3,000,000 |
| <input type="checkbox"/> | 5,000,000 | Split at 5,000,000 |
| <input type="checkbox"/> | | |

Set Up Hankin Hante Split Amounts form

Payments

Select to specify that the split amount is for payments.

Drafts

Select to specify that the split amount is for drafts.

Split Amount

Enter the amount at which the system splits payments or drafts in the Hankin Hante process. The system stores split amounts for payments and drafts in the F75J04SA table.

The Automatic Payment Split - Hankin Hante program (R75J04PS) uses the split amounts to determine the level breaks for creating drafts and bank transfer payments.

When you run the R75J04PS program, the system:

- Applies the value in the Draft Ratio (data item DRATIO) field that is specified for each payee to the selected AP payments to determine the maximum draft amount.

For example, if the draft ratio is 50 percent, then no more than 50 percent of the total payment can be a draft.

- Reads the F75J04SA table to determine the highest split amount that is less than or equal to the result of applying the draft ratio to the payment.

For example, if payment split amounts are defined in 100,000 yen increments beginning with 100,000 yen, a payment of 420,000 yen with a 50 percent draft ratio is split into a 200,000 yen draft and a 220,000 bank transfer payment.

The Automatic Draft Split - Hankin Hante program (R75J04DS) uses the split amounts that you set up for drafts to split AP drafts into smaller drafts.

During the automatic draft split process, the original draft is split into two or more smaller drafts using either the split amounts that are identified here, or using a fixed amount. You set a processing option to specify whether the system uses the split amount levels in the F75J04SA table or a fixed amount at which to split a payment. If you use the levels in the F75J04SA table, each split uses the highest draft split amount that is stored in the table that is less than or equal to the remaining amount.

For example, if draft split amounts are defined in 200,000 yen increments beginning with 100,000 yen, a draft of 475,000 yen would be split into three drafts of 300,000 yen, 100,000 yen, and 75,000 yen.

Setting Up the Stamp Tax Table

Access the Stamp Tax Revision - Japan form.

Stamp Tax Revision - Japan form

Payment Amount (More Than)

Enter the amount of the payment.

Stamp Tax

Enter the amount that is assessed and payable to tax authorities. It is the total of the value-added tax , use, and sales taxes (PST).

Setting Up Payment Formats for Japan

This section provides an overview of payment formats for Japan and discusses how to:

- Set processing options for the Create A/P Bank Tape - Japan (R04572JP) program.
- Set processing options for the Print Automatic Payments - Draft Format (R04572N) program.

Understanding Payment Formats for Japan

JD Edwards EnterpriseOne software provides these payment formats for Japan:

| Format | Description |
|-----------------|---|
| Payment formats | Specify the Create A/P Bank Tape - Japan program (R04572JP) as the Write program to generate the payment format that is accepted by Japanese banks. |
| Attachments | Specify the Japan Bank Transfer Paper program (R04573JP) as the Attachment program to generate the attachments for accounts payable bank transfers for Japan. |

Setting Processing Options for Create A/P Bank Tape - Japan (R04572JP)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

| | |
|---------------------|--|
| Device Name | Specifies the name of the device. |
| Tape Density | Specifies the density of the tape to be created, for example, 1600, 6250, and so on. |
| Label Name | Specifies the Label Name. |
| Block Size | Specifies the Block Length. |
| New Volume | Specifies the New Volume name. |

Tape (more)

| | |
|---------------------|---|
| New Owner ID | Specifies the new owner ID. |
| File Name | Specifies the name of a file as it is known to a program. |

Setting Processing Options for Japan Bank Transfer Paper (R04573JP)

Processing options enable you to specify the default processing for programs and reports.

Date Selection

| | |
|-------------------------|--|
| Selection Number | Enter <i>01</i> to use the Japanese date format. If you leave this processing option blank, the system uses the Western date format. |
|-------------------------|--|

CHAPTER 87

(JPN) Working with Other Functionality for Japan

This chapter includes overviews of bank ID and bank account validation, accounts receivable draft processing, and the create payment control groups process for Japan, and discusses how to:

- Work with Kagami statements.
- Calculate supplier withholding.
- Process *hankin hante* payments.
- Process Accounts Payable drafts.
- Process bank information.

Understanding Bank ID and Bank Account Validation

A bank identification (ID) number identifies the bank with which you have established an account. The bank ID number is included in the customer information that you remit for processing accounts receivable drafts and EFT payments.

You activate bank ID validation routines by setting up the localization country code in your user profile:

Completing the Localization Country Code field on the User Profile Revisions form causes the system to search for a bank ID validation routine, but the validation routine to use is not specified. For example, if you specify Japan in the Localization Country Code field, you can still validate bank IDs for other countries. When you use the Bank Account Cross-Reference program (P0030A), the system uses the value in the Country field on the Mailing tab on the Address Book Revision form to determine which validation to use for the address book record.

The system validates bank code numbers and bank branch codes when you enter bank IDs into the Bank Account Cross-Reference or the Bank Account Information (P0030G) program. The system identifies the customers whose bank information is invalid with an error message.

You can check for missing bank information for customers by running the Bank Account Exception Report (R00314).

The system validates account and bank identification information throughout the draft process:

| Process | Function |
|------------------------------------|---|
| A/R Batch Draft Creation (R03B671) | The system prints an error report that lists customers with missing or invalid bank information. You can review the list to correct or update the bank information before you generate the drafts. |
| Draft Remittance (R03B672) | When you remit drafts, the system validates bank information again and includes the drafts for all of the specified customers in the electronic bank file. The system prints an error report that lists the customers with missing or invalid bank information. |

Bank ID Validation Overrides

You can override bank ID validation for a specific country by adding the country code to UDC 70/BI. The system does not run bank ID validation routines for countries listed in this UDC table.

Understanding Accounts Receivable Draft Processing in Japan

In Japan, banks assign a draft number to all drafts. All queries regarding drafts refer to this bank-assigned draft number. Businesses are required to include the bank-assigned draft number on all draft reporting.

Bank-assigned draft numbers are alphanumeric codes that are *not* generated by JD Edwards EnterpriseOne software. You can input and revise this number manually. You can also use this number to inquire on drafts in the system.

Use the Reference field to input the draft number. The Reference field is alphanumeric and cannot include any blanks, special characters, or punctuation marks.

The Reference field is included in these programs:

- Enter Our Drafts (P03B602)
- Enter Customer Drafts (P03B602)
- Draft Inquiry (P03B602)
- A/R Draft Remittance Magnetic Tape Format program (R03B672T)

To access the Reference field, locate a draft and click Select. Select Additional Information from the Form menu on the Drafts Entry form.

Understanding the Create Payment Control Groups Process for Japan

You must set up a unique version of the Create Payment Control Groups program to process accounts payable drafts for Japan. Set up the data selection for the version to specify the payment instrument for drafts or bank transactions. To specify the draft payment instrument, select user-defined code *D*. To specify the bank transaction payment instrument, select user-defined code *Q*.

Use the processing options for the new version to specify an override bank account number. The system uses the override account number as the short account ID of the draft payables account to which the drafts will be posted.

Set up the data selection for the version to specify your payment instrument for Japanese drafts and the original bank account number on the voucher records.

Processing Bank Transfers

You must also set up a unique version of the Create Payment Control Groups program to process accounts payable bank transfers for Japan. Set up the data selection for the version to specify the payment instrument for bank transfers.

When you run the Create Payment Control Groups program for bank transfers, the system:

- Calculates the appropriate bank charges and consumption tax for each transfer.
- Creates a separate pay item for each transfer to represent the bank charge, consumption tax, and adjustment amounts:
 - Pay item 997 represents the bank charge amount.
 - Pay item 998 represents the consumption tax amount.
 - Pay item 999 represents any adjustment amount.
- Reduces the total payment amount for the transfer by these amounts.
- Prints a report listing the bank charges.

Note. If you use accounts payable bank transfers for Japan, the system reserves voucher pay items 997, 998, and 999. You cannot use these voucher pay items in the base JD Edwards EnterpriseOne Accounts Payable system.

When you process accounts payable bank transfers for Japan, the system creates these journal entries for each transfer:

- Normal journal
- Bank charge journal
- Consumption tax journal
- Bank charge adjustment journal

To void the bank transfer, you must void all of the associated journals entries.

Working with Kagami Statements

This section provides an overview of Kagami statements and discusses how to:

- Print Kagami statements.
- Set processing options for Kagami Invoice Statement - Japan (R03B5001JP).

Understanding Kagami Statements

In Japan, bank transfers are the most commonly used method of payment. Japanese banks charge a fee for each transfer that a business requests. To help customers avoid excessive bank charges, a monthly summarized invoice, or *Kagami*, is issued as the general billing procedure for Japanese businesses.

Businesses that use monthly summarized invoicing do not issue invoices for every goods delivery. Instead, businesses establish a monthly cutoff date with the customer and issue one invoice that summarizes all of the customer's business transactions for the prior month.

Kagami statements include this information:

- Bill to name and address for the customer.
- Billing period.

Although billing periods vary by customer, the beginning of the period must be the day after the last cutoff date. The end of the previous period is the cutoff date.

- Open amount as of the cutoff date.

The open amount is summarized by sales, cash receipts, adjustments, and so on.

- Detailed information, such as invoice number, item number, and price, from each sales order.

Prerequisite

Verify that you have a next number set up for the summarized invoice number in the JD Edwards EnterpriseOne Accounts Receivable system. For this verification, use the next number for the Statement No. (statement number) field.

See *JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide*, "Setting Up the JD Edwards EnterpriseOne Accounts Receivable System," Setting Up Next Numbers for Accounts Receivable.

Printing Kagami Statements

To print Kagami statements, follow the A/R statement process, specifying Kagami Invoice Statement Japan (R03B5001JP) in the Print Program processing option of a copy of the XJDE0002 (Statement Refresh with Draft) version of the Statement Print with Draft program (R03B500X).

Setting Processing Options for Kagami Invoice Statement - Japan (R03B5001JP)

Processing options enable you to specify the default processing for programs and reports.

Print

Use these processing options to customize defaults for Kagami Invoice Statement Print - Japan (R03B01JP).

- | | |
|-----------------------------|--|
| 1. Aging Information | Specify whether to print aging information. Values are: Blank: The system does not print aging information. <i>1</i> : The system prints aging information. |
| 2. Account Summary | Specify whether to print the account summary. Values are: Blank: The system prints the account summary. <i>1</i> : The system does not print the account summary. |

| 6. Tax Information | Specify whether to print tax information on the invoice document level. Values are: Blank: The system does not print the tax information. <i>1</i> : The system prints the tax information. |
| 7. Sales Information | Specify whether to print sales information on the invoice. You can specify that the system prints information from the Sales Order Detail table (F4211) or from the Sales Order History table (F42119). Values are: Blank: The system does not print sales information. <i>1</i> : The system prints sales information from the F4211 table. <i>2</i> : The system prints sales information from the F42119 table. <i>3</i> : The system prints sales information from the F4211 table if it exists. If no data exist in the F4211 table, the system prints sales information from the F42119 table. |
| 8. Kagami Summary | Specify whether to print the Kagami summary. Values are: Blank: The system does not print the Kagami summary. <i>1</i> : The system prints the Kagami summary. |

Process

Use this processing option to customize invoice records when printing the Kagami invoice statement.

- | | |
|--------------------------|---|
| 1. Invoice Record | Specify whether to summarize each invoice record. Values are: Blank: The system does not summarize each invoice record. <i>1</i> : The system summarizes each invoice record. |
|--------------------------|---|

Calculating Withholding for Japan

This section provides an overview of the withholding process for Japan and discusses how to:

- Run the Calculate Withholding - Japan report.
- Set processing options for Calculate Withholding - Japan (R7500090).
- Set processing options for Country Specific Processing Options - Japan (P04580JP).

Understanding the Withholding Process

The Calculate Withholding - Japan (R7500090) program calculates the withholding for Japan, updates the status of the existing pay item, and creates these additional pay items:

- A negative pay item for the withholding amount with the same payee, pay status, and due date as the original voucher pay item.
- A positive pay item for the withholding amount using the tax authority in the supplier master record.

You can specify a different tax authority in the Tax Authority for A/P processing option.

If you leave the Withheld Pay Status Code processing option blank, the system assigns a pay status of *H* (hold) to pay items for tax authorities, thus enabling you to accumulate withholdings and pay them on a periodic basis.

You use the Withholding Tax Basis processing option to specify whether to calculate the withholding amount based on the gross amount or the taxable amount. If you use the taxable amount to calculate the withholding amount, the system returns an error for any pay item that does not have a taxable amount and does not process that pay item.

To calculate the correct withholding amounts for both taxable and non-taxable amounts, you must run the Calculate Withholding - Japan program twice: once, using the gross amount; and again, using the taxable amount. You can use data selection to select only non-taxable transactions when you run the Calculate Withholding - Japan program using the gross amount, and then run the Calculate Withholding - Japan program using the taxable amount for all remaining transactions. Or, you can run the Calculate Withholding - Japan program using the taxable amount, enabling the program to generate errors for all non-taxable transactions; and then run the Calculate Withholding - Japan program using the gross amount to calculate the withholding amount for those transactions.

The system stores the withholding information in the Withholding Tax Detail - Japan (F750411) table.

Additional results to consider are:

- If you change the default pay status of the original pay item, the system changes the default pay status for the negative pay item.
- The negative pay item offsets the amount of the original pay item when you process the original and negative pay items for payment.

Prerequisites

Before you complete the tasks in this section:

- Set up your suppliers with a payment instrument and withholding tax authority.

See [Chapter 86, “\(JPN\) Setting Up Country-Specific Functionality for Japan,” Setting Up Supplier Information for Japan, page 1493.](#)

- Set the processing options for Country Specific Processing Options - Japan (P04580JP) using the Interactive Versions program.
- Set the processing options for Calculate Withholding - Japan (R7500090), including the withheld record due date and the rounding.

Running the Calculate Withholding - Japan Report

Select Japanese Localization (G75J), Calculate Withholding - Japan.

Setting Processing Options for Calculate Withholding - Japan (R7500090)

Processing options enable you to specify the default processing for programs and reports.

Process

- | | |
|---|---|
| 1. Release Pay Status Code | Enter a value from the Payment Status Codes (00/PY) UDC to specify the pay status that the system assigns to the voucher to be released for payment. If you leave this processing option blank, the system uses <i>A</i> . |
| 2. Withheld Pay Status Code | Enter a value from the Payment Status Codes (00/PY) UDC to specify the pay status that the system assigns to the withheld pay item. If you leave this processing option blank, the system uses <i>H</i> for the default value. |
| 3. Withheld Record Due Date | Assign the due date to the withheld pay item. If you leave this processing option blank, the system assigns the voucher's due date. |
| 4. Rounding | <p>Specify the method of rounding. Values are:</p> <p>Blank: Round to the nearest integer.</p> <p>1: Round down.</p> <p>2: Round up.</p> <p>Examples of rounding down:</p> <p>Amount of 1,500.15 is rounded to 1,500.00.</p> <p>Amount of 1,500.65 is rounded to 1,500.00.</p> <p>Example of rounding up:</p> <p>Amount of 1,500.15 is rounded to 1,501.00.</p> |
| 5. G/L Offset | Enter the GL offset AAI PC to assign to the withheld pay item. This offset should represent the withholding account. |
| <hr/> <p>Note. Do not use code 9999. It is reserved for the post program and indicates that offsets should not be created.</p> <hr/> | |
| 6. G/L Bank Account | Assign the GL bank account to the withheld pay item. If you leave this processing option blank, the system assigns the bank account from AAI item PB. |

Taxes

1. Tax Authority for A/P Withholding

Enter an override tax authority that the system assigns to the Alt Payee (Alternate Payee) field in the withholding entry. If you leave this processing option blank, the system retrieves the tax authority from the address book record of the supplier.

Setting Processing Options for Country Specific Processing Options - Japan (P04580JP)

Processing options enable you to specify the default processing for programs and reports.

Defaults

1. Tax Authority Search Type

Enter a value from the Search Type (01/ST) UDC table to identifies the type of address book record the system finds when you conduct a search.

Processing Hankin Hante Payments for Japan

This section provides an overview of processing *hankin hante* payments for Japan and discusses how to:

- Run the Automatic Payment Split - Hankin Hante program.
- Set processing options for Automatic Payment Split - Hankin Hante (R75J04PS).

Understanding the Hankin Hante Split Payment Process

Hankin hante is a Japanese payment method to automatically split Accounts Payable payments. Payments over a designated amount are split into two smaller payments of different payment instruments— typically, a bank transfer and a draft. Splitting payments by using the *hankin hante* method is a general business practice in Japan because it enables companies to improve cash flow by deferring payment.

The Japanese government imposes a stamp tax on bank drafts. The amount of the stamp tax is determined by the draft amount. As a general practice, Japanese businesses split draft payments into two or more smaller drafts so that they pay less stamp tax.

For example, the stamp tax for a draft of 8,000,000 JPY is 2,000 JPY, the stamp tax for a 5,000,000 JPY draft is 1,000 JPY, and the stamp tax for a draft of 3,000,000 JPY is 600 JPY. Splitting an 8,000,000 JPY draft into two drafts of 5,000,000 JPY and 3,000,000 JPY saves 400 JPY in stamp tax.

To split Accounts Payable payments into payments of different types, complete the following steps:

1. Set up your system for *hankin hante* payments:
 - Define the split amounts for drafts and for bank transfers in the Hankin Hante Split Amounts program (P75J0411).
 - Assign the same payment instrument to each *hankin hante* supplier.
 - Complete the Draft Ratio field on the Address Book Revision Japan form. You complete this form when you enter additional information for suppliers.
2. Use the Create Payment Control Groups program (R04570) to create preliminary payment control groups.

3. Run the Automatic Payment Split - Hankin Hante program (R75J04PS) in proof mode to review the *hankin hante* payment splits.
4. Run the Automatic Payment Split - Hankin Hante program in final mode.
5. Run the Create Payment Control Groups program to create payment control groups for the newly split bank transfers and drafts.
6. Run the Work With Payment Groups program (P04571) to write and update draft and bank transfer payments.
7. Run the Batches program (P0011) to review draft and bank transfer payments.
8. Run the General Ledger Post Report program (R09801) to post draft and bank transfer payments to the general ledger.
9. Run the Automatic Draft Split - Hankin Hante (R75J04DS) program in proof mode to review the split of the *hankin hante* draft payments.
10. Run the Automatic Draft Split - Hankin Hante program in final mode.
11. Run the Bank Draft Number Revision-Japan program (P75301) to update the draft number and change the maturity date.
12. Run the Manual Draft Split - Hankin Hante program (P75J04DS) to manually split drafts that could not be split automatically.
13. Run the A/P Draft Payable List program (R75402) to print the draft report.
14. Run the A/P Drafts Inquiry/Selection program (P04260) to select drafts for settlement.
15. Run the Post Drafts Payable program (R04803) to post the drafts to the general ledger.

Automatically Splitting Payments in Japan

You run the Automatic Payment Split - Hankin Hante program after you run the Create Payment Control Groups program. When you run the Automatic Payment Split - Hankin Hante program in final mode, the system splits *hankin hante* payments into bank transfers and drafts. You specify in processing options the payment type for *hankin hante* payments and the payment types for drafts and bank transfer. The system splits the amount for each supplier into bank transfers and drafts according to the split amounts that you set up in the Hankin Hante Split Amounts program and the draft ratio that you specify when you set up the supplier master information.

When the system splits the payment into a draft and bank transfer:

- The vouchers are restored to an unpaid, approved status.
- The payment instrument for each voucher changes to either a draft or bank transfer, and if necessary, the system splits the one pay item into two pay items.

You specify the payment instruments for the *hankin hante* payments that you want to split and the payment instruments for drafts and bank transfers in the processing options. The *hankin hante* payment instrument determines which payment workfile records the system selects for processing. In final mode, the system assigns the draft and bank transfer payment instruments to the F0411 table records for each payment that is split into drafts and bank transfers. You set up payment instruments in the Payment Instrument (00/PY) UDC.

When you run the Automatic Payment Split - Hankin Hante program, the system processes only the payment control groups that are at a *Write* status and that are of the payment instrument type that you specify for *hankin hante* payments.

You can specify in the processing options the version of the Create Payment Control Groups program that the Automatic Payment Split - Hankin Hante batch process runs as the final step when you run the Automatic Payment Split - Hankin Hante program in final mode. If you do not specify a version for the Create Payment Control Groups program in the Automatic Payment Split - Hankin Hante program, you must run the Create Payment Control Groups process manually.

The report for the Automatic Payment Split - Hankin Hante program includes this information in the detail section:

- Payee number
- Payee name
- Payment type
- Document number
- Company
- Original pay item
- Original amount
- Draft payment
- Bank transfer payment
- New pay items

If you have not set up the F75J04SA table with the payment split amounts, the report prints an error message and the system does not process any records.

Example of Automatically Splitting Hankin Hante Payments

Suppose that your company has defined the split for *hankin hante* payments in 1,000,000 JPY increments. Suppose further that you set up and assigned a payment type of *H* to suppliers for *hankin hante* payments and that you set up the draft ratio for your suppliers as shown in Table 1.

Table 1 (Draft Ratios)

This table shows the draft ratio for your suppliers:

| Supplier | Payment Instrument | Draft Ratio |
|----------|--------------------|-------------|
| 5001 | H | 50 percent |
| 5002 | H | 75 percent |
| 5003 | H | 50 percent |
| 5004 | H | 50 percent |
| 5005 | H | 0 percent |

You run the Create Payment Control Groups program to create payment workfile records for H-type payment instruments, and then run the Automatic Payment Split - Hankin Hante program to split the H-type payment records into bank transfers and drafts.

The system splits the payment amount that is due to each supplier according to the split amounts in the F75J04SA table and the draft ratio for each supplier. The system first verifies that the payment amount is at least equal to the lowest split amount in the F75J04SA table. If the payment amount is greater than or equal to the lowest amount in the table, the system processes the amount that is due to the supplier according to the supplier's draft ratio. If the payment amount is not at least the amount of the lowest split amount, the system processes the amount that is due as a draft.

Table 2 (Supplier Payments)

This table shows how the system would split *hankin hante* payments for the suppliers who are listed in Table 1:

| Supplier | Original Payment Amount | Draft Payment | Bank Transfer Payment |
|----------|-------------------------|---------------|-----------------------|
| 5001 | 4,000,000 | 2,000,000 | 2,000,000 |
| 5002 | 4,000,000 | 3,000,000 | 1,000,000 |
| 5003 | 1,500,000 | 750,000 | 750,000 |
| 5004 | 1,000,000 | 1,000,000 | |
| 5005 | 1,000,000 | | 1,000,000 |

Table 3 (Supplier 5001 Vouchers)

Suppose supplier 5001 has three vouchers that total 4,000,000 JPY:

| Voucher | Original Payment Amount |
|-------------|-------------------------|
| PV 1234 001 | 1,000,000 |
| PV 1235 001 | 2,000,000 |
| PV 1236 001 | 1,000,000 |

Supplier 5001 has a draft ratio of 50 percent. This situation means that up to 50 percent of the amount due can be sent as a draft. Since 50 percent of the original amount is equal to one of the levels in the F75J04SA table, the payment is split into a draft of 2,000,000 JPY and a bank transfer of 2,000,000 JPY. The system does the following to accomplish the split:

- Resets PV 1234 001 from payment instrument H (hankin hante) to payment instrument D (draft).
- Splits PV 1235 001 into two pay items.
Pay item 001 is reset to payment instrument of D (draft) and the amount is changed to 1,000,000 JPY. Pay item 002 has a payment instrument of W (bank transfer) and is 1,000,000 JPY.
- Resets PV 1236 001 from payment instrument H (hankin hante) to payment instrument W (bank transfer).

Table 4 (Supplier 5001 Splits)

This table shows the results of the payment split for supplier 5001:

| Voucher | Original Payment Amount | Draft Payment | Bank Transfer Payment |
|-------------|-------------------------|---------------|-----------------------|
| PV 1234 001 | 1,000,000 | 1,000,000 | NA |
| PV 1235 001 | 2,000,000 | 1,000,000 | NA |
| PV 1235 002 | NA | NA | 1,000,000 |
| PV 1236 001 | 1,000,000 | NA | 1,000,000 |

The total of the original payment amount is 4,000,000. The total of the draft payment is 2,000,000. The total of the bank transfer is 2,000,000.

Table 5 (Supplier 5002 Vouchers)

Suppose supplier 5002 has three vouchers that total 4,000,000 JPY:

| Voucher | Original Payment Amount |
|-------------|-------------------------|
| PV 2234 001 | 1,000,000 |
| PV 2235 001 | 2,000,000 |
| PV 2236 001 | 1,000,000 |

Supplier 5002 has a draft ratio of 75 percent. This situation means that up to 75 percent of the amount that is due can be sent as a draft. Since 75 percent of the original amount is equal to one of the levels in the in the F75J04SA table, the system splits the original amount into a draft that is equal to 75 percent of the original amount and a wire transfer that is equal to 25 percent of the original amount. The system does the following to accomplish the split:

- Resets PV 2234 001 and PV 2235 001 from payment instrument H (hankin hante) to payment instrument D (draft).
- Resets PV 2236 001 from payment instrument H (hankin hante) to payment instrument W (bank transfer).

Table 6 (Supplier 5002 Splits)

This table shows the results of the payment split for supplier 5002:

| Voucher | Original Payment Amount | Draft Payment | Bank Transfer Payment |
|-------------|-------------------------|---------------|-----------------------|
| PV 2234 001 | 1,000,000 | 1,000,000 | NA |
| PV 2235 001 | 2,000,000 | 2,000,000 | NA |
| PV 2236 001 | 1,000,000 | NA | 1,000,000 |

The total of the original payment amount is 4,000,000. The total of the draft payment is 3,000,000. The total of the bank transfer is 1,000,000.

Suppose supplier 5003 has one voucher of 1,500,000 JPY. Supplier 5003 has a draft ratio of 50 percent. This situation means that up to 50 percent of the amount due can be sent as a draft. Since 50 percent of the original amount is less than the lowest split amount in the F75J04SA table, the system splits the original amount into a draft that is equal to 50 percent of the original amount and a wire transfer that is equal to 50 percent of the original amount. The system splits PV 3235 001 into two pay items to accomplish the split. Pay item 001 is reset to payment instrument D (draft), and the amount is changed to 750,000 JPY. Pay item 002 has a payment instrument of W (bank transfer) and is 750,000 JPY.

Table 7 (Supplier 5003 Splits)

This table shows the results of the payment split for supplier 5003:

| Voucher | Original Payment Amount | Draft Payment | Bank Transfer Payment |
|-------------|-------------------------|---------------|-----------------------|
| PV 3234 001 | 1,500,000 | 750,000 | NA |
| PV 3234 002 | NA | NA | 750,000 |

Suppose supplier 5004 has one voucher of 1,000,000 JPY. Since 1,000,000 is equal to the lowest split amount in the F75J04SA table, the system processes the entire payment as a draft and does not consider the supplier's draft ratio. The system resets PV 4234 001 from payment instrument H (Hankin Hante) to payment instrument D (draft) to process the payment.

Table 8 (Supplier 5004 Splits)

This table shows the result of the R75J04PS process for supplier 5004:

| Voucher | Original Payment Amount | Draft Payment | Bank Transfer Payment |
|-------------|-------------------------|---------------|-----------------------|
| PV 4234 001 | 1,000,000 | 1,000,000 | none |

Suppose supplier 5005 has one voucher of 1,000,000 JPY. This supplier has a draft ratio of zero percent, so the system processes the entire amount that is due as a bank transfer. The system resets PV 5234 001 from payment instrument H (hankin hante) to payment instrument W (bank transfer) to process the payment.

Table 9 (Supplier 5005 Splits)

This table shows the result of the R75J04PS process for supplier 5005:

| Voucher | Original Payment Amount | Draft Payment | Bank Transfer Payment |
|-------------|-------------------------|---------------|-----------------------|
| PV 5234 001 | 1,000,000 | none | 1,000,000 |

Running the Automatic Payment Split - Hankin Hante Program

Select Japanese Localization menu (G75J), Automatic Payment Split - Hankin Hante.

Setting the Processing Options for Automatic Payment Split - Hankin Hante (R75J04PS)

Process

- | | |
|--|---|
| 1. Proof or Final Mode | Enter <i>1</i> to run process in final mode. The system restores the vouchers to an unpaid approved status, updates the F0411 table, and prints the report. If you leave this processing option blank, the system generates and prints a report without performing any updates. |
| 2. Draft Payment Instrument | Enter a value that exists in the Payment Instrument UDC table (00/PY) to specify the type of payment instrument that the system assigns to the voucher pay items for the split payment that is paid by the draft. |
| 3. Bank Transfer Payment Instrument | Enter a value that exists in the Payment Instrument UDC table (00/PY) to specify the type of payment instrument that the system assigns to the remaining voucher pay items of the split payment to be paid by bank transfer. |

Select

- | | |
|---|--|
| 1. Hankin Hante Payment Instrument | Enter a value that exists in the Payment Instrument UDC table (00/PY) to specify the type of payment instrument that the system splits into draft and bank transfer payments. The system selects for processing only the unwritten payment control groups of the payment instrument type that you specify. |
|---|--|

Versions

- | | |
|--|--|
| 1. Create Payment Control Groups (R04570) | Specify the version that the system uses to create new payment groups. If you enter a version, the system automatically runs the specified version of the Create Payment Control Groups program after splitting the <i>hankin hante</i> payments into draft and bank transfer payments. If you leave this processing option blank, you must run the Create Payment Control Group process manually. |
|--|--|

Processing Accounts Payable Drafts in Japan

In addition to the base software processes, processing accounts payable drafts in Japan also involves splitting drafts, printing the Stamp Tax Calculation Report - Japan, and entering bank-assigned draft numbers. You can also create drafts using the Payment with Voucher Match program (P0413M) if you need to remit payment to a supplier immediately.

This section provides overviews of splitting drafts in Japan, the Stamp Tax Calculation Report - Japan, and entering bank-assigned draft numbers and discusses how to:

- Manually split drafts.
- Run the Automatic Draft Split - Hankin Hante report.
- Set processing options for Automatic Draft Split - Hankin Hante (R75J04DS).
- Print the Stamp Tax Calculation Report - Japan.
- Set processing options for the Stamp Tax Calculation Report - Japan.

- Enter bank-assigned draft numbers.

Understanding the Process to Split Drafts

You split drafts to minimize the amount of stamp tax that you must pay. In the processing options for the Automatic Draft Split - Hankin Hante program (R75J04DS), you can specify whether the system splits drafts according to the split amounts that you specify in the Hankin Hante Split Amounts table (F75J04SA) or according to the fixed amount that you specify in the processing options. You set up the amounts in table F75J04SA by using the Hankin Hante Split Amounts program (P75J0411).

If you choose to split the drafts using the amounts in the F75J04SA table, you can also select whether to limit the number of splits. When you limit the number of splits, you limit the number of drafts. For example, if you specify that two splits are allowed, the maximum number of drafts is three (the original draft plus the two drafts that are split from the original).

The system processes only pending drafts that have a document type of P1, a pay status of D, and that are eligible for splitting. Eligible drafts are those that have amounts greater than the fixed amount which is specified, if the fixed-amount split method is selected in the processing options, or that have amounts greater than the lowest table-split amount if that split method is selected.

The report for the Automatic Draft Split - Hankin Hante program includes:

- Payee number
- Payee name
- Payment type
- Document number
- Company
- Original pay item
- Original draft amount
- Split draft amounts
- New pay items

The system produces a report when you run the Automatic Draft Split - Hankin Hante program in proof and final mode. Additionally, when you run the program in final mode, the system:

- Splits the original drafts into smaller drafts.
- Retains the original pay item for one draft.
- Creates new pay items for the new drafts.
- Updates the F0411 table with the new draft amount for the original pay item, and the new pay items and amounts for the new drafts.

If you set the Draft Split Method processing option to process splits by using table amounts and you have not set up the table amounts, or you set the processing option to process splits by using a fixed amount and you have not specified an amount in the Fixed Split Amount processing option, the system does not process the splits; the report contains an error message.

Example of Automatic Draft Splits using the Table Amounts Method

Suppose your company has defined split amounts for drafts as shown in this table:

| Split Type | Amount |
|------------|------------|
| Draft | 1,000,000 |
| Draft | 2,000,000 |
| Draft | 3,000,000 |
| Draft | 5,000,000 |
| Draft | 10,000,000 |

Suppose further that you set the Draft Split Method processing option to process splits using table amounts and do not specify a maximum number of splits. When you run the Automatic Draft Split - Hankin Hante program, the system splits an 18,500,000 JPY draft into four drafts:

- The original draft amount of 18,500,000 JPY is greater than the last (highest) draft split amount of 10,000,000 JPY, so the system changes the amount for that pay item to 10,000,000 JPY.
- The remaining 8,500,000 JPY is greater than the fourth split amount of 5,000,000 JPY, so the system creates a second pay item for 5,000,000 JPY.
- The remaining 3,500,000 JPY is greater than the third split amount of 3,000,000 JPY, so the system creates a third pay item for 3,000,000 JPY.
- The remaining 500,000 JPY is less than the first (lowest) split amount, so the system creates a fourth pay item for 500,000 JPY.

This table shows how the system split the original draft:

| Original Draft | Original Draft Amount | Split Drafts | Splits Draft Amounts |
|----------------|-----------------------|--------------|----------------------|
| P1 1234 001 | 18,500,000 | P1 1234 001 | 10,000,000 |
| | | P1 1234 002 | 5,000,000 |
| | | P1 1234 003 | 3,000,000 |
| | | P1 1234 004 | 500,000 |

If you process the same original draft of 18,500,000 JPY and set the Maximum Number of Splits processing option to 2, the system splits the draft as follows:

- The original draft amount of 18,500,000 JPY is greater than the last (highest) draft split amount of 10,000,000 JPY, so the system changes the amount for that pay item to 10,000,000 JPY.
- The remaining 8,500,000 JPY is greater than the fourth split amount of 5,000,000 JPY, so the system creates a second pay item for 5,000,000 JPY.
- The system creates a third pay item for the remaining 3,500,000 JPY because three is the maximum number of drafts allowed when you set the maximum number of splits to two.

This table shows how the system split the original draft:

| Original Draft | Original Draft Amount | Split Drafts | Splits Draft Amounts |
|----------------|-----------------------|--------------|----------------------|
| P1 1234 001 | 18,500,000 | P1 1234 001 | 10,000,000 |
| | | P1 1234 002 | 5,000,000 |
| | | P1 1234 003 | 3,500,000 |

Example of Automatic Draft Splits using the Fixed Amounts Method

Suppose that you set the Draft Split Method processing option to process splits using a fixed amount, and you set the Fixed Split Amount processing option to 1,000,000 JPY. When you run the Automatic Draft Split - Hankin Hante program, the system splits a 3,500,000 JPY draft into four drafts:

- The original draft amount of 3,500,000 JPY is greater than the specified split amount of 1,000,000 JPY, so the system changes the amount for that pay item to 1,000,000 JPY.
- The remaining 2,500,000 JPY is greater than the specified split amount of 1,000,000 JPY, so the system creates a second pay item for 1,000,000 JPY.
- The remaining 1,500,000 JPY is greater than the specified split amount of 1,000,000 JPY, so the system creates a third pay item for 1,000,000 JPY.
- The remaining 500,000 JPY is less than the specified split amount of 1,000,000 JPY, so the system creates a fourth pay item for 500,000 JPY.

This table shows how the system split the original draft:

| Original Draft | Original Draft Amount | Split Drafts | Splits Draft Amounts |
|----------------|-----------------------|--------------|----------------------|
| P1 4321 001 | 3,500,000 | P1 4321 001 | 1,000,000 |
| | | P1 4321 002 | 1,000,000 |
| | | P1 4321 003 | 1,000,000 |
| | | P1 4321 004 | 500,000 |

Understanding the Stamp Tax Calculation Report

When businesses in Japan issue drafts for payment, they are required to pay a stamp tax. The tax amount depends on the amount of the draft. Use the Stamp Tax Calculation report to report and remit a stamp tax for each voucher that is paid with a draft. The system generates this report based on the amount of the draft and the information in the Stamp Tax - Japan table (F75013).

Understanding How to Enter Bank-Assigned Draft Numbers

In Japan, banks assign a bank draft number to all draft transactions. Businesses are required to include the bank draft number on all draft reporting.

Bank draft numbers are alphanumeric codes that you can input and revise manually. You can also use the number to review your drafts.

Prerequisite

Set up the Stamp Tax - Japan table (F75013).

See Chapter 86, “(JPN) Setting Up Country-Specific Functionality for Japan,” Setting Up the Stamp Tax Table, page 1499.

Forms Used to Process Drafts for Japan

| Form Name | FormID | Navigation | Usage |
|----------------------------|-----------|---|---|
| Split Drafts Pending | W75J04DSA | Japanese Localization (G75J), Bank Draft Number Revision On the Bank Draft Number Revision form, select Split from the Row menu. | Split drafts. The system displays the unallocated amount in the Remaining Amount field. You must specify one or more drafts for this amount until the amount displayed is 0. The new draft has the same document number, document type, and document company as the original draft. The pay item for the new draft is the next pay item number. The OK button is disabled until the amount in the Remaining Amount field is 0. |
| Bank Draft Number Revision | W75301C | Japanese Localization (G75J), Bank Draft Number Revision | Locate specific drafts and enter the bank-assigned draft numbers. |

Manually Splitting Drafts

Access the Split Drafts Pending form.

Running the Automatic Draft Split - Hankin Hante Report

Select Japanese Localization (G75J), Automatic Draft Split - Hankin Hante.

Setting Processing Options for Automatic Draft Split - Hankin Hante (R75J04DS)

Processing options enable you to specify the default processing for programs and reports.

Process

1. Proof or Final Mode

Leave this processing option blank to run the report in proof mode. The system prints an edit report and does not update any records. Enter 1 to run the report in final mode. The system splits the selected drafts, updates the F0411 table, and prints a report.

2. Draft Split Method

Specify the method that the system uses to split the selected drafts. If you select the fixed amount method, you must enter an amount in the Fixed Split Amount processing option in the R75J04DS program. Values are:

1: Fixed amount method. The system splits the selected drafts according to the amount that you enter in the Fixed Split Amount processing option. For example, if you enter 1,000,000, the system splits a draft of 3,000,000 into three drafts of 1,000,000 each, and splits a draft of 1,500,000 into one draft of 1,000,000 and one draft of 500,000.

2: Table amounts method. The system splits the selected drafts based on the amounts set up for drafts in the Hankin Hante Split Amounts table (F75J04SA).

3. Fixed Split Amount

Specify the amount of the fixed split when you use the fixed amount method to split drafts. You must enter an amount in this processing option if you set the Draft Split Method processing option in this program to *1* (Fixed amount). The system ignores this processing option if you set the Draft Split Method processing option to *2* (Table amount).

4. Maximum Number of Splits

Specify the maximum number of times that the system splits selected drafts into smaller drafts when you set the Draft Split Method processing option to *2* (Table amounts). When you set the Draft Split Method processing option to *2* and specify a maximum number of splits in this processing option, the system splits the original drafts into smaller drafts according to the draft split amounts in the Hankin Hante Split Amounts table (F75J04SA), but limits the number of times it splits the original drafts.

For example, if the F75J04SA table specifies draft split levels of 1,000,000, 3,000,000, 5,000,000, and 10,000,000, and you enter 2 for this processing option, the system splits an original draft of 19,500,000 two times, which results in three drafts (the original draft and two new drafts). In this example, the draft amounts would be 10,000,000, 5,000,000, and 4,500,000. If you did not specify a maximum number of splits in this processing option, the system would split the original draft into drafts of 10,000,000, 5,000,000, 3,000,000, 1,000,000, and 500,000.

If you leave this processing option blank and you set the Draft Split Method processing option for this program to *2* (Table amounts), the system does not limit the number of splits. The system ignores this processing option if you set the Draft Split Method processing option to *1* (Fixed amount).

Running the Stamp Tax Calculation Report

Select Japanese Localization (G75J), Stamp Tax Calculation Report - Japan.

Setting Processing Options for Stamp Tax Calculation Report - Japan (R750403)

Processing options enable you to specify the default processing for programs and reports.

Process**1. Mode**

Enter *1* to process stamp tax calculations in final mode.

Entering Bank-Assigned Draft Numbers

Access the Bank Draft Number Revision form.

Draft Number

Enter the number that identifies the original document, such as a voucher, invoice, or journal entry. On entry forms, you can assign the document number or let the system assign it using the Next Numbers program (P0002). Matching document numbers (DOCM) identify related documents in the JD Edwards EnterpriseOne Accounts Receivable and JD Edwards EnterpriseOne Accounts Payable systems.

Bank Draft Number

Enter the supplier's invoice number that is used for voucher entry. Voucher entry enables only one invoice per voucher number. If multiple invoice numbers exist on a voucher, you must set them up as multiple vouchers or combine the invoices and enter them as one voucher. Depending on how you have your accounts payable constants set, the system can:

- Accept a duplicate invoice number without warning or error.
- Generate a warning message in which the duplicate invoice number can still be accepted.
- Generate an error message.

Blank values are treated in the same manner as any other invoice number. Two blank invoice numbers are treated as duplicates. To test for duplicate invoice numbers that might have been entered in error, run the Suspected Duplicate Payments report (R04601).

The duplicate invoice number validation is not run for vouchers with document type NO. These vouchers are created by the Generate Reimbursements program (R03B610).

Cleared Date

Enter the date that the payment amount was debited or credited to the bank account. The value date is not the date the bank reconciled the payment. Automatic payments populate this field automatically. If you are making manual payments and have set a processing option to display the value date field, you can manually enter the value date here.

Processing Bank Information in Japan

This section provides an overview of Japanese bank transfers and discusses how to:

- Upload Japanese bank and branch information.
- Set processing options for Bank/Branch Table Upload - Japan (R75010A).
- Revise Japanese bank and branch information.
- Enter Japanese bank charges.

Understanding Japanese Bank Transfers

Bank transfers are commonly used in Japan to move funds between bank accounts. The Japanese Bank Association (JBA) has defined detailed standards regarding fund transfers that include:

- Bank transfer tape format.
- Bank charges applied to transfers.
- Consumption taxes assessed on bank charges.

In Japan, businesses can remit payment by electronic or paper bank transfers. To process any bank transfer, banks require:

| Requirement | Explanation |
|--|---|
| Bank/branch number | Every bank and bank branch through which a transfer is processed can be identified by a bank/branch number. Bank/branch numbers are assigned to banks by the JBA. Businesses should validate these numbers to prevent incurring a bank charge for the submission of invalid bank information. |
| Payor and payee bank account information | The bank account information for the payor and the payee consists of an account number and an account type. These account types are possible: <ul style="list-style-type: none"> • Savings • Current • Deposit • Other |
| Bank transfer payor number | A bank transfer number is assigned to each payor by the bank. |
| Transfer type | Businesses can select these transfer types: <ul style="list-style-type: none"> • Express with bank charges • Letter with bank charges • Express without bank charges • Letter without bank charges |

Bank Charges

Banks levy a service charge on each transfer that they process. The amount of the service charge is based on:

- The actual amount of the transfer (also referred to as the treating amount).
- Whether the transfer is an express or letter transfer.
- Whether the transfer is an internal or external bank transfer.
- Whether the transfer is an internal or external branch transfer.

Either the customer or the supplier agrees to pay the bank charges. The amount of the transfer is the total payment amount minus the bank charges and tax.

In addition, the service charge for each bank transfer is subject to consumption tax. In some cases, the addition of the consumption tax on the amount of the transfer moves the transfer into another treating charge category. When this happens, the transfer becomes subject to a lower service charge, and the business must recognize an adjustment for the transfer.

The bank transfer type is payee-specific and is stored in the F750401 table. You can access the information that is stored in this table by choosing Regional Info from the Form menu of the Supplier Master Information form.

Payor and Payee Bank Account Information

You use the Bank Account Information program (P04130) to set up bank account information for payors and assign a record type of *G* to the record. You use the Bank Account Cross Reference (P0030) program to set up bank account information for payees and assign a record type of *V* to the record. The system stores bank account information for payors and payees in the Bank Transit Master (F0030) table.

Chapter 86, “(JPN) Setting Up Country-Specific Functionality for Japan,” Setting Up UDCs for Bank Accounts for Japan, page 1492

Chapter 87, “(JPN) Working with Other Functionality for Japan,” Understanding the Create Payment Control Groups Process for Japan, page 1505

Forms Used to Set Up Japanese Bank Information

| Form Name | FormID | Navigation | Usage |
|------------------------|----------|---|--|
| Work with Bank - Japan | W7530JPA | Japanese Localization (G75J), Bank/Branch/Charge Revision | Review a list of existing banks. |
| Bank Revision - Japan | W7530JPB | On the Work with Bank - Japan form, click Add. | Set up bank and branch information. |
| Bank/Branch Revision | W7530JPC | On the Work with Bank - Japan form, select Bank/Branch from the Row menu. | Revise bank and branch information. |
| Bank Charge Revision | W7530JPD | On the Work with Bank - Japan form, select Bank Charge from the Row menu. | Enter bank charge information for Japan. |

Uploading Japanese Bank and Branch Information

Select Japanese Localization (G75J), Bank/Branch Table Upload.

In Japan, banks and bank branches are identified by a bank number and a branch number. These numbers are assigned to banks by the JBA

You can upload the latest bank and branch information from the JBA into a table on your system. When you process bank transfers, the system validates the bank numbers and branch numbers for each transfer against values in the table.

The Bank/Branch Table Upload program creates the Bank/Branch Master - Japan table (F75010) and prints a report that lists:

- Total number of bank records added.
- Total number of branch records added.
- Total number of records read.

Use processing options to replace all of the existing records in the F75010 table or to add only those records that do not already exist in the table.

Setting Processing Options for Bank/Branch Table Upload - Japan (R75010A)

Processing options enable you to specify the default processing for programs and reports.

File

The two processing options on the File tab are for future use.

Update

- 1. Enter '1' to REPLACE records in file. Default is ADD record to file. Replace or Add.**
- Specify whether the system replaces records in the file. Values are:
Blank or 0: Add record to file.
1: Replace records in file.

Revising Japanese Bank and Branch Information

Access the Bank/Branch Revision form.

Bank Name (Secondary Alpha) Enter an alternate name field in the JD Edwards EnterpriseOne Address Book system to accommodate double-byte coding.

Bank Name (Alpha Name) Enter the text that names or describes an address. This 40-character alphabetic field appears on a number of forms and reports. You can enter dashes, commas, and other special characters, but the system cannot search on them when you use this field to search for a name.

Entering Japanese Bank Charges

Access the Bank Charge Revision form.

Bank/Branch/Charge Revision - Bank Charge Revision

OK Delete Cancel Tools

Bank Code 0001 Currency Code JPY

| Records 1 - 3 | | | | | |
|--------------------------|-----------------|------------------|-----------------|------------------|-----------------|
| | Treating Amount | In-Branch Charge | In-Branch C-Tax | Ex-Branch Charge | Ex-Branch C-Tax |
| <input type="checkbox"/> | 29,999 | 100 | 5 | 200 | 10 |
| <input type="checkbox"/> | 9,999,999,999 | 500 | 25 | 600 | 30 |

Bank Charge Revision form

Treating Amount Enter the amount of the payment in the JD Edwards EnterpriseOne Accounts Payable system.

In the JD Edwards EnterpriseOne Accounts Receivable system, the amount of the receipt. This amount must balance to the total amount applied to the invoice pay items.

| | |
|-----------------------------|--|
| | The total amount of the invoices or vouchers in a payment group that is submitted to a bank for processing. |
| In-Branch Charge | Enter the bank charge fee assessed when the payor's bank account and the payee's bank account are in the same branch and bank. |
| In-Branch C-Tax | Enter the consumption tax assessed on the bank charge when the payor's bank account and the payee's bank account are in the same branch and bank. |
| Ex-Branch Charge | Enter the bank fee that is assessed when the payor's bank account and payee's bank account are in different branches of the same bank. |
| Ex-Branch C-Tax | Enter the consumption tax assessed on the bank charge when the payor's bank account and the payee's bank account are in different branches of the same bank. |
| Express-Trans Charge | Enter the bank charge for a type E bank transfer (Express Transfer). This charge is assessed when the payor's bank account and the payee's bank account are in different banks. |
| Express-Trans C-Tax | Enter the amount of consumption tax assessed on a bank charge for bank transfer types E (Express Transfer). A bank charge is assessed when the payor's bank account and the payee's bank account are in different banks. |
| Letter-Trans Charge | Enter the bank charge for type L bank transfers (Letter Transfer). This charge is assessed when the payor's bank account and the payee's bank account are in different banks. |
| Letter-Trans C-Tax | Enter the consumption tax amount assessed on the bank charge for a type L bank transfer. This tax is assessed when the payor's bank account and the payee's bank account are in different banks. |

PART 20

Mexico

Chapter 88

(MEX) Understanding Country-Specific Functionality for Mexico

Chapter 89

(MEX) Setting Up Country-Specific Functionality for Mexico

CHAPTER 88

(MEX) Understanding Country-Specific Functionality for Mexico

This chapter discusses:

- Mexico-specific setup and processes.
-

Mexico-Specific Setup and Processes

This table lists the country-specific setup and functionality for Mexico.

| Setup or Process | Description |
|--------------------------|--|
| VAT processes for Mexico | <p>In addition to setting up tax information in the base software, Mexico-specific setup for tax processing includes:</p> <ul style="list-style-type: none">• VAT (value-added taxes) setup for payments and receipts.• Processing VAT and the general ledger. <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Setting Up Tax Information,” (MEX) Setting Up VAT on Payments and Receipts.</p> <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Working With VAT Processing,” (MEX) Processing VAT and the General Ledger.</p> |

CHAPTER 89

(MEX) Setting Up Country-Specific Functionality for Mexico

This chapter provides overviews of processing VAT on payments and receipts for Mexico, processing VAT and the general ledger, and discusses how to:

- Set processing options for POs Redistribute AP VAT - Mexico (R76M1630).
- Set processing options for POs Redistribute AR VAT - Mexico (R76M1010).
- Review Mexican VAT transactions.

Working with the Setup for Processing VAT on Payments and Receipts for Mexico

You must complete this setup before processing Mexican VAT transactions.

Discounts and Write-Offs

Discounts (AP and AR) and Write-offs (AR) proportionally decrease the amount of the suspense VAT during the post of the receipt or payment.

To calculate discounts and write-offs correctly, you must complete this setup:

- Select these options in the Tax Rules program (P0022) for both the JD Edwards EnterpriseOne Accounts Payable and JD Edwards EnterpriseOne Accounts Receivable systems:
 - Tax on Gross including Discount.
 - Discount on Gross Including Tax.
- Set the processing options on the Taxes tab for the General Ledger Post Report program (R09801) as:
 - Update Tax File = 3 (for all Tax Explanation Codes).
 - Adjust V.A.T. Account for Discount Taken = 2 (Update VAT, Ext. Price and Taxable).
- Adjust V.A.T. Account for Receipt Adjustments and Write Offs = 2 (Update VAT, Ext. Price and Taxable).

See *JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide*, “Setting Up Tax Information,” Setting Up Tax Rules.

GL Date for Vouchers and Invoices

For Mexican VAT calculations, you must set the Service/Tax Date processing option on these master business functions to use the GL date:

- Voucher Entry MBF Processing Options (P0400047).

- Invoice Entry MBF Processing Options (P03B0011).

Automatic Accounting Instructions

To post the tax amount that is calculated when posting vouchers and invoices to a Suspense VAT account, you must set up these AAIs to reference the Suspense VAT account:

- PTxxxx
- RTxxxx

The Suspense VAT account holds the tax amount until a payment or receipt is applied to the voucher or invoice, and the payment or receipt is posted.

You must set up these AAIs with the VAT account to reclassify the tax amount from the Suspense VAT account to the VAT account when the payments or receipts are posted:

- PLxxxx
- RLxxxx

The suffix xxxx indicates the GL offset code that is defined on the corresponding tax rate/areas. Blank is a valid GL offset code.

Note. You can specify a unique VAT account in the processing options for the POs Redistribute AP VAT - Mexico program (R76M1630) and the POs to Redistribute AR VAT Accounts - Mexico program (R76M1010).

See *JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide*, “Setting Up Tax Information,” Setting Up AAIs for Taxes.

Set Processing Options to Redistribute AP and AR VAT for Mexico

When you run the version of the post program to post AP payments and AR receipts, the system automatically submits the program to redistribute the VAT amounts. You must set the processing options for these programs so that VAT amounts are posted to the proper account and the correct version of the GL post report is submitted to post the new batch of VAT transactions.

Note. The system does not generate a report for the redistributed VAT batches.

Understanding VAT Processing and the General Ledger

See *JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide*, “Working With VAT Processing,” Understanding VAT Processing and the General Ledger.

Reviewing Mexican VAT Transactions

You can inquire on the reclassification journal entries in the Account Ledger Inquiry program (P09200).

For Accounts Payable transactions, you can inquire using the supplier invoice number or purchase order number in addition to the payment or prepayment number.

For Accounts Receivable transactions, you can inquire using the invoice number within wildcard characters (for example, *12345*) in the Explanation field of the QBE line.

Error Handling

In some cases, the Mexican VAT process might be unable to reclassify the tax information successfully. If this situation happens, you can view the error in the Work Center.

If a fatal error occurs during VAT reclassification and no journal entries are generated, you must calculate the VAT amount to reclassify and enter the journal entry manually.

When the AAI does not exist or when an invalid account has been set up for the Mexican VAT process, the reclassification journal entry is generated with a blank account number. In this case, you must correct the account number on the journal entry and post the journal entry.

See *JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide*, “Working With VAT Processing,” Reviewing Mexican VAT Transactions.

PART 21

The Netherlands

Chapter 90

(NLD) Understanding Country-Specific Functionality for the Netherlands

Chapter 91

(NLD) Setting Up Functionality for the Netherlands

CHAPTER 90

(NLD) Understanding Country-Specific Functionality for the Netherlands

This chapter provides an overview of Netherlands-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Netherlands-Specific Setup or Processes

This table lists the country-specific setup and functionality for the Netherlands.

| Setup or Process | Description |
|---------------------------|--|
| UDCs (user-defined codes) | <p>In addition to the standard UDC setup, in the Netherlands, set up UDCs for bank account setup.</p> <p>See Chapter 91, “(NLD) Setting Up Functionality for the Netherlands,” Setting Up UDCs for Bank Accounts in the Netherlands, page 1541.</p> |
| Payment processing | <p>In addition to the standard setup for payment processing, set up the Netherlands-specific payment formats.</p> <p>See Chapter 91, “(NLD) Setting Up Functionality for the Netherlands,” Setting Up Payment Formats for the Netherlands, page 1544.</p> <p>Specific processing option requirements exist for the Work With Payment Groups program (P04571) when you run the program for payments in the Netherlands.</p> <p>See Chapter 91, “(NLD) Setting Up Functionality for the Netherlands,” Setting Up the Work With Payment Groups Program (P04571) for the Netherlands, page 1547.</p> |

| Setup or Process | Description |
|----------------------------|--|
| Invoice processing | <p>In addition to standard invoice processing, you can print invoices with an attached International Payment Instructions (IPI). To print these invoices and attachments:</p> <ul style="list-style-type: none"> Set up UDCs for IPIs. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.</p> <ul style="list-style-type: none"> Set processing options for the invoice print program. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Invoice Print with International Payment Instruction (R03B5053), page 1247.</p> <ul style="list-style-type: none"> Print invoices with attached IPIs. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing Invoices with an Attached International Payment Instruction, page 1245.</p> |
| Automatic debit processing | <p>In addition to the standard setup for debit processing, set up the Netherlands-specific debit format.</p> <p>See Chapter 91, “(NLD) Setting Up Functionality for the Netherlands,” Setting Up Automatic Debit Formats for the Netherlands, page 1548.</p> |
| Bank accounts | <p>To set up bank accounts for the Netherlands:</p> <ul style="list-style-type: none"> Set up UDCs. <p>See Chapter 91, “(NLD) Setting Up Functionality for the Netherlands,” Setting Up UDCs for Bank Accounts in the Netherlands, page 1541.</p> <ul style="list-style-type: none"> Enter additional bank account information. <p>See Chapter 91, “(NLD) Setting Up Functionality for the Netherlands,” Setting Up Bank Information in the Netherlands, page 1549.</p> |

| Setup or Process | Description |
|---------------------|---|
| Intrastat reporting | <p>To set up and use Intrastat reporting:</p> <ul style="list-style-type: none"> Review the overview about European Union reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Understanding European Union Functionality, page 1215. Set up UDCs. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221. Set up commodity codes. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up Commodity Code Information, page 1230. Set up cross-references between suppliers and items to show the country of origin. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Entering Cross-References for Items and Suppliers, page 1231. Set the processing options for the Intrastat workfiles programs. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Sales (R0018I1), page 1254. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Procurement (R0018I2), page 1256. Populate the workfiles. See Chapter 66, “(Europe) Working With European Union Functionality,” Populating the Intrastat Workfile, page 1250. Revise the workfiles as necessary. See Chapter 66, “(Europe) Working With European Union Functionality,” Revising Intrastat Information, page 1258. |

| Setup or Process | Description |
|---------------------------------|--|
| Intrastat reporting (continued) | <p>To print and purge Intrastat records:</p> <ul style="list-style-type: none"> • Use the IDEP/IRIS Interface program (R0018I3) to generate an electronic Intrastat declaration in the format required for the Netherlands. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Using the IDEP/IRIS Interface for Intrastat Reporting, page 1264.</p> <ul style="list-style-type: none"> • Purge records from the Intrastat table (F0018T). <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Purging Records from the Intrastat Table (F0018T), page 1263.</p> |
| Other European Union reporting | <p>In addition to Intrastat reporting, you can generate these reports:</p> <ul style="list-style-type: none"> • EC Sales List Reports <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding EC Sales List Reports for European Reporting, page 1245.</p> <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sales List Report (R0018L), page 1273.</p> <ul style="list-style-type: none"> • EC Sales A/R Report <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sale List - AR Report (R0018S), page 1276.</p> |

CHAPTER 91

(NLD) Setting Up Functionality for the Netherlands

This chapter discusses how to set up:

- UDCs (user-defined codes).
- Payment formats.
- Processing options for the Work With Payment Groups program (P04571).
- Automatic debit formats.
- Bank accounts.

Setting Up UDCs for the Netherlands

Setting up Netherlands-specific UDCs enables you to use Netherlands-specific functionality. You also set up some base software UDCs with Netherlands-specific values.

Setting Up UDCs for Bank Accounts in the Netherlands

Before you set up bank accounts, set up these UDCs.

Article Number Code (74/AN)

Set up article number codes to identify the goods bought and sold by the transit trader. This code is assigned by the DNB (Netherlands Central Bank) to transit traders. Examples of article numbers include:

- *00*: Livestock
- *03*: Fish
- *11*: Drinks
- *21*: Untanned hides
- *33*: Crude oil

Bank Account Type (74/BK)

Set up a code for each bank account type in UDC table 74/BK. The bank account number is validated based on the bank account type. Set up these values:

- *B*: Domestic Dutch bank
- *P*: Domestic Postbank
- *X*: Foreign bank

Check Crossing Code (74/CC)

Set up codes in UDC table 74/CC to indicate whether a check that is issued by the bank should be crossed. Crossed checks cannot be cashed over the counter. Payment can only be made directly to the account of the payee. Values are:

Y: Cross the check.

N: Do not cross the check (default).

Check Forwarding Code (74/CV)

Set up check forwarding codes in UDC table 74/CV to indicate the location to which a check should be sent. Set up these values:

- *1*: Principle's branch
- *2*: Principle
- *3*: Beneficiary

Domestic Costs Code (74/DC)

The codes in UDC table 74/DC specify whether the principle or the beneficiary is responsible for paying costs. The values are hard-coded and include:

| Code | Description |
|------|------------------------------------|
| 1 | Charged to Principle's NLG/EUR. |
| 2 | Charged to Principle's FC Account. |
| 3 | Charged to Beneficiary Details. |

Group Name Code (74/GP)

Set up codes in UDC table 74/GP to indicate the payment category. The options are prescribed by the DNB (Netherlands Central Bank). Values are:

- 1*: Goods
- 2*: Transit trade
- 3*: Services and capital
- 4*: Transfer to your own account
- 5*: Other registered items

Payment Instruction Code (74/I1)

Set up payment instruction codes in UDC table 74/11 to include in SWIFT messages to foreign banks. Values are:

- 0*: Advise beneficiary by phone.
- 02*: Advise beneficiary by telex.
- 03*: Advise beneficiary bank by phone.

- 04: Advise beneficiary bank by telex.
- 05: Advise beneficiary bank by cable/SWIFT charges for us.
- 06: Advise beneficiary bank by cable/SWIFT without charges for us.
- 07: Hold disposal.
- 12: If beneficiary is unknown or deceased, please return amount.
- 13: This payment is irrevocable.
- 14: Intercompany transfer.

Costs Abroad (74/KC)

Set up codes in UDC table 74/KC to indicate how costs charged by the ABN AMRO Bank for processing payment orders are settled. This code is used in the foreign payment system.

Values are:

- 1: Charged to principle NLG/EUR.
- 2: Charged to principle FC account.
- 3: Charged to beneficiary details.

Costs NLG/Foreign Code (74/KG)

Set up codes to indicate how costs charged by foreign correspondent banks are settled. This code is used in the foreign payment system.

Values are:

- 1: Charged to principle NLG/EUR.
- 2: Charged to principle FC account.
- 3: Charged to beneficiary details.

Payment Method Code (74/NO)

Set up codes in UDC table 74/NO to indicate the method of payment.

Values are:

Normal (funds transfer)

Check

Urgent transfer

Processing Code (74/SU)

Set up processing codes in UDC table 74/SU to indicate whether the SWIFT message should be sent with standard or priority status when transferring funds. Set up these codes:

- 0: SWIFT standard
- 2: SWIFT priority

Transit Type Code (74/TT)

Set up codes in UDC table 74/TT to indicate transit types. This code is used to validate the supplier's bank transit number. You must specify the format of the transit number for each transit type in the Description 02 field using these characters:

- *N*: Numeric; blank not allowed
- *Y*: Numeric; blank allowed
- *X*: Nonnumeric; blank not allowed
- *Z*: Nonnumeric; blank allowed
- *B*: Alphanumeric; blank allowed

The system uses the format that you specify to validate the bank transit number.

For example, entering *NNNN* in the Description 02 field indicates that transit numbers of the associated transit type consist of four numeric characters with blanks allowed in each position.

You should enter the format for domestic accounts in the Description 02 field for the blank UDC code.

Note. When a transit number has fewer characters than the specified format, the system adds trailing blanks to the transit number.

Do not change the SW (Swift address worldwide) code. The format in the Description 02 field of the SW code is hard-coded for validation of the Swift code.

Setting Up Payment Formats for the Netherlands

This section provides an overview of payment formats for the Netherlands, lists a prerequisite, and discusses how to set up processing options for:

- Create A/P Bank Tape - CLIEOP02/CLIEOP03 - Holland (R04572H1).
- Create A/P Bank Tape - Foreign ABN AMRO - Holland (R04572H2).

Understanding Payment Formats for the Netherlands

JD Edwards EnterpriseOne software supports these country-specific automatic payment formats for the Netherlands:

| Format | Description |
|---------|---|
| ClieOp2 | The ClieOp2 (<i>Client opdracht indeling 2</i>) is the standard format developed by the banks in the Netherlands. Both the BankGiro Centrale (BGC) and the Postbank accept this format. |

| Format | Description |
|---------|--|
| ClieOp3 | The ClieOp3 (<i>Client opdracht indeling 3</i>) is the euro-compliant payment format. It contains all of the functionality of ClieOp2 and is upward-compatible. |
| BTL91 | ABN AMRO bank provides the BTL91 payment format for foreign payments. This format supports IBAN; the output records contain the IBAN number and other related IBAN information if you set up IBAN information for your bank and your supplier's bank. The format is also euro-compliant. |

Use these write programs to generate payment formats for the Netherlands:

| Program | Description |
|----------|--------------------------------------|
| R04572H1 | Domestic formats ClieOp2 or ClieOp3. |
| R04572H2 | Foreign format ABN AMRO. |

You create two versions of the domestic payment format program (P04572H1): one for ClieOp2 and one for ClieOp3. To create a version for ClieOp2, leave the processing option on the ClieOp3 tab blank. To create a version for ClieOp3, enter *1* in the processing option on the ClieOp3 tab.

Prerequisite

For each supplier for which you use the ABN AMRO BTL91 standard and want to print IBAN information, verify that the IBAN field (data item IBAN) is complete on the Set Up Bank Account Address form in the Bank Accounts by Address program (P0030A).

See *JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide*, "Setting Up Bank Accounts".

Setting Processing Options for Create A/P Bank Tape - CLIEOP2\CLIEOP3 - Holland (R04572H1)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- 1. Medium** Enter *T* to indicate tape. Enter *X* to indicate 8-inch tape. Enter *P* to indicate a PC file.
- 2. Devise Name** Enter the devise name.
- 3. Tape Density** Enter the tape density
- 4. File identification number** Enter the file identification number.
- 5. Block Size** Enter the block size.

| | |
|--------------------------------------|---|
| 6. Volume serial number | Enter the volume serial number. |
| 7. Number of tapes in use | Enter the number of tapes in use. |
| 8. Owner ID | Enter the owner ID> |
| 9. File Name | Enter the file name. |
| 10. Label Name | Enter the label name. |
| 11. Sender Information | Enter the sender information. |
| 12. Fixed Description | Enter the fixed description. |
| 13. Requested Processing Date | Enter the requested processing date. |
| 14. Transaction Type | Enter the transaction type. Values are: 0000: Non-net creditor payment into giro account. 0003: Non-net salary payment into giro account. 0005: Net credit payment into a giro account. Creditor payment into a bank account. 0008: Net salary payment into a giro account. Salary payment into a bank account. |
| 15. Payment ID | Enter the payment ID. |

Print

Process This processing option is not used.

Process

| | |
|------------------------------|---|
| Customer Number | Enter <i>I</i> to include the customer number from the supplier bank account in the F04572OW table. |
| Remark | Enter <i>I</i> to include the remark from the voucher in the F04572OW table. The invoice number is always included. |
| Paid Amount | Enter <i>I</i> to include the paid amount for each voucher in the F04572OW table. |
| Require Customer Name | Enter <i>I</i> if the customer name and address are required. |
| Mode | Enter <i>I</i> to run in final mode. |
| Duplicate | Enter <i>I</i> if this is a duplicate run. |

Clieop03

Clieop03 Version Enter *I* to use the Clieop03 version. If you leave this processing option blank, the system uses Clieop02.

Setting Processing Options for Create A/P Bank Tape - Foreign ABN AMRO - Holland (R04572H2)

Processing options enable you to specify the default processing for programs and reports.

Tape

Use these processing options to specify the default values for the bank tape.

- | | |
|--------------------------------------|--|
| 1. Medium | Enter <i>T</i> to indicate tape. Enter <i>X</i> to indicate 8-inch tape. Enter <i>P</i> to indicate a PC file. |
| 2. Devise Name | Enter the devise name. |
| 3. Tape Density | Enter the tape density |
| 4. File identification number | Enter the file identification number. |
| 5. Block Size | Enter the block size. |
| 6. Volume serial number | Enter the volume serial number. |
| 7. Number of tapes in use | Enter the number of tapes in use. |
| 8. Owner ID | Enter the owner ID> |
| 9. File Name | Enter the file name. |
| 10. Label Name | Enter the label name. |
| 11. Desired Processing Date | Enter the requested processing date. |

Print

Process This processing option is not used.

Process

Exchange Bank Field Enter *1* to write *ABNA* to the Exchange Bank field. Enter *2* to write *ABNT* to the Exchange Bank field.

Funds This processing option is not used.

Setting Up the Work With Payment Groups Program (P04571) for the Netherlands

This section discusses how to set the processing options for the Work With Payment Groups program (P04571) when running the program for payments in the Netherlands

Setting Processing Options for the Netherlands

Special considerations exist when you use the Work With Payment Groups program (P04571) in the Netherlands.

Before using the program, you should set the processing options as indicated:

- On the Print tab, for the Print Program Version processing option, enter one of the following versions.
- *XJDE0001* for ClieOp2
- *XJDE0002* for ClieOp3 and BTL91

If you are using the BTL91 format for foreign payments, enter 2 in the Payment Control Group Output processing option on the Print tab to create one file for all control groups. Alternatively, the system creates one file for each bank account and currency.

Setting Up Automatic Debit Formats for the Netherlands

This section provides an overview of automatic debits for the Netherlands and discusses how to set processing options for Automatic Debits Dutch Format (R03B575DH).

Understanding Automatic Debits for the Netherlands

The automatic debits formats that are most commonly used in the Netherlands are ClieOp2 (*Client opdracht indeling 2*) and ClieOp3 (*Client opdracht indeling 3*). ClieOp2 is the standard format that was developed by the banks in the Netherlands. Both the BankGiroCentrale (BGC) and the Postbank accept this format. ClieOp3 is the euro-compliant automatic debiting format. It contains the ClieOp2 format and is upward-compatible.

The JD Edwards EnterpriseOne system provides Automatic Debits Dutch Formats ClieOp2 and ClieOp3 (R03B575DH) for automatic debits.

This program generates a bank table that adheres to the banking standards for automatic debits in the Netherlands.

You specify the debit format (ClieOp2 or ClieOp3) that you want to use on the File Info tab of the processing options for the Automatic Debits Dutch Formats ClieOp2 and ClieOp3 program (R03B575DH).

You must specify a file serial number for each automatic debit file that you create. In the Enter File Serial Number processing option on the File Info tab, type *01* for the first file that you create each day. If you create more than one file in a day, you must update this value. The value must be updated for every subsequent file that is created each day (that is, 01, 02, 03).

Setting Processing Options for Automatic Debits Dutch Format (R03B575DH)

Processing options enable you to specify the default processing for programs and reports.

File Info

1. Clieop Format

Specify which Clieop format the system uses when processing automatic debits. Values are:

Blank: Use Clieop02 format.

| | |
|----------------------------------|---|
| | <i>I</i> : Use Clieop03 format. |
| 2. Duplicate Code | Specify whether the file is a duplicate of the file that was previously supplied. Values are: <i>I</i> : Original file. <i>2</i> : Duplicate file. |
| 3. Sender Identification | Specify which Clieop format the system uses when processing automatic debits. Values are: Blank: Use Clieop02 format. <i>I</i> : Use Clieop03 format. |
| 4. Payment ID | Specify the payment ID. |
| 5. File Serial Number | Specify the file serial number. If this is the first tape that you are processing for the day, enter <i>01</i> . |
| 6. File Fixed Description | Specify the file fixed description. |
| Date | |
| 7. Processing Date | Specify the processing date. If you leave this processing option blank, the system will use the system date. |
| 8. Currency Code | Specify the currency code in which the records are written. |
| 9. Test Code | Specify the test code. Values are: <i>P</i> : Production <i>T</i> : Test |
| 10. Type of Transaction | Specify the type of transaction. If you leave this processing option blank, the system uses <i>1001</i> as the default. |

Setting Up Bank Information in the Netherlands

This section provides overviews of Dutch bank account setup, lists a prerequisite, and discusses how to set up Dutch bank account information.

See Also

JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide, “Setting Up Bank Accounts”

Understanding Dutch Bank Account Setup

You should set up additional bank account information for your suppliers, both foreign and domestic, after you set up bank accounts by address. This additional bank information is stored in the Dutch Payments Bank Information table (F74030H) and creates a link between the Dutch bank account number and the Bank Transit Master table (F0030).

You can designate multiple bank accounts for a single supplier when the supplier is associated with a unique payment handling code.

The system validates the Transit Number and the Swift Code that you enter in the Dutch Payments Bank Information program (P74030H). Validation of the Transit Number is based on the value in the Transit Type field.

You set up Dutch bank information on the Dutch Account Maintenance form. Alternatively, you can set up Dutch bank information by selecting Regional Info from the Form menu on the Setup Bank Accounts By Address form if you set your user profile to the Netherlands.

Form Used to Set Up Bank Accounts

| Form Name | FormID | Navigation | Usage |
|--------------------------------------|----------|--|--|
| Work With Dutch Bank Account Summary | W74030HA | Dutch Localizations (G74N), Dutch Bank Account | Review a list of bank accounts. |
| Dutch Bank Account Maintenance | W74030HB | On the Work With Dutch Bank Account Summary form, click Add. | Set up Dutch bank account information. |

Prerequisite

Verify that the UDCs for bank accounts are set up.

See [Chapter 91, “\(NLD\) Setting Up Functionality for the Netherlands,” Setting Up UDCs for Bank Accounts in the Netherlands, page 1541](#).

Setting Up Dutch Bank Account Information

Access the Dutch Bank Account Maintenance form.

| | |
|------------------------------------|---|
| Payment Handling Code | Enter a code from UDC table 00/HC for the system to use to sequence the printing of payments. |
| Bank Account Number | <p>Enter the account number for a local Dutch bank or for Postbank. If the bank account number belongs to a local Dutch bank (Bank Type = B), enter the nine or 10-digit number that complies to the modulus-11 test.</p> <p>If the bank account number belongs to the Postbank (Bank Type = P), valid account numbers cannot be longer than seven digits. If the Bank Type is neither B nor P, then the account number must be at least one digit.</p> |
| Customer Number | Enter the address number in the administration of the supplier. |
| Bank Account Type | <p>Enter the type of bank. Values are:</p> <p><i>B</i>: Domestic Dutch bank (must pass the modulus-11 check).</p> <p><i>P</i>: Giro (< 10000000).</p> <p><i>X</i>: Foreign bank (no validation occurs).</p> |
| Checking or Savings Account | Enter a code from UDC table H00/CK that specifies the type of bank account. This code is used during bank tape processing for automatic payments. |

| | |
|------------------------------|---|
| Domestic Costs Code | <p>Enter a code that indicates how costs charged by the ABN/AMRO Bank for processing payment orders (for example, transfer charges or check clearing charges) are settled. This value is used in the foreign payment system.</p> <p>Values are:</p> <p>Blank: No cost to be charged</p> <p>1: Cost to be charged to the payor's NLG/Euro account.</p> <p>2: Cost to be charged to the payor's foreign currency account.</p> <p>3: Cost to be charged to the payee. The bank indicates which codes are allowed.</p> <p>This code is a required entry in the Dutch Payments Bank Information table (F74030H).</p> |
| Currency Code | Enter a code that identifies the currency of a transaction. |
| Transit Type | <p>Enter a code that indicates the transit type.</p> <p>If you leave the Transit Type field blank, the system does not validate the supplier's bank transit number in the Transit Number - Bank field.</p> |
| Transit Number - Bank | Enter the routing and transit number for a particular bank account. The combination of account number and transit number must be unique. |
| Normal or Check | <p>Enter a code that indicates the method of payment. This code is used in the foreign payment system. Values are:</p> <p>0: Normal/funds transfer.</p> <p>1: Check (at ABN/AMRO send to beneficiary).</p> <p>2: Urgent transfer</p> <p>This code is a required entry in the F74030H table.</p> |
| Payment Category Code | <p>Enter the payment category code is used with foreign transfers. Values are:</p> <p>Blank: Not applicable</p> <p>1: Goods.</p> <p>2: Transit trade.</p> <p>3: Services and capital.</p> <p>4: Transfer to your own account.</p> <p>5: Other registered items.</p> <p>This is an optional entry in the F74030H table.</p> |
| Article No. | <p>Enter a code (74/AN) that is assigned by the DNB (Netherlands Central Bank) to transit traders for the purpose of identifying the goods bought and sold by the traders.</p> <p>For example, you might use these codes:</p> <p>00: Livestock</p> <p>01: Meat and meat products</p> <p>02: Dairy products and eggs</p> |

| | |
|--|---|
| | <p><i>11: Drinks</i></p> <p>This is an optional entry in the F74030H table.</p> |
| Trader No. (trader number) | <p>Enter a code that is assigned to transit traders by the DNB (Netherlands Central Bank).</p> <p>This is an optional entry in the F74030H table.</p> |
| DNB Registration No. (DNB registration number) | <p>Enter a number assigned by DNB (Netherlands Central Bank) to the payor for the purpose of registration of a number of foreign payment categories.</p> <p>This is an optional entry in the F74030H table.</p> |
| Nature of Pmt Code 1 (nature of payment code 1) | <p>Enter a description of the nature of the payment.</p> <p>This is an optional entry in the F74030H table.</p> |
| Nature of Pmt Code 2 (nature of payment code 2) | <p>Enter a description of the nature of the payment.</p> <p>This is an optional entry in the F74030H table.</p> |
| Bank Address Number | <p>Enter the address number of a foreign bank. This number provides a relationship between the F74030H table and the Address Book Master table (F0101).</p> |
| Correspondent Costs Code | <p>Enter a code that indicates how the costs charged by foreign correspondent banks are settled. This value is used in the foreign payment system. Values are:</p> <p><i>1: Costs to be charged to the payor's NLG/Euro account.</i></p> <p><i>2: Costs to be charged to the payor's foreign currency account.</i></p> <p><i>3: Costs to be charged to payee NOTE: The bank will indicate which codes are allowed.</i></p> <p>This code is an optional entry in the F74030H table.</p> <p>You must complete this field if the payment is made by transferring funds. If the payment is made by check, leave this field blank.</p> |
| Processing Code | <p>Enter a code that indicates whether a SWIFT message should have standard or priority status when transferring funds. Values are:</p> <p><i>0: SWIFT standard</i></p> <p><i>2: SWIFT priority</i></p> <p>This code is an optional entry in the F74030H table.</p> |
| SWIFT Code | <p>Enter an international banking identification code used to identify the origin and destination of electronic (or wire) financial transfers. The Society for Worldwide Interbank Financial Telecommunications (SWIFT) provides the code to user banks. Enter the SWIFT code of the beneficiary's bank.</p> |
| Payment Instruction code 1 | <p>Enter a code that specifies instructions for the receiving bank, which should be included in SWIFT messages for foreign banks. This code is an optional entry in the F74030H table.</p> |
| Check Crossing Code | <p>Enter a code that indicates whether the check issued by the bank should be crossed.</p> <p>Crossing of a check means that the receiver cannot cash the check. The check can only be transferred into the account of the beneficiary. Values are:</p> |

N: Do not cross the check

Y: Cross the check

This code is an optional entry in the F74030H table.

Check Forwarding Code

Enter a code that indicates the location to which a check should be sent.
Values are:

1: Principal's branch

2: Principal

3: Beneficiary

This code is an optional entry in the F74030H table.

(POL) Understanding Country-Specific Functionality for Poland

This chapter provides an overview of Poland-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Poland-Specific Setup and Processes

This table lists the country-specific setup and functionality for Poland.

| Setup or Process | Description |
|--|--|
| UDCs (user-defined codes) | <p>Set up base-software UDCs with Poland-specific values, and set up Poland-specific UDCs for:</p> <ul style="list-style-type: none">• Legal documents• Tax processing• Accounts payable processing <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (POL and RUS) Setting Up UDCs for Poland and Russia, page 1576.</p> |
| AAIs (automatic accounting instructions) | <p>No country-specific setup for AAIs is required for Poland.</p> |
| Next numbers | <p>In addition to the standard next numbering schemes, set up next numbers for legal documents in Poland. Set up legal numbering for invoices and correction invoices.</p> <p>See Chapter 95, “(POL and RUS) Setting Up Legal Numbering,” Setting Up Next Numbers for Legal Documents, page 1612.</p> |
| Customers and suppliers | <p>In addition to the standard setup for customers, in Poland, enter information about the VAT applicability.</p> <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (POL) Understanding Address Book Information for Poland, page 1575.</p> <p>See <i>JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide</i>, “Entering Address Book Records,” (POL) Entering Additional Address Book Information.</p> |

| Setup or Process | Description |
|-------------------|--|
| Companies | <p>In addition to the standard setup for companies, set up legal companies so that you can associate the companies that you use for transaction processing (transactional companies) with companies that you use for legal reporting (legal companies) so that legal reports can contain data for more than one transactional company.</p> <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland.” (POL and RUS) Setting Up Legal Companies for Russia and Poland, page 1591.</p> |
| Cash transactions | <p>To work with cash transactions in the JD Edwards EnterpriseOne Accounts Payable, JD Edwards EnterpriseOne Accounts Receivable, and JD Edwards EnterpriseOne General Accounting systems, you:</p> <ul style="list-style-type: none"> • Enter vouchers or enter receipts for invoices. • Pay the vouchers or invoices from a cash account. • Use the Cash Desk Transaction (P74P9101) program to print a report for an inbound or outbound transaction. • Use the Cash Desk Report program to print a record of all cash transactions for a specified period. <p>See Chapter 96, “(POL) Working with Poland-Specific Functionality,” Understanding Cash Transactions, page 1622.</p> <p>See Chapter 96, “(POL) Working with Poland-Specific Functionality,” Printing Reports for Inbound and Outbound Cash Transactions, page 1622.</p> <p>See Chapter 96, “(POL) Working with Poland-Specific Functionality,” Generating the Cash Desk Report (R74P9104), page 1624.</p> |

| Setup or Process | Description |
|----------------------------|--|
| Invoice processing (setup) | <p>In addition to the standard setup for invoice processing, in Poland:</p> <ul style="list-style-type: none"> • Set up corresponding versions of the Add Invoice - PO (P7433B11) and Standard Invoice Entry (P03B11) programs. • Set up corresponding versions of Print Invoice/Invoice Correction - PO (P7420565) and Standard Invoice Print (R42565) programs. • Set up legal numbering so that invoices and correction invoices that you print from the JD Edwards EnterpriseOne Accounts Receivable and JD Edwards EnterpriseOne Sales Order Management systems contain information required for tax reporting. Setting up legal numbering requires that you: <ul style="list-style-type: none"> - Set up legal document types. - Associate legal document types with document types. - Set up legal documents issue places. - Set up next numbers. - Set up print template definitions for legal documents. - Specify rows for print template line types. - Associate legal document types with print templates. - Specify programs and versions to print legal documents. <p>See Chapter 95, “(POL and RUS) Setting Up Legal Numbering,” page 1609.</p> • Set up exchange rate table numbers. <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (POL) Setting Up the Exchange Rate Table Number, page 1607.</p> |

| Setup or Process | Description |
|-------------------------------|---|
| Invoice processing (printing) | <p>In addition to the standard processes for invoice processing, in Poland:</p> <ul style="list-style-type: none"> • Run the Add Invoice - PO program (P7433B11). • Set processing options for Add Invoice - PO (P7433B11). • Enter additional information for invoices. • Add related invoices. • Set processing options for Print Invoice (R7430030). • Specify whether the system enables or requires that you enter related invoices when you add credit notes or debit notes. • Use the Print Invoice - Poland - SOP/AR program (R74P3030) to print an invoice or invoice correction. • Use the Reprint Invoice program (P7430031) to reprint selected documents. <p>See Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland.” (POL and RUS) Working with Invoices for Poland and Russia, page 1667.</p> |
| Delinquency fee processing | <p>Poland-specific programs and processes exist for delinquency fee processing.</p> <p>See Chapter 96, “(POL) Working with Poland-Specific Functionality,” Working with Delinquency Fees for Poland, page 1626.</p> |
| Voucher processing | <p>In addition to the standard process for working with vouchers, in Poland:</p> <ul style="list-style-type: none"> • Set up voucher types. <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland.” (POL) Setting Up Voucher Types, page 1606.</p> <ul style="list-style-type: none"> • Enter additional information for vouchers. <p>See Chapter 96, “(POL) Working with Poland-Specific Functionality,” Understanding Voucher Entry and Voucher Match for Poland, page 1621.</p> |

| Setup or Process | Description |
|------------------|--|
| Tax processing | <p>Before you process transactions with taxes for Poland:</p> <ul style="list-style-type: none"> Set up the required UDCs. <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland.” (POL and RUS) Setting Up UDCs for Tax Processing for Poland and Russia, page 1579.</p> <ul style="list-style-type: none"> Set up voucher types to identify transactions to include in the VAT reports. <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland.” (POL) Setting Up Voucher Types, page 1606.</p> <p>To process taxes for Poland:</p> <ul style="list-style-type: none"> Enter additional information that is used in the VAT reports. <p>See Chapter 96, “(POL) Working with Poland-Specific Functionality.” Understanding Voucher Entry and Voucher Match for Poland, page 1621.</p> <ul style="list-style-type: none"> Generate these reports: <ul style="list-style-type: none"> VAT Purchase Domestic Register (R74P0410). VAT Purchase Import Register (R74P0420). VAT Purchase Register - Paid Vouchers (R74P5010). VAT Sales (R74P03B1). <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “(RUS and POL) Setting Up the System for Russian and Polish Taxes,” Understanding System Setup for Russia and Poland Taxes.</p> <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “(RUS and POL) Setting Up the System for Russian and Polish Taxes,” (POL) Working with Tax Processing for Poland.</p> |

| Setup or Process | Description |
|------------------------|---|
| Sales order processing | <p>In addition to the base software setup and processes, for Poland:</p> <ul style="list-style-type: none"> • Set up UDCs for legal document types. See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” Setting Up UDCs for Legal Documents for Poland and Russia, page 1576. • Set processing options for: <ul style="list-style-type: none"> - Invoice Print - PO (P7420565). See Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland,” Setting Processing Options for Invoice Print - PO (P7420565), page 1678. - Sales Legal Document Inquiry by Legal Number (P7420002). See Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland,” Setting Processing Options for Sales Legal Document Inquiry by Legal Number (P7420002), page 1681. - Print Invoice/Invoice Correction - PO program (P7420565). • Set up corresponding versions of Sales Order Entry (P4210) and Sales Order - PO (P7424210). • Search for sales order lines by legal document number or internal document number. See Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland,” Inquiring on Sales Orders for Poland and Russia, page 1681. • Print legal documents including shipment notes, stock delivery notes, goods dispatch note, stock movement note, and invoices. See Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland,” (POL and RUS) Working with Sales Order Management Processes for Poland and Russia, page 1674. |

| Setup or Process | Description |
|---------------------|---|
| Financial reporting | <p>These general ledger reports exist for Poland:</p> <ul style="list-style-type: none">• AR Trial Balance Report (R74P03B61).• AP Trial Balance (R74P0450).• GL Trial Balance by Object (R74P9010).• GL Trial Balance by Category Code (R74P9015).• Transaction Journal (R74P9020).• Bank Register (R74P9030). <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (POL) Reports for Poland, page 1872.</p> |

CHAPTER 93

(RUS) Understanding Country-Specific Functionality for Russia

This chapter provides an overview of Russia-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Russia-Specific Setup and Processes

This table lists the country-specific setup and functionality for Russia:

| Setup or Process | Description |
|---------------------------|---|
| UDCs (user-defined codes) | <p>Set up base-software UDCs with Russia-specific values, and set up Russia-specific UDCs for:</p> <ul style="list-style-type: none">• Legal documents• Legal companies• Tax processing• Payment processing• Correspondence of accounts• Financial reports• Fixed assets• Sales order processing <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (POL and RUS) Setting Up UDCs for Poland and Russia, page 1576.</p> <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (RUS) Setting Up Long Descriptions for Russia-Specific UDCs, page 1588.</p> |

| Setup or Process | Description |
|--|--|
| Next numbers | <p>Set up next numbering before processing value-added tax (VAT), cash transactions, and petty cash.</p> <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (POL and RUS) Setting Up Next Numbers for Poland and Russia, page 1589.</p> <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” Setting Up Next Numbers for Petty Cash, page 1595.</p> <p>See Chapter 95, “(POL and RUS) Setting Up Legal Numbering,” Setting Up Next Numbers for Legal Documents, page 1612.</p> |
| AAIs (automatic accounting instructions) | <p>In addition to the standard AAI setup:</p> <ul style="list-style-type: none"> • Set up AAIs to process Russian taxes. <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (RUS) Setting Up AAIs for Russian Taxes, page 1589.</p> <ul style="list-style-type: none"> • Set up AAIs to process amount difference vouchers and invoices. <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (RUS) Setting Up Amount Difference Accounting, page 1592.</p> |
| Customers and suppliers | <p>In addition to the standard setup for customers, in Russia, enter information about the VAT applicability.</p> <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (RUS) Understanding Additional Address Book Information for Russia, page 1576.</p> <p>See <i>JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide</i>, “Entering Address Book Records,” (RUS) Entering Additional Address Book Information.</p> |

| Setup or Process | Description |
|------------------------------|---|
| Companies | <p>In addition to the standard setup for companies, in Russia:</p> <ul style="list-style-type: none"> • Set up UDCs for legal companies. <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” Setting Up UDCs for Legal Companies, page 1578.</p> <ul style="list-style-type: none"> • Set up legal companies so that you can associate the companies that you use for transaction processing (transactional companies) with companies that you use for legal reporting (legal companies) so that legal reports can contain data for more than one transactional company. <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (POL and RUS) Setting Up Legal Companies for Russia and Poland, page 1591.</p> |
| Amount difference accounting | <p>Amount differences occur when sales or purchase transactions are contracted in a currency other than rubles, and a difference exists in the exchange rate between the purchase or sales date and the date on which the payment is made. You must set up general ledger accounts, bank accounts, AAIs, and document types to process vouchers and invoices to account for amount differences.</p> <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (RUS) Setting Up Amount Difference Accounting, page 1592.</p> <p>See Chapter 98, “(RUS) Working with Vouchers and Payment Processing,” Generating Amount Difference Vouchers in Russia, page 1643.</p> <p>See Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland,” (RUS) Generating Amount Difference Invoices for Russia, page 1672.</p> |

| Sales order processing | <p>In addition to the base software setup and processes, for Russia:</p> <ul style="list-style-type: none"> • Set up UDCs for legal document types. <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” (RUS) Setting Up UDCs for Sales Order Processing for Russia, page 1587.</p> <p>See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” Setting Up UDCs for Legal Documents for Poland and Russia, page 1576.</p> <ul style="list-style-type: none"> • Set up corresponding versions of Sales Order Entry (P4210) and Sales Order - PO (P7424210). • Set processing options for Invoice Print - PO (P7420565). • Set up corresponding version of Sales Order Entry (P4210) and Sales Order - PO (P7424210). • Set processing options for Sales Legal Document Inquiry by Legal Number (P7420002). • Search for sales order lines by legal document number or internal document number. • Print legal documents including shipment notes, stock delivery notes, goods dispatch note, stock movement note, and invoices. <p>See Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland,” (POL and RUS) Working with Sales Order Management Processes for Poland and Russia, page 1674 and Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland,” Inquiring on Sales Orders for Poland and Russia, page 1685.</p> |

| Setup or Process | Description |
|----------------------|---|
| Inventory management | <p>In addition to the base software setup and processes, for Russia:</p> <ul style="list-style-type: none"> • Set processing options for Set Up Item - Custom Declaration Number (P7464108). • Enter lot and customs information. • Generate stock balance report to confirm stock balances and transactions for a specified period. • Generate the Print Transfer Item Note Report when you transfer inventory between two business units within the same company. <p>See Chapter 99, “(RUS) Working With General Ledger Reporting, Fixed Assets, and Inventory Management for Russia,” (RUS) Entering Additional Lot Information, page 1665.</p> <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (RUS) Reports for Russia, page 1883.</p> |

CHAPTER 94

(POL and RUS) Setting Up Functionality for Russia and Poland

This chapter provides overviews of address book information for Poland and for Russia and discusses how to set up:

- (POL and RUS) User-defined codes (UDCs).
- (RUS) Long descriptions for UDCs.
- (RUS) Automatic accounting instructions (AAIs) for Russian taxes.
- (POL and RUS) Next numbers.
- (RUS) Corresponding versions for Russia.
- (RUS and POL) Legal companies.
- (RUS) Amount difference accounting.
- (RUS) Petty cash processing.
- (RUS) General ledger report formats.
- (RUS) Correspondence of accounts.
- (RUS) Voucher processing.
- (POL) Set up voucher types.
- (POL) Set up the exchange rate table number.

(POL) Understanding Address Book Information for Poland

When you set up address book records for customers and suppliers in Poland, you must add information about the VAT applicability. When you enter address book records for Poland, the system displays the Address Book Localization Data form. The system saves the information that you enter in the Address Book Localization Data form in the Address Book Tag File - COMM - 01 table (F741001T).

See *JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide*, “Entering Address Book Records,” (POL) Entering Additional Address Book Information.

(RUS) Understanding Additional Address Book Information for Russia

You enter address book records to create a database of information about your employees, customers, suppliers and tax authorities. In addition to entering the standard address book information, you enter specific information for Russia for reporting purposes. For example, the system uses the information that you enter in the Address Book Localization Data program (P74R0102) for the information that it prints in the footer of the Goods Dispatch Note.

You use the Address Book Localization Data program to enter information that is specific to Russia. When you add an address book record for Russia, the system displays the Address Book Localization Data form after you click OK on the Address Book Revision form. Or, you can access the Address Book Localization Data form by selecting Regional Info from the Row menu on the Address Book Revisions form.

The system saves the data that you enter in the Address Book Tag File - RUS - 01 table (F74R101T).

See *JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide*, “Entering Address Book Records,” (RUS) Entering Additional Address Book Information.

(POL and RUS) Setting Up UDCs for Poland and Russia

Setting up Poland-specific and Russia-specific UDCs enables you to use country-specific functionality. You also set up some base software UDCs with country-specific values.

Set up UDCs for:

- (POL and RUS) Legal documents
- (RUS) Legal companies
- (POL and RUS) Tax processing
- (RUS) Payment processing
- (RUS) Correspondence of accounts
- (RUS) Financial reports
- (RUS) Sale order processing
- (RUS) Fixed assets
- (POL) Accounts payable

Setting Up UDCs for Legal Documents for Poland and Russia

Set up these UDCs to work with legal documents.

(RUS) Document Types (00/DT)

In addition to the hard-coded document types that are used throughout JD Edwards EnterpriseOne software, you can set up document types that are based on your specific business needs. You must set up code PD in this UDC for returned goods for which payments have been received. The system searches for the PD code when it processes amount difference vouchers.

For example, you might set up these document types for Russia:

| Codes | Description |
|-------|--|
| CB | Petty Cash Book. This document type is used only for next numbers and should never be used to enter transactions. |
| CR | Petty Cash Receipt. This document is used to track next numbers for Petty Cash receipts. Its use is optional, and you may use it for entering petty cash transactions. |
| CI | Petty Cash Issue. This document is used to track next numbers for Petty Cash issues. Its use is optional, and you may use it for entering petty cash transactions. |
| PH | Prepayment Voucher. This document may be used to distinguish between normal and prepayment vouchers. |
| PD | Credit memo. Use for returned goods for which payment have been received. |

(POL and RUS) Legal Document Type Group (74/DG)

JD Edwards EnterpriseOne provides hard-coded values for this UDC. You use these values when you set up document types in the Legal Document Types program (P7400002). Verify that these values exist in your system:

| Code | Description |
|---------|--------------------------|
| (blank) | Not Applicable/Other |
| IN | Invoice |
| CD | Credit Note/ Debit Note |
| SN | Shipment Note |
| ED | Exchange Rate Difference |

See [Chapter 95, “\(POL and RUS\) Setting Up Legal Numbering,” Understanding Legal Document Types, page 1610.](#)

(POL and RUS) Print Line Types for Legal Documents (74/PL)

JD Edwards EnterpriseOne software provides hard-coded values for this UDC that the system uses to specify the types of lines that the system can print on legal documents. You use the values in this UDC when you set up print templates for legal documents in the Print Template Def Legal Doc program (P7430021). Verify that these values exist in the system:

| Code | Description |
|------|-------------------------|
| ISO | Invoice Line SOP |
| PA2 | Price Adjustment Type 2 |

| Code | Description |
|------|-------------------------|
| PA6 | Price Adjustment Type 6 |
| ATT | Attachment Line |
| SHP | Shipment Guide Line |
| IAR | Invoice Line AR |

(POL and RUS) VAT Condition (74/VC)

JD Edwards EnterpriseOne software provides hard-coded values for this UDC. The system uses the values in this UDC to associate legal document types with document types when you use the Legal Documents Types/Document Types Relationships program (P7400003). Verify that these values exist in the system:

| Code | Description |
|------|----------------|
| Y | Registered |
| N | Not registered |

(RUS) Petty Cash Document Type (74R/CD)

Set up this UDC to identify the types of documents that you use for petty cash transactions. You specify whether the code is for an inbound or outbound transaction by completing the Special Handling Code field. Enter *I* for inbound transactions. Enter *O* for outbound transactions. For example, you might set up these codes:

| Code | Description | Special Handling Code |
|------|-------------------|-----------------------|
| KP | Cash Receipt Note | I |
| KW | Cash Issue Note | O |

Setting Up UDCs for Legal Companies

You must set up these UDCs to use legal companies in Poland and Russia.

(RUS) Document Types (00/DT)

This table lists some possible document types in UDC table 00/DT for Russia:

| Code | Description |
|------|---|
| CB | Petty Cash Book. Used only for next numbers and should never be used to enter transactions. |
| CR | Petty Cash Receipt (optional). Used to track next numbers for Petty Cash receipts. You can use this document type for entering petty cash transactions. |
| CI | Petty Cash Issue (optional). Used to track next numbers for Petty Cash issues. You can use this document type for entering petty cash transactions. |

| Code | Description |
|------|--|
| PD | Credit Memo (required). Used for returned goods for which payments have been received. The system searches for code PD when it processes amount difference vouchers. |
| PH | Prepayment Voucher. Used to distinguish between regular vouchers and prepaid vouchers. |

(RUS) Document Types – Vouchers Only (00/DV)

Transactions with voucher document type codes can exist by themselves. That is, they do not need to be associated with a document that has a different document type code. All voucher document type codes are soft-coded.

The document types that you set up in UDC table 00/DV must also exist in UDC table 00/DT. Additionally, you must set up default voucher and return document types in the processing options for the Voucher Entry MBF (P0400047).

This table describes the codes that are delivered in UDC table 00/DV for vouchers:

| Code | Description |
|------|--|
| PV | Voucher. Used for a supplier's invoice during voucher entry. |
| PR | Recurring Voucher. Used for vouchers that require a specific number of payments at specified intervals. |
| PM | Manual Voucher. Used when the voucher and the payment are created at the same time. |
| PD | Credit Memo (required). Used for returned goods for which payments have been received. The system searches for code PD when it processes amount difference vouchers. |
| PL | Logged Voucher. Used when you enter a logged voucher. |

(POL and RUS) Setting Up UDCs for Tax Processing for Poland and Russia

Set up these UDCs before processing taxes.

(RUS) Average Cost Calculation (40/AV)

Set up codes for the average cost calculator to control which program is used for procurement taxation processing. This UDC links the base software for the JD Edwards Enterprise One Procurement system to the Russian localization. You must add the following code to the UDC table (40/AV):

| Code | Description 01 | Description 02 |
|---------|----------------|----------------|
| P74RLCP | Landed Cost | Y |

(RUS) Document Types (74R/DT)

In addition to the standard document types, you set up copies of voucher types that the system uses for value-added tax (VAT) processing.

For example, you might set up these document types for Russia:

| Codes | Description |
|-----------|---|
| <i>PH</i> | Prepayment Voucher. Enter <i>P</i> in the Special Handling Code field. The system does not generate general ledger entries when you process vouchers with this document type. Vouchers assigned this document type are not included in Purchase Register and are not subject to VAT recovery. |
| <i>PV</i> | Simple Voucher. Leave the Special Handling Code field blank. The system generates general ledger entries for when you process vouchers with this voucher type. Vouchers with this document type are included in the Purchase Register after the voucher is paid. |
| <i>PZ</i> | Voucher with Delayed VAT Recovery. Enter <i>L</i> in the Special Handling Code field. The system generates general ledger entries when you process vouchers with this document type. Vouchers with this document type are included in the Purchase Register after the voucher is paid. |
| <i>PD</i> | Negative Voucher. Enter <i>S</i> in the Special Handling Code field. Assign this document type to vouchers generated for the return of goods, when payment for the goods was made. The system generates reversing entries in the general ledger when you process vouchers with this document type. Vouchers with this document type are included in the Purchase Register after the voucher is paid. |
| <i>PX</i> | Negative Voucher. Enter <i>Z</i> in the Special Handling Code field. Assign this document type to vouchers generated for the return of goods when the goods are returned before payment is made. Vouchers with the document type are not included in the Purchase Register. The voucher that you match to this voucher to reverse the accounting entries also is not included in the Purchase Register. |

(RUS) AP Tax Rates/Areas (74R/TP)

In addition to the tax rate/areas that are used throughout JD Edwards EnterpriseOne software, you should set up copies of tax rate/areas to identify the type of VAT recovery for Accounts Payable transactions in Russia.

The system uses the values in the Special Handling Code field to identify when or if VAT is recoverable when you run the AP Russian Tax File Maintenance program (R74R4018).

Valid special handling codes are:

- D (recovered)
- R (recoverable)
- N (not recoverable)

Transactions for which the value is *N* (not recoverable) are not included in the Purchase Register. Transactions for which the value is *D* (recovered) are included in the Purchase Register at the time of voucher entry. Transactions for which the value is *R* (recoverable) or is blank are included in the Purchase Register after payment.

Examples of codes tax rate/areas for Russia are:

| Codes | Description 01 | Special Handling Code |
|--------------|---------------------------------|-----------------------|
| <i>VATP</i> | Recoverable VAT - P percent | Blank or <i>R</i> |
| <i>VATPN</i> | Not Recoverable VAT - P percent | <i>N</i> |
| <i>VATPD</i> | Recovered VAT - P percent | <i>D</i> |

(POL) Customs Tax Categories (74P/IM)

You set up the Customs Tax Categories UDC to create a cross reference between tax rate/areas and types of taxes or fees on imported goods. The system uses the special handling code in the (74P/IM) UDC to define the type of taxes and fees associated with a tax rate/area when you process VAT reports.

To create the cross reference, enter the tax rate/area in the Codes field of the UDC table, and enter one of these codes in the Special Handling Code field to specify the tax or fee that applies.

- 0 (Net value of purchase)
- 1 (Duty)
- 2 (Package tax)
- 3 (Excise tax)
- 4 (Additional duty payments)

(RUS) Setting Up UDCs for Payment Processing for Russia

Set up these UDCs before processing payments.

Payment Instruments (00/PY)

You set up the Payment Instruments (00/PY) UDC table to identify each payment instrument that you use. You can associate payment instruments with documents so that you can process similar documents together.

The system prints the text that appears in the Description field as the transfer type on the Payment Order.

See *JD Edwards EnterpriseOne Accounts Payable 8.12 Implementation Guide*, “Setting Up the Accounts Payable System for Automatic Payment Processing,” Setting Up Payment Instruments and Print Programs.

Amount Difference Document Type (74R/AD)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values for this UDC. Additionally, you must add the code PD to this UDC table for returned good for which payments have been received. You use these values when you set up amount difference accounting. Verify that these values exist in your system:

- *CI*: Credit Invoice
- *CV*: Credit Voucher
- *DI*: Debit Invoice
- *DV*: Debit Voucher

Budget Classification Code (74R/PB)

Set up this UDC to specify the budget code that appears on payment orders. The system uses the values from this UDC when you run the Automatic Payment Order program (R74R4520) or run the Payment Order Reprint program (R74R4530) to print a payment order manually. For example, you might set up this value:

| Codes | Description |
|-------|-------------|
| 01 | KBK |

Payment Type (74R/PC)

Set up the Payment Type UDC to identify the type of payment included on a payment order. The system uses the values from this UDC when you run the Automatic Payment Order program (R74R4520) or run the Payment Order Reprint program (R74R4530) to print a payment order manually. For example, you might set up these values:

| Codes | Description |
|-------|---|
| 1 | DGI (<i>Direccion General Impositiva</i>) Tax Payment |
| 2 | Federal Taxes Payment |

Tax Period (74R/PP)

Set up the Tax Period UDC to identify the tax period for which you issue a payment order. The system uses the values from this UDC when you run the Automatic Payment Order program (R74R4520) or run the Payment Order Reprint program (R74R4530) to print a payment order manually. For example, you might set up these values:

| Codes | Description |
|-------|-------------|
| FY | Fiscal Year |
| TP | Tax Period |
| YY | YY.02 |

Payment Reason (74R/PR)

Set up the Payment Reason UDC to identify the reason for the payment included on a payment order. The system uses the values from this UDC when you run the Automatic Payment Order program (R74R4520) or run the Payment Order Reprint program (R74R4530) to print a payment order manually. For example, you might set up these values:

| Codes | Description |
|-------|-------------------------|
| Y | Payment of Current Year |
| D | Deferred Debts Payment |
| R | Restructured Debts |

Payment Status (74R/PS)

Set up the Payment Status UDC to identify the type of payment included on a payment order. The system uses the values from this UDC when you run the Automatic Payment Order program (R74R4520) or run the Payment Order Reprint program (R74R4530) to print a payment order manually. For example, you might set up these values:

| Codes | Description |
|-------|---------------|
| TP | Tax Payment |
| TB | Other payment |

AR Tax Rates/Areas (74R/TR)

In addition to the Tax Rate/Areas that are used throughout JD Edwards EnterpriseOne software, you should set up copies of Tax Rates/Areas to identify the type of VAT billing.

The system uses the values in the Special Handling Code field to identify when or if VAT is payable when you run the Russian Tax File Maintenance - AR program (R74R3018). Transactions for which the value in the Special Handling Code field is *E* (excluded) are not included in the Sales Book. Transactions for which the value in the Special Handling Code field is *P* (payable) are included in the Sales Book at invoice entry. Transactions for which the value in the Special Handling Code field is *S* (suspended) are included in the Sales Book after the invoices become payable.

The system stores the invoice and tax information in the F74R0018 table, and reads this table when you generate the Sales Book.

Examples of codes Tax Rate/Areas for Russia are:

| Codes | Description | Table Column Heading - |
|--------------|---------------------------|------------------------|
| <i>VATP</i> | Payable VAT - P percent | Blank or <i>P</i> |
| <i>VATPN</i> | Excluded VAT - P percent | <i>E</i> |
| <i>VATPD</i> | Suspended VAT - P percent | <i>S</i> |

The system includes invoices in the Sales Book according to these rules:

| Type of Invoice | Special Handling Code (SHC) | VAT Results |
|-----------------|---|---|
| Sales invoice | SHC in (74R/DT) = S (sales) SHC in (74R/TR) = P or blank (payable) | VAT is posted to the actual VAT account. The transactions are included in the Sales Book after you enter the invoices. |
| Sales invoice | SHC in (74R/DT) = S (sales) SHC in (74R/TR) = S (suspended) | VAT is posted to a suspense VAT account and later becomes payable. When it becomes payable, the VAT amount is transferred to actual VAT account. These transactions are included in the Sales Book after they become payable, which is after you enter the receipt. |

| Type of Invoice | Special Handling Code (SHC) | VAT Results |
|--|---|--|
| Sales invoice | SHC in (74R/DT) = S (sales) SHC in (74R/TR) = E (excluded) | Since VAT is not payable on these transactions, no VAT amounts are included in the Sales Book. |
| Logged invoice Logged invoices are used for fixed assets. | SHC in (74R/DT) = L (logged) SHC in (74R/TR) = P or S | VAT is payable, reclassified, and included in the Sales Book when an additional clause is met. |

GL offset accounts for unapplied cash are linked to tax explanation codes and tax rate/areas by the Unapplied Cash Tax Code (74R/UT) UDC table. For all unapplied cash types, the system calculates and posts VAT according to tax explanation and tax rate/areas. When you apply an unapplied cash receipt to an invoice, the system reverses the transaction. The original VAT calculation for the prepayment is included in the Sales Book, and the reversal transactions are included in the Purchase Register.

You can delete partially paid invoices only if you first void the payment.

Unapplied Case Tax Code (74R/UT)

Generally, you must calculate VAT for unapplied cash. Set up codes in this UDC to apply VAT to unapplied cash.

Enter the class of the unapplied cash in the Code field. Enter the tax area and the tax explanation code for the unapplied documents in the Description 02 field. The system uses the value in the Description 02 field to calculate the tax on the unapplied cash.

For example, you might set up the these unapplied cash classes for Russia:

| Code | Description 1 | Description 2 |
|------------|--|---------------|
| <i>UC</i> | Standard unapplied cash - 18 percent VAT should be calculated | V VAT18 |
| <i>UCI</i> | VAT not assigned | E VAT0E |

(RUS) Setting Up UDCs for Correspondence of Accounts for Russia

Set up these UDCs to before using correspondence of accounts.

Amount Correspondences (74R/AG)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values for this UDC. You use these values when you set up account correspondence in the Correspondence Account Setup (P74R9001) program. Verify that these values exist in your system:

- – Minus Amount
- + Plus Amount

Correspondence Batch Status (74R/CS)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values for this UDC. You use these values when you change batch statuses in the Review Correspondence Batches (P74R0011) program. Verify that these values exist in your system:

- Blank: Generating Corresp. Pending
- *GE*: Corresp. Generated Successfully
- *PO*: Correspondence Posted
- *EG*: Error Generating Correspondence

Correspondence Methods (74R/MH)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values for this UDC. You use these values when you associate batch types to correspondence methods in the Correspondence Account Setup (P74R9001) program. Verify that these values exist in your system:

| Code | Description |
|-----------|--------------------------------------|
| <i>01</i> | Direct between two concurrent lines. |
| <i>02</i> | Direct between debit and credit. |
| <i>03</i> | One debit, multiple credits. |
| <i>04</i> | Several debits, several credits. |

Correspondence Print Options (74R/PO)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values for this UDC. You use these values when you set up accounts in the Correspondence Account Setup (P74R9001) program. Verify that these values exist in your system:

| Code | Description |
|-----------|-------------|
| Blank | . |
| <i>HI</i> | Hide |
| <i>RV</i> | Red void |

Correspondence Result Code (74R/RC)

Use this UDC to set up values that the system displays in the Correspondence Batch Revision program to specify the status of the correspondence record. For example, you might set up these values:

- *E*: Error
- *G*: Generated
- *I*: Ignore
- *P*: Posted

(RUS) Setting Up UDCs for Financial Reports for Russia

Set up these UDCs before you generate financial reports.

Account Type (74R/AT)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values that the system uses when you set up general ledger report formats by using the G/L Reports Setup program (P74R9020). The system uses the values in the 74R/AT UDC table to determine if the account is an object/subsidiary account, or if the account is set up in a category code.

Code Type (74R/CT)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values that the system uses when you set up general ledger report formats by using the G/L Reports Setup program (P74R9020). The system uses these values to determine the type of row. Some row types determine the tables the system reads to obtain balances. Other row types specify whether the system calculates values or prints a title for the row.

Factor Row (74R/FA)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values that the system uses when you set up general ledger report formats by using the G/L Reports Setup program (P74R9020). The system uses the values in the 74R/FA UDC table to determine whether the system changes the sign of the amount from positive to negative, negative to positive, or leaves the original sign.

Formula Type (74R/FT)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values that the system uses when you set up Changes in Equity report formats by using the G/L Reports Setup program (P74R9020). The system uses the values in the 74R/FT UDC table to determine the time period for which to report.

Record Type (74R/RT)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values that the system uses when you set up general ledger reports by using the G/L Reports Setup program (P74R9020). The system uses these values to determine what types of rows, accounts, and other criteria are applicable for the reports you create.

Section Number (74R/SE)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values that the system uses when you set up general ledger reports by using the G/L Reports Setup program (P74R9020). The system uses these values to determine the section in which to print the rows.

Scale Factor (74R/SF)

The system uses the Scale Factor UDC table (74R/SF) to determine how to print numerical values on general ledger reports. You specify in a processing option the scaling factor, if any, that you want the system to use.

When you choose to scale numerical values, the system divides the numerical values on the report by the scaling amount that you specify. For example, suppose that the amount in an account is 23,929. If you choose to scale the amount by a factor of 1000, the system divides 23,929 by 1000, rounds to the nearest whole number, and prints 24 on the report.

Visible Row (74R/VI)

The JD Edwards EnterpriseOne General Accounting system provides hard-coded values that the system uses when you set up general ledger report formats by using the G/L Reports Setup program (P74R9020). The system uses the values in the 74R/VI UDC table to determine whether the row you define is printed on the report. Generally, you indicate that rows that contain formulas do not print on the report.

(RUS) Setting Up UDCs for Sales Order Processing for Russia

In addition to the standard UDCs for sales order processing, set up this Russian-specific UDC:

Signature Role (74R/RL)

You specify in a processing option for legal documents the text that appears by the signature line on the document. You select one of the values that you set up in this UDC for the processing option. For example, you might set up a signature role for the person approving the document, an attorney, the head accountant, and so on.

(RUS) Setting Up UDCs for Fixed Assets for Russia

In addition to the standard UDCs for fixed asset processing, set up these Russian-specific UDCs:

Documents for Change (74R/CH)

Set up this UDC with values that reflect document types for actions that increase fixed assets costs. For example, you might set up values for reconstruction or modernization of the asset.

Documents for Maintenance (74R/MN)

Set up values in this UDC to reflect actions that incur costs for maintenance of fixed assets. The system uses the values in this UDC when you produce the Fixed Asset Card report (R74R5120).

(POL) Setting Up UDCs for Accounts Payable Processing for Poland

Set up this UDC before processing accounts payables for Poland.

Document Type (00/DT)

In the Document Type (00/DT) UDC table, set up document types for these types of vouchers:

- Purchases
- Purchases corrections
- Customs documents
- Employee expenses
- Employee expenses corrections

Address Number Label (74P/AL)

The system uses the values in the Address Number Label UDC table to identify the type of entity that uses the document type for which you set up additional information for accounts payable transactions. For example, you might set up these values:

| Code | Description |
|------|----------------|
| 1 | Supplier |
| 2 | Employee |
| 3 | Customs office |

(RUS) Setting Up Long Descriptions for Russia-Specific UDCs

This section provides an overview of the Regional User-Defined Codes program (P74R0005) and discusses how to enter long descriptions.

Understanding the Regional User-Defined Codes Program

The User-Defined Codes program (P0005) provides a field for entering a description of the codes that you define. However, the field length is not long enough for some of the descriptions needed for Russian localizations. The Regional User-Defined Codes program (P74R0005) enables you to enter long descriptions for UDCs.

When the system accesses a user-defined code for which a long description exists, it uses the long description when printing the UDC description on reports.

Note. When you delete a UDC record from the F0005 table, the system does not delete the corresponding description from the F74R0005 table. You must use the Regional User-Defined Codes program to delete the descriptions.

Forms Used to Set Up Long Descriptions

| Form Name | FormID | Navigation | Usage |
|---------------------------------------|-----------|---|---|
| Work With Regional User-Defined Codes | W74R0005B | Enter P74R0005 in the Fast Path, or access using Interactive Versions | Choose a user-defined code that exists in the User-Defined Codes table (F0005). |
| Regional User-Defined Codes | W74R0005C | Complete the Product Code field and the User-Defined Code fields in the header area and click Find on the Work With Regional User-Defined Codes form. Then, select a record and click Select. | Add long descriptions to existing UDC values. |

Entering Long Descriptions

Access the Regional User-Defined Codes form.

Regional Description 1 and Regional Description 2 Enter the description that the system prints on legal reports when the UDC description is printed on the report.

(RUS) Setting Up AAIs for Russian Taxes

In addition to the standard AAIs available throughout JD Edwards EnterpriseOne software, you must set up Automatic Accounting Instructions (AAIs) to process Russian value-added tax (VAT).

Russian-Specific AAIs

You must set up AAIs to account for gains and losses in currency exchanges when you process vouchers and invoices.

Set up these AAIs for Russia:

- P9xxxx for VAT actual accounts for Accounts Payable transactions, where xxxx is the general ledger class of the tax area.
- PTxxxx for VAT receivable accounts for Accounts Payable transactions, where xxxx is the general ledger class of the tax area.
- R9xxxx for VAT actual account, for Accounts Receivable transactions, where xxxx is the general ledger class of the tax area.
- RTxxxx for VAT receivable accounts, for Accounts Receivable transactions, where xxxx is the general ledger class of the tax area.

Notes About Standard AAIs

When you set up AAIs for Russia, note that:

- AAIs 4350 and 4355 for the JD Edwards Enterprise One Procurement system are used only with the C tax explanation code.

These AAIs look for a combination of the company number, order type, and general ledger class code in the F4008 table. If you do not set up these AAIs correctly, you receive an error message when you run the PO Receipts (P4312) program.

- AAI 4250 for the JD Edwards EnterpriseOne Sales Order Management system is used only with the C tax explanation code.

This AAI looks for a combination of the company number, order type, and general ledger class code in the F4008 table. If the 4250 AAI is not set up correctly, you receive an error message when you run the Sales Update (R42800) program.

- AAI RT for Accounts Receivables is used only with the V and E tax explanation codes, including items that are not taxable.

When an item or line type has an N in the taxable field, the system passes an E (exempt from tax) explanation code. Even though this item/line is not taxable, the Sales Update program still validates the existence of the RT AAI and will error if it is not set up.

(POL and RUS) Setting Up Next Numbers for Poland and Russia

For Russia, set up next numbers for VAT and cash transactions, Petty cash, and legal documents. For Poland, set up next numbers for legal documents.

This section discusses how to set up next numbers for VAT and cash transactions for Russia

See Also

Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” Setting Up Next Numbers for Petty Cash, page 1595

Chapter 95, “(POL and RUS) Setting Up Legal Numbering,” Setting Up Next Numbers for Legal Documents, page 1612

(RUS) Setting Up Next Numbers for VAT and Cash Transactions

You must set up next numbering schemes for VAT recovery on line 5 of the Set Up Next Numbers by System form in the Next Numbers Revisions (P0002) program.

You also set up next numbering for cash transactions. The system stores the next number assigned to a cash transaction in the Petty Cash Transactions (F74R0100) table. Before cash transactions are printed, the system displays the Enter Additional Information form (W74R0101B) in the Petty Cash Transactions program (P74R0101). When you click OK on the Enter Additional Information form, the system stores the next number for the transaction in table F74R0100. You must set up the numbering scheme for cash transactions on line 1 of the Set Up Next Numbers by System form in the Next Numbers Revisions (P0002) program.

(RUS) Setting Up Corresponding Versions for Russia

Some country-specific functionality requires that you create versions of the same name for a country-specific programs and a base software program. For example, to have the system access the processing options for a country-specific voucher program, you might need to set up a version named XYZ for the country-specific voucher program, and a version named XYZ of the Standard Voucher Entry (P0411) program.

Set up corresponding versions for these programs:

| Russian Program | Base Software Program |
|---|----------------------------------|
| <p>Sales Order - PO (P7424210)</p> <p>See <u>Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland,” Understanding Invoices, page 1667.</u></p> <p>See <u>Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland,” Understanding Sales Order Processes for Poland and Russia, page 1674.</u></p> | <p>Sales Order Entry (P4210)</p> |

| Russian Program | Base Software Program |
|--|---------------------------------|
| Print Invoice/Invoice Correction - PO (P7420565) See Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland.” (POL and RUS) Understanding the Print Process for Legal Documents, page 1677. | Standard Invoice Print (R42565) |
| Add Invoice - PO (P7433B11) See Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland.” (POL and RUS) Working with Invoices for Poland and Russia, page 1667. | Standard Invoice Entry (P03B11) |

(POL) Setting Up Corresponding Versions for Poland

Some country-specific functionality requires that you create versions of the same name for a country-specific programs and a base software program. For example, to have the system access the processing options for a country-specific voucher program, you might need to set up a version named XYZ for the country-specific voucher program, and a version named XYZ of the Standard Voucher Entry (P0411) program.

Set up corresponding versions for these programs:

| Poland Program | Base Software Program |
|---|-------------------------------------|
| Add Invoice - PO (P7433B11) See Chapter 100, “(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland.” (POL and RUS) Working with Invoices for Poland and Russia, page 1667. | Standard Invoice Entry (P03B11) |
| Sales Order - PO (P7424210) | Sales Order Entry (P4210) |
| Print Invoice/Invoice Correction - PO (P7420565) | Standard Invoice Print (R42565) |
| PO-Localization Finance Charge Processing (R03B525) (P74P525) | Generate Delinquency Fees (R03B525) |

(POL and RUS) Setting Up Legal Companies for Russia and Poland

This section provides an overview of legal companies and discusses how to associate transactional companies with a legal company.

Understanding Legal Companies

Legal company and transactional company relationships enable many companies to be unified in one legal company and to produce combined accounts payable reports. You can associate the companies that you use for transaction processing (transactional companies) with companies that you use for legal reporting (legal companies) so that legal reports can contain data for more than one transactional company. At a minimum, a legal company and a transactional company relationship must exist for the default company.

To associate transaction companies with legal companies, you use the Company Localized Data form. The system stores information about the association in the F7400010 table.

Form Used to Set Up a Legal Company

| Form Name | FormID | Navigation | Usage |
|------------------------|-----------|---|---|
| Company Localized Data | W7400010A | <p>Organization & Account Setup (G09411). Company Names & Numbers</p> <p>On the Work With Companies form, select Regional Info from the Row menu.</p> | Associate transactional companies with legal companies. |

Associating Transactional Companies with a Legal Company for Poland and Russia

Access the Company Localized Data form.

Company Enter the transactional company with which to associate a legal company.

Legal Company Enter the legal company with which to associate a transactional company.

(RUS) Setting Up Amount Difference Accounting

Amount differences occur when sales or purchase transactions are contracted in a currency other than rubles, and there is a difference in the exchange rate between the purchase or sales date and the date on which the payment is made. For example, when the company agrees to purchase goods from a supplier, you might set the price in euros or in U.S. dollars. The payment for the goods must occur in rubles, and will likely occur at a date after the shipment of the goods, so there might be a difference in the contracted amount and the actual payment amount due to fluctuations in the exchange rate from the time the goods were purchased and the time the goods are paid for.

When an amount difference occurs in a transaction, you must issue a voucher for the difference in amounts. This difference is subject to VAT and is reported in the Sales Book or the Purchase Register.

To set up the system for the amount differences caused by the use of two currencies:

- Set up amount difference accounts.

You should set up accounts for debits and for credits. For example, you might set up an account for Other Income for credits and Other Expenditures for debits.

- To process vouchers, you must set up the AAI items PLxxx (realized gains) and PGxxx (realized losses), where xxx is the currency code of the vouchers that you process.

For example, to process vouchers in rubles, you must set up the AAI item PLRUB.

- To process invoices, you must set up the AAI items for RGxxx (realized gains) and for RLxxx (realized losses), where xxx is the currency code of the invoices that you process.
- Set up bank accounts for the amount difference accounts so that the system can process manual and automatic payments for amount difference vouchers.
- Set up the amount difference voucher type for returned goods.

The system recognizes vouchers created for returned goods that have already been paid for by searching for document type PD. This voucher type must exist in these UDC tables:

- Document Type (00/DT)
- Document Type - Vouchers Only (00/DV)
- Amount Diff Document Type (Amount Difference Document Type) (74R/AD)

- Set up other required amount difference vouchers.

(RUS) Setting Up Petty Cash Processing for Russia

Russian regulations require the reporting of certain information that is not stored in the standard JD Edwards EnterpriseOne software.

This section provides an overview of supplemental information for petty cash for Russia, and discusses how to:

- Set processing options for Petty Cash Next Number Set Up (P74R0002).
- Set up next numbers for petty cash.
- Set processing options for Petty Cash Transactions (P74R0101).
- Add supplemental information for petty cash transactions.

Understanding Petty Cash Setup for Russia

When you set up your system to account for petty cash transactions, you must set up UDC values and next numbers as well as set processing options that the system uses when processing and printing cash transaction documents.

UDCs for Petty Cash

Set up these UDCs for petty cash transactions and reports:

- Document Types (00/DT).
- Petty Cash Document Type (74R/CD).

See Chapter 94, “(POL and RUS) Setting Up Functionality for Russia and Poland,” Setting Up UDCs for Legal Documents for Poland and Russia, page 1576.

Next Numbers for Petty Cash

You set up next numbers for petty cash using the Petty Cash Next Numbers Set Up program (P74R0002). The system stores the next numbering scheme in the Cash Next Numbers Setup (F74R0002) table. Set up the next numbering scheme for petty cash to start with 1 for each fiscal year. Because all petty cash documents must be numbered sequentially, the system uses the next number in the scheme regardless of whether you print a cash issue note or cash receipt note and whether you print the document from the JD Edwards EnterpriseOne Accounts Payable, JD Edwards EnterpriseOne Accounts Receivable, or JD Edwards EnterpriseOne General Accounting system.

Supplemental Information for Petty Cash

The Russian government requires that companies account for all inbound and outbound cash transactions. JD Edwards EnterpriseOne software for Russia provides the means to add to inbound (receipts) and outbound (payments) transactions the information that you must track and report. Additionally, you can add required information to transaction records before you print a cash-issue note to allow for cash payments or a cash receipt note to allow for cash receipts. You can also print a report that shows the activity in cash accounts.

You can print a cash-issue note or a cash-receipt note before you post the payment or receipt. Therefore, you cannot delete the transactions after you have printed the document. If you need to reverse a transaction, you must first post the payment or receipt and then void it.

After you create records in the JD Edwards EnterpriseOne Accounts Payable, JD Edwards EnterpriseOne Accounts Receivable, or JD Edwards EnterpriseOne General Accounting system, you use the Petty Cash Transactions program (P74R0101) to add petty cash information to the records that the system lists in these reports:

- Petty Cash Issue
- Petty Cash Receipts
- Cash Desk Transaction

If you do not add the supplemental information, the system displays a warning message but prints the document if you click OK a second time.

Forms Used to Set Up Petty Cash

| Form Name | FormID | Navigation | Usage |
|------------------------------------|-----------|--|--|
| Work With Petty Cash Document Type | W74R0002A | Cash Desk Transactions (G74RCASH), Petty Cash Next Number Setup | Select an existing record. |
| Petty Cash Next Number | W74R0002B | Select a record and click Add on the Work With Petty Cash Document Type form. | Set up next numbers for petty cash. |
| Work With Petty Cash Transactions | W74R0101A | Cash Desk Transactions (G74RCASH), Petty Cash Transactions | Review a list of petty cash transactions. |
| Enter Additional Information | W74R0101B | On the Work With Petty Cash Transactions form, select a record and select Add Information from the Row menu. | Enter the additional information for the transactions. The system prints the document after you enter the information and click OK. |

Setting Processing Options the Petty Cash Next Number Set Up (P74R0002)

Processing options enable you to specify the default processing for programs.

General

- Category Code** Specify the category code that you specified in the Category Code processing option for the Cash Transactions program (P74R0101).

Setting Up Next Numbers for Petty Cash

Access the Petty Cash Next Number form.

- Company** Enter the company for which you set up the next numbering scheme.
- Account ID** Enter the account from which petty cash transactions are written.
- Do Ty Cash Desk** (document type cash desk) Enter the document type for the type of cash transaction. The value that you enter must exist in UDC table 74R/CD for petty cash document types.
- Next Number Range 1** Enter the first number in the numbering scheme.

Setting Processing Options for the Petty Cash Transactions Program (P74R0101)

Specify the default values that the system uses when it processes petty cash transactions.

General

- | | |
|---|--|
| 1. Version for Petty Cash Issue (R74R003) | Specify the version of the Cash Issue Note Print program (R74R5003) that the system uses when it processes petty cash transactions. If you leave this processing option blank, the system uses version ZJDE0001. |
| 2. Version for Petty Cash Receipt (R74R5005) | Specify the version of the Cash Note Receipt program (R74R5005) that the system uses when it processes petty cash transactions. If you leave this processing option blank, the system uses version ZJDE0001. |
| 3. Ledger Type | This processing option is not used. |
| 4. Category Code | Specify the category code that identifies cash accounts. |
| 5. Document Type | This processing option is not used. |

Adding Supplemental Information for Petty Cash Transactions

Access the Enter Additional Information form.

- | | |
|--|---|
| Address Number | Enter the address number of the recipient of the petty cash. |
| Person Name | Enter the name of the recipient of the petty cash. |
| Source Documents | Enter an explanation of the source of the petty cash issue request. You can enter up to 240 characters. |
| Recipients Personal Information | Enter the title of the person receiving the petty cash for inbound transactions. |
| VAT (value-added tax) | Enter the VAT amount in words for outbound transactions. |

(RUS) Setting Up General Ledger Report Formats for Russia

This section provides an overview of general ledger reports set up and discusses how to:

- Add report formats.
- Add row details for sections.
- Specify columns for changes in equity reports.
- Associate accounts with rows in the reports.

Understanding General Ledger Report Setup

Before you run the general ledger reports, such as the Profit and Loss statement, you must set up the formats required for the reports. The system produces reports to the specifications you set up. You use the reports generated to complete the general ledger reports that you send to the government.

When you use the G/L Reports Setup program (P74R9020) to set up general ledger reports, you:

- Define the rows and columns that the system prints on the reports.
- Define the account or group of accounts that the system prints.

- Define formulas that the system uses to calculate sums based on amounts in certain rows or columns.
- Define the title of the reports.

You must set up a one or more report formats for these reports:

- Profit and Loss
- Balance Sheet
- Changes in Equity
- Cash Flow

When you complete the setup for general ledger reports, the system populates the tables that are accessed as the system generates the reports. The tables populated are:

| Table ID | Description |
|----------|--|
| F74R9020 | Includes data about the report format, such as the report name, type, and the source of the accounts. The system reads this table when you generate general ledger reports to determine the format of the report. |
| F74R9021 | Includes data about the sequence of the rows, the row definitions that print on the report, and whether the rows are visible. The system reads this table to determine the sequence of rows and the row descriptions when you generate general ledger reports. |
| F74R9022 | Includes data about the accounts or range of accounts for which the system prints balances or calculates amounts. The system reads this table when you generate general ledger reports to determine the source of the amounts to print. |
| F74R9023 | Includes data about columns for the Changes in Equity report. The system reads this table when you run the Changes in Equity program (R74R9030) to determine the report name, and row and column definitions. |

To set up general ledger reports, complete these steps:

| Step | Description |
|--|--|
| Add report formats. | You add report formats to identify the type of report and the source of the records that the system reads. For example, some reports might read records in F0902 table, and some reports read records in the F74R9002 table. |
| Add row details. | Select an existing format on the Setup G/L Reports form, then click Add to access the Report Row Detail Definition form. Click Add to access the Add/Update Detail row form, which is where you specify the type of rows for each section of the report, the sequence of the rows and the description for the row that prints on the report. |
| Associate accounts, or a range of accounts, to the rows. | After you define rows, you specify the account or range of accounts from which the system reads amounts. |
| Define columns for Changes in Equity reports. | After you define rows for Changes in Equity reports, you define the columns for the report. |

Forms Used to Set Up General Ledger Reports

| Form Name | FormID | Navigation | Usage |
|---------------------------------|-----------|---|---|
| Setup G/L Reports | W74R9020A | General Ledger (G74R09), G/L Reports Setup | Select existing reports. |
| Add/Update Setup G/L Reports | W74R9020C | Click Add on the Setup G/L Reports form. | Add report formats to which you can add detail row definitions. |
| Add/Update Detail Row | W74R9020B | Click Add on the Report Detail Row Definition form. | Select existing row, or add a new detail row. |
| Report Detail Row Definition | W74R9020D | After adding new rows, click OK on the Add/Update Detail Row form. Select a record and click Select on the Setup G/L Reports form. | Add the row sequence numbers and descriptions that the system uses as it prints rows on the report, or select an existing row to add account information. |
| Accounts Groups Definition | W74R9020E | Select a record on the Report Detail Row Definition form. Select a record on the Report Detail Column Definition form. | Define the accounts for the row. |
| Add/Update Column Detail | W74R9020F | Click Add on the Report Detail Column Definition form. | Add a new column definition. |
| Report Detail Column Definition | W74R9020G | When working with a Changes in Equity report, select a record on the Report Detail Row Definition form. | Select an existing record or access the Add/Update Column Detail form. |
| Copy of Report Definition | W74R9020H | Select a record and click Copy on the Add/Update Setup G/L Reports form. | Copy a report and all of its details. |

Adding Report Formats

Access the Add/Update Setup G/L Reports form.

| | |
|---------------------|--|
| Report Name | Enter the name that the system will use to identify the report format. When you generate the general ledger reports, you will specify this name in the processing options to specify the format that the system uses to print the report. |
| Report Type | Enter the type of report for which you create a format. The Report Type determines the rows, accounts, and other criteria that are applicable to the format. The value that you enter must exist in the UDC table 74R/RT. The values in 74R/RT are hard-coded. |
| Account Type | Enter the source of the accounts, or groups of accounts, for which you set up the format. The value that you enter must exist in the Account Type (74R/AT) UDC table. |

Adding Row Details for Sections

Access the Add/Update Detail Row form.

| | |
|----------------------------|--|
| Report Section | <p>Enter the section for which you specify row definitions. The value that you enter must exist in the UDC 74R/SE table.</p> <p>You must research the sections that the government requires for each report. JD Edwards EnterpriseOne reads section one (01) for the Balance Sheet and the Cash Flow, and sections one and two (01 and 02) for Profit and Loss Report and Changes in Equity. If you enter a different section number, the system will not show it on the reports.</p> |
| Report Row Section | <p>Enter a sequence in which the row appears in the section. You can enter up to four characters.</p> <p>Each sequence number must be unique for the entire report, not just the section. Consider beginning your sequence numbers with the number of the section so that you do not repeat the sequence number. Additionally, consider leaving unused numbers in the sequencing so that you can add additional rows if needed. For example, consider sequencing rows in section one as: 1010, 1020, 1030, and so on, and sequence rows in section two as 2010, 2020, 2030, and so on.</p> |
| Code Type | Enter the code that represents the type of row. The code that you enter must exist in the UDC table 74R/CT. Enter one of these codes: |
| Code | Enter the code provided by the Russian government that corresponds to the information for the line. For example, if the code for a row for Other Income is 050, enter 050. This field is optional. |
| Visible Row | Enter <i>Y</i> to make the row visible. Enter <i>N</i> to hide the row. Generally, you enter <i>N</i> for rows that contain formula information. |
| Factor Row | Specify whether the system changes the sign of an account from positive to negative, or negative to positive. Enter 1 to leave the sign unchanged. Enter -1 to reverse the sign. |
| Correspondence Flag | <p>This field appears for Cash Flow reports. The system completes the field with <i>S</i> if the system will read the F0902 table for the amounts, and completes the field with <i>C</i> if the system will read the F74R9002 table for the amounts.</p> <p>The value that you enter in the Code Type field determines which table the system reads for amounts.</p> |

Specifying Columns for Changes in Equity Reports

Access the Add/Update Column Detail form.

| | |
|------------------------------|--|
| Report Section Column | Enter the column number. For Section 01, you set up Column 3, Column 4, Column 5, and Column 6. For Section 02, you set up Columns 3, 4, and 5. |
| Formula Type | <p>Enter the type of amounts that print on the report. The value that you enter must exist in the Formula Type (74R/FT) UDC table. Values are:</p> <p><i>AA</i>: Current audit activity from periods 13 and 14</p> <p><i>AAI</i>: Audit activity one year before the current period, from periods 13 and 14:</p> |

AA2: Audit activity two years before the current period, from periods 13 and 14

AB: Current account balance for the current period

AB1: Account balance for the period one year prior

AB2: Account balance for the period two years prior

PA: Current period activity months 01–12 of the current year

PA1: Period activity, months 01–12 of one year prior

PA2: Period activity, months 01–12 of two years prior

PY: Prior year end balance for the current period

PY1: Prior year end balance for the period one year prior

PY2: Prior year end balance for the period two years prior

Factor Row

Specify whether the system changes the sign of an account from positive to negative, or negative to positive. Enter *1* to leave the sign unchanged. Enter *1* to reverse the sign.

Associating Accounts with Rows in the Reports

Access the Account Group Definition form.

The fields that appear on the Account Group Definition form differ depending on the value in the Code Type field on the Report Detail Row Definition form. If the value in the Code Type field is TLT (Title), the Account Group Definition form does not appear when click Select on the Report Detail Row Definition form.

| | |
|----------------------------------|--|
| Account Number | Enter the account from which the system prints the amount on the report. This field appears when the Code Type is ACC (accounts only). |
| From Object/Subsidiary | Enter the beginning of a range of accounts from which the system prints the amount on the report. This field appears when the Code Type is AGR (Accounts Group). |
| Thru Object/Subsidiary | Enter the end of a range of accounts from which the system prints the amount on the report. This field appears when the Code Type is AGR (Accounts Group). |
| Codes Formula Description | <p>Enter the formula that the system uses to calculate an amount that appears on the report. You enter the formula by entering the Code for the row inside of brackets. For example, to sum the amounts of rows with row Codes 010, 020, and 030, enter: [010] + [020] + [030]. This field appears when the Code Type is FRM (Code Formulate).</p> <p>The rows that you use in the formula must be sequenced before the row that contains the formula.</p> |

(RUS) Setting Up Correspondence of Accounts

This section provides an overview of correspondence of accounts set up, and discusses how to:

- Set processing options for Correspondence Account Setup (P74R9001).

- Set up accounts.
- Set up correspondence methods.
- Set up correspondence rules.

Understanding Correspondence of Accounts Setup

You set up the correspondence accounts, rules, and methods for all accounts in your chart of accounts for which you must have corresponding accounts.

Note. This document describes how to set up and use correspondence accounts within the JD Edwards EnterpriseOne system. It does not provide legal advice on the legal requirements. You must verify the requirements for these accounts with the government office responsible for publishing the requirements.

To set up correspondence of accounts, you use the Correspondence Account Setup (P74R9001) program to:

- Specify how the system generates correspondence accounts.
- Associate batch types and document types to the method by which the system processes corresponding accounts.
- Define correspondence rules by associating debit accounts to credit accounts.

When you set up your chart of accounts for correspondence, you:

- Must have the chart of accounts for all companies defined in the same way, such as all companies using the standard account setup, or all using the same statutory category code.

You can use the standard account setup of object.subsidiary, or use account category codes 21, 22, or 23 to set up your chart of accounts.

- Must have the same fiscal date pattern set up for all companies.

Correspondence Accounts

You use the Account Setup option in the Correspondence Account Setup program to specify how the system generates correspondence accounts. For each account that you identify, you specify whether the system changes the sign of the amounts from the F0911 table as it writes the amounts to the F74R9011 table. For example, you might specify that the system change negative amounts to positive amounts, and leave positive amounts as positive amounts. If you do not specify that the system change the sign, the sign remains unchanged.

You can specify the correspondence of accounts at various levels of detail. The system searches for the setup from the lowest level of detail to the highest level.

Correspondence Processing Methods

You set up correspondence methods to associate batch types and document types with predefined methods by which the system processes account transactions. The predefined methods that you associate to batch types and document types are:

| Method Number | Method Description | Use |
|---------------|--|--|
| 01 | Direct correspondence between two concurrent lines in the F0911 table. | Assign this method for fixed asset transactions, such as depreciation records. |

| Method Number | Method Description | Use |
|---------------|--|---|
| 02 | Direct correspondence between a debit line and a credit line in the F0911 table by amount. | Assign this method for inventory transactions when there is one debit line for each credit line with the same amount, but the lines are not necessarily concurrent. |
| 03 | Correspondence between one debit line and several credit lines, or between several debit lines and one credit line in table F0911. | Assign this method to have the system process transactions using the lowest level of detail. If a transaction to which you assign this method has multiple debits and credits, the system first matches debit and credits which have the same amount, and then applies a percentage to the remaining lines. |
| 04 | Correspondence between several debit lines and several credit lines | Assign this method to document types for which the system writes multiple debit and credit lines to table F0911. The system determines a percentage to apply to the credit and debit lines. |

If the system cannot identify the correspondence method to use for a transaction because there is no association between a document type and a method, the system uses method 04 for the transaction.

Correspondence Rules

You set up the correspondence accounts, rules, and methods for all accounts in your chart of accounts for which you must have corresponding accounts.

You set up correspondence rules to determine the allowed relations between debit and credit accounts. The system uses the rules that you define to determine how it searches for corresponding accounts when you run the Correspondence Transaction Generation (R74R9801) program. To improve system performance, you can also specify the batch type and document type for the accounts.

You can set up or modify correspondence rules one at a time, or you can access a form that lets you enter or import multiple rules.

Forms Used to Set Up Correspondence of Accounts

| Form Name | FormID | Navigation | Usage |
|--|-----------|---|---|
| Correspondence Setup | W74R9001E | Correspondence (G74R09COR), Correspondence Setup | Choose to set up accounts, methods, or rules. |
| Work With Correspondence Account Setup | W74R9001A | Click Account Setup on the Correspondence Setup form. | View, copy, or delete account setups. |
| Edit Correspondence Account Setup | W74R9001B | Click Add on the Work With Correspondence Account Setup form, or choose a record and click Select | Add a new account setup or modify an existing account setup. |
| Work with Correspondence Rules | W74R9001C | Click Correspondence Rules on the Correspondence Setup form. | View, copy, or delete account rules. |
| Work with Correspondence Method | W74R9001E | Click Correspondence Method on the Correspondence Setup form. | View, copy, or delete account methods. |
| Edit Correspondence Method | W74R9001F | Click Add on the Work with Correspondence Method form, or choose a record and click Select | Add a new correspondence method or modify an existing method. |
| Edit Correspondence Rules | W74R9001G | Click Add on the Work with Correspondence Rules form, or choose a record and click Select. | Add a new account rule or modify an existing account rule. |
| Edit Correspondence Rules | W74R9001H | Choose Form, Multiple Rules on the Work with Correspondence Rules form. | Add or modify multiple rules. For example, you can import rules from a spreadsheet. |

Setting Processing Options for Correspondence Account Setup (P74R9001)

Processing options enable you to specify the default processing for programs and reports.

General

1. Account Type

Specify the type of account that the system displays in the Edit Correspondence Account Setup form. Enter 21 to allow access to the values in the G/L Reporting Code 21 (09/21) UDC table in the Edit Correspondence Account Setup form. Enter 22 to allow access to the values in the G/L Reporting Code 22 (09/22) UDC table. Enter 23 to allow access to the values in the G/L Reporting Code 23 (09/23) UDC table. Enter OS or leave this processing option blank to allow entry of a specific object and subsidiary.

Setting Up Accounts

Access the Edit Correspondence Account Setup form.

| | |
|------------------------------|---|
| Category Code General | Enter the category code value that identifies the account for which you specify the account setup. The system displays this field only when you set the Account Type processing option to display category code 21, 22, or 23, and lets you choose a value from the corresponding UDC table, such as the G/L Reporting Code 21 (09/21) UDC table. |
| Object Account | Enter the object portion of the account for which you specify the account setup. The system displays this field only when you set the Account Type processing option to OS (object subsidiary). |
| Subsidiary | Enter the subsidiary portion of the account for which you specify the account setup. The system displays this field only when you set the Account Type processing option to OS (object subsidiary). |
| Plus Amount | Enter a value from the Amount Correspondences (74R/AG) UDC table to specify the sign that the system assigns to the amounts that it writes to the F74R9011 table when it writes positive amounts from the F0911 table to the F74R9011 table. |
| Minus Amount | Enter a value from the Amount Correspondences (74R/AG) UDC table to specify the sign that the system assigns to the amounts that it writes to table F74R9011 when it writes negative amounts from table F0911 to table F74R9011. |
| Plus Void Amount | Enter a value from the Amount Correspondences (74R/AG) UDC table to specify the sign that the system assigns to the amounts that it writes to table F74R9011 when it writes positive amounts that have been voided in table F0911 to table F74R9011. |
| Minus Void Amount | Enter a value from the Amount Correspondences (74R/AG) UDC table to specify the sign that the system assigns to the amounts that it writes to table F74R9011 when it writes negative amounts that have been voided in table F0911 to table F74R9011. |

Setting Up Correspondence Methods

Access the Edit Correspondence Method form.

| | |
|-------------------------------------|--|
| Batch Type | Enter the batch type to which you assign a correspondence method. The value that you enter must exist in the Batch Type (98/IT) UDC table. If you leave this processing option blank, the system uses all batch types. |
| Document Type | Enter the document type to which you assign a correspondence method. The value that you enter must exist in UDC table 00/DT. If you leave this processing option blank, the system uses all document types. |
| Correspondence Method | Enter the correspondence method to associate with the batch and document types. The value that you enter must exist in the Correspondence Methods (74R/MH) UDC table. |
| Correspondence Print Options | Enter a code that the system writes to the F74R9011 table for the specified document type / batch type combination. The value that you enter must exist in the Correspondence Print Options (74R/PO) UDC table. |

Setting Up Correspondence Rules

Access the Edit Correspondence Rules form.

| | |
|-------------------------------|--|
| Correspondence Rule ID | Enter a numeric value that identifies the correspondence rule. You can enter up to six characters. |
| Batch Type | Enter the batch type to which you assign a correspondence rule. The value that you enter must exist in the Batch Type (98/IT) UDC table. If you leave this processing option blank, the system uses all batch types. |
| Document Type | Enter the document type to which you assign a correspondence rule. The value that you enter must exist in the Document Type (00/DT) UDC table. If you leave this processing option blank, the system uses all batch types. |
| Debit Legal Account | Enter the portion of the debit account that you assign to the correspondence rule. You can enter up to 14 characters, but the system displays only 10 characters. The system does not validate that the account number that you enter is a valid account in your chart of accounts. |
| Credit Legal Account | Enter the portion of the credit account that you assign to the correspondence rule. You can enter up to 14 characters, but the system displays only 10 characters. The system does not validate that the account number that you enter is a valid account in your chart of accounts. |

(RUS) Setting Up for Voucher Processing for Russia

In addition to setting up document types for vouchers in the standard UDC tables of Document Type (00/DT) and Document Types - Vouchers Only (00/DV), you set up voucher types in the Document Type (74R/DT) UDC table.

Set up tax rate areas for Russian vouchers in the A/P Tax Rate/Areas (74R/TP) UDC table. The system uses the value that you specify in the Special Handling Code field to determine if tax is applicable in the tax area.

The system uses the voucher type that you assign from the 74R/DT UDC, along with the tax area that you assign, to determine whether to include the voucher in the Purchase Register report. The system stores the voucher and tax information in the F74R0018 table, and reads this table when you generate the Purchase Register.

See *JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide*, “(RUS and POL) Setting Up the System for Russian and Polish Taxes,” Understanding the Russian Tax Table.

The system includes vouchers according to these rules:

| Type of Voucher | Special Handling Code (SHC) | VAT Results |
|-----------------|--|---|
| Simple voucher | SHC in 74RDT is S (simple) SHC in 74R/TP is D (recovered) | VAT is recovered, reclassified, and included in the Purchase Register at the time the voucher is entered. |
| Simple voucher | SHC in 74RDT is S (simple) SHC in 74R/TP is R (recoverable) | VAT is recovered, reclassified, and included in the Purchase Register at the time the payment is made. |

| Type of Voucher | Special Handling Code (SHC) | VAT Results |
|--|--|---|
| Logged voucher Logged vouchers are used for fixed assets. | SHC in 74R/DT is L (logged) SHC in 74R/TP is D or R | VAT is recovered, reclassified, and included in the Purchase Register when an additional clause is met. |
| Negative voucher Negative vouchers are used when returning goods for which payment has not been received. | SHC in 74R/DT is Z SHC in 74R/TP is D | VAT is recovered, but is not included in the Purchase Register. The simple voucher that you match to a negative voucher also is not included. |
| Prepayment voucher | SHC in 74R/DT is P SHC in 74R/TP is N (not recoverable) | VAT is not recovered and is not included in the Purchase Register. |

After you enter vouchers, you can modify them by using the standard voucher entry programs. If you make changes before the voucher is posted, the system includes the changed information in the F74R0018 table, and in the Purchase Register as applicable.

You cannot delete a partially paid voucher. You can delete partially paid vouchers only if you first void the payment. You cannot modify a posted voucher.

(POL) Setting Up Voucher Types

This section provides an overview of voucher types for Poland and describes how to set up document types for accounts payable transactions.

Understanding Voucher Types

The system uses the document type of transactions to determine the transactions to include in the purchase registers. To include the correct transactions in the purchase registers, you should set up document types in the Document Type (00/DT) UDC table for these types of transactions:

- Purchases
- Purchase corrections
- Customs documents
- Employee expenses
- Employee expenses corrections

After you create the document types, you use the Set Up AP Document Types program (P74P4010) to associate additional information to the UDC values that represent the vouchers that you pay.

Note. When you set up voucher types for domestic purchase corrections and domestic purchase of fixed assets correction, you must specify that the entry of the original document type, original document number, and the original invoice date is required. This information is required in the VAT Domestic Register report.

Forms Used to Set Up AP Document Types

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|--|
| Work With Poland Document Types | W74P4010A | Accounts Payable (G74P04), Set Up AP Document Types | Choose existing records. |
| Edit Document Types – Setup Information | W74P4010C | Click Add on the Work With Poland Document Types form. | Add a new record or modify an existing record. |

Setting Up Voucher Types for Poland

Access the Edit Document Types – Setup Information form.

| | |
|-------------------------------|--|
| Document Type | Enter a document type that exists in the Document Type (00/DT) UDC table. |
| Original Document Flag | Enter <i>Y</i> (yes) to require that information about the document on which a voucher is based is entered during voucher entry. |
| Address Number Flag | Enter <i>Y</i> (yes) to enable a change to the default value in the Address Number Label field. Enter <i>N</i> (no) to accept the default value of 1 (supplier) in the Address Number Label field. You must complete this field. |
| Address Number Label | If you entered <i>Y</i> in the Address Number Flag field, enter a value that exists in the Address Number Label (74P/AL) UDC table that represents the type of address book record for the payee. |
| Standard Dates Flag | Enter <i>Y</i> (yes) to enable the change of the invoice or service date for a voucher during voucher entry. Enter <i>N</i> (no) to prevent the change of the invoice or service date. |

(POL) Setting Up the Exchange Rate Table Number

This section provides an overview of exchange rate setup and discusses how to enter the exchange rate table number.

Understanding Exchange Rate Table Setup

In Poland, invoices that include a foreign currency must include:

- The exchange rate.

You set up exchange rates in the Currency Exchange Rate Entry program (P0015A) in the base software.

See *JD Edwards EnterpriseOne Multicurrency Processing 8.12 Implementation Guide*, “Setting Up Exchange Rates”.

- The exchange rate table number that includes the exchange rate used, as published by the National Bank of Poland (NBP).

The NBP publishes a new, numbered exchange rate table when the official exchange rate changes.

- The date of the exchange rate table number.

You use the Exchange Table Number program (P74P0001) to enter the exchange rate table number and the date of the exchange rate table. You can enter one exchange rate table number per date. The system stores the data that you enter in the Exchange Table Number table (F74P0001).

When you print invoices from the JD Edwards EnterpriseOne Accounts Receivable or the JD Edwards EnterpriseOne Sales Order Management system, the system prints the exchange rate table number and corresponding date for the table using this hierarchy:

1. If an exchange rate table number exists in the F74P0001 table for the date on which the invoice is entered, the system prints that exchange rate table number and its corresponding date for the table.

For example, if you enter an invoice on October 20 and the F74P0001 table includes an exchange rate table number for October 20, the system prints the table number entered for October 20, and prints October 20 as the date of the exchange rate table number.

2. If no exchange rate table number exists in the F74P0001 table for the date on which the invoice is entered, the system searches for the most recent prior date for which an exchange rate table number exists and prints that date and corresponding exchange rate table number.

For example, if you enter an invoice on October 20 and the F74P0001 table does not include an exchange rate table number for October 20, the system searches for the most recent prior date to October 20 for which an exchange rate table number exists. If no exchange rate table number exists for October 19, the system searches for an exchange rate table number for October 18. If no exchange rate table number exists for October 18, the system searches for an exchange rate table number for October 17. The system continues searching prior dates until it finds an exchange rate table number in the F74P0001 table. When the system finds an exchange rate table number (for example October 14), it prints that exchange rate table number and prints the date of the exchange rate table number on the invoice.

Forms Used to Enter the Exchange Rate Table Number

| Form Name | FormID | Navigation | Usage |
|---------------------------------|-----------|---|--|
| Work With Exchange Table Number | W74P0001A | Set Up Legal Documents (G74PDOG), Exchange Table Number | Access existing exchange rate table numbers and effective dates of the tables. |
| Exchange Table No Revision | W74P0001D | Click Add on the Work With Exchange Table Number form. | Add new table numbers and effective dates. |

Entering the Exchange Rate Table Number

Access the Exchange Table No Revision form.

| | |
|------------------------------|---|
| Effective Date | Enter the effective date for the exchange rate table number as published by the National Bank of Poland. |
| Exchange Table Number | Enter the exchange rate table number as published by the National Bank of Poland that corresponds to the date that you entered in the Effective Date field. |

CHAPTER 95

(POL and RUS) Setting Up Legal Numbering

This chapter provides an overview of legal numbering for Russia and Poland, lists a prerequisite, and discusses how to:

- Set up legal document types.
- Associate legal document types with document types.
- Set up legal documents issue places.
- Set up next numbers for legal documents.
- Set up print template definitions for legal documents.
- Specify rows for print template line types.
- Associate legal document types with print templates.
- Specify programs and versions to print legal documents.
- (RUS) Set up legal document footer signatures.
- Set up versions for legal documents.

Understanding Legal Numbering

You set up legal numbering so that invoices that you print from the JD Edwards EnterpriseOne Accounts Receivable and JD Edwards EnterpriseOne Sales Order Management systems contain information required for tax reporting. You follow the process to set up legal numbering for each type of document that uses a legal numbering scheme.

(POL) For Poland, you set up legal numbering for invoices and correction invoices.

(RUS) For Russia, you set up legal numbering for invoices and shipment notes.

Prerequisite

Verify that the Legal Document Type Group (74/DG) UDC table is set up.

Setting Up Legal Document Types

This section provides an overview of legal document types and discusses how to enter legal document type information.

Understanding Legal Document Types

You set up legal document types to specify how the system handles taxes for a type of document, whether the system must print the document on one page, and whether multiple payment terms are allowed for a document. You use the Legal Document Types program (P7400002) to associate the legal document types that you create with the legal document type groups that exist in the Legal Document Type Group (74/DG) UDC table.

When you create legal document types, you assign a legal document type group to each document type by selecting a value from the Legal Document Type Group (74/DG) UDC table.

When you set up legal documents:

- (RUS) Assign SN (shipment note) as the document type group for goods dispatch notes and stock delivery notes, specify that the system calculates and discriminates taxes, and specify that the system not break on payment terms.
- (RUS) Assign SN (shipment note) as the document type group for outbound stock movement notes, and specify that the system not calculate taxes and not break on payment terms.
- (POL and RUS) Assign IN (invoice) as the document type group for invoices. Specify that the system calculates and discriminates taxes, and specify that the system breaks on payment terms.
- (POL) Assign CD (credit note/debit note) as the document type group for correction invoices. Specify that the system calculates and discriminates taxes, and specify that the system breaks on payment terms.

The system stores the legal document types that you create in the F7400002 table.

Forms Used to Enter Legal Document Types

| Form Name | FormID | Navigation | Usage |
|--------------------------------|-----------|--|---|
| Work With Legal Document Types | W7400002A | <ul style="list-style-type: none"> • Set Up Legal Documents (G74RDOC), Legal Document Types • Set Up Legal Documents (G74PDOC), Legal Document Types | Select an existing legal document type. |
| Legal Document Type Revision | W7400002B | On the Work With Legal Document Types form click Add. | Add legal document types. |

Entering Legal Document Types

Access the Legal Document Type Revision form.

| | |
|----------------------------------|---|
| Legal Document Type | Enter the name that you assign to a legal document type. |
| Legal Document Type Group | Enter the group to which the legal document type that you are creating belongs. When you complete this field with <i>IN</i> or <i>CD</i> , the value in the Calculate Taxes processing option must be <i>I</i> . You must enter a value that exists in the Legal Document Type Group (74/DG) UDC table. |
| Calculate Taxes | Select this check box to have the system calculate taxes. When you select this option, you can complete the Discriminate Taxes processing option. |

| | |
|------------------------------|---|
| Discriminate Taxes | Select this check box to have the system print the value of the goods or services and the tax amounts separately. If you do not select this check box, the system prints the value of the goods or services and the value of the taxes as one item. |
| One Page Document | Select this check box to have the system print the legal document on one page. |
| Break on Payment Term | Select this check box to have the system print the detail lines for only one payment term. If you do not select this check box, the system does not create a page break based on payment terms. |

Associating Legal Document Types with Document Types

This section provides an overview of the association of legal document types with document types and discusses how to associate legal document types with document types.

Understanding How to Associate Document Types with Legal Document Types

You associate the values in the Document Type (00/DT) UDC table with the values that you create for legal document types.

You use the Legal Document Types program (P7400002) to create legal document types, then use the Legal Doc. Types Relationship program (R7400003) to create the relationships between legal document types and internal document types. When you create the relationships, you also specify the company for which the relationship applies and the VAT Register VAT Condition for which the relationship applies.

The system stores the relationships in the F7400003 table.

Forms Used to Associate Legal Document Types With Document Types

| Form Name | FormID | Navigation | Usage |
|--|-----------|--|---|
| Work with Legal Document Types/Document Types Relationship | W7400003A | Set Up Legal Documents (G74RDOC), Legal Docs Type Relationship Set Up Legal Documents (G74PDOC), Legal Docs Type Relationship | Select an existing record. |
| Legal Document Types/Document Types Relationship Revision | W7400003B | Click Add n the Work with Legal Document Types/Document Types Relationship form. | Associate legal document types with document types. |

Associating Legal Document Types

Access the Legal Document Types/Document Types Relationship Revision form.

Legal Company Enter the company for which the association applies.

| | |
|----------------------------|---|
| Document Type | Enter the document type that you want to associate with the legal document type. You must enter a value that exists in the Document Types (00/DT) UDC table and the Document Types - Invoices Only (00/DI) UDC table. |
| VAT Condition | Enter a VAT condition code that exists in the VAT Condition (74/VC) UDC table. The system associates this code with the legal document type. |
| Legal Document Type | Enter the legal document type that you want to associate with the document type. The legal document type that you enter must exist in the F7400002 table. |

Setting Up Legal Documents Issue Places

This section provides an overview of legal document issue places and discusses how to enter legal document issue places.

Understanding Issue Places

You set up codes to represent the location where legal documents are issued. For example, if the company issues documents from a general office and from a warehouse, you set up codes to represent each of these locations.

The system stores the codes that you set up in the F7400004 table.

Forms Used to Enter Issue Places

| Form Name | FormID | Navigation | Usage |
|--|-----------|--|----------------------------|
| Work With Legal Documents Issue Places | W7400004A | <ul style="list-style-type: none"> Set Up Legal Documents (G74RDOC), Issue Places Set Up Legal Documents (G74PDOC), Issue Places | Select an existing record. |
| Legal Documents Issue Places Revision | W7400004B | On the Work With Legal Documents Issue Places form click Add. | Set up issue places. |

Entering Issue Places

Access the Legal Documents Issue Places Revision form.

| | |
|--------------------|---|
| Issue Place | Enter a code that represents the location where the document is issued. |
|--------------------|---|

Setting Up Next Numbers for Legal Documents

This section provides an overview of next numbers for legal documents and discusses how to set up next numbers.

Understanding Legal Document Next Numbers

The numbering for each type of legal document be consecutive. Because you can print some of the legal documents from more than one JD Edwards EnterpriseOne program, you set up next numbers for legal documents so that the system assigns a valid next number no matter which program you use to print a document.

(RUS) You set up different next numbering schemes for each type of legal document. For example, you might set up a next numbering scheme for invoices, and set up a different numbering scheme for shipment notes, which include Goods Dispatch Notes, Stock Delivery Notes, and outbound Stock Movement Notes.

(POL) You set up different next numbering schemes for each type of legal document. For example, you might set up a next numbering scheme for invoices and a different next numbering scheme for correction invoices.

The system stores the next numbering schemes in the F7400001 table.

Forms Used to Set Up Legal Document Next Numbers

| Form Name | FormID | Navigation | Usage |
|---------------------------------------|-----------|--|-------------------------------------|
| Work with Next Legal Document Numbers | W7400001A | <ul style="list-style-type: none"> Set Up Legal Documents (G74RDOC), Legal Document Next Numbers Set Up Legal Documents (G74PDOC), Legal Document Next Numbers | Select an existing record. |
| Next Legal Document Number Revision | W7400001B | On the Work with Next Legal Document Numbers form click Add. | Set up legal document next numbers. |

Setting Up Next Numbers for Legal Documents

Access the Next Legal Document Number Revision form.

| | |
|------------------------------------|--|
| Legal Company | Enter the company for which you set up the next numbers. |
| Legal Document Type | Enter the legal document type for which you set up next numbers. The value that you enter must exist in the F7400002 table. |
| Issue Place | Enter the code that represents the place of issue for the legal document. The value that you enter must exist in the F7400004 table. |
| Legal Document Type Same As | <p>Enter the legal document types that share the same next numbering scheme. The value that you enter must exist in the F7400002 table.</p> <p>(POL) For example, you might indicate that all correction invoices have the same next numbering scheme.</p> <p>(RUS) For example, you might indicate that all shipment notes, such as the Stock Delivery Note and the Goods Dispatch Note, have the same next numbering scheme.</p> |
| Next Legal Number | Enter the number that precedes the number that the system uses as the first number in the next numbering scheme. For example, if you enter 99, the system uses 100 as the first number in the next numbering scheme for the legal document type that you specify. |

Setting Up Print Template Definitions for Legal Documents

This section provides an overview of print template definitions and discusses how to set up print template definitions.

Understanding Print Template Definitions

You set up print templates to define the number of rows and the types of information that print in the detail section of legal documents. After you set up the print template definitions, you assign legal document types to the definitions so that the system uses the correct template for each legal document type.

The system stores information about print templates in the Print Template Definition of Legal Documents table (F7400021), the Print Line Types Definition for Legal Documents table (F7400022), and the Legal Document Types / Print Templates Relationship table (F74200023).

Forms Used to Set Up Print Template Definitions

| Form Name | FormID | Navigation | Usage |
|--|-----------|--|--|
| Work With Print Templates Definition for Legal Documents | W7430021A | <ul style="list-style-type: none"> Set Up Legal Documents (G74RDOC), Print Template Def. Legal Doc. Set Up Legal Documents (G74PDOCC), Print Template Def. Legal Doc | Select an existing print template. |
| Print Templates Definition for Legal Documents Revision | W7430021B | On the Work With Print Templates Definition for Legal Documents form click Add. | Set up print template definitions for legal documents. |

Setting Up Print Template Definitions

Access the Print Templates Definition for Legal Documents Revision form.

| | |
|---|--|
| Print Template | Enter a code that you assign to the print template. You must complete this field. |
| Total Nbr of Rows in Detail Section (total number of rows in detail section) | Enter the number of rows to print in the detail section. The value that you enter must be greater than 0 (zero). The maximum value you can enter is 999. |
| Print SO Attachments in Detail Section (print sales order attachments in detail section) | Select this option to have the system print the sales order header attachment in the detail section of the document. |
| Nbr of Rows for SO Attachments (number of rows for sales order attachments) | Enter the maximum number of rows that the system uses for the sales order header attachment. You complete this field only when you select the Print SO Attachments in Detail Section option. The maximum value you can enter is 999. |
| Print Line Attachments | Select this option to have the system print the sales order line attachment in the detail section of the document. |

Nbr of Rows for Line Attachments (number of rows for line attachments)

Enter the maximum number of rows that the system uses for the sales order line attachment. You complete this field only when you select the Print SO Attachments in Detail Section option. The maximum value you can enter is 999.

Attachment Line Length

Enter the line length beyond which the system does not print the attachment. For example, if you enter 50, the system does not print the attachment if the number of detail lines exceeds 50.

Specifying Rows for Print Template Line Types

This section discusses how to set up rows for print template line types.

Forms Used to Set Up Rows for Print Template Line Types

| Form Name | FormID | Navigation | Usage |
|--|-----------|---|---|
| Work With Print Templates Definition for Legal Documents | W7430021B | <ul style="list-style-type: none"> Set Up Legal Documents (G74RDOC), Print Template Def. Legal Doc. Set Up Legal Documents (G7PDOC), Print Template Def. Legal Doc. | Select an existing print template. |
| Print Line Types Definition for Legal Documents | W7430021D | On the Work With Print Templates Definition for Legal Documents Revisions form select Line Types Definition from the Form menu. | Define the number of rows for line types that print on legal documents. |

Setting Up Rows

Access the Print Line Types Definition for Legal Documents form.

Print Template Line Type

Enter the line type for which you want to specify the number of allowed rows. The value that you enter must exist in the Print Line Types for Legal Docs (74/PL) UDC table.

No Rows for Line Type

Enter the maximum number of rows on which the system prints the line type you specify. The maximum number is 999.

Associating Legal Document Types with Print Templates

This section discusses how to associate legal document types with print templates.

Forms Used to Associate Legal Document Types with Print Templates

| Form Name | FormID | Navigation | Usage |
|--|-----------|--|--|
| Work with Legal Document Types / Print Templates | W7430023A | <ul style="list-style-type: none"> Set Up Legal Documents (G74RDOC), Print Template Def Relationship Set Up Legal Documents (G74PDOC), Print Template Def Relationship | Select an existing record. |
| Legal Document Types / Print Templates Relationship Revision | W7430023B | On the Work with Legal Document Types / Print Templates form click Add. | Associate legal document types with print templates. |

Associating Legal Document Types with Templates

Access the Legal Document Types/Print Templates Relationship Revision form.

| | |
|----------------------------|--|
| Legal Company | Enter the company for which you set up the association between a legal document type and a print template. |
| Legal Document Type | Enter the legal document type for which you associate a print template. The value that you enter must exist in the F7400002 table. |
| Print Template | Enter the print template that you associate with the legal document type. The value that you enter must exist in the F7430021 table. |

Specifying Programs and Versions to Print Legal Documents

This section provides an overview of versions for legal documents and discusses how to specify programs and versions.

Understanding Versions for Legal Documents

You use the Legal Documents Print UBEs & Versions program (P7430024) to associate legal document types with versions of print programs that generate legal documents. For example, to set up a version for invoices:

- Specify the Legal Company.
- Specify in the Legal Document Type field the document type that you set up for invoices.
- Specify the issue place and user ID (optional).
- (RUS) Specify the version of the document to print.

For example, enter *R74R3031* in the UBE field of the Legal Documents Print UBEs & Versions program to print the goods dispatch note.

- (POL) Specify *R74P3030* (Print Invoice / Invoice Correction) in the UBE field of the Legal Documents Print UBEs & Versions program.

- Specify the version of the print program that you set up for invoices in the Version field of the Legal Documents Print UBEs & Versions program.

The ZJDE0001 version is the default version.

- Complete other fields on the Legal Documents Print UBEs & Versions Revision form.

The system stores the information for versions and programs in the F7430024 table.

Forms Used to Specify Versions and Print Programs

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|---|
| Work With Legal Documents Print UBEs & Versions | W7430024A | <ul style="list-style-type: none"> • Set Up Legal Documents (G74RDOC), Legal Document / UBE Relationship • Set Up Legal Documents (G74PDOC), Legal Document / UBE Relationship | Select an existing record. |
| Legal Documents Print UBEs & Versions Revision | W7430024B | On the Work With Legal Documents Print UBEs & Version form click Add. | Specify the program and version the system uses to print legal documents. |

Specifying Versions and Print Programs

Access the Legal Documents Print UBEs & Versions Revision form.

| | |
|-------------------------------------|--|
| Legal Company | Enter the company for which you set up the association between a print program and a version for the print program. |
| Legal Document Type | Enter the legal document type for which you associate print program and a version of the print program. The value that you enter must exist in the F7400002 table. |
| Issue Place | Enter the place of issue of the legal document. This field is optional. The value that you enter must exist in F7400004 table. |
| User ID | Enter a User ID to confine permission to print the document to the specified person. This field is optional. |
| UBE (universal batch engine) | Enter the print program to which you want to associate a version. |
| Version | Enter the version of the program that you specified in the UBE field that you want the system to use when you run the specified program. |

(RUS) Setting Up Legal Document Footer Signatures

This section provides an overview of footer signatures and discusses how to set up footer signatures.

Understanding Legal Document Footer

You set up legal document footers to specify the persons responsible for issuing or reviewing legal documents. You set up specific information for each legal document type.

Forms Used to Set Up Footer Signatures

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|---|
| Work With Legal Document Footer Signature | W74R0007A | Set Up Legal Documents (G74RDOC), Set Up - Legal Document Footer Signature | Select an existing record. |
| Legal Document Footer Signature Setup | W74R0007B | On the Work With Legal Document Footer Signature form click Add. | Add information to create a footer section for a signature on a legal document. |

Setting Up Footer Signatures

Access the Legal Document Footer Signature Setup form.

| | |
|----------------------------|--|
| Legal Company | Enter the company for which you set up the signature footer. |
| Program ID | Enter the program ID of the print program that generates the legal document. |
| Legal Document Type | Enter the legal document type for which you create the signature footer. The value that you enter must exist in F7400002 table. |
| Issue Place | Enter the place of issue of the legal document. The value that you enter must exist in the F7400004 table. |
| Version | Enter the version of the print program that generates the legal document. |
| Signature Role | Enter the role of the person who will sign the legal document. The value that you enter must exist in the Signature Role (74R/RL) UDC table. You must complete this field. |
| Sequence Number | Enter the sequence number of the signature line you want to print. You assign sequence numbers when you set up report formats. |
| Address Number | Enter the address book number of the person who will sign the legal document. |
| Alpha Name | Enter the name of the Chief Accountant or Company CEO that appears on the invoice or legal document. |
| Position | Enter the position of the person issuing the legal document. |
| Signature Status | Enter a value to specify the status of the person signing the legal document. The value that you enter must exist in the Signature Status (74R/FS) UDC table. |

Setting Up Versions for Legal Documents

For legal documents printed from the JD Edwards EnterpriseOne Sales Order Management system, you must set up corresponding versions for the legal documents in the country-specific programs for the legal documents, and in the Print Invoices (R42565) program. You do this in addition to completing the steps to set up legal numbering and associate print templates to legal document types. You use the P7420565 program to set up versions for:

- (RUS) Goods Dispatch Note
- (RUS) Stock Movement Note (outbound)
- (RUS) Stock Delivery Note
- (POL and RUS) Invoices
- (POL) Correction Invoices

The program for printing legal documents (P7420565) appears on the Sales Order menus for Poland and Russia under these names:

- (POL) Print Invoice / Invoice Correction - PO
- (RUS) Print Invoice - PO
- (RUS) Print Stock Delivery Note - PO
- (RUS) Print Goods Dispatch Note - PO
- (RUS) Print Stock Movement Note - PO

CHAPTER 96

(POL) Working with Poland-Specific Functionality

This chapter provides overviews of voucher entry and voucher match and cash transactions; and discusses how to:

- Print reports for inbound and outbound cash transactions.
- Generate the Cash Desk Report (P74P9104).
- Repost the Account Ledger tag file.
- Work with delinquency fees.

Understanding Voucher Entry and Voucher Match for Poland

You use the standard voucher entry programs to enter vouchers for Poland. You then use the Voucher Additional Information program (P74P411H) to enter additional information about the voucher that the system uses when you produce the purchase registers for tax reporting. For example, depending on the document type set up in the Set Up AP Document Types program (P74P4010), you might enter information about the original document or change an invoice or service date. The system automatically launches the Voucher Additional Information program when you add a voucher or modify an existing, non-posted voucher. You can also access the Voucher Additional Information program from a menu option.

When you delete a voucher, the system deletes the information for the voucher that is stored in the F0411 Header File - POL (F74P011H) table.

Type of Vouchers

In the Document Type (00/DT) UDC table, set up document types for these types of vouchers:

- Purchases
- Purchases corrections
- Customs documents
- Employee expenses
- Employee expenses corrections

The system enables you to enter as many corrective documents as needed, but the total value of all corrections combined with the original documents must not be less than zero. You cannot enter a correction for a correction.

Additional Voucher Information

The fields that appear on the Voucher Additional Information form vary, depending on the type of voucher for which you are entering information. The voucher type determines the information that the system includes in the VAT registers. Each voucher type must have its own document type defined in the Document Type (00/DT) UDC table.

Voucher Match

You use the Voucher Match program (P4314) to match vouchers to purchase orders for Poland. Additionally, you must enter information that is used for VAT reporting in the Voucher Additional Information program (P74P411H). The system automatically launches the Voucher Additional Information program when you add a voucher or modify an existing, non-posted voucher. Or, you can access the Voucher Additional Information program from a menu option.

Understanding Cash Transactions

You work with cash transactions in the JD Edwards EnterpriseOne Accounts Payable, JD Edwards EnterpriseOne Accounts Receivable, and JD Edwards EnterpriseOne General Accounting systems.

To work with cash transactions in these systems, you:

- Enter vouchers or enter receipts for invoices.
- Pay the vouchers or invoices from a cash account.
- Use the Cash Desk Transaction (P74P9101) program to print a report for an inbound or outbound transaction.
- Use the Cash Desk Report program to print a record of all cash transactions for a specified period.

Printing Reports for Inbound and Outbound Cash Transactions

This section provides an overview of printing cash desk transaction documents and discusses how to:

- Set processing options for Cash Desk Transaction (P74P9101).
- Set processing options for Cash Desk Transaction Document (R74P9102).
- Select transactions to print.

Understanding How to Print Cash Desk Transaction Documents

You use the Cash Desk Transaction program (P74P9101) to select and print cash desk transaction documents. When you select Cash Desk Transaction from the Cash Desk Transactions menu (G74PCASH), the system displays the processing options. When you click OK on the processing options template, the system displays the Work With Cash Desk Transactions form. You then select the record to print and select Print Report from the Row menu to launch the Cash Desk Transaction Document (R74P9102) program and print the report.

When you run the Cash Desk Transaction Document program (R74P9102) from the Work With Cash Desk Transactions form, the system prints a report that includes:

- Name of the company issuing the document.
- Document type.
- Whether the transaction is inbound or outbound.
- Document number.
- Cash account number and description.
- Transaction date, amount, and description.
- Transaction amount, printed literally.
- Cashier ID.
- Person responsible for the transaction.

You access the processing options for the Cash Desk Transaction Document program from Batch Versions.

Prerequisites

Before you perform the tasks in this section:

- Verify that the Localization Country Code field in your User Display Preferences is set to *PL* (Poland).
- Verify that specific accounts for cash are set up.
- Verify that legal numbering is set up for legal document types for cash transactions.

Form Used to Work with Cash Transactions

| Form Name | FormID | Navigation | Usage |
|----------------------------------|-----------|---|-------------------------------------|
| Work With Cash Desk Transactions | W74P9101A | Cash Desk Transactions (G74PCASH), Cash Desk Transaction Complete the processing options, then click OK. | Select records to print or reprint. |

Setting Processing Options for Cash Desk Transaction (P74P9101)

Processing options enable you to specify the default processing for programs and reports.

General

| | |
|----------------------|---|
| Version | Specify the version of the Cash Desk Transaction Document (R74P9102) program that the system uses to print the report. If you leave this processing option blank, the system uses version XJDE0001. |
| Ledger Type | Specify the ledger type for general ledger transactions. If you do not complete this processing option, the system uses <i>AA</i> . |
| Category Code | Specify the category code that identifies where the cash accounts are defined. |

Setting Processing Options for Cash Desk Transaction Document (R74P9102)

Processing options enable you to specify the default processing for programs and reports.

General

| | |
|-------------------------------|---|
| Number of Copies | Enter the number of copies to print. If you leave this processing option blank, the system prints two copies. |
| Document Type Inbound | Enter a document type from the Document Type (00/DT) UDC table to specify the document type for inbound transactions. If you do not specify a document type, the system uses document type <i>KP</i> . |
| Document Type Outbound | Enter a document type from the Document Type (00/DT) UDC table to specify the document type for outbound transactions. If you do not specify a document type, the system uses document type <i>KW</i> . |

Selecting Transactions to Print

Access the Work With Cash Desk Transactions form.

Select a record, then select Print Report from the Row menu.

Generating the Cash Desk Report (R74P9104)

This section provides an overview of the Cash Desk Report and discusses how to:

- Run the Cash Desk Report (R74P9104) program.
- Set processing options for the Cash Desk Report (R74P9104).

Understanding the Cash Desk Report

You run the Cash Desk Report program (R74P9104) to print a list of the cash transactions for a specified period. The system prints only transactions that appear in the Cash Desk Transaction (F74P9100) table and prints debit transactions as cash receipts and credit transactions as cash issues.

In the header area of the report, the system lists:

- The name of the company issuing the report.
- The report name and number.
- The name of the person printing the report.
- The number and description of the cash account.
- The currency code.
- The beginning balance.

In the detail area, the report lists for each cash desk transaction report:

- The legal number of each inbound or outbound cash transaction.

- The GL date of each transaction.
- The document type.
- The document description.
- The amount of inbound and outbound transactions, in separate columns.
- The closing balance of the cash account.

Running the Cash Desk Report Program (R74P9104)

Select Cash Desk Transactions (G74PCASH), Cash Desk Report.

Setting Processing Options for Cash Desk Report (R74P9104)

Processing options enable you to specify the default processing for programs and reports.

Select

| | |
|-----------------------------|---|
| Account Number | Enter the account number for which you run the report. |
| Ledger Type | Enter the ledger type for which you run the report. If you leave this processing option blank, the system uses ledger type AA. |
| Reporting Begin Date | Enter the first day of a range of dates that the system uses to select records to process. |
| Reporting End Date | Enter the last day of a range of dates that the system uses to select records to process. |
| Mode | Leave this processing option blank to print in proof mode; the system does not validate the closing balance and the closing date when you run the report in proof mode. Enter <i>/</i> to print in final mode. The system prints the report and validates the closing balance and closing date. |
| Company | Enter the company for which you run the report. |
| Document Type | Enter a value that exists in the Document Type (00/DT) UDC table. The system uses the next numbering scheme associated with the document type that you specify. |

Localization Options

| | |
|------------------------------------|---|
| Report Title | Enter the report title that prints in the header area of the report. You can enter up to 100 characters. |
| Report Title (Continuation) | Enter additional text that the system appends to the text that you enter in the Report Title processing option. |

Reposting the Account Ledger Tag File

This section provides an overview of the Repost Account Ledger Tag File program and discusses how to:

- Run the Repost Account Ledger Tag File program.

- Set processing options for Repost Account Ledger Tag File.

See Also

JD Edwards EnterpriseOne General Accounting 8.12 Implementation Guide, “Reposting the Account Ledger and Recalculating a Fiscal Year”

Understanding the Repost Account Ledger Tag File Program

If you have never run trial balance reports or if the data in the F74902T table becomes corrupted, run the Repost Account Ledger Tag File program (R749102) to populate the F74902T table. The F74902T table stores information about the debit and credit amounts in the F0911 table.

After you run the Repost Account Ledger Tag File program for the first time, the system updates the values in the F74902T table when it updates the F0902 table.

Running the Repost Account Ledger Tag File Program

Select General Ledger (G74P09), Repost Account Ledger Tag File.

Setting Processing Options for Repost Account Ledger Tag File (R749102)

Processing options enable you to specify the default processing for programs and reports.

Mode

| | |
|------------------------------------|---|
| Process Mode | Specify the processing mode. Values are: 1 Proof mode. 2 Final mode. The system updates the F74902T table. |
| Check F0902 Balance | Specify whether to validate balances. Values are: Blank: Suppress validation. 1 Validate the existence of balances in the F0902 table before writing balances to the F74902T table. |
| Check F0911 Missing Entries | Specify whether to validate transactions. Values are: Blank: Suppress validation Enter 1 to validate the existence of entries in the F0911 table. |

Working with Delinquency Fees for Poland

This section provides an overview of delinquency fees, methods of calculating delinquency fees, the A/R Delinquency Fee Journal For Poland (R74P3B22) program, and the delinquency fee process flow; lists prerequisites; and discusses how to set processing options for PO-Localization Finance Charge Processing (R03B525) (P74P525).

Understanding Delinquency Fees for Poland

In Poland, the interest rate charged as a delinquency fee on past-due invoices can change over the life of the invoice. For example, the interest rate charged on an invoice that is 90 days past due might be different for the first 30 days than for the last 60 days.

JD Edwards EnterpriseOne software enables you to setup delinquency interest rates with effective dates. The added programs for Poland enables you to apply multiple interest rates to a specific invoice from the due date to the actual payment date or as of date, even when the payment date or as of date is more than 30 days from the invoice date.

Note. The effective due date is always a business day. If the due date occurs on a non-working day such as a Sunday, the effective due date is the immediately previous workday.

The application of delinquency fees to customers or invoices is optional. A company can apply them or not apply them.

Understanding Methods of Calculating Fees

The system provides a processing option to enable you to specify whether the system calculates delinquency fees based on the pending amount and the amount of payments that are made after the due date, or based on the open amount (30-day rule method).

The amount of the delinquency fees calculated might be different for each method, depending on whether the interest rate charged increases or decreases from the invoice due date until the invoice is paid in full, and depending on whether the customer makes partial payments.

The system uses these methods of calculating delinquency fees:

| Method | Base amount | Interest type | Date from | Date through |
|-------------|--------------|---------------|--|---|
| 30 day rule | Open amounts | Legal rate | The latest occurring of the invoice date, shipment date, or delivery date, plus 30 days. | <p>The earliest occurring of the invoice due date, the as of date, or the date receipt cleared date.</p> <p>Note. A processing option in the PO – Localization Finance Charge Processing (R03B525) (P74P525) program determines whether the system uses the receipt cleared date or standard as of processing.</p> |

| Method | Base amount | Interest type | Date from | Date through |
|---------------|-----------------|------------------------|------------------|--|
| Late payment | Paid amount | Legal or contract rate | Invoice due date | Receipt cleared date. Note. A processing option in the PO – Localization Finance Charge Processing (R03B525) (P74P525) program determines whether the system uses the receipt cleared date or standard as of processing. |
| Open invoices | Pending amounts | Legal or contract rate | Invoice due date | As of date |

The system supports as of processing for the 30 day rule method. When an invoice is fully or partially paid, the system uses the value from the Cleared/Value Date to determine the open amount for which to calculate delinquency fees. If no value exists for the Cleared/Value Date, the system uses the G/L date of the receipt.

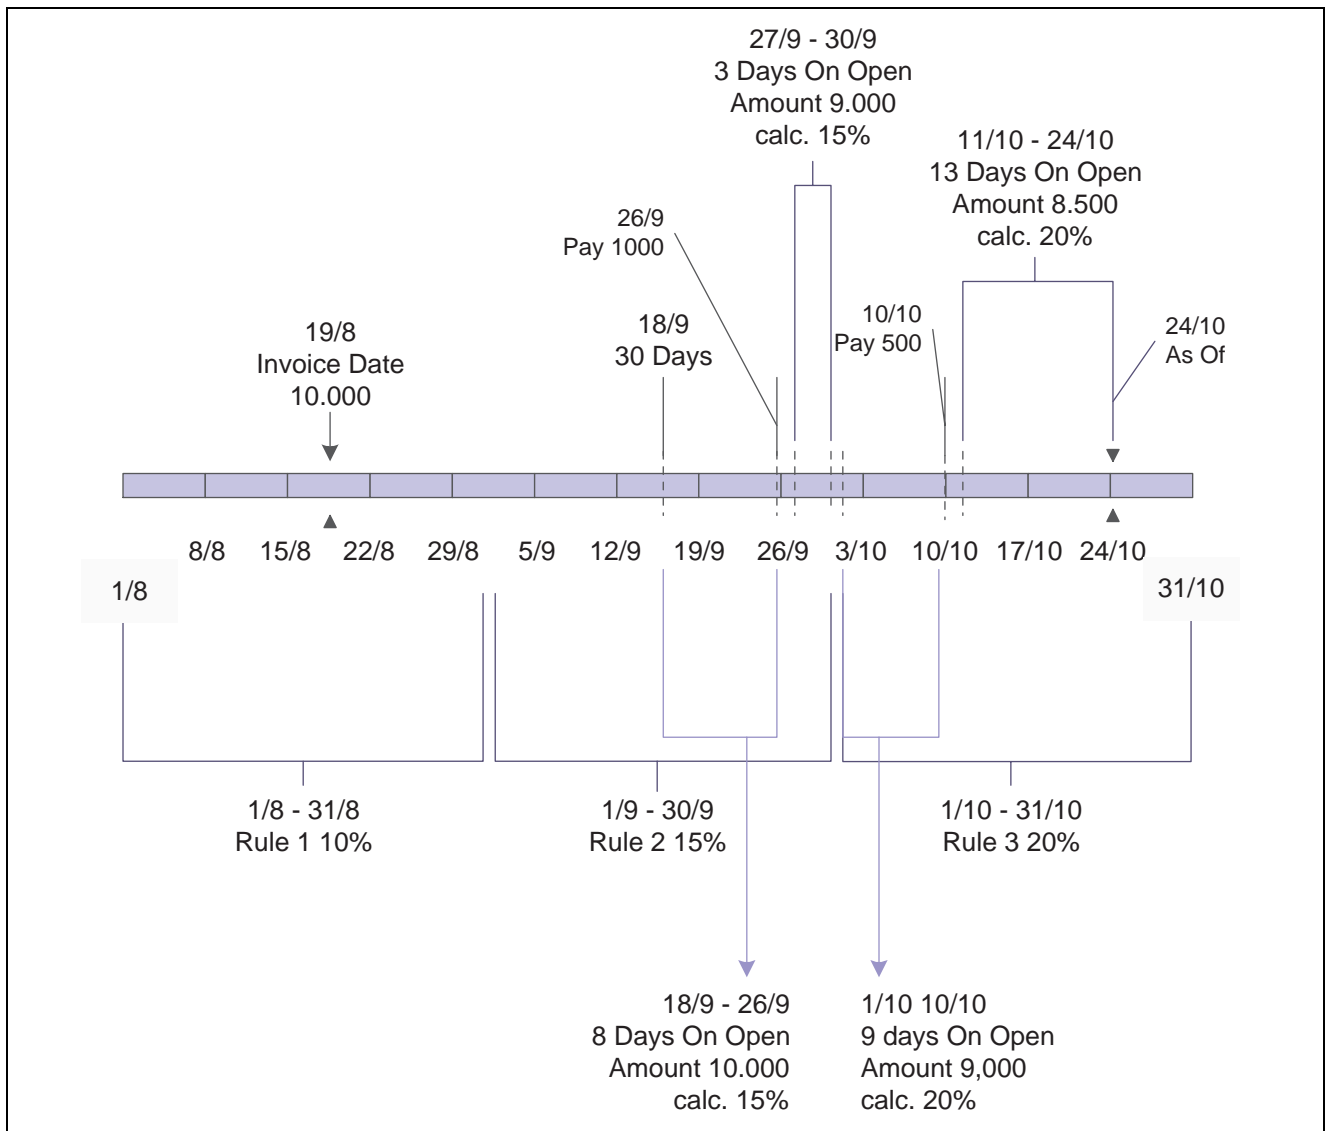

Note. All of the calculation methods could be applied to the same invoice.

30 Day Rule Method

The system writes to two additional tables when you use the 30-day rule method to calculate delinquency fees. The Processed Documents in Finance Charge Process table (F74P3B24) includes the ending date for the period for which each fee is calculated for each invoice. The system also writes data to the A/R Fee Journal History Detail for Poland table (F74P3B23). The system uses the information in this table when you generate the A/R Delinquency Fee Journal For Poland (R74P3B22) report.

See [Chapter 96, “\(POL\) Working with Poland-Specific Functionality,” Understanding the A/R Delinquency Fee Journal For Poland \(R74P3B22\) Program, page 1632.](#)

This graphic shows how the system processes delinquency fees using the 30-day rule method.

30-day Rule Method

When you set the 30 Day Rule processing option to specify that the system uses the 30-day rule method, the system:

1. Calculates the delinquency fee for the number of days for which the entire invoice amount is overdue.

The system uses the invoice date, shipment date, or delivery date, plus 30 days as the beginning of the period for which it calculates the delinquency fees, and uses the earliest of the invoice due date or the as of date as the end of the calculation period. If the period for which the entire amount is past due spans more than one interest rate as set up in the Define Delinquency Policies program (P03B2501), the system calculates the delinquency fee for the number of days for which the amount is past due for each interest rate in effect.

2. If a partial payment is made, calculates the delinquency fee for the number of days for which the open amount is overdue up to invoice due date or the as of date, whichever date is earliest.

For the partially paid amount, the system calculates the fees up to the receipt clear date or receipt GL date according to processing option setup.

For example, if the customer makes a 1000 payment on a 10,000 invoice, the system calculates the delinquency fee on 10,000 up to the date on which the amount is paid. The system also calculates delinquency fees on 9000 up to the invoice due date or the as of date, whichever date is earliest. If you set the processing options to use the receipt cleared date, the system uses that date instead of the payment date to determine the number of days for which to calculate the delinquency fee.

If the period for which the entire amount is past due spans more than one interest rate, the system calculates the delinquency fees for the number of days for which the amount is past due for each interest rate in effect. When the final payment is made, the system calculates the delinquency fee from the date of the last delinquency fee calculation until the date of the earliest occurring of the invoice due date, the as of date, or the receipt cleared date or receipt GL date. In the example in this section, the delinquency fees would be calculated on the 9000 that was cancelled in the last receipt.

If the period for which the entire amount is past due spans more than one interest rate, the system calculates the delinquency fees for the number of days for which the amount is past due for each interest rate in effect.

Late Payment and Open Invoice Methods

When you specify that the system does *not* use the 30-day rule method, the system bases the delinquency fee calculations on the pending amount and the amount and date of the late payments.

This graphic shows how the system calculates delinquency fees when you do not use the 30-day rule method.

Late Payment and Open Invoice Methods

The system:

1. Calculates the delinquency fee on the lowest open amount from the invoice due date to the execution date.

The lowest open amount is the original invoice amount minus any partial payments.

If the period for which the lowest open amount is past due spans more than one interest rate, the system calculates the delinquency fees for the number of days for which the amount is past due for each interest rate in effect.

2. Calculates the delinquency fee on the amount of each partial payment for the number of days that the payment amount was past due up to the date receipt cleared date or receipt GL date, depending on the processing options.

If the period for which the partial payment is past due spans more than one interest rate, the system calculates the delinquency fees for the number of days for which the amount is past due for each interest rate in effect.

Examples of Delinquency Fee Calculations

The base software calculates delinquency fees for open amounts from the due date to the as of date, uses only one interest rate, and calculates delinquency fees on late payments from the due date to the payment date.

When you complete the process for calculating delinquency fees for Poland, the system either uses the 30-day rule method to calculate the delinquency fees or calculates the delinquency fees based on the pending and late payment amounts.

Suppose you issued an invoice and received payment for the invoice with these factors in effect:

- Invoice amount is 10,000.
- Invoice is issued on August 19.
- 30-day due date is September 18.
- The interest rate in effect on September 18 is 15 percent.
- The interest rate changes to 20 percent on October 1.
- The customer makes these payments:
 - 1000 on September 26.
 - 500 on October 10.
- October 24 is the As Of processing date.

The system makes these calculations when you enable the 30-day rule method:

- When the 1000 payment is made on September 26, determines and applies to the 10,000 original invoice amount a daily delinquency fee based on an interest rate of 15 percent and multiplies it by 8 days (September 18 through September 26).
- When the interest rate changes on October 1, determines and applies to the open amount of 9000 a daily delinquency fee based on an interest rate of 15 percent and multiplies it by 4 days (September 27 through September 30).
- When the payment of 500 is made on October 10, determines and applies to the open amount of 9000 a daily delinquency fee based on an interest rate of 20 percent and multiplies it by 10 days (October 1 through October 10).

- When you calculate the delinquency fees on October 24, determines and applies to the open amount of 8,500 a daily delinquency fee based on an interest rate of 20 percent and multiplies it by 14 days (October 10 through October 24).

The system makes these calculations for based on pending amounts and late payments (the 30-day rule method is *not* enabled):

1. For the 1,000 paid on September 26, determines a daily delinquency fee based on an interest rate of 15 percent and multiplies it by 8 days (September 18 through September 26).
2. For the 500 paid on October 10:
 - Determines a daily delinquency fee based on the interest rate of 15 percent and multiplies it by 12 days (September 18 through September 30).
 - Determines a daily delinquency fee based on the interest rate of 20 percent and multiplies it by 10 days (October 1 through October 10).
3. For the 8,500 open amount up to the As Of execution date, October 24:
 - Determines a daily delinquency fee based on the interest rate of 15 percent and multiplies it by 12 days (September 18 through September 30).
 - Determines a daily delinquency fee based on the interest rate of 20 percent and multiplies it by 24 days (October 1 through October 24).

Understanding the A/R Delinquency Fee Journal For Poland (R74P3B22) Program

The system automatically runs the A/R Delinquency Fee Journal For Poland program (R74P3B22) and the Delinquency Fee Journal Program (R03B22) when you run the Generate Delinquency Fee program (R03B525). The A/R Delinquency Fee Journal For Poland program, reads the A/R Fee Journal History Detail for Poland table (F74P3B23) and generates a report that lists the standard information that the system includes in the report for the Delinquency Fee Journal program plus selected information from the F74P3B23 table.

This table describes the fields in the F74P3B23 table:

| Heading | Descriptions | Included in R74P3B22 Report |
|---------------------------|---|-----------------------------|
| Policy Number/Line Number | Lists the policy name used to determine the delinquency fee calculations and the line number if multiple lines for the policy are generated. The policy number appears in the standard report; the line number is specific to the Polish process. | Yes |

| Heading | Descriptions | Included in R74P3B22 Report |
|---|---|-----------------------------|
| Delinquency Fee Date Used (data item P74DBEG) | <p>When using the 30-day rule method, the system calculates the beginning date on the latest of the invoice date, the shipment date, or the delivery date, plus 30 days.</p> <p>This field contains a 1 if the beginning date of the calculation is based on the invoice date plus 30 days, contains 2 if the beginning date is based on the shipment date plus 30 days, and contains 3 if the beginning date is based on the delivery date plus 30 days.</p> | Yes |
| Period Number (data item P74PN) | When using the 30-day rule method, the system indicates when more than one receipt is processed during the period for which an interest rate is effective. For the first receipt within the effective date range of an interest rate, the system writes 1 to this field, for the second receipt, the system writes 2, and so on. | No |
| Begin Period (data item P74BPE) and End Period (data item P74EPE) | When using the 30-day rule method, the system generates periods for each receipt in the date range and writes the beginning date and ending date used for the delinquency fee calculation. | Yes |
| Number of Rule (data item P74NRUL) | <p>If the invoice has past due or open amounts that span more than one interest rate period (rule), the system indicates for which period the record is written.</p> <p>The system writes 1 if the record is created for the first rule, writes 2 if the record is created for the second rule, and so on.</p> | No |
| Date From Fee Calculated (data item P74FFC) and Date Thru Fee Calculated (data item P74TFC) | The system writes the beginning and ending dates for the period for which the fees are calculated. | Yes |

Understanding the Delinquency Fee Process Flow for Poland

To apply different interest rates to invoices:

1. Set up delinquency fee policies using the Define Delinquency Policies program (P03B2501).

See *JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide*, “Setting Up Credit and Collections Management,” Setting Up Delinquency Policies.

2. Set the processing options for the PO-Localization Finance Charge Processing (R03B525) program (P74P525) using a version that has the same name as the version of the Generate Delinquency Fees program (R03B525) that you use to process delinquency fees for Poland.

If you do not set up corresponding versions, the system uses version ZJDE0001 of the P74P525 program.

3. Set the processing options for the Add Invoice - PO (P7433B11) program in which the Issue Place processing option is set to the issue place from which the system generates the legal number for the fees invoice.

See [Chapter 100, “\(POL and RUS\) Working With Sales Order and Invoice Processing for Russia and Poland,” Setting Processing Options for Add Invoice - PO, page 1670.](#)

4. Run the Generate Delinquency Fee program (R03B525).

See *JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide*, “Processing Delinquency Notices and Fees,” Running the Print Delinquency Notices Program.

When the country code is set to PL (Poland), the system reads the processing options for the PO-Localization Finance Charge Processing (P74P525) program and calculates delinquency fees.

5. If the Late Payment Delinquency Fee processing option in the Generate Delinquency Fee program is blank so that the system does not calculate late payment fees when you run the Generate Delinquency Fee program, run the Late Payment Delinquency Fees program (R03B221) to generate delinquency fees.

See *JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide*, “Processing Delinquency Notices and Fees,” Generating Delinquency Notices.

6. Run the Review Delinquency Notices program (P03B22) to generate a report that can be used to review and approve the delinquency fees.

See *JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide*, “Setting Up Credit and Collections Management,” Setting Up Delinquency Policies.

Note. The system automatically runs the A/R Delinquency Fee Journal For Poland program (R74P3B22) and the Delinquency Fee Journal Program (R03B22) when you run the Generate Delinquency Fee program (R03B525).

Prerequisites

Before you complete the tasks in this section:

- Verify that the value in the Localization Country Code field in the in User Profile Revisions program (P0092) is set to *PL* (Poland).
- Set the processing options for Add Invoice - PO (P7433B11).
- Set up corresponding versions of the Generate Delinquency Fee program (R03B525) and the PO-Localization Finance Charge Processing (R03B525) program (P74P525).
- Verify that the workday calendar and due date rules are set up.

See *JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide*, “Understanding Payment Terms,” Advanced Payment Terms.

See *JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide*, “Setting Up Payment Terms,” Setting Up Advanced Payment Terms.

Setting Processing Options for PO – Localization Finance Charge Processing (R03B525) (P74P525)

Access the PO – Localization Finance Charge Processing (R03B525) program from the Accounts Receivable (G74P03B) menu. The system launches a program that enables you to set the processing options.

General

| | |
|---------------------------|--|
| Policy | Enter the policy name set up in the Define Delinquency Policies program (P03B2501) that the system uses to apply delinquency fees. |
| Company | Enter the company name associated with the policy that the system uses to apply delinquency fees. If you leave this processing option blank, the system uses company 00000. |
| Cleared/Value Date | <p>Enter 1 to use the value in the Cleared/Value Date field on the Receipt Entry form of the Standard Receipts Entry program (P03B102) to calculate the fees when you enter 1 for the 30 Day Rule processing option. The system uses this value only when a value exists in the Receipts Header table (F03B13). If no value exists, the system uses the G/L date.</p> <p>Leave this processing option blank to use the G/L date to calculate the delinquency fees.</p> |

30–Day Rule

| | |
|--------------------|---|
| 30 Day Rule | <p>Leave this processing option blank to base delinquency fee calculations on the open amount and late payment amounts.</p> <p>Enter 1 to calculate delinquency fees based on the late payments plus 30 days.</p> |
|--------------------|---|

Customer Selection

| | |
|---|--|
| Customer Master Category Code Number | Enter the address book category code in which exists customer data for applying delinquency fees. |
| Customer Master Category Code Value | Enter the value that exists in the category code identified in the A/B Category Number processing option what identifies the customers for which you process delinquency fees. |

RF Generation

| | |
|----------------|--|
| Version | Enter the version of the Add Invoice - PO (P7433B11) program in which the Issue Place processing option is set to the issue place from which the system generates the legal number for the fees invoice. |
|----------------|--|

CHAPTER 97

(RUS) Working with Correspondence of Accounts

This chapter provides an overview of correspondence of accounts, lists prerequisites, and discusses how to:

- Generate correspondence transaction records
- Modify correspondence accounts
- Post correspondence batches
- Repost correspondence records

Understanding Correspondence of Accounts

Correspondence is the relationship between accounts used to process certain types of transactions. The Russian government defines rules for the accounts to which transactions can be credited and debited. For example, if you debit an account for an asset under construction, you can credit only an account for materials, stock, accounts payable, future period expenses, or other payables. The rules for correspondence also specify the naming conventions for the accounts. For example, accounts used for fixed asset transactions must begin with the characters 01.

When you generate reports to meet legal requirements, you can produce the reports only from accounts that are enabled under the rules of correspondence. These reports include the balance sheet, income statement, and cash flow reports.

To work with correspondence of accounts, you:

- Run the General Ledger Post program (R09801).
- Run the Generate Correspondence program (R74R9801) to write detail correspondence information to the Correspondence Relation With Amount (F74R9011) table.
- Use the Review Correspondence Batches program (P74R0011) to create batch headers for correspondence batches and change batch statuses.
- Run the Post Correspondence program (R74R9002) to post correspondence transactions to the F74R9002 table.
- Use the Review Correspondence program (P74R9011) to modify or add correspondence records in table F74R9011, as necessary.
- Run the Repost Correspondence program (R74R9003) to post the changes you make to posted records in table F74R9011.

Prerequisites

Before you work with correspondence of accounts, you must:

- Verify that the accounts, methods, and rules that you need to report on correspondence accounts are set up.

See [Chapter 94, “\(POL and RUS\) Setting Up Functionality for Russia and Poland,” \(RUS\) Setting Up Correspondence of Accounts, page 1600](#).

- Verify that the Zero Amounts processing options for the version of the Journal Entry MBF Processing Options that is associated with voucher and invoice entry programs is set up to allow zero amounts.

Generating Correspondence Transaction Records

This section provides an overview of the Correspondence Transaction Generation program and discusses how to:

- Generate correspondence records.
- Set processing options for Correspondence Transaction Generation.

Understanding the Correspondence Transaction Generation Program

When you run the Correspondence Transaction Generation program (R74R9801), the system reads records for posted batches in the F0911 table and generates transaction records in the F74R9011 table. The transaction records in the F74R9011 table relate debits with credits.

When you run the program in final mode, the system writes lines which are processed without error to table F74R9011, and assigns G to the post status and GE to the correspondence batch header status. If there are errors for any lines when you run the program in final mode, the system assigns E (error) as the post status and writes EG (error generated) for the status of the correspondence batch header, and sends a message to the work center. Errors exist when:

- No valid rule exists in the correspondence rules setup for the account relation.
- The amounts do not balance.
- The sum of the correspondence generated amounts for an account is not equal to the account amount in table F0911 for that journal entry.

You run the Generate Correspondence program after you run the General Ledger Post program, and before you run the Post Correspondence program.

Generating Correspondence Records

Select Correspondence (G74R09COR), Correspondence Transaction Generation.

Setting Processing Options for Correspondence Transaction Generation (R74R9801)

Processing options enable you to specify the default processing for programs and reports.

General

- | | |
|---------------------------------|--|
| 1. Final Mode | Specify whether the system runs the program in proof or final mode. When you run the program in proof mode, the system generates a report and does not update records. When you run the program in final mode, the system generates a report and updates table F74R9011. |
| 2. Account Type | Specify the account type setup for correspondence accounts. The value that you enter must exist in the Account Type (74R/AT) UDC table. |
| 3. Ledger Types | Specify the ledger types that the system uses to select records to process. You can enter up to three ledger types. The values that you enter must exist in the Ledger Types (09/LT) UDC table. |
| 4. Print Processed Lines | Enter <i>1</i> to print only the lines with errors on the report. Leave this processing option blank to print all lines on the report. |
| 5. Tolerance Margin | Specify the tolerance margin allowed for differences between the debit amount and the credit amount when the journal entries use correspondence method 01 or correspondence method 02. |

Modifying Correspondence Records

This section provides an overview of correspondence records and discusses how to:

- Set processing options for Correspondence Batch Revision.
- Change the status of a batch.

Understanding Correspondence Records

The Correspondence Revision (P74R9011) program enables you to:

- Manually redistribute amount for transactions with a batch header status that is not equal to P (posted).
- Delete lines for transactions with a batch header status that is not equal to P (posted).
- Modify lines for transactions with a batch header status that is not equal to P (posted).
- Add correspondence transactions to table F74R9011.

The Correspondence Batch Revision (P74R0011) program enables you to:

- Create correspondence batch headers.
- Review or change the status.
- Run the Correspondence Transaction Generation (R74R9801) program.
- Run the Post Correspondence (R74R9002) program.

Forms Used to Review and Modify Correspondence Account Transactions

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|---|
| Work With Correspondence Batches | W74R0011A | Correspondence (G74R09COR), Correspondence Batch Revision | Review and modify the batches in table F0011, and run the R74R9801 or R74R9002 programs. |
| Edit Batch Header | W74R0011B | <p>Choose a record, then click Select on the Work With Correspondence Batches form.</p> <p>Choose a record, then choose Row, Review Status on the Work With Correspondence Batches form.</p> <p>Choose a record, then choose Row, Create Batch Header on the Work with Batches Without Correspondence Header form.</p> | <p>Change the status of the batch when you access this form from the Work With Correspondence Batches.</p> <p>Create a batch header record in table F74R0011 when you access this form from the Work with Batches Without Correspondence Header form.</p> |
| Work with Batches Without Correspondence Header | W74R0011C | <p>On the Work With Correspondence Batches form, select Form, Create Batch Header.</p> <p>Select a record and then choose Create Batch Header from the Row menu.</p> | <p>View all batches in F0011 that do not have corresponding records in the F74R0011 table.</p> <p>Create a correspondence batch header record.</p> |
| Work With Batch | W74R9011A | Correspondence (G74R09COR), Correspondence Maintenance Application | View batches for which a record exists in the Correspondence Relation With Amount (F74R9011) table. |
| Display Batch Correspondence | W74R9011B | Choose a record, then click Select on the Work With Batch form. | Review detail of records that exist in table F74R9011 |
| Work With Correspondence | W74R9011D | <p>Choose a record, then click Select on the Display Batch Correspondence form.</p> <p>Choose a record, then choose Row, Review Corresp. on the Work With Correspondence Batches form.</p> | Modify the correspondence record. |
| Select Documents | W74R9011C | On the Work With Correspondence from, select Form, Documents. | Choose a document that exists for the batch |

Setting Processing Options for Correspondence Batch Revision (P74R0011)

Processing options enable you to specify the default processing for programs and reports.

General

- 1. Batch Type** Specify the default value for the batch type that the system displays in the Work With Correspondence Batches form.

Changing the Status of a Batch

Access the Edit Batch Header form.

- Correspondence Status** Enter the status of the batch. The value that you enter must exist in the Correspondence Batch Status (74R/CS) UDC table.

Posting Correspondence Records

This section provides an overview of the Post Correspondence program and discusses how to:

- Post correspondence records
- Set processing options for Post Correspondence

Understanding the Post Correspondence Program

Balances for correspondences accounts must exist in the F74R9002 table before you can generate the Cash Flow report. You run the Post Correspondence program (R74R9002) to populate the F74R9002 table after you run the Correspondence Transaction Generation program to generate records.

When you run the Post Correspondence program, the system:

- Selects all correspondence transactions with a status of G and a correspondence batch header status of GE.
- Updates the F74R9002 table, if run in final mode.
- Updates the posted code for each correspondence transaction to P in the F74R9011 table.
- Prints a report showing the processed records.
- Updates the status of the correspondence batch header to PO (posted).

Posting Correspondence Records

Select Correspondence (G74R09COR), Post Correspondence.

Setting Processing Options for Post Correspondence (R74R9002)

Processing options enable you to specify the default processing for programs and reports.

Mode

- 1. Mode** Leave this processing option blank to print the report in proof mode. Enter *1* to print the report and update the Correspondence Balance table (F74R9002) to match the Correspondence With Relation Amount table (F74R9011).
- 2. Missing Entries** Specify whether the system verifies if a record for the batch exists in the F74R9011 table. Enter *1* to validate the entries. The system uses this processing option when you run the Repost Correspondence program.

Reposting Correspondence Records

This section provides an overview of the Repost Correspondence program and discusses how to:

- Reposting correspondence records.
- Set processing options for Repost Correspondence.

Understanding the Repost Correspondence Program

You use the Repost Correspondence program (R74R9003) to post changes that you made to posted records in the F74R9011 table. The Repost Correspondence program updates the F74R9002 table with the posted amounts from the F74R9011 table.

When you run the Repost Correspondence program, the system:

- Selects records from the F74R9011 table that have a correspondence results code *P*.
- Updates, deletes, or adds balances to the F74R9002 table when records are processed in final mode.
- Prints a report showing the processed transactions.

Reposting Correspondence Records

Select Correspondence (G74R09COR), Repost Correspondence.

Setting Processing Options for Repost Correspondence (R74R9003)

Processing options enable you to specify the default processing for programs and reports.

Mode

- 1. Mode** Leave this processing option blank to print the report in proof mode. Enter *1* to print the report in final mode and update the F74R9002 table.
- 2. Missing Entries** Specify whether the system verifies if a record for the batch exists in the F74R9011 table. Enter *1* to validate the entries and delete records in table F74R9002 that do not have transactions in the F74R9011 table.

CHAPTER 98

(RUS) Working with Vouchers and Payment Processing

This chapter provides an overview of legal payments; and discusses how to:

- Generate amount difference vouchers.
- Add information to payments.
- Print payment orders.
- Change the payment GL date.

Understanding Legal Verification of Payments

In Russia, the bank statement that a bank sends to its customer is the only legal confirmation of activity in the accounts used for payments. When you process payments, you send to the bank a payment order that includes both summary payment details, similar to those printed on a standard check, and detailed payment information. Depending on the circumstances, it may take from one to several days to process the payment. If the layout of the payment order is incorrect or required information is missing, the bank must refuse to process the payment.

After the bank receives the payment orders and processes them, the bank sends to the customer a bank statement that is used to verify the actual payment date. You use the date that the bank confirms in the bank statement as the actual payment date in your accounts. To make the payment date in your accounts match the payment date in the bank statement, you change the GL transaction date for payment transactions after you receive the bank statement that confirms the payment.

Generating Amount Difference Vouchers in Russia

This section provides an overview of amount difference vouchers, lists a prerequisite, and discusses how to:

- Generate amount difference vouchers.
- Set processing options for Generate Amount Differences Voucher (R74R4010).

Understanding Amount Difference Vouchers

You enter amount difference vouchers when there is a difference in the exchange rate on the date that you enter a voucher and the date that you pay the voucher. You run the Generate Amount Differences Voucher program (R74R4010) to generate vouchers to account for the gain or loss. The system writes records to the F0411 table for new vouchers created from the JD Edwards EnterpriseOne Accounts Payable system, and writes to the F03B11 table when you run the Generate Amount Differences Voucher program from the JD Edwards EnterpriseOne Accounts Receivable system.

When you run the Generate Amount Differences Voucher program, the system creates vouchers for the gain or loss. You must post those vouchers. When you post the new vouchers, the system writes the data to the Russian Tax File table (F74R0018) so that the data can be reported in the Sales Book or the Purchase Book.

When you run the Generate Amount Differences Voucher program, the system generates vouchers in domestic currency, and:

- Marks the vouchers as paid.
- Summarizes the lines by original document and tax area.
- Shows the amount difference as either the gross amount or the taxable amount, depending on the processing options.
- Generates entries to the F0911 table.
- Writes records to the F0414 Tag File - RUS (F74R4014) table.

Prerequisite

Verify that document types for account difference vouchers exist in the Amount Dif Document Type (74R/AD) UDC table.

Running the Generate Amount Differences Voucher Program (R74R4010)

Select Accounts Payable (G74R04), Amount Difference Generation.

Setting Processing Options for Generate Amount Differences Voucher (R74R4010)

Processing options enable you to specify the default processing for programs and reports.

Default

- | | |
|---------------------------|--|
| 1. Processing Mode | Leave this processing option blank to process records in proof mode. Enter <i>1</i> to process records in final mode. If you process in final mode, the system pays the voucher, and updates the F74R0018 table and the F0911 table. |
| 2. Amount Type | Leave this processing option blank to print the taxable amount of the transactions on the voucher. Enter <i>1</i> to print the gross amount of the transactions on the voucher. |

Voucher

- 1. Tax/Rate Area** Specify the tax rate/area that the system assigns to the new voucher. The value that you enter must exist in the F4008 table.
- 2. Tax Explanation Code** Specify the tax code that the system assigns to the new voucher. The value that you enter must exist in the Tax Explanation Codes (00/EX) UDC table.
- 3. Tax Area** Leave this processing option blank to use the tax/rate area that you entered in the Tax/Rate Area processing option. Enter *1* to use the tax rate/area from the original voucher. Enter *2* to use the tax rate/area from the F0401 table.
- 4. Name- Remark** Enter a remark that the system saves to the F0411 table. The system does not print the remark on the voucher.
- 5. Payment Term** Specify the payment term that the system assigns to the new voucher. The code that you enter must exist in the F0014 table.
- 6. Payment Instrument** Specify the payment instrument that the system assigns to the new voucher. The code that you enter must exist in the Payment Instrument (00/PY) UDC table.
- 7. Payment Term Choice** Leave this processing option blank to use the payment term code that you specified in the Payment Instrument processing option. Enter *1* to use the payment term from the original voucher. Enter *2* to use the payment term from the F0401 table.
- 8. Version** Specify the version of the Voucher Entry MBF Processing Options (P0400047) program that the system uses when you run the Generate Amount Differences Voucher (R74R4010) program. If you leave this processing option blank, the system uses version ZJDE0001.

G/L

- 1. Explanation** Enter a remark that the system prints on the voucher.
- 2. Version** Specify the version of the Journal Entry MBF Processing Options (P0900049) program that the system uses when you run the Generate Amount Differences Voucher (R74R4010) program. If you leave this processing option blank, the system uses version ZJDE0001.

Payment

- 1. Name - Remark** Enter a remark that the system saves to the F0411 table. The system does not print the remark on the voucher.

Adding Information to Payments

This section provides an overview of the payment process for Russia, lists a prerequisite, and discusses how to:

- Add payment information.
- Set processing options for Review Payments Additional Information (P74R4510).

Understanding the Payment Process for Russia

When you process payments for Russia, you add additional information that the system prints on the payment order, and then you print the payment order.

The system displays the forms on which you need to add information when you write automatic payments. Alternatively, you can manually add information by using a menu option.

Forms Used to Add Payment Information

| Form Name | FormID | Navigation | Usage |
|-----------------------------|-----------|--|---|
| Work With Supplemental Data | W74R4510A | Accounts Payable (G74R04), Review Payments Additional Information | Select a payment to review. |
| Supplemental Data Revision | W74R4510C | Select a record and click Select on the Work With Supplemental Data form to add or modify information. Select a record and select Reprint from the Row menu to print. | Review payment information, or manually print the Payment Order document. |

Adding Payment Information

Access the Supplemental Data Revision form.

Review Payments additional Information - Supplemental Data Revision

OK Cancel Tools

Document Co/Ty/Num 00050 PK 5002

Payment Condition Tax Information

Payment Terms Type

Pay Terms Type Description

Agreement Number

Date of Agreement

Supplemental Data Revision form

| | |
|---------------------------------|--|
| Payment Terms Type | Enter a code that exists in the Payment Terms (74R/PT) UDC table to identify the type of payment. The description for the code prints on the Payment Order document. |
| Agreement Number | Enter the contract number from the purchase order. |
| Agreement Date | Enter the date of the contract for the purchase order. |
| Payment Status | Enter a code that exists in the Payment Status (74R/PS) UDC table to identify the reason for the payment. |
| OKATO Code | Enter the code that identifies the administrative and territorial division. You complete this field for tax payments only. |
| Organization Budget Code | Enter a value that exists in the Budget Code (74R/PB) UDC table to specify the budget code for the payment order. You complete this field for tax payments only. |
| Payment Reason | Enter a value that exists in the Payment Reason (74R/PR) UDC table to specify the reason for tax payment. You complete this field for tax payments only. |
| Tax Period Code | Enter a value that exists in the Tax Period (74R/PP) UDC table to specify the tax period for which a tax payment applies. You complete this field for tax payments only. |
| Tax Period | Enter the period for which the tax applies. You complete this field for tax payments only. |

| | |
|------------------------|--|
| Document Number | Enter the document number of the document that specified that a tax payment must be made. You must complete this field for tax payments. |
| Document Date | Enter the date of the document that specified that a tax payment must be made. Complete this field for tax payments only. |
| Payment Type | Enter a value that exists in the Payment Type (74R/PC) UDC table to identify the type of tax payment. Complete this field for tax payments only. |

Setting Processing Options for Review Payments Additional Information (P74R4510)

Processing options enable you to specify the default processing for programs and reports.

General

| | |
|---|---|
| 1. Version of Payment Order Report | Specify the version of Payment Order Reprint program (R74R4530) that the system uses when you run the Review Payments Additional Information (P74R4510) program. If you leave this processing option blank, the system uses version ZJDE0001. |
|---|---|

Printing Payment Orders for Russia

This section provides an overview of payment orders, lists a prerequisite, and discusses how to:

- Print a payment order automatically.
- Print a payment order manually.
- Set processing options for Automatic Payment Order (R74R4520) and for Payment Order Reprint (R74R4530).

Understanding Payment Orders

You print a payment order for all domestic payments. You deliver copies of the payment orders to the bank that processes your payments. You can print the payment order when you work with automatic payments or when you work with manual payments.

When you print a payment order, the system prints a document that includes:

- Date of the order, in the correct format.
- Supplemental data from the Payment Order Supplemental Data (F74R4500) table.
- Amount in rubles.
- Company information.
- Payee information.
- Bank information.
- Payment detail.

- Amount of payment order.
- Amount in words.

Printing the Payment Order Automatically

To automatically print the payment order:

- Write payments by clicking Write in the Work With Payment Groups (P04571) program.
The system displays the Supplemental Data Revision form.
- Add the required data for each payment in the group by selecting each payment and then entering the data.
When you click OK, the system saves the data that you enter to the F74R4500 table, runs the Automatic Payment Order (R74R4520) program, and prints the payment order.

Printing the Payment Order Manually

You can manually print the payment order from the Review Payments Additional Information program (P74R4510). To print the payment order manually, you:

- Process a manual payment.
- Select a record on the Supplemental Data Revision form in the Review Payments Additional Information program, and enter the required data.
- Click OK to store the additional information in the F74R4500 table.
- Click OK to run the Manual Payment Order (R74R4520) program and print the payment order.

Setting Processing Options for Automatic Payment Order (R74R4520) and for Payment Order Reprint (R74R4530)

Processing options enable you to specify the default processing for programs and reports.

General

- | | |
|---|---|
| 1. Print Company Address | Enter <i>Y</i> to print the address company address on the payment order. Leave this processing option blank to suppress the printing of the company address. |
| 2. Print Payee Address | Enter <i>Y</i> to print the payee address on the payment order. Leave this processing option blank to suppress the printing of the payee address. |
| 3. Print City | Enter <i>Y</i> to print the payee address city on the payment order. Leave this processing option blank to suppress the printing of the city. |
| 4. Print Account Number | Enter <i>Y</i> to print the account number on the payment order. Leave this processing option blank to suppress the printing of the account number. |
| 5. G/L Bank Account Description | Enter <i>Y</i> to use the GL Bank Description as your company's bank name on the payment order. |
| 6. Bank Cross Reference | Enter <i>Y</i> to use the Bank Cross Reference description as the payee's bank name on the payment order. |
| 7. Document Type for Next Number | Specify the document type for which the system assigns a next number. |

- | | |
|---|---|
| 8. Voucher Description | Enter a code that is associated with the voucher description that prints on the payment order. The value that you enter must exist in the Payment Order (74R/UC) UDC table. |
| 9. Transit Account | Enter a code that is associated with a type of bank account. The value that you enter must exist in the H00/CK UDC table. |
| 10. Correspondent Bank Record Type | Specify the type of bank. The value that you enter must exist in the Bank Type Code (00/BT) UDC table. |

Payment Details

- | | |
|-----------------------------------|--|
| 1. Compress Pay Items | Enter <i>Y</i> to compress pay items into one line. |
| 2. New Line Level | Enter <i>Y</i> to create a new line level for each pay item. |
| 3. Print Payment Remark | Enter <i>Y</i> to print the remark for the payment on the payment order. |
| 4. Print Invoice Reference | Enter <i>Y</i> to print the reference to the invoice on the payment order. |
| 5. Print VAT Amount | Enter <i>Y</i> to print the VAT amount on the payment order. Leave this processing option blank to suppress the printing of the VAT amount. |
| 6. Print Attachments | Enter <i>Y</i> to print the attachments that you specify in the Payment Instrument Defaults (P0417) program. Leave this processing option blank to suppress the printing of the attachments. |

Print Fields

- | | |
|--|--|
| 1. Operation Code | Enter the text that the system prints as the operation code on the payment order. |
| 2. Payment Destination | Enter the text that the system prints as the payment destination on the payment order. |
| 3. Code | Enter the text that the system prints as the code on the payment order. |
| 4. Payment Priority | Enter the text that the system prints as the payment priority on the payment order. |
| 5. Check Digit | Enter the text that the system prints as the check digit on the payment order. |
| 6. Print Payment Order Payee Code | Enter <i>Y</i> to print the payment order payee code on the payment order. |

Prepayments

- | | |
|---|---|
| 1. Prepayment Voucher Type | Specify the document type that identifies prepayment vouchers. The value that you enter must exist in the Document Type (00/DT) UDC table. |
| 2. Prepayment Tax/Rate Area | Specify the tax rate and area that identifies prepayments. The value that you enter must exist in the F4008 table. |
| 3. Prepayment Tax Explanation Code | Specify the tax explanation code that identifies prepayments. The value that you enter must exist in the Tax Explanation Codes UDC (00/EX) table. |

Language

- | | |
|--------------------------------------|---|
| 1. Language Preference | Specify the language in which the system prints the payment order. The value that you enter must exist in the Language (01/LP) UDC table. |
| 2. Language for Payment Terms | Specify the language in which the system prints the payment terms. The value that you enter must exist in the Language (01/LP) UDC table. |

Tax

- | | |
|-------------------------------------|--|
| 1. Tax Rate/Area Item Code 1 | Specify the code that identifies a VAT exempt tax rate and area. The code that you enter must exist in the H00/TV UDC table. |
| 2. Tax Rate/Area Item Code 2 | Specify an additional code that identifies a VAT exempt tax rate and area. The code that you enter must exist in the H00/TV UDC table. |

Address

- | | |
|----------------------------|--|
| 1. Address Location | Enter <i>Y</i> to use the payee address from the Address Book Tag File - RUS (F74R101T) table. |
|----------------------------|--|

Changing the Payment GL Date in Russia

This section provides an overview of the payment GL date and discusses how to:

- Individually update the payment GL date.
- Globally update the payment GL date.

Understanding the Payment GL Date for Russia

In Russia, the bank statement is the only document that is used to confirm general ledger bank account transactions. The payment order GL date must be equal to the bank statement date even when the payment order is issued with a different payment date.

JD Edwards EnterpriseOne software provides a program that enables you to modify the payment GL date after payments are written. A typical scenario for changing the GL date might be:

- Write payments using the Work With Payment Groups program (P04571) (June 1).
- Send payment orders to the bank (June 2).
- Receive executed payment orders and bank statements that show the actual payment date of June 5 (June 6).
- Locate payment records for the transactions in the bank statement and change the GL date for the transactions from June 1 to June 5 to show the date the payment actually occurred.

Note. You can update the GL date only for payments at an Update status.

Forms Used to Update Payment GL Dates

| Form Name | FormID | Navigation | Usage |
|--|-----------|---|--|
| Work with Payment Groups | W04571A | Automatic Payment Processing (G0413), Work with Payment Group | Select a record or process multiple records. |
| Work with Payment Groups - Update Status | W04572UB | Select a record and click Select on the Work with Payment Groups form. | Select a record. |
| Revise Payment G/L Date | W74R0451A | Select Form, Regional Info on the Work with Payment Groups - Update Status form. Select Form, Regional Info on the Work with Payment Groups form. Accounts Payable (G74R04), Changing General Ledger Date | Update the GL date. |

Individually Updating Payment GL Dates

Access the Revise Payment G/L Date form.

To individually update payment GL dates:

Enter the date provided by the bank statement in the Global G/L Date field to update the GL date for the selected payment and click OK.

Revise Payment G/L Date

OK Find Cancel Load Date Form Tools

Bank Account * Total Amount

Version *

Global G/L Date

Records 1 - 10

| | Payee Number | Payee Name | Payment Amount | G/L Date |
|----------------------------------|--------------|---------------------|----------------|----------|
| <input checked="" type="radio"/> | 4356 | American Express Co | 1,400.00 | 01/06/05 |
| <input type="radio"/> | 4356 | American Express Co | 800.00 | 01/06/05 |

Revise Payment G/L Date form

Globally Updating Payment GL Dates

Access the Revise Payment G/L Date form.

To globally update payment GL dates:

1. Use the filtering options to display only the payments that you want to change.
2. Enter the date provided by the bank statement in the Global G/L Date field.
3. Select Load Date from the Form menu.

CHAPTER 99

(RUS) Working With General Ledger Reporting, Fixed Assets, and Inventory Management for Russia

This chapter discusses how to:

- This chapter discusses how to:
- Generate a balance sheet.
- Generate the profit and loss report.
- Generate a cash flow statement.
- Generate a changes in equity report.
- Generate the Petty Cash Book report.

Generating a Balance Sheet

This section provides an overview of the balance sheet for Russia, lists prerequisites, and discusses how to:

- Print a balance sheet.
- Set processing options for Balance Sheet.

Understanding the Balance Sheet for Russia

The Russian government requires that you produce a balance sheet report at the end of each accounting period. JD Edwards EnterpriseOne provides the Balance Sheet (R74R9030) to generate a report in PDF format. The system also populates the F74R9030 table when you run the Balance Sheet report.

The report can show amounts for one account, a group of accounts, or a formula based on previous rows. You determine the amounts that appear on the report when you use the G/L Reports Setup program (P74R9020) to create the format for the report.

When you run the Balance Sheet report, the system reads the F0902 table and populates the first column of the report with the balance forward amount of the current year, and populates the second column with the balance for the account as of the end of the accounting period specified in the processing options.

The system accesses the values in processing options to determine whether to scale the amounts that it prints, the ledgers and subledgers to use, and whether to print the report title that was defined in the Setup G/L Reports program.

Prerequisite

Verify that the report format, row descriptions, and other information that the system uses to print the report exist in the F74R9020, F74R9021, F74R9022, and F74R9023 tables.

Printing a Balance Sheet

Select General Ledger (G74R09), Balance Sheet.

Setting Processing Options for Balance Sheet (R74R9030)

Processing options enable you to specify the default processing for reports.

Defaults

- | | |
|--|---|
| 1. Fiscal Year and 2. Period Number | Enter the fiscal year and period number for which to run the report. If you leave these processing options blank, the system uses the current year and period for the company that you specify in the Company Number processing option. |
| 3. Company Number | Specify the number of the company for which to run the report. If you leave this processing option blank, the system uses company 00000. |
| 4. Ledger Types (LT1, LT2, LT3) | Enter up to three ledger types for which to run the report. The values that you enter must exist in the UDC table 09/LT. |
| 5. Subledger | Specify the subledger for which to run the report or enter * to run the report for all subledgers. Leave this processing option blank to suppress subledger information. |
| 6. Subledger Type | Specify the subledger type for which to run the report. The value that you enter must exist in the UDC table (00/ST). |
| 7. Scale Factor | Specify the scaling factor that the system uses when printing numerical values on the report. The value that you enter must exist in UDC table 74R/SF. If you choose to scale numerical values, the system divides the numerical values on the report by the scaling amount that you specify. For example, suppose that the amount for an account in the F0902 table is 23,929. If you choose to scale the amount by a factor of 1000, the system divides 23,929 by 1000, rounds to the nearest whole number, and prints 24 on the report. |

Print

- | | |
|-------------------------------------|--|
| 1. Report Name | Specify the format that the system uses to print the report. The format that you specify must exist in the F74R9020 table. |
| 2. Report Title | Specify the title that prints on the report. |
| 3. Report Title Continuation | Specify additional text that prints with the title of the report. |

Generating the Profit and Loss Report

This section provides an overview of the Profit and Loss report for Russia, lists a prerequisite, and discusses how to:

- Print the profit and loss report.
- Set processing options for Profit and Loss (R74R9010).

Understanding the Profit and Loss Report for Russia

The Russian government requires that you produce a Profit and Loss report (R74R9010) at the end of each accounting period. The Profit and Loss report is generated in PDF format. The report shows year-to-date balances of groups of accounts as well as previous year balances.

When you run the Profit and Loss report, the system reads the F0902 table to obtain the balances to print on the report. It also reads tables F74R9020, F74R9021, F74R9022, and F74R9023 to obtain information about the report column and row names to print, as well as other information about the layout of the report. The system produces a report and writes records to the F74R9010 table.

The Profit and Loss report has two sections:

| Report Section | Description |
|-----------------------------------|---|
| Profit and Loss Statement | The Profit and Loss Statement section of the report has two columns. The first column contains the sum of each period of the current year's balances. For example, if you run the report for the accounting period ending June, 2006, the first column shows the sums of the accounts from January, 2006 through June, 2006. The second column shows the sum of the same periods balances of the previous year. |
| Explanation of Incomes and Losses | The Explanation of Incomes and Losses section of the report contains four columns. There is a column for Income and a column for Expenses for the current year and for the previous year. Accounts with negative balances appear in the Expenses column. Accounts with a positive balance appear in the Income column. |

The system accesses the values in processing options to determine whether to scale the amounts that it prints, the ledger and subledgers to use, and the title to print on the report.

Prerequisite

Verify that the report format, row descriptions, and other information that the system uses to print the report exist in tables F74R9020, F74R9021, F74R9022, and F74R9023.

Printing the Profit and Loss Report

Select General Accounting (G74R09), Profit and Loss.

Setting Processing Options for Profit and Loss (R74R9010)

The processing options for this report are the same as those for the Balance Sheet (R74R9030).

See Chapter 99, “(RUS) Working With General Ledger Reporting, Fixed Assets, and Inventory Management for Russia,” Setting Processing Options for Balance Sheet (R74R9030), page 1656.

Generating a Cash Flow Statement

This section provides an overview of the Cash Flow report, lists prerequisites, and discusses how to:

- Print the cash flow statement.
- Set processing options for Cash Flow (R74R9050).

Understanding the Cash Flow Report

The Russian government requires that you produce a cash flow report at the end of each accounting period. The Cash Flow statement (R74R9050) shows the starting balances of a group of accounts as well as the activity in the correspondence accounts. When you generate the Cash Flow statement, the system prints a report in PDF format and populates the F74R9050 table.

The report can show amounts for one account, a group of accounts, or a formula based on previous rows. You determine the amounts that appear on the report when you use the G/L Reports Setup program (P74R9020) to create the format for the report. If, when you create the report format, you define a row type as ACC (Accounts Only) or as AGR (Accounts Group), the system writes balances from the F0902 table to populate the starting balances on the report. The first column of the report shows the amount for the current fiscal year, and the second column shows the amount of the previous fiscal year. If you define a row type as AC2 (Correspondence - Account), the system populates the report with Period activity amounts (Periods 01 through 12) from the F74R9002 table.

The system accesses the values in processing options to determine whether to scale the amounts that it prints, the ledger and subledgers to use, and whether to print the report title the was defined in the Setup G/L Reports program.

Prerequisite

Verify that the report format, row descriptions, and other information that the system uses to print the report exist in tables F74R9020, F74R9021, F74R9022, and F74R9023.

Printing the Cash Flow Statement

Select General Ledger (G74R09), Cash Flow.

Setting Processing Options for Cash Flow (R74R9050)

The processing options for this report are the same as those for the Balance Sheet (R74R9030).

See Chapter 99, “(RUS) Working With General Ledger Reporting, Fixed Assets, and Inventory Management for Russia,” Setting Processing Options for Balance Sheet (R74R9030), page 1656.

Generating the Changes in Equity Report

This section provides an overview of the Changes in Equity report, lists prerequisites, and discusses how to:

- Print the Changes in Equity report.
- Set processing options for Changes in Equity (R74R9040).

Understanding the Changes in Equity Report

The Russian government requires that you produce a changes in equity report at the end of each accounting period. The Changes in Equity report (R74R9040) shows the progress of several equity accounts. The report shows the balance, period activity, year-end adjustments as shown in accounting periods 13 and 14, and the starting balances for current and previous year.

When you generate the Changes in Equity report, the system prints a report in PDF format and populates the F74R9040 table.

Prerequisite

Verify that the report format, row descriptions, and other information exists in the F74R9020, F74R9021, F74R9022, and F74R9023 tables.

Printing the Changes in Equity Report

Select General Ledger (G74R09), Changes in Equity.

Setting Processing Options for Changes in Equity (R74R9040)

The processing options for this report are the same as those for the Balance Sheet (R74R9030).

See [Chapter 99, “\(RUS\) Working With General Ledger Reporting, Fixed Assets, and Inventory Management for Russia,” Setting Processing Options for Balance Sheet \(R74R9030\), page 1656.](#)

Generating the Petty Cash Book Report

This section provides an overview of the Petty Cash Book report and discusses how to:

- Run the Petty Cash Book report.
- Set processing options for Petty Cash Book (R74R5004).

Understanding the Petty Cash Book Report

Many transactions in Russia, including payroll and reimbursement for expenses, are paid in cash. Because of the transitory nature of cash, the Russian government requires additional steps to assure accurate accounting of cash transactions.

The Petty Cash Book report (R74R5004) contains one or more pages for each day of the year in which petty cash transactions take place. The pages list the transactions for the day. All pages are numbered consecutively by date; there cannot be any skipped numbers. This report satisfies the legal need for printing Russian Petty Cash Book. Transactions which are posted to the JD Edwards EnterpriseOne General Accounting system and transactions for which you have printed a cash issue note or a cash receipt note appear on the Petty Cash Book report.

When you run the Petty Cash Book report, the system reads records in F74R0100, F0901, and F0911 tables and summarizes the data by the GL date of the records.

The Petty Cash Book report lists:

- Document number of the cash issue and cash receipt documents.
- Name of person who received or issued the cash.
- Corresponding account.
- Issue amount.
- Beginning and ending balance of the account.
- Cash payroll transaction.

You use the Cash Book report to reconcile the Petty Cash Issue and Petty Cash Receipt documents against petty cash accounts.

Running the Petty Cash Book Report

Select Cash Desk Transactions (G74RCASH), Cash Book Report.

Setting Processing Options for Petty Cash Book (R74R5004)

Processing options enable you to specify the default processing for reports.

Selection

| | |
|------------------------------------|--|
| Company | Specify the company for which to run the report. If you leave this processing option blank, the system searches records for company 00000. |
| Business Unit | Specify the business unit for which to run the report. If you leave this processing option blank, the system selects records for all business units associated with the company that you specify in the Company processing option. |
| Start Date and Through Date | Specify the beginning and ending of the date range that the system uses to select records to process. |

Accounting

| | |
|--|--|
| Petty Cash Account Number | Specify the account number of petty cash transactions. |
| Russian Account Analysis Category | Specify the petty cash account. |
| Petty Cash Book Document Type | Specify the document type of the outbound petty cash transactions that you want to process. The value that you enter must exist in the UDC table 74R/CD. |

Detail Lines per Page Specify the number of detail lines that print on each page. The maximum number of lines that you can use is determined by the page size. For example, for a standard letter size page, you can print up to 47 lines.

Ledger Type Specify a value that exists in the Ledger Type (00/LT) UDC table that the system uses to select records.

Print Fields

Cashier Full Name and Accountant Full Name Specify the name of the cashier and the name of the accountant responsible for the Cash Book.

Print Header Page Specify whether the system prints a header page. Values are:
Blank or *N*: Do not print the header page.
Y: Print the header page.

Print Footer Page Specify whether the system prints a footer page. Values are:
Blank or *N*: Do not print the footer page.
Y: Print the footer page.

Number Leaf for Month Specify the month that prints in the footer of the report if you set the Print Footer Page processing option to *Y*.

Start Page Number Specify the starting page number that the system prints on the report.

Report Name Specify the title that the system prints on the report.
Leave this processing option blank to append the text that you enter to the text "Petty Cash for." For example, if you enter March 31, 2007, the system prints Petty Cash for March 31, 2007 on the report.
Enter *I* to print the text "Loose Leaf of Cash Book" on the report.

Foreign Currency Specify the currency in which to print the report. Values are:
Blank or *N*: Print the report in the domestic currency.
Y: Print foreign currency specified for the account in the F0901 table.

Print Voided Documents Specify whether to print voided documents on the report. Values are:
Blank or *N*: Exclude voided documents.
Y: Include voided documents.

Language

Report Language Preference Specify the language in which the system prints the report. The value that you enter must exist in UDC table 01/LP.

Setting Up Depreciation

You use the JD Edwards EnterpriseOne Fixed Assets system to set up depreciation for Russia. A Russian-specific depreciation method is provided, along with two Russian-specific formulas.

You must run the depreciation calculations for fixed assets on a monthly basis. Depreciation in Russia is calculated by dividing the net book value by the actual remaining asset life periods.

If you post additional costs to a fixed asset, you must add the additional cost to the original cost, subtract the accumulated depreciation, and then divide that sum by the remaining life of the asset. For example, if the original cost of the asset is 120,000 euros and the asset life is 12 months, the first month's depreciation is 10,000 euros. If you post an additional cost of 50,000 euros to the fixed asset during the second month, the calculation for depreciation would be $(120,000 + 50,000 - 10,000) / 11 = 14,545.56$.

Depreciation is calculated by using this formula:

(Original Cost + Additional Cost + Accumulated Depreciation - Salvage Value) divided by Actual Remaining Asset Life Periods

To set up depreciation for Russia, complete these steps:

1. Add RU (Russian Depreciation Method - 74R) to the Depreciation Method (12/DM) UDC table.
2. Use the Depreciation Formula Revisions program (P12853) to add the basis formula, RU1: (Basis [Cst-Svg] -74R). The formula is: 01+22+02-07.
3. Use the Depreciation Formula Revision program to add the depreciation formula, RU2: (SL [Period] - 74R). The formula is: 10/03.
4. Use the Depreciation Rules Revision program (P12851) to create a new depreciation rule for each Asset Life period that you define. Enter a Computation Direction of P and enter the Asset Life in periods.
5. Use the Depreciation Default Coding program (P12002) to add codes for each major accounting class.

Creating a Revaluation Code

This section provides an overview of revaluation codes for Russia, lists a prerequisite, and discusses how to create revaluation codes.

Understanding Creating a Revaluation Code

You use the Revaluation Code by Class program (P74R45010) to associated revaluation codes to the asset type for a fixed asset.

See Also

JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide, “Setting Up the Fixed Assets System,” Setting Up Revaluation Indexes

JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide, “Setting Up the Fixed Assets System,” Automatic Accounting Instructions

Forms Used to Create a Revaluation Code

| Form Name | FormID | Navigation | Usage |
|----------------------------|-----------|---|------------------|
| Work With Revaluation Code | W74R5010A | Fixed Assets (G74R12), Revaluation Codes | Select a record. |
| Revaluation Code Review | W74R5010B | Select a record and click Add on the Work With Revaluation Code form. | Modify a record. |

Creating a Revaluation Code

Access the Revaluation Code Review form.

| | |
|-------------------------------|---|
| Company | Enter the company for which you revalue an asset. |
| Major Accounting Class | Enter the accounting class to which the asset belongs. The value that you enter must exist in the Major Accounting Class (12/C1) UDC table. |
| Major Equipment Class | Enter the subcategory to which the asset belongs. The value that you enter must exist in the Major Equipment Class (12/C2) UDC table. |
| Revaluation Code | Enter the index that you use to revalue the asset. The code that you enter must exist in the Revaluation Index (12/RI) UDC table. |

(RUS) Entering Additional Information for Fixed Assets in Russia

This section provides an overview of the additional information that you enter for fixed assets for Russia, lists a prerequisite, and discusses how to enter additional information

Understanding Additional Information for Fixed Assets

You use the Work With Additional Information program (P74R5100) to enter information about the fixed assets that the system uses when you print legally required documents for fixed assets. The system opens the forms that you need to complete after you add or modify data in the Asset Master Information program (P1201).

Prerequisite

Verify that Localization Country Code in the User Display Preference is set to RU (Russia).

Forms Used to Enter Additional Information for Fixed Assets

| Form Name | FormID | Navigation | Usage |
|--|-----------|--|-----------------------------------|
| Work With Fixed Assets Additional Information | W74R5100A | Fixed Asset Master Information (G1211), Master Information Complete the necessary information, then click OK. | Select an existing record. |
| Fixed Assets Additional Information - Revision | W74R5100B | Select a record on the Work With Fixed Assets Additional Information form and click Select. | Add additional asset information. |

Entering Fixed Asset Additional Information

Access the Fixed Assets Additional Information - Revision form.

| | |
|------------------------------------|---|
| Date of Manufacturing | Enter the date on which the asset was placed in service. |
| Date of Modernization | Enter the date on which the asset was upgraded or modernized. |
| Doc Name of Placement | Enter the name of contains the information about the asset being purchased or placed in service. |
| Doc Number of Placement | Enter the legal number from the document that contains the information about the asset being purchased or placed in service. |
| Date of Placement | Enter the date of the contains the information about the asset being purchased or placed in service. |
| Actual Periods | Enter the number of periods that the asset has been in service. |
| Depreciation Amount | Enter the amount that the system adds to the account balance of the associated account balance. Enter negative numbers by entering a minus sign (–) before or after the amount. |
| Net Book Value | Enter the net book value that the system prints on the Fixed Asset Card document. |
| Membership of Share Holding | Enter the name of the shareholder for a joint venture. |
| Share Percentage | Enter the percentage of the asset owned by the shareholder in a joint venture. |
| Presence of Jewels | Enter an explanation if the assets are jewels. |
| Unit of Measure as Input | Enter the unit of measure for the asset. The value that you enter must exist in the Unit of Measure (00/UM) UDC table. |
| Quantity | Enter the quantity of the asset. |
| Actual Weight | Enter the weight of the asset. |

Item Characteristics

Enter a description of the asset.

(RUS) Entering Additional Lot Information

This section provides an overview of the additional lot information you must enter for Russia and discusses how to:

- Set processing options for Set Up Item - Custom Declaration Number (P7464108).
- Enter additional lot information.

Understanding Lot Information for Russia

After you enter lot information by using the Lot Master program (P4108), the system displays the forms for the Set Up Item - Custom Declaration Number program (P7464108). You enter customs information for foreign items for Russia in the Lot Additional Information program. The system determines that an item is a foreign item by comparing the Country of Origin field in the F4108 table with the Country Code field of the address book number of the Business Unit in table F4108. If both fields are different and are not blank, the system identifies the item as foreign.

When you enter the customs information, the system updates the F4108 table with the status code, according to the values set in the processing options.

Forms Used to Enter Additional Lot Information for Russia

| Form Name | FormID | Navigation | Usage |
|--------------------------------------|-----------|--|--|
| Lot Master Revisions | W4108A | Lot Control (G4113), Lot Master Revisions. Select Add on the Work With Lot Master form. | Select Add on the Work With Lot Master form. |
| Work With Lot Additional Information | W7464108A | Click OK on the Lot Master Revisions form. | Select an existing lot record. |
| Lot Additional Information | W7464108B | Select a record on the Work With Lot Additional Information form and click Select. | Add customs information. |

Setting Processing Options for Set Up Item - Custom Declaration Number (P7464108)

Use these processing options to specify default values for the program.

General

1. Update Status Code

Specify whether the system updates the status code in the Status Code field (data item LOTS) in the F4801 table. Enter 1 to update the Status Code. Leave this processing option blank to suppress updating the status code.

- 2. Enter Status Code** Enter the code that the system uses to update the Status Code field (data item LOTS) in the F4801 table when you set the Update Status Code processing option to 1.
- 3. Status Code Search** Specify the status of the lot that the system uses to select records. The value that you specify must exist in the Lot Status Codes (41/L) UDC table.

Entering Additional Lot Information for Russia

Access the Lot Additional Information form.

- Customs Declaration Nbr (Customs Declaration Number)** Enter the Declaration Number from the customs form.
- Customs Dispatch Date** Enter the date of the customs form.
- Customs Code** Enter the code that describes the customs classification for the lot. The code that you enter must exist in the Customs Code (74/CU) UDC table.

CHAPTER 100

(POL and RUS) Working With Sales Order and Invoice Processing for Russia and Poland

This chapter discusses how to:

- Work with invoices
- (RUS) Generate amount difference invoices.
- Work with sales orders.
- Inquire on sales orders.

(POL and RUS) Working with Invoices for Poland and Russia

This section provides an overview of invoice processing and discusses how to:

- Run the Add Invoice - PO program (P7433B11).
- Set processing options for Add Invoice - PO (P7433B11).
- Enter additional information for invoices.
- Add related invoices.
- Set processing options for Print Invoice (R7430030).

Understanding Invoices

You use the standard JD Edwards EnterpriseOne functionality to work with invoices for Poland and Russia. Additionally, programs are provided to enable you to:

- Add additional information for invoices.
- Specify whether the system enables or requires that you enter related invoices when you add credit notes or debit notes.
- (RUS) Print tax invoices.
- (RUS) Print amount difference invoices.
- (POL) Work with cash transactions.
- (POL and RUS) Reprint invoices.

Additional Information for Invoices

The system launches the Invoice Related Information program (P7430011) when you select Regional Info from the Form menu on the Standard Invoice Entry form. You use this program to enter the shipment date and approval date for invoices.

The system launches the Invoice Related to CN/DN (P7430015) program from the Invoice Related Information form in the Invoice Related Information program. You use the Invoice Related to CN/DN program to enter one or multiple legal documents related to a debit note or credit note. The processing options that you specify in the Add Invoice- PO program (P7433B11) determine if the system requires or enables you to enter related invoices, and the parameters for entering the related invoices.

Additional Processing Options for Standard Invoice Entry (P03B11)

You use the to set additional processing options that the system uses to enable or disable an option to enter related invoices to credit notes or debit notes.

You must set up corresponding versions for the Standard Invoice Entry program and the Add Invoice - PO program.

Reprint Invoices

Use the Reprint Invoice program (P7430031) to reprint selected documents. When you reprint a document, the system prints the same legal number as used on the original legal document. When you select to reprint, the system verifies whether the record is included in the F7430030 table. If the record is not in the F7430030 table, the system adds the record to the table as well as to the F7430032 table.

See [Chapter 100, “\(POL and RUS\) Working With Sales Order and Invoice Processing for Russia and Poland,” Reprinting Invoices, page 1672.](#)

(RUS) Tax Invoices

You can generate tax invoices from the JD Edwards EnterpriseOne Accounts Receivable or JD Edwards EnterpriseOne Sale Order Management systems. You must print a tax invoice for VAT when you receive prepaid amounts (JD Edwards EnterpriseOne Accounts Receivable system), and print a tax invoice when you sell inventory items to customers (JD Edwards EnterpriseOne Sales Order Management system).

The Russian tax invoice includes information about the issuing company, customer, details of items, quantity, amount without tax, tax rate, tax amounts, amounts with tax, customer declaration number (for imported items), and others information. The system considers the customer billing instructions to determine how many copies of the report to print and if the customer allows consolidated invoices. The system uses data from the address book record for the footer section of the report.

The system produces the tax invoice when you run the Print Invoices program (R42565). The Print Invoices program completes the validations and tax calculations and launches the Invoice Print - Russia program (R74R3030). The Invoice Print - Russia program assigns the legal number and produces the report. The system uses the legal numbering setup to determine the print format, attachments, and legal number to print for invoices.

(POL) Correction Invoices

Use the Print Invoice - Poland - SOP/AR program (R74P3030) to print an invoice or invoice correction. The system launches the Print Invoice - Poland - SOP/AR program when you run the:

- Print Invoices program (R42565) (JD Edwards EnterpriseOne Sales Order Management system).

This Print Invoices program makes the standard validations and calculations. The system calls the version of the Print Invoice - PO program (P7420565) program that matches the version of the Print Invoices program, and launches the Print Invoice - Poland - SOP/AR program to print the Legal Document.

- Print Invoice program (R7430030) (JD Edwards EnterpriseOne Accounts Receivable system).

This Print Invoice program selects invoices from the F03B11 table and writes data to the localization tables. It then calls the Print Invoice - Poland - SOP/AR program, which assigns the legal number when in final mode.

You use a debit note (DN) or a credit note (CN) to issue a correction for an invoice when amounts or tax rates are incorrect. When you create a correction invoice, you make entries to reverse the original entry. For example, if an original invoice contains a tax rate of 21 percent and the tax rate should have been 18 percent, then the credit order (for Sales Order functionality) or the correction invoice (for Accounts Receivable functionality) is entered with one line showing the amount calculated at the 21 percent rate shown as a negative amount, and a different line with the amount calculated at 18 percent as a positive amount.

When you correct an invoice by using a credit note or a debit note, you print a correction invoice that shows the original amount, the corrected amount, and the difference between the amounts.

When the system prints the correction invoice, it prints three sections:

- Before Correction

The system prints information about the original invoice, such as the item number, the quantity, price, VAT rate, VAT amount, and gross amount.

- After Correction

The system subtracts from the original invoice the amounts entered in the credit note or debit note. When the original invoice was entered into the JD Edwards EnterpriseOne Sales Order Management system and the DN or CN was also entered from the JD Edwards EnterpriseOne Sales Order Management system, the system processes the correction amount if the unit of measure, unit price, tax code, and adjustments are the same.

If the original invoice was entered into the JD Edwards EnterpriseOne Accounts Receivable system and the DN or CN was also entered from the JD Edwards EnterpriseOne Accounts Receivable system, the system processes the correction amount if the tax area and tax explanation code are the same.

- Value of Correction

The system prints the values entered for the DN or CN including the quantity, price, VAT rate, VAT amount, and gross amount.

See [Chapter 95, “\(POL and RUS\) Setting Up Legal Numbering,” page 1609](#).

(POL) Cash Transactions

You can use the Cash Desk Transaction program (P74P9101) to select and print the cash desk transaction document, and the Cash Desk Report program (R74P9104) to generate a report of all cash transactions.

See [Chapter 96, “\(POL\) Working with Poland-Specific Functionality,” page 1621](#).

Forms Used to Work with Invoices

| Form Name | FormID | Navigation | Usage |
|------------------------------------|------------|---|---|
| Work With Customer Ledger Inquiry | W03B2002A | Customer Invoice Entry (G03B11), Standard Invoice Entry | Select or review invoices. |
| Standard Invoice Entry | W03B11A | On the Work With Customer Ledger Inquiry form, click Add. | Enter invoices. |
| Invoice Related Information | W7430011A | After completing the Company and Address Number fields on the Standard Invoice Entry form, select Regional Info from the Form menu. | Enter additional information for Russian invoices. |
| Invoices Related to DN/CN | W7430015A | On the Invoice Related Information form, select Invoice Related on the Form menu. | Enter one or more legal documents related to a credit or debit memo. |
| Change Invoice Related Information | W7430001A | On the Work With Customer Ledger Inquiry form, select a record and then select Regional Info from the Form menu. | Enter or modify the approval date of the information related to an invoice. |
| Work With Legal Documents Reprint | W74R30031A | On the Work With Customer Ledger Inquiry form, select a record and click Select, then select Reprint from the Row menu. | Select a document to reprint, and print the document. |

Running Add Invoice - PO

(RUS) Select Accounts Receivable (G74R03B), Add Invoice - PO

(POL) Select Accounts Receivable (G74P03B), Add Invoice - PO

When you launch this program, you add or select a version. When you select a version, the system displays the processing options.

Setting Processing Options for Add Invoice - PO

These processing options are used by the Standard Invoice Entry program (P03B11) to enable or disable an option to enter related invoices to credit notes or debit notes.

General

1. Shipment Mandatory Date

Enter 1 to require entry of the shipping date. Leave this option blank or enter 0 to allow, but not require, the entry of the shipping date.

Legal Number

1. Issue Place

Specify the issue place for the legal document number.

Related Invoices

- | | |
|---|--|
| 1. Related Invoices | Enter <i>1</i> to allow the entry of related invoices for a debit or credit note. Leave this processing option blank to not allow entry of related invoices. |
| 2. Multiple Related Invoices | <p>Enter <i>1</i> to allow the entry of multiple related invoices for a credit or debit note. Leave this processing option blank to allow the entry of only one related invoice.</p> <p>Complete this processing option if you entered <i>1</i> in the Related Invoices processing option.</p> |
| 3. Require Entry of Related Invoices | <p>Enter <i>1</i> to require the entry of a related invoice. If no related invoice is entered, the system displays an error message and does not allow the user to continue until a related invoice is entered.</p> <p>Leave this processing option blank to have the system display a warning message when no related invoice is entered. The warning message allows the user to continue without entering a related invoice.</p> |
| 4. Allow Different Address Number | Enter <i>1</i> to allow the entry of a related invoice with a different address book number from the credit or debit note. Leave this processing option blank to have the system display an error message if the user enters a related invoice with a different address book number. |
| 5. Allow Different Issue Place | Enter <i>1</i> to allow the entry of a related invoice with a different issue place from the credit or debit note. Leave this processing option blank to have the system display an error message if the user enters a related invoice with a different issue place. |

Entering Additional Information for Invoices

Access the Invoice Related Information form.

- | | |
|-------------------------|--|
| Actual Ship Date | Enter the date on which the shipment to the customer is confirmed. The system updates the Sales Order Detail (F4211) table with this date. |
| Approval Date | Enter the date on which the invoice was approved. |

Adding Related Invoices

Access the Invoices Related to DN/CN form.

- | | |
|----------------------------|--|
| Legal Company | Enter the legal company to which you add related invoices. The value that you enter must exist in the F7400010 table. |
| Legal Document Type | Enter the legal document type of related invoices. The value that you enter must exist in the F7400002 table. |
| Issue Place | Enter the place of issue of the legal document to which you add related invoices. The value that you enter must exist in the F7400004 table. |
| Legal Number | Enter the legal number assigned to the invoice. |
| Address Number | Enter the address number of the company to which you add related invoices. |

Setting Processing Options for Print Invoice (R7430030)

Use these processing options to specify additional parameters for tax invoices that you print from the JD Edwards EnterpriseOne Accounts Receivable system.

General

- | | |
|--|--|
| 1. Mode | Enter <i>I</i> to process records in final mode. Leave this processing option blank to process records in proof mode. |
| 2. Print Currency | Enter <i>D</i> to print the invoice in domestic currency. If the invoice was entered in a foreign currency, enter <i>F</i> to print the invoice in the foreign currency. |
| 3. Launch UBE Automatically (launch universal batch engine automatically) | Leave this processing option blank to automatically launch the Print Invoice - PO program (R7430030). Enter <i>I</i> to suppress the automatic launch of this program. |
| 4. Print Line Attachment | Enter <i>I</i> to print the attachment that you specified when you entered the invoice. Leave this processing option blank to suppress printing of the attachment. |

Reprinting Invoices

Access the Work With Legal Documents Reprint form.

On the Work With Customer Ledger Inquiry form, select a record and click Select, then select Reprint from the Row menu.

(RUS) Generating Amount Difference Invoices for Russia

This section provides an overview of amount difference invoices and discusses how to:

- Print amount difference invoices.
- Set processing options for Generate Amount Differences Invoice (R74R3010).

Understanding Amount Difference Invoices

You enter amount difference invoices when there is a difference in the exchange rate on the date that you enter an invoice and the date on which you pay the invoice. You run the Amount Difference Generation (R74R3010) program to generate invoices to account for the gain or loss. When you post the new invoice, the system writes the data to the F74R0018 table so that the data can be reported in the Sales Book or the Purchase Register.

When you run the Amount Differences Generation program, the system generates invoices in the domestic currency, and:

- Marks the invoices as paid.
- Summarizes the lines by original document and tax area.
- Shows the amount difference as either the gross amount or the taxable amount, depending on the processing options.
- Generates entries to the F0911 table.

Printing the Amount Difference Invoice

Select Accounts Receivable (G74R03B), Amount Difference Generation.

Setting Processing Options for Amount Difference Generation (R74R3010)

Processing options enable you to specify the default processing for programs and reports.

Default

These processing options specify the mode in which the program is run as well as how the amount difference is used.

- 1. Mode** Enter *1* to process invoices in final mode. When you process in final mode, the system updates the F74R3B14 table. Leave this option blank to process invoices in proof mode.
- 2. Amount Type** Enter *1* to use the amount difference as the gross amount on the invoice. Leave this processing option blank to use the amount difference as the taxable amount on the invoice.

Invoice

These processing options specify information that the system assigns to new invoices.

- | | |
|--------------------------------|---|
| Tax Rate/Area | Specify the tax rate/area that the system uses for the new invoice. The value that you enter must exist in the F4008 table. |
| Tax Explanation Code | Specify the tax explanation code that the system uses for the new invoice. The value that you enter must exist in the Tax Explanation Codes (00/EX) UDC table. |
| Tax Area | Enter <i>1</i> to use the tax rate/area from the original invoice on the new invoice. Enter <i>2</i> to use the tax rate/area from the F03012 table on the new invoice. Leave this processing option blank to use the tax rate/area that you entered in the Tax Rate/Area processing option. |
| Name -- Remark | Enter a remark that the system prints on the invoice. |
| Payment Terms Code | Specify the payment terms that the system uses for the invoice. The value that you enter must exist in the F0014 table. |
| Payment Instrument | Specify the payment instrument that the system uses for the invoice. The value that you enter must exist in the Payment Instrument (00/PY) UDC table. |
| Payment Term/Instrument | Enter <i>1</i> to use the payment term and payment instrument from the original invoice for the new invoice. Enter <i>2</i> to use the payment terms and payment instrument from the F03012 table for the new invoice. Leave this processing option blank to use the payment term entered in the Payment Terms Code processing option and the payment instrument entered in the Payment Instrument processing option. |
| Version for P03B0011 | Specify the version of the Invoice Entry MBF Processing Options program (P03B0011) that the system uses when generating amount difference invoices. If you leave this processing option blank, the system uses version ZJDE0001. |

G/L

These processing options specify how the system processes records.

- 1. G/L Name -- Alpha Extension** Enter a remark that the system saves in the F0911 table.
- 2. Version for P0900049** Specify the version of the Journal Entry MBF Processing Options program (P0900049) that the system uses when generating amount difference invoices. If you leave this processing option blank, the system uses version ZJDE0001.

Receipt

This processing option specifies the remark that the system prints on receipts.

- 1. Receipt Name - Remark** Enter a remark that prints on the receipt.

(POL and RUS) Working with Sales Order Management Processes for Poland and Russia

This section provides overviews of sales order processes for Poland and Russia and the print process for legal documents, lists prerequisites, and discusses how to: .

- Set processing options for Invoice Print - PO (P7420565).
- Set processing options for Sales Order - PO (P7424210).

Understanding Sales Order Processes for Poland and Russia

This section provides an overview of sales order processes.

(POL and RUS) Sales Order Processes

You use standard JD Edwards EnterpriseOne Sales Order Management to work with sales orders. You use country-specific programs to print legal documents. To work with sales orders for Poland and Russia, complete these tasks:

| Process | Description |
|---|---|
| Set processing options for the Sales Order - PO program (P7424210). | You set these processing options to specify additional parameters for the Sales Order Entry program (P4210). You must set up corresponding versions for P7424210 and P4210. |
| Enter sales orders. | You use the Sales Order Entry program (P4210) to enter sales orders. |

| Process | Description |
|--|---|
| Set processing options for the Print Invoice/Invoice Correction - PO program (P7420565). | <p>You set these processing options to specify additional parameters for the Standard Invoice Print program (R42565). You must set up corresponding versions for P7420565 and R42565.</p> <p>(POL) The system uses the additional parameters to print invoices and correction invoices.</p> <p>(RUS) The system uses the additional parameters to print invoices, stock delivery notes, goods dispatch notes, and stock movement notes.</p> |
| Search for sales order lines associated with a legal document number. | You use the Sales Legal Doc. Inquiry by Int. Doc (Sales Legal Document Inquiry by Internal Document) program (P7420001) to locate information about sales orders using the document type. |
| Search for invoices and shipment notes by sales order. | You use the Sales Legal Doc. Inquiry by Legal Number program (P7420002) to locate information about sales orders by using the legal document number. |
| Enter invoices related to credit or debit notes. | You use the Invoice Related to CN/DN Sales Order - COMM - 42 program (P7420015) to enter one or more legal documents that are related to a sales order. The system automatically calls the Invoice Related to CN/DN Sales Order - COMM - 42 program when you add credit or debit notes from the P4210 program. |
| Update sales. | <p>When you run the Sales Update program for Polish transactions, the system populates certain fields in the F03B11 table with values from the F7430010 table. When it populates the F03B11 table, the system:</p> <ul style="list-style-type: none"> • Right justifies the value in the Issue Place field in the F7430010 table. • Converts the legal number in the F7430010 table to a string and pads the values with zeros to the left of the value. • Concatenates the values in the Issue Place and Legal Number fields and writes the value to the Reference field (VR01) in the F03B11 table. • Copies the Invoice Date from the F7430010 table to the Invoice Date - Julian field in the F03B11 table. |

(RUS) Understanding the Invoice Print - Russia (R74R3030) Program

You must generate a tax invoice when you sell inventory items or services to customers. The system produces the tax invoice when you run the Print Invoices (R42565) program, or when you enter an invoice into the JD Edwards EnterpriseOne Accounts Receivable system. The Print Invoices program completes the validations and tax calculations. The system calls the version of the Print Invoice - PO program (P7420565) program that matches the version of the Print Invoices program, and launches the Invoice Print - Russia - SOP/AR program (R74R3030). This program assigns the legal number and produces the report.

You can set up customer billing instructions to allow consolidated invoices. If you do so, the system assigns one invoice number for all selected sales orders for the same customer. The system also summarized all lines with the same item number in one line if you set up the system to do so.

You set processing options for the Invoice Print - Russia - SOP/AR program by creating a version of the Print Invoice - PO program (P7420565) for tax invoices.

(RUS) Understanding the Stock Delivery Note Report (R74R3032)

You produce the Stock Delivery Note report (R74R3032) to confirm shipment of goods to a customer. You can select multiple sales orders for which you print one stock delivery note. When you select multiple sales orders, the system assigns the same delivery number to each sales order if the customer bill instructions allow consolidated invoices. The system also summarized all lines with the same item number in one line if you set up this functionality.

To print the Stock Delivery Note report, you run the Print Invoices program (R42565). The Print Invoices program completes the validations and tax calculations. The system calls the version of the Print Invoice - PO program (P7420565) program that matches the version of the Print Invoices program, and launches the Stock Delivery Note program. The Stock Delivery Note program assigns the legal number and produces the report.

You set processing options for the Stock Delivery Note program by creating a version of the Print Invoice - PO program (P7420565) for stock delivery note documents.

(RUS) Understanding the Goods Dispatch Note Report (R74R3031)

In some situations, you might ship goods without selling the goods. You produce the Goods Dispatch Note report (R74R3031) to confirm the shipment of materials to a contractor or to another business unit when the materials are shipped but not sold. You can select multiple sales orders for which you print one good dispatch note. When you select multiple sales orders, the system assigns the same delivery number to all sales order selected if the customer bill instructions allow consolidated invoices. The system also summarized all lines with the same item number in one line if you set up this functionality.

To print the Goods Dispatch Note report, you run the Print Invoices program (R42565). The Print Invoices program completes the validations and tax calculations. The system calls the version of the Print Invoice - PO program (P7420565) program that matches the version of the Print Invoices program and launches the Goods Dispatch Note program. The Goods Dispatch Note program assigns the legal number and produces the report.

You set processing options for the Goods Dispatch Note program by creating a version of the Print Invoice - PO program (P7420565) for goods dispatch note documents.

(RUS) Understanding the Stock Movement Note Report (R74R3033)

The software provides a Stock Movement Note report (R74R3033) that a branch that is issuing a stock transfer generates. The software also provides a Stock Movement Note report (R74R6001) that the branch that is receiving a stock transfer generates.

For each transfer of merchandise and finished goods, both the sender and the receiver of the stock must produce a stock movement note to confirm the movement of the stock between warehouses or stock keepers. This means that when you transfer goods to another warehouse or other stock holding place, you must send a stock movement note with the goods to confirm that the stock left the location, and when you receive transferred goods, you complete a stock movement note to confirm that you received the goods.

The system provides two versions of the Stock Movement Note report: one each for outbound and for inbound transfers. The outbound version (R74R3033) is based on the F4211 table. When you print one stock movement note for multiple transfer orders, the system assigns the same delivery number to each transfer order if the customer billing instructions are set up to consolidate invoices. The system also consolidates all lines with the same item number into one line if you set up this functionality.

To print the Stock Movement Note report, you run the Print Invoices program (R42565). The Print Invoices program completes the validations and tax calculations. The system calls the version of the Print Invoice - PO program (P7420565) program that matches the version of the Print Invoices program, and launches the Stock Movement Note program, based on the version of the Print Invoices program that you specified. The Stock Movement Note program assigns the legal number and produces the report.

You set processing options for the Stock Delivery Note program by creating a version of the Print Invoice- PO program (P7420565) for stock delivery note documents.

(POL and RUS) Understanding the Print Process for Legal Documents

When you print legal documents for Poland or Russia, the system uses the legal numbering setup to determine the print format, attachments, and legal number to print legal documents.

The system looks at the customer billing instructions to determine how many copies of the report to print and whether the customer enables consolidated invoices. The system also looks at the address book data for information to use for the footer section of the report.

You use the P7420565 program to set up versions for each of the legal documents that you print. You must also set up a corresponding version for each legal document type in the Print Invoices program (R42565). When you run the Print Invoices program, the system uses the document type that you specified in the processing options for the P7420565 program to determine which legal document to print.

(POL) For Poland, the system prints invoices and invoice corrections.

(RUS) For Russia, the system prints:

- Goods dispatch note.
- Stock movement note (outbound).
- Stock delivery note.
- Invoices.

Use the Reprint Invoices program (P7430031) to reprint selected documents.

Note. The program for printing legal documents (P7420565) appears on the Sales Order menus for Poland and Russia under these names:

(RUS) Print Invoice - PO.

(RUS) Print Stock Delivery Note - PO.

(RUS) Print Goods Dispatch Note - PO.

(RUS) Print Stock Movement Note - PO.

(POL) Print Invoice / Invoice Correction - PO.

(POL and RUS) Setup Notes

When you run the P7420565 program in proof mode, you should set the processing options so that the system does not update accounts receivable tables and does not update the sales order status. In final mode, set the processing options so that the system updates accounts receivable tables and statuses.

When you set up legal documents:

- (RUS) Assign SN (shipment note) as the document type group for goods dispatch notes and stock delivery notes, specify that the system calculates and discriminates taxes, and specify that the system not break on payment terms.
- (RUS) Assign SN (shipment note) as the document type group for outbound stock movement notes, and specify that the system not calculate taxes and not break on payment terms.
- (POL and RUS) Assign IN (invoice) as the document type group for invoices, specify that the system calculates and discriminates taxes, and specify that the system breaks on payment terms.

When you run the P7420565 program from the menu, you can choose an existing version from the Batch Versions form. If you select an existing version, the system displays a message after you click Select on Batch Versions and closes the program. If you select version ZJDE0001, you copy the version, name it, and set processing options that are saved for the new version.

Prerequisites

Before you complete the tasks in this section:

- Verify that the localization country code in the User Display Preferences is set to the appropriate localization code.
- Verify that a version with the same name exists for program P7420565 and the Print Invoices (R42565) program for each legal document type.

Setting Processing Options for Invoice Print - PO (P7420565)

Use these processing options to specify default values for Russia and Poland that the system uses when you run the Print Invoices (R42565) program to print legal documents. The programs are:

- (RUS) Print Invoice - PO.
- (RUS) Print Stock Delivery Note - PO.
- (RUS) Print Goods Dispatch Note - PO.
- (RUS) Print Stock Movement Note - PO.
- (POL) Print Invoice / Invoice Correction - PO.

General

- 1. Document Issue Place** Specify the legal document issue place. The value that you enter must exist in the F7400004 table.
- 2. Internal Document Type for Invoices** Specify the document type that you use for the business purposes to identify invoices. The value that you enter must exist in the Document Type (00/DT) UDC table and should be the document type that you specified for invoices in the Legal Doc. Types Relationship program (R74R0003).

- 3. Internal Document Type for Shipment Notes** (RUS) Specify the document type that you use for the business purposes to identify shipment notes. The value that you enter must exist in the Document Type (00/DT) UDC table and should be the document type that you specified for shipment notes in the Legal Doc. Types Relationship program (R74R0003).
This processing option is not used for Poland.
- 4. Mode** Enter *1* to print in final mode. Leave this processing option blank to print in proof mode.
- 5. Summarize Sales Order Lines by Item** Enter *1* to summarize sales order lines by item. Leave this processing option blank to have the system print all sales order lines.
- 6. Automatic Printing** Leave this processing option blank to call the R74R3030 program for Russia, or the R74P3030 program for Poland and automatically print the legal document. Generally, you leave this option blank. Enter *1* to suppress printing.

Shipment Notes

- 1. Weight Unit of Measure** (RUS) Specify the unit of measure that the system uses to print the weight of the shipment. The value that you enter must exist in the Unit of Measure (00/UM) UDC table. If you do not complete this processing option, the system uses *Item* as the unit of measure.
This processing option is not used for Poland.
- 2. Volume Unit of Measure** (RUS) Specify the unit of measure that the system uses to print the volume of the shipment. The value that you enter must exist in the Unit of Measure (00/UM) UDC table. If you do not complete this processing option, the system uses *Item* as the unit of measure.
This processing option is not used for Poland.

Error Processing

- 1. Last Status Code for Invoices** Specify the last status code that invoices should have attained. The value that you enter must exist in the Activity/Status Codes (40/AT) UDC table. If the invoice has not attained the status code that you specify, the system displays an error message.
If you leave this processing option blank, the system uses *931* as the last status code.
- 2. Next Status Code for Invoices** Specify the next status code to which invoices will be moved. The value that you enter must exist in the Activity/Status Codes (40/AT) UDC table. If the invoice does not move to the status code that you specify, the system displays an error message.
If you leave this processing option blank, the system uses *831* as the last status code.
- 3. Last Status Code for Shipment Notes** Specify the last status code that shipment notes should have attained. The value that you enter must exist in the Activity/Status Codes (40/AT) UDC table. If the shipment note does not attained the status code that you specify, the system displays an error message.
If you leave this processing option blank, the system uses *932* as the last status code.

4. Next Status Code for Shipment Notes

Specify the next status code to which shipment notes will be moved. The value that you enter must exist in the Activity/Status Codes (40/AT) UDC table. If the shipment note does not move to the status code that you specify, the system displays an error message.

If you leave this processing option blank, the system uses 832 as the last status code.

Setting Processing Options for Sales Order - PO (P7424210)

You use the standard Sales Order Entry (P4210) program to generate sales orders. Before you generate sales orders, you set the processing options for the Sales Order - PO (P7424210) program. This program exists solely to contain processing options. The system uses the processing options you set for the Sales Order - PO program as additional parameters for the Sales Order Entry program.

Related Invoices

Although processing options are set up during JD Edwards EnterpriseOne implementation, you can change processing options each time you run a program.

1. Related Invoices

Specify whether the system enables the entry of related invoices for a debit or credit note. Values are:

Blank: Disallow the entry of related invoices.

1: Enable the entry of related invoices for a debit or credit note.

2. Multiple Related Invoices

Specify whether the system enables the entry of multiple related invoices for a credit or debit note. Complete this processing option if you entered *1* in the Related Invoices processing option. Values are:

Blank: Enable the entry of only one related invoice.

1: Enable the entry of multiple related invoices for a credit or debit note.

3. Require Entry of Related Invoices

Specify whether the system displays an error or warning message when no related invoice is entered. Values are:

Blank: Display a warning message when no related invoice is entered. The warning message enables the user to continue without entering a related invoice.

1: Display an error message and do not allow the user to continue until a related invoice is entered.

4. Allow Different Address Number

Specify whether the system allows the entry of a related invoice that has a different address book number from the credit or debit note. Values are:

Blank: Display an error message if the user enters a related invoice with a different address book number.

1: Allow the entry of a related invoice that has a different address book number from the credit or debit note.

Inquiring on Sales Orders for Poland and Russia

This section discusses how to:

- Search for sales orders by legal number.
- Set processing options for Sales Legal Document Inquiry by Legal Number (P7420002).

Forms Used to Inquire on Sales Orders

| Form Name | FormID | Navigation | Usage |
|---|-----------|--|---|
| Sales Legal Document Inquiry by Internal Document (POL and RUS) | W7420001A | On the Customer Service Inquiry form, enter a sales order and order type and click Find to display legal documents related to the sales order. Select an existing sales order line that generated a legal document and then select Regional Info from the Form menu. | (POL and RUS) Search for sales order lines associated with a legal document number. |
| Sales Legal Document Inquiry by Legal Number (POL and RUS) | W7420002A | On Work With Sales Ledger Inquiry, select an existing sales order line that generated a legal document and then select Regional Info from the Form menu. | (POL and RUS) Search for invoices and shipment notes by sales order or by legal number for each legal document. |

Searching for Sales Orders by Legal Number

Access the Sales Legal Document Inquiry by Legal Number (RUS) form.

Issue Place

Enter the place of issue of the legal document for which you want to locate sales orders. The value that you enter must exist in the F7400004 table.

Setting Processing Options for Sales Legal Document Inquiry by Legal Number (P7420002)

Processing options enable you to specify the default processing for programs and reports.

General

These processing options specify default values that the program uses when displaying information in the forms for the program.

1. Legal Document Group Column 1

Specify a legal document type that the system uses to select records to display in column 1 in the Sales Legal Document Inquiry by Legal Number form. The value that you enter must exist in the Legal Document Type Group (74/DG) UDC table.

2. Legal Document Group Column 2

Specify a legal document type that the system uses to select records to display in column 2 in the Sales Legal Document Inquiry by Legal Number form.

The value that you enter must exist in the Legal Document Type Group (74/DG) UDC table.

3. Legal Document Group Column 3

Specify a legal document type that the system uses to select records to display in column 3 in the Sales Legal Document Inquiry by Legal Number form. The value that you enter must exist in the Legal Document Type Group (74/DG) UDC table.

Versions

These processing options specify the versions that the system uses when it displays forms after you use a Form or Row exit on the Sales Legal Document Inquiry by Legal Number form.

Sales Order Header Revision

Specify the version of the Sales Order Entry (P4210) program that the system uses when displaying the Sales Order Header (W4210G) form. If you do not complete this processing option, the system uses version ZJDE0001.

Sales Order Detail Revision

Specify the version of the Sales Order Entry (P4210) program that the system uses when displaying the Sales Order Detail Revisions (W4210A) form. If you do not complete this processing option, the system uses version ZJDE0001.

Sales Order Dates

Specify the version of the Customer Service Inquiry (P42045) program that the system uses when displaying the Dates (W42045G) form. If you do not complete this processing option, the system uses version ZJDE0001.

Sales Order Address Number

Specify the version of the Customer Service Inquiry (P42045) program that the system uses when displaying the Address Numbers (W42045F) form. If you do not complete this processing option, the system uses version ZJDE0001.

Customer Service Inquiry

Specify the version of the Customer Service Inquiry (P42045) program that the system uses when displaying the Customer Service Inquiry (W4210E) form. If you do not complete this processing option, the system uses version ZJDE0001.

CS Inquire

Specify the version of the Sales Order Entry (P4210) program that the system uses. If you do not complete this processing option, the system uses version ZJDE0001.

PART 23

Singapore

Chapter 101

(SGP) Setting Up Country-Specific Functionality for Singapore

CHAPTER 101

(SGP) Setting Up Country-Specific Functionality for Singapore

This chapter discusses how to set up payment formats for Singapore.

Setting Up the Payment Format for Singapore

This section provides an overview of the payment format for Singapore and discusses how to set up processing options for Print Singapore CTS Cheque (R04572SG).

Understanding the Payment Format for Singapore

The Association of Banks in Singapore established a standardized cheque format so that it could implement a Cheque Truncation System (CTS). You use the Print Singapore CTS Cheque program (R04572SG) to generate cheques in the standardized format.

Considerations for Using the Print Singapore CTS Cheque Program (R04572SG)

Before you use the Print Singapore CTS Cheque program (R04572SG), consider this information:

- The cheques contain a numerical representation of the amount as well as an English-language representation of the amount in words. For example, the system writes the amount 123.45 USD as one hundred twenty-three dollars and forty-five cents. When you set the Literal Amount Lines processing option for the Print Singapore CTS Cheque program to use three lines, the system prints up to 150 characters. When you set the Literal Amount Lines processing option to use two lines, the system prints up to 100 characters. If the amount in words exceeds the allowed character count, the system prints the amount in its numerical representation.
- You must customize the placement of remittance information to suit the fields on your cheque stock.
- Street address information is not included on the printed cheque; the address is printed on the remittance advice.
- The system prints a maximum of 14 characters for the numerical value (999,999,999.99), and includes leading fill characters (*) if the value is less than 14 characters. For example, the system writes 1,234,567.00 as **1,234,567.00.
- The Professional Title (ATTL) field in the Address Book - Who's Who table (F0111) is not controlled by the Payee Control function.

This table describes how the system prints the payee name, based on the type code of the record in the Address Book Who's Who table, the type code that you specify in the Type Code processing option, and the value that you specify for the Format Payee Name processing option:

| Format Payee Name Processing Option | Type Code Processing Option | How the Payee Name is printed |
|--|---|---|
| Enter 1 or leave the option blank. | Enter a valid value from the Type Code (01/W0) UDC table. | The system prints one line of text that consists of a concatenation of a Mailing Name (MLNM) and Professional Title (ATTL) for the type code that you specified. The system prints the first 60 characters of the concatenated value. |
| Enter 1 or leave the option blank. | Leave the option blank or enter a value that does not exist in the Type Code (01/W0) UDC table. | The system prints one line of text that consists of the Mailing Name (MLNM) for record 0 in table F0111. |
| Enter 2. | Enter a valid value from the Type Code (01/W0) UDC table. | The system prints two lines of text that consist of a Mailing Name (MLNM) on one line and a Professional Title (ATTL) on the second line for the type code that you specified. The system prints up to 40 characters for each line. |
| Enter 2. | Leave the option blank or enter a value that does not exist in the Type Code (01/W0) UDC table. | The system prints one line of text that consists of the Mailing Name (MLNM) for record 0 in table F0111. |

Setting Processing Options for Print Singapore CTS Cheque (R04572SG)

Processing options enable you to specify the default processing for programs and reports.

Print Format

1. Format Payee Name

Specify whether the system prints the payee name on one or two lines of the cheque. Values are:

Blank or 1: If you complete the Type Code processing option with a valid value from the Type Code (01/W0) UDC table, the system prints one line of text that consists of a concatenation of a mailing name (data item MLNM) and professional title (data item ATTL) for the type code that you specified. The system prints the first 60 characters of the concatenated value. If you leave the Type Code processing option blank or enter a value that does not exist in the Type Code (01/W0) UDC table, the system prints one line of text that consists of the first 60 characters of the mailing name for record 0 in the Address Book - Who's Who table (F0111).

2: If you complete the Type Code processing option with a valid value from the Type Code (01/W0) UDC table, the system prints two lines of text that consist of a mailing name on one line and a professional title on the second line for the type code that you specified. The system prints up to 40 characters for each line. If you leave the Type Code processing option blank or enter a value that does not exist in the Type Code (01/W0) UDC table, the system prints one line of text that consists of the first 60 characters of the mailing name for record 0 in the Address Book - Who's Who table (F0111).

2. Type Code

Specify whether the system uses the default value for the mailing name or uses a mailing name that consists of a combination of the mailing name and professional title that is based on the type code of the record. If more than one record for the payee exists in the Address Book - Who's Who table (F0111), the system uses the type code from the record with the lowest value in the Line Number (LNID) field. If no type code exists for the payee, the system uses the mailing name for record 0 in table (F0111). You must enter a value other than Blank to make the system merge the mailing name and professional title fields. Values are hard-coded.

3. Literal Amount Lines

Specify whether the system prints the literal amount on two or three lines, if needed. The literal amount is an English-language representation of the payment amount in words. When you set this processing option to use three lines, the system prints up to 150 characters. When you set this processing option to use two lines, the system prints up to 100 characters. If the amount in words exceeds the allowed character count, the system prints the amount in its numerical representation. Values are:

Blank or a value other than 3: The system prints the literal amount on two lines.

3: The system prints the literal amount on three lines.

PART 24

Spain

Chapter 102

(ESP) Understanding Country-Specific Functionality for Spain

Chapter 103

(ESP) Setting Up Functionality for Spain

Chapter 104

(ESP) Working With Functionality for Spain

CHAPTER 102

(ESP) Understanding Country-Specific Functionality for Spain

This chapter provides an overview of Spain-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Spain-Specific Setup and Processes

This table lists the country-specific setup and functionality for Spain.

| Setup or Process | Description |
|---------------------------|---|
| UDCs (user-defined codes) | <p>In addition to the base software UDCs:</p> <ul style="list-style-type: none">• Set up the Draft Print Program (03B/DP) UDC with Spain-specific values. See Chapter 103, “(ESP) Setting Up Functionality for Spain,” Setting Up UDCs for Accounts Receivable Drafts for Spain, page 1701.• Set up UDCs for European Union reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221.• Set up UDCs to print invoices with an attached International Payment Instruction (IPI). See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.• Set up these UDCs for companies:<ul style="list-style-type: none">- Affiliated Companies (74/AC)- Code Number (74/30) See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for European Companies, page 1230. |

| Setup or Process | Description |
|---------------------------|---|
| Companies and individuals | <p>To set up companies and individuals for Spain:</p> <ul style="list-style-type: none"> • Enter the village code when you set up companies. See Chapter 103, “(ESP) Setting Up Functionality for Spain,” Entering a Village Code for Companies in Spain, page 1703. • Enter the <i>Codigo de Identificacion Fiscal</i> (C.I.F.) for a foreign company or enter the <i>Numero de Identificacion Fiscal</i> (N.I.F.) for foreign individuals. See Chapter 103, “(ESP) Setting Up Functionality for Spain,” Understanding Foreign Tax ID Validation for Spain, page 1699. • Set up the system to validate bank account information. See Chapter 104, “(ESP) Working With Functionality for Spain,” Entering A.E.B. Customer and Supplier Bank Information for Spain, page 1724. |
| Chart of accounts | <p>Spain uses a chart of accounts that is different from the standard chart of accounts provided.</p> <p>See Chapter 103, “(ESP) Setting Up Functionality for Spain,” Understanding the Alternate Chart of Accounts for Spain, page 1700.</p> |
| Bank accounts | <p>When setting up bank accounts for Spain:</p> <ul style="list-style-type: none"> • Set up the system to validate bank account information. See Chapter 104, “(ESP) Working With Functionality for Spain,” Entering A.E.B. Customer and Supplier Bank Information for Spain, page 1724. • Review the overview about bank account validation. See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding Bank ID and Bank Account Validation, page 1238. • Review the overview about using international bank account numbers (IBAN). See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding International Bank Account Numbers, page 1237. |

| Setup or Process | Description |
|--------------------|--|
| Invoice processing | <p>In addition to standard invoice processing, you can print invoices with an attached International Payment Instructions (IPI). To print these invoices and attachments:</p> <ul style="list-style-type: none">• Set up UDCs for IPIs. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.• Set processing options for the invoice print program. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Invoice Print with International Payment Instruction (R03B5053), page 1247.• Print invoices with attached IPIs. See Chapter 66, “(Europe) Working With European Union Functionality,” Printing Invoices with an Attached International Payment Instruction, page 1245. |

| Setup or Process | Description |
|--------------------------------------|--|
| Accounts Receivable draft processing | <p>A validation routine exists for bank IDs and bank accounts. The system uses the validation routine when you process accounts receivable drafts.</p> <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding Bank ID and Bank Account Validation, page 1238.</p> <p>To use draft processing for accounts receivables in Spain:</p> <ul style="list-style-type: none"> Set up the standard UDCs for draft processing and set up a country-specific value for the Draft Print Program (03B/DP) UDC. <p>See Chapter 103, “(ESP) Setting Up Functionality for Spain,” Setting Up UDCs for Accounts Receivable Drafts for Spain, page 1701.</p> <p>See <i>JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide</i>, “Setting Up the JD Edwards EnterpriseOne Accounts Receivable System,” Setting Up UDCs for Accounts Receivable.</p> <ul style="list-style-type: none"> Set up a fee schedule for drafts. <p>See Chapter 103, “(ESP) Setting Up Functionality for Spain,” Setting Up Draft Stamps for Spain, page 1701.</p> <ul style="list-style-type: none"> Set the processing options for the Spanish draft remittance programs. <p>See Chapter 104, “(ESP) Working With Functionality for Spain,” Working With Draft Remittance Formats for Spain, page 1712.</p> <ul style="list-style-type: none"> Set up to validate bank account information. <p>See Chapter 104, “(ESP) Working With Functionality for Spain,” Entering A.E.B. Customer and Supplier Bank Information for Spain, page 1724.</p> <ul style="list-style-type: none"> Use the Stamp Fees Report (R74S540) to print a report to view the total amount and the fee amount for each draft. <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (ESP) Reports for Spain, page 1888.</p> <ul style="list-style-type: none"> Use Spain-specific processes for: <ul style="list-style-type: none"> Originating drafts <p>See Chapter 104, “(ESP) Working With Functionality for Spain,” Originating Drafts for Spain, page 1715.</p> Reprinting drafts <p>See Chapter 104, “(ESP) Working With Functionality for Spain,” Reprinting Drafts for Spain, page 1720.</p> |

| Setup or Process | Description |
|------------------------------|--|
| Payment processing | <p>A validation routine exists for bank IDs and bank accounts. The system uses the validation routine when you process EFT payments.</p> <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding Bank ID and Bank Account Validation, page 1238.</p> <p>Before processing payments in Spain:</p> <ul style="list-style-type: none"> • Set up payment formats. <p>See Chapter 103, “(ESP) Setting Up Functionality for Spain,” Setting Up Payment Formats for Spain, page 1704.</p> <ul style="list-style-type: none"> • Set up to validate bank account information. <p>See Chapter 104, “(ESP) Working With Functionality for Spain,” Entering A.E.B. Customer and Supplier Bank Information for Spain, page 1724.</p> |
| Tax processing and reporting | <p>JD Edwards EnterpriseOne provides these VAT reports:</p> <ul style="list-style-type: none"> • Print Invoice Company (R74S440). • VAT Report by Tax Rate/Area (R74S450). <p>Other required tax reports and filings for Spain include:</p> <ul style="list-style-type: none"> • 347 Tax Declaration tape file. <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “(ESP) Processing the 347 Tax Declaration”.</p> <ul style="list-style-type: none"> • 347 - Dec. Companies Report (R74S71). <p>347 - Operations Report (R74S72)</p> <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (ESP) Reports for Spain, page 1888.</p> <ul style="list-style-type: none"> • 349 Tax Declaration tape file. <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “(ESP) Processing the 349 Tax Declaration”.</p> <ul style="list-style-type: none"> • 349 - Dec. Companies Report (R74S91). <p>349 - Operations Report (R74S92).</p> <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (ESP) Reports for Spain, page 1888.</p> |

| Setup or Process | Description |
|--------------------------|---|
| Fixed asset depreciation | <p>JD Edwards EnterpriseOne software provides a predefined depreciation method for Spain.</p> <p>See <i>JD Edwards EnterpriseOne Fixed Assets 8.12 Implementation Guide</i>, “Understanding International Depreciation Methods”.</p> |
| Intrastat reporting | <p>To set up and use Intrastat reporting:</p> <ul style="list-style-type: none"> Review the overview about European Union reporting. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Understanding European Union Functionality, page 1215. Set up UDCs. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221. Set up commodity codes. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up Commodity Code Information, page 1230. Set up cross-references between suppliers and items to show the country of origin. See Chapter 65, “(Europe) Setting Up European Union Functionality,” Entering Cross-References for Items and Suppliers, page 1231. Set the processing options for the Intrastat workfiles programs. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Sales (R0018I1), page 1254. See Chapter 66, “(Europe) Working With European Union Functionality,” Setting Processing Options for Intrastat Workfile Generation - Procurement (R0018I2), page 1256. Populate the workfiles. See Chapter 66, “(Europe) Working With European Union Functionality,” Populating the Intrastat Workfile, page 1250. Revise the workfiles as necessary. See Chapter 66, “(Europe) Working With European Union Functionality,” Revising Intrastat Information, page 1258. |

| Setup or Process | Description |
|---------------------------------|--|
| Intrastat reporting (continued) | <p>To print and purge Intrastat records:</p> <ul style="list-style-type: none"> • Use the IDEP/IRIS Interface program (R0018I3) to generate an electronic Intrastat declaration in the format required for Spain. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Using the IDEP/IRIS Interface for Intrastat Reporting, page 1264.</p> <ul style="list-style-type: none"> • Purge records from the Intrastat table (F0018T). <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Purging Records from the Intrastat Table (F0018T), page 1263.</p> |
| Other European Union reporting | <p>In addition to Intrastat reporting, you can generate these reports:</p> <ul style="list-style-type: none"> • EC Sales List Reports <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding EC Sales List Reports for European Reporting, page 1245.</p> <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sales List Report (R0018L), page 1273.</p> <ul style="list-style-type: none"> • EC Sales A/R Report <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sale List - AR Report (R0018S), page 1276.</p> |

| Setup or Process | Description |
|-------------------|---|
| Integrity reports | <p>JD Edwards EnterpriseOne software provides these integrity reports for Spain:</p> <ul style="list-style-type: none"> • G/L by Category Code (R70470). • G/L by Object and Subsidiary (R7409C1). • G/J by Obj. Account or Cat. Code - Spain (R74S490). • G/L by Obj. Account - Spain (R74S560). • T/B by Obj. Account (R74S570). <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (ESP) Reports for Spain, page 1888.</p> |
| Rapid Start | <p>The JD Edwards EnterpriseOne Rapid Start solution from Oracle is available for Spain, as well as other countries. The preconfigured data that are part of the Rapid Start solution is based on business processes that have been designed according to the best business practices for a specific country and industry.</p> <p>See <i>JD Edwards EnterpriseOne Rapid Start 8.12 Documentation</i></p> |

CHAPTER 103

(ESP) Setting Up Functionality for Spain

This chapter provides overviews of the foreign tax ID validation, the alternate chart of accounts for Spain, and discusses how to set up:

- User-defined codes (UDCs).
- Draft stamps.
- Village codes for companies.
- Payment formats.

See Also

JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide, “Setting Up Accounts Receivable Drafts”

Understanding Foreign Tax ID Validation for Spain

Foreign companies and individuals in Spain are assigned national fiscal identification (ID) numbers. These numbers are used on legal and fiscal documents, such as invoices, vouchers, and fiscal reports. The fiscal ID number for companies is called the *Codigo de Identificacion Fiscal* (C.I.F.), and the number for individuals is called the *Numero de Identificacion Fiscal* (N.I.F.).

When you enter address book records for Spain, you enter the N.I.F. and C.I.F. numbers in the Tax ID field on the Address Book Revision form, and the system validates the number against the required format.

For foreign C.I.F. numbers, the system validates that the number is nine digits and contains the following attributes:

- The first character is N.
N represents the type of company.
- Characters two through seven contain a numeric string.
- The last character is a check digit that the system assigns using an algorithm that is applied to the numeric string.

For foreign N.I.F. numbers, the system validates that the number is nine digits and contains the following attributes:

- The first character is K, L, M, or X.
This value represents the type of foreign individual (for example: resident, nonresident, less than 14 years old, and so on).
- Characters two through seven contain a numeric string.

- The last character is a check digit that the system assigns using an algorithm that is applied to the numeric string.

If you enter a number in the Tax ID field that does not follow the required format, the system generates an error message.

When you run the Address Book Batch Upload program to upload records for Spain, the system validates numbers against the required format and generates an error message in the Work Center if any numbers are invalid.

Understanding the Alternate Chart of Accounts for Spain

In Spain, local businesses are required to use a legal, also known as a statutory, chart of accounts (PGC - Plan General de Cuentas). The Spanish statutory chart of accounts uses a decimal-based numbering system with ten account classes:

| Account | Classes |
|------------------|---|
| Balance Sheet | <p>These account classes are included on the Balance Sheet:</p> <ul style="list-style-type: none"> • Class 1: Capital Accounts and Borrowings and Long Term Debt • Class 2: Fixed Assets and Long Term Investments and Assets • Class 3: Inventories • Class 4: Receivables, Payables, and related accounts with third parties • Class 5: Cash and Marketable Securities |
| Income Statement | <p>These account classes are included on the Income Statement:</p> <ul style="list-style-type: none"> • Class 6: Expenses • Class 7: Income and Revenue |
| Other | <p>These account classes are reserved for other reporting purposes:</p> <ul style="list-style-type: none"> • Class 0: Special Accounts - generally, commitments that are not recorded on the Balance Sheet, and so on • Class 9: Analysis Accounts - does not directly concern general accounting and fiscal statement preparation • Class 8: Currently not used |

Classes and Subclasses

Accounts are organized in classes, subclasses, sub-subclasses, and so on. For example:

- Class: 4 - Receivables and Payables
- Subclass: 40 - Payables; 41 - Receivables

- Sub-subclass: 419 - Advances Received from Customers, Discounts, and Refunds
- Sub-sub-subclass: 4191 - Advances Received on Orders

Setting Up UDCs for Accounts Receivable Drafts for Spain

Set up the Draft Print Program (03B/DP) UDCs with Spain-specific values.

Set up each draft print program that you use in conjunction with the Invoice Group by Draft program (R03B5052). These draft print programs are available for Spain:

- R74S500 (Print Receipt with Letter)
- R74S502 (Print Drafts from Invoices)

Setting Up Draft Stamps for Spain

This section provides an overview of draft stamps and discusses how to set up fees for draft stamps.

Understanding Draft Stamps

Spanish law allows you to collect payment on multiple invoices by combining those invoices on a draft. The government collects a fee on drafts by requiring that the draft be printed on special paper with a government stamp. Spanish businesses pay the fee by purchasing the stamped paper. The amount of the fee depends on the amount of the draft. The government provides various stamps that correspond to the different fees.

To process drafts in the JD Edwards EnterpriseOne Accounts Receivable system, you need to set up a fee table. The fee table lists the fees for various draft amounts. You can set up more than one fee table and distinguish one from another by currency code, months outstanding, or effective date. For example, you might set up one fee table for drafts that are due within six months and another fee table for drafts with a due date that is more than six months away.

When a draft amount exceeds the upper limit on the fee table, the government increases the fee amount in proportion to the increase in the draft amount.

You should set up fees for draft stamps when you begin using the JD Edwards EnterpriseOne Accounts Receivable system to process drafts. You can revise the table of fees if the government changes the fees.

The system stores fee tables in these tables:

- Stamps (Timbres) Fee Detail (F74S502).
- Stamps (Timbres) Fee Header (F74S505).

Forms Used to Set Up Fees for Draft Stamps

| Form Name | FormID | Navigation | Usage |
|--|----------|---|---------------------------------------|
| Work With Stamp (<i>Timbre</i>) Fees | W74S505A | Spanish Draft Processing (G74S03B161), Maintenance of Stamp Fees. | Locate Spanish stamp fees. |
| Stamp (<i>Timbre</i>) Fees Detail | W74S505B | On the Work With Stamp (<i>Timbre</i>) Fees form, click Add. | Set up fees for Spanish draft stamps. |

Setting Up Fees for Draft Stamps

Access the Stamp (*Timbre*) Fees Detail form.

Maintenance of Stamp Fees - Stamp (Timbre) Fees Detail

OK Delete Cancel Tools

Currency Code ★ EUR Euro

Months Outstanding Effective Date ★ 01/01/06

Records 1 - 6 Customize Grid

| | Check Amount | Stamp ★ Fee | Additional Fee Amt | For Each Amt |
|--------------------------|--------------|-------------|--------------------|--------------|
| <input type="checkbox"/> | 4,000.00 | 10.00 | | |
| <input type="checkbox"/> | 8,000.00 | 20.00 | | |
| <input type="checkbox"/> | 15,000.00 | 40.00 | | |
| <input type="checkbox"/> | 30,000.00 | 80.00 | | |
| <input type="checkbox"/> | 60,000.00 | 160.00 | | |
| <input type="checkbox"/> | | | | |

Stamp (*Timbre*) Fees Detail form

Currency Code

Enter the code that identifies the currency of the fees.

Months Outstanding

Enter the number of months between the draft emission date and the draft due date.

Effective Date

Enter the date on which stamp fees become effective.

Check Amount

Enter the upper limit of the receipt amounts to which the fee applies. For example, if you enter a check amount of 4000 on the first line with a corresponding stamp fee of 10, all receipts less than or equal to 4000 will require a stamp fee of 10.

The check amount you enter also becomes the lower limit for the next line. For example, if you enter a check amount of 4000 on the first line and a check amount of 8000 on the second line, all receipts that are greater than 4000 and less than or equal to 8000 require the stamp fee that corresponds to the 8000 check amount.

Stamp Fee

Enter the fee amount (*Timbre*) paid to the government when a draft (*Efecto*) is created. The fee is based on these factors:

- The amount of the draft receipt.
- The number of days between the draft origination date and the draft due date.
- The currency code.
- The effective date.

Additional Fee Amt
(additional fee amount)

Enter the additional fee amount that will be added to the original fee amount obtained from the fee table. An additional fee amount is added when the draft amount is beyond the upper limit that is listed on the table.

For Each Amt (for each amount)

Enter the additional draft amount for which you have to pay an additional fee. For example, if you must pay a 3 euro fee for each additional 1000 euros of the draft amount, you would enter 1000 in this field and enter 3 in the Additional Fee Amount field.

Note. You complete the Check Amount and Stamp Fee fields for each row in the fee table. You complete the Additional Fee Amt and For Each Amt fields only for last row in the fee table.

Entering a Village Code for Companies in Spain

This section provides an overview of village codes for companies and discusses how to enter the village code.

Understanding Village Codes for Companies

In Spain, when you set up a company record, you need to enter a village code for the company. The village code is the INE (National Institute of Statistics) code that identifies the place of origin of transactions that are initiated by the customer or supplier.

If your user profile is set to Spain (ES), the Spain Company Additional Information Revisions form appears when you add a company record. You specify the village code for the company on this form.

Forms Used to Set Up Companies for Spain

| Form Name | FormID | Navigation | Usage |
|--|-----------|---|----------------------------|
| Company Setup | W0010B | Organization & Account Setup (G09411), Company Names & Numbers On the Work With Companies form, click Add. | Enter company information. |
| Spain Company Additional Information Revisions | W74S0010A | Click OK on the Company Setup form. | Enter the village code. |

Entering the Village Code

Access the Spain Company Additional Information Revisions form.

Setting Up Payment Formats for Spain

This section provides an overview of payment formats for Spain and discusses how to:

- Create a payment format template.
- Set processing options for Print Automatic Payments - Check - Spain (R74S572A).
- Set processing options for Print Automatic Payments - Check With Letter - Spain (R74S572B).
- Set processing options for Print Automatic Payments - Draft - Spain (R74S572C).
- Set processing options for Print Automatic Payments - Funds Transfer Order - Spain (R74S572D).
- Set processing options for Print Automatic Payments - Transf Order, (Foreign) - Spain (R74S572E).
- Set processing options for Print Automatic Payments - Tape Format, (CSB 34/1) - Spain (R74S572FA).

Understanding Payment Formats for Spain

JD Edwards EnterpriseOne software provides these payment formats for Spain:

| Format | Description |
|-----------|---|
| R74S572A | Checks. |
| R74S572B | Checks with letters. |
| R74S572C | Draft format. |
| R74S572D | Transfer order (domestic currency). |
| R74S572E | Transfer order (foreign currency). |
| R74S572FA | Electronic fund transfer. This format supports IBAN; the output records contain the IBAN number and other related IBAN information if you set up IBAN information for your suppliers. |

Considerations for the Print Automatic Payments - Tape Format, (CSB 34/1) - Spain (R74S572FA) Format

The Print Automatic Payments - Tape Format, (CSB 34/1) - Spain format supports cheques, electronic funds transfers (EFT) for foreign payments, and EFT for domestic payments. You specify in a processing option whether the system processes payments as foreign EFT, domestic EFT, or cheques.

Understanding Payment Format Templates for Spain

Use the Media Objects program (P98TMPL) to create header text for these payment formats:

- R74S572B for check with letter.
- R74S572C for draft.
- R74S572D for transfer order (domestic currency).
- R74S572E for transfer order (foreign currency).

You attach the header text to these payment formats by entering the name of the payment format template in the processing options of the payment formats.

Note. The Media Objects program is not available in the web client. You must access an non-web client to create the payment format templates.

See *JD Edwards EnterpriseOne Tools 8.96 Foundation Guide*.

Setting Processing Options for Print Automatic Payments - Check - Spain (R74S572A)

Processing options enable you to specify the default processing for programs and reports.

Translation

| | |
|----------------------------|---|
| Translation Program | Specify which translation program to use to translate the payment amount into words. The value that you enter must exist in the Check Translation (98/CT) UDC table. If you leave this processing option blank, the system uses the translation program associated with the payment currency. |
|----------------------------|---|

Conversion

| | |
|-------------------------|--|
| First Line Size | Enter the size of the first line of the check format. If you leave this processing option blank, the system uses the maximum value of 85. |
| Second Line Size | Enter the size of the second line of the check format. If you leave this processing option blank, the system uses the maximum value of 85. |
| Convert Decimals | Enter <i>1</i> to prevent the conversion of decimal numbers (cents) to words. |

Payment

| | |
|---------------------|--|
| Company Name | Enter <i>1</i> to print the company name and address on the payment. If you leave this processing option blank, no company information is printed. |
|---------------------|--|

Print

| | |
|---------------------------|--|
| Form Type (Future) | This processing option is not used. |
| City Name | Enter the name of the city to print on the check. If you leave this processing option blank, no city is printed. |

Setting Processing Options for Print Automatic Payments - Check with Letter - Spain (R74S572B)

Processing options enable you to specify the default processing for programs and reports.

Translation

Translation Program Specify which translation program to use to translate the payment amount into words. The value that you enter must exist in the Check Translation (98/CT) UDC table. If you leave this processing option blank, the system uses the translation program associated with the payment currency.

Conversion

First Line Size Enter the size of the first line of the check format. If you leave this processing option blank, the system uses the maximum value of 85.

Second Line Size Enter the size of the second line of the check format. If you leave this processing option blank, the system uses the maximum value of 85.

Convert Decimals Enter 1 to prevent the conversion of decimal numbers (cents) to words.

Payment

Company Name Enter 1 to print the company name and address on the payment. If you leave this processing option blank, no company information is printed.

Purchase Order Enter 1 to print the purchase order number on the stub instead of the supplier invoice number.

Alternate Stub Information Enter 1 to print the supplier name on the payment stub. Enter 2 to print the supplier invoice number. Leave this processing option blank to print the remark.

Print

Form Type (Future) This processing option is not used.

City Name Enter the name of the city to print on the check. If you leave this processing option blank, no city is printed.

Template Name Enter the name of the template that will be used to retrieve the header text.

Setting Processing Options for Print Automatic Payments - Draft - Spain (R74S572C)

Processing options enable you to specify the default processing for programs and reports.

Translation

Translation Program Specify which translation program to use to translate the payment amount into words. The value that you enter must exist in the Check Translation (98/CT) UDC table. If you leave this processing option blank, the system uses the translation program associated with the payment currency.

Print

Form Type (Future) This processing option is not used.

| | |
|-----------------------------------|---|
| City Name | Enter the name of the city to print on the check. If you leave this processing option blank, no city is printed. |
| Template Name | Enter the name of the template that will be used to retrieve the header text. |
| Conversion | |
| First Line Size | Enter the size of the first line of the check format. If you leave this processing option blank, the system uses the maximum value of 85. |
| Second Line Size | Enter the size of the second line of the check format. If you leave this processing option blank, the system uses the maximum value of 85. |
| Convert Decimals | Enter <i>1</i> to prevent the conversion of decimal numbers (cents) to words. |
| Payment | |
| Company Name | Enter <i>1</i> to print the company name and address on the payment. If you leave this processing option blank, no company information is printed. |
| Purchase Order | Enter <i>1</i> to print the purchase order number on the stub instead of the supplier invoice number. |
| Alternate Stub Information | Enter <i>1</i> to print the supplier name on the payment stub. Enter <i>2</i> to print the supplier invoice number. Leave this processing option blank to print the remark. |

Setting Processing Options for Print Automatic Payments - Funds Transfer Order - Spain (R74S572D)

Processing options enable you to specify the default processing for programs and reports.

Translation

| | |
|----------------------------|---|
| Translation Program | Specify which translation program to use to translate the payment amount into words. The value that you enter must exist in the Check Translation (98/CT) UDC table. If you leave this processing option blank, the system uses the translation program associated with the payment currency. |
|----------------------------|---|

Conversion

| | |
|-------------------------|--|
| First Line Size | Enter the size of the first line of the check format. If you leave this processing option blank, the system uses the maximum value of 75. |
| Second Line Size | Enter the size of the second line of the check format. If you leave this processing option blank, the system uses the maximum value of 75. |
| Convert Decimals | Enter <i>1</i> to prevent the conversion of decimal numbers (cents) to words. |

Print

| | |
|---------------------------|--|
| Form Type (Future) | This processing option is not used. |
| City Name | Enter the name of the city to print on the check. If you leave this processing option blank, no city is printed. |

Template Name Enter the name of the template that will be used to retrieve the header text.

Processing Options for Print Automatic Payments -Transf. Order (Foreign) - Spain (R74S572E)

Processing options enable you to specify the default processing for programs and reports.

Address

Address Format Enter an override address format to use for the payee or company addresses. If you leave this processing option blank, the address does not print.

Translation

Translation Program Specify which translation program to use to translate the payment amount into words. The value that you enter must exist in the Check Translation (98/CT) UDC table. If you leave this processing option blank, the system uses the translation program associated with the payment currency.

Conversion

First Line Size Enter the size of the first line of the check format. If you leave this processing option blank, the system uses the maximum value of 75.

Second Line Size Enter the size of the second line of the check format. If you leave this processing option blank, the system uses the maximum value of 75.

Convert Decimals Enter 1 to prevent the conversion of decimal numbers (cents) to words.

Payment

Purchase Order Enter 1 to print the purchase order number on the stub instead of the supplier invoice number.

Print

Form Type (Future) This processing option is not used.

City Name Enter the name of the city to print on the check. If you leave this processing option blank, no city is printed.

Summarize Statistic Codes Enter 1 to summarize detail lines by the Statistic Code. If you leave this processing option blank, the system prints detailed information.

Template Name Enter the name of the template that will be used to retrieve the header text.

Setting Processing Options for Print Automatic Payments - Tape Format, (CSB 34/1) - Spain (R74S572FA)

Processing options enable you to specify the default processing for programs and reports.

Address

- 1. Address Line #** Specify the address line that contains the address of the payee. If you do not complete this processing option, the system prints the value that exists in the Address Line 4 field (data item ADD4) in the Address Book Master table (F0101).
- 2. City Line Number** Specify the Address Line that contains the city of the payee. If you do not complete this processing option, the system prints the value that exists in the City field (data item CTY1) in the Address Book Master table (F0101).
- 3. Zip Code Field** Specify whether the system uses the value that exists in the Postal Code field as the postal code. Values are:

Blank: The system uses the value that exists in the Postal Code field (data item ADDZ) in the Address Book Master table (F0101).

1: The system uses the first five characters of the value that exists in the City field (data item CYT1) in the Address Book Master table (F0101).
- 4. Second Company Address Number** Enter the Address Number of a second company if the order belongs to other company.

If the order belongs to another company, use this processing option to specify the address number of the company.
- 5. Suffix** Specify a suffix for the file. The value that you enter must be between 111 and 999.

Print

- 1. Form Type (Future Use)** This processing option is not used.

Tape Format

- 1. Transaction Type** Specify whether the tape contains cheques, or is a domestic or cross-border transfer. Values are:

1: Cheques
2: Domestic transfer
3: Cross-border transfer
- 2. Expenses** Specify whether expenses are paid by your company or by the payee. Values are:

1: Expenses are paid by company.
2: Expenses are paid by the payee.
3: Expense costs are shared.
- 3. Charge Detail** Specify whether the system prints detailed information about the expenses. Values are:

Blank: No details are printed.
1: Details are printed.
- 4. Payment City Name** Specify the city of origin for the payment.

CHAPTER 104

(ESP) Working With Functionality for Spain

This chapter provides an overview of accounts receivable draft processing and discusses how to:

- Work with draft remittance formats.
- Originate drafts for Spain.
- Reprint drafts for Spain.
- Enter A.E.B. customer and supplier bank information for Spain

Understanding Accounts Receivable Draft Processing in Spain

The JD Edwards EnterpriseOne system provides country-specific functionality for draft origination and draft remittance in Spain. To process accounts receivable drafts in Spain, perform these steps:

1. Set up the JD Edwards EnterpriseOne Accounts Receivable system base software for drafts, and also use the Maintenance of Stamp Fees program (P74S505) to set up fees for draft stamps for Spain.
2. Use Spain-specific programs to group invoices and print drafts.
3. Use the standard JD Edwards EnterpriseOne Accounts Receivable software to accept drafts.
4. Use Spain-specific programs to remit drafts.
5. Use the standard JD Edwards EnterpriseOne Accounts Receivable software to collect drafts.

See Also

JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide, “Processing Accounts Receivable Drafts”

Prerequisites

Before you work with draft remittance for Spain:

- Set up UDCs.

See *JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide*, “Setting Up the JD Edwards EnterpriseOne Accounts Receivable System,” Setting Up UDCs for Accounts Receivable.

See [Chapter 103, “\(ESP\) Setting Up Functionality for Spain,” Setting Up UDCs for Accounts Receivable Drafts for Spain, page 1701.](#)

- Set up draft stamp tables.

See [Chapter 103, “\(ESP\) Setting Up Functionality for Spain,” Setting Up Draft Stamps for Spain, page 1701.](#)

Working With Draft Remittance Formats for Spain

This section provides an overview of draft remittance formats and discusses how to:

- Set processing options for Draft Remittance File Format AEB 19 - Spain (R74S6729).
- Set processing options for Draft Remittance File Format AEB 32 - Spain (R74S6722).
- Set processing options for Draft Remittance File Format AEB 58 - Spain (R74S6728).

Understanding Remittance Formats for Spain

The system provides these remittance formats to remit drafts to the bank:

- Draft Remittance File Format AEB 19 - Spain (R74S6729)
- Draft Remittance File Format AEB 32 - Spain (R74S6722).
- Draft Remittance File Format AEB 58 - Spain (R74S6728).

To remit drafts using one of these formats, enter the program number and version of the format that you want to use in the Paper/Tape processing option of the Draft Remittance program (R03B672).

The Spanish remittance formats create Text File Processor batches that contain the remittance information.

AEB 19

Use the AEB 19 format to remit drafts for which the funds will be collected later.

The AEB 19 can be submitted in either of two formats. You specify the format in the processing options of the Draft Remittance File Format AEB 19 - Spain program (R74S6729). Format 1 contains the invoice number in the reference field. Format 2 contains the draft number in the reference field. The format that you select depends on the requirements of the bank to which you remit the drafts.

AEB 32

Use the AEB 32 to remit discounted drafts for which you have a physical receipt.

AEB 58

Use the AEB 58 format to remit drafts for which the bank will advance you the funds before the due date of the draft. This process is called discounting a draft. When you discount a draft in Spain, you must recognize contingent liability.

See *JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide*, “Processing Accounts Receivable Drafts,” Understanding Journal Entries Created by the Draft Post.

Setting Processing Options for Draft Remittance File Format AEB 19 - Spain (R74S6729)

Processing options enable you to specify the default processing for programs and reports.

Process

These processing options specify the format in which drafts are printed as well as where address information is stored on customer records in the JD Edwards EnterpriseOne Address Book system.

| | |
|-----------------------------------|--|
| Format | Specify the format that the system uses. Values are: Blank: Format one. 1: Format two. |
| Client Address Line Number | Specify the address line number in the address book record that contains the street address of the client. Values are: Blank: Address line 1. 1: Address line 2. 2: Address line 3. |
| City Address Line Number | Specify the address line number in the address book record that contains the city of the client. Values are: Blank: Address line 1. 2: Address line 2. 3: Address line 3. 4: Address line 4. |

Currency

This processing option specifies the currency in which the system creates remittances.

| | |
|-----------------------------|---|
| Currency Designation | Specify whether the system creates remittances using euros or the currency of the company. Values are: Blank: Use the company currency. 1: Use euros (EUR). |
|-----------------------------|---|

Defaults

These processing options specify processing information that the system uses when creating remittances.

| | |
|------------------------------|---|
| 1. File Creation Date | Specify the date on which the remittance is created. If you leave this processing option blank, the system uses the system date as the default value. |
| 2. Company Number | Specify the company that is issuing the remittance. Blank is not a value. |

Setting Processing Options for Draft Remittance File Format AEB 32 - Spain (R74S6722)

Processing options enable you to specify the default processing for programs and reports.

Process

| | |
|-----------------------------------|--|
| Client Address Line Number | Specify the address line number in the address book record that contains the street address of the client. Values are: |
|-----------------------------------|--|

Blank: Address line 1.

1: Address line 2.

2: Address line 3.

City Address Line Number Specify the address line number in the address book record that contains the city of the client. Values are:

Blank: Address line 1.

2: Address line 2.

3: Address line 3.

4: Address line 4.

Currency

This processing option specifies the currency in which the system creates remittances.

Currency Designation Specify whether the system creates remittances using euros or the currency of the company. Values are:

Blank: Use the company currency.

1: Use euros (EUR).

Defaults

These processing options specify processing information that the system uses when creating remittances.

- 1. File Creation Date** Specify the date on which the remittance is created. If you leave this processing option blank, the system uses the system date as the default value.
- 2. Company Number** Specify the company that is issuing the remittance. Blank is not a value.
- 3. Draft Type** Specify the type of draft that the system uses to create remittances. Values are:
Blank: Receipt.
1: *Letra*
2: Receipt
3: *Pagare*
- 4. Customer Acceptance Status** Specify the customer draft acceptance status. Values are:
Blank: Drafts are not accepted.
1: Drafts are accepted.
2: Drafts are not accepted.
- 5. Draft Fees Choice** Specify the draft fees choice. Values are:
0: Without fees.
1: With fees.
9: *Orden de protesto notarial*.

- 6. Geographic Area Code** Specify the geographic area code (UDC 00/S) that the system prints on remittance records. If this processing option is left blank, the system uses the first two digits in the zip code.
- 7. Village Emission Code** Specify the name of the city of the company.

Setting Processing Options for Draft Remittance File Format AEB 58 - Spain (R74S6728)

Processing options enable you to specify the default processing for programs and reports.

Currency

This processing option specifies the currency in which the system creates remittances.

- 1. Currency Designation** Specify whether the system creates remittances using euros or the currency of the company. Values are:
- Blank: Use the company currency.
- I*: Use euros (EUR).

Date

This processing option specifies the date that the remittance is created.

- 1. File Creation Date** Specify the date on which the remittance is created. If you leave this processing option blank, the system uses the system date as the default value.

Company

This processing option specifies the company number issuing the remittance.

- 1. Company Number** Specify the company that is issuing the remittance. Blank is not a value.

AEB 58

- AEB 58 Suffix** Enter the suffix for the tax ID. This value should be from 000 to 999.

Originating Drafts for Spain

This section provides an overview of Spanish draft origination, the Print Receipt with Letter Program, and the Print Drafts from Invoices program, list prerequisites, and discusses how to:

- Group invoices for drafts.
- Set processing options for Invoice Group by Draft (R03B5052).
- Print drafts with letters.
- Set processing options for Print Receipt with Letter (R74S500).
- Print drafts from invoices.
- Set processing options for Print Drafts from Invoices (R74S502).

Understanding Spanish Draft Origination

The draft process begins when you originate (print) a draft. The draft shows the amount to be paid, the due date, and information about the underlying liabilities (invoices).

The first step in draft origination is grouping invoices for drafts. You use the Invoice Group by Draft program (R03B5052) to group invoices for drafts.

The Invoice Group by Draft program groups open invoices from the F03B11 table by either customer number or payor number; and by company, currency code, and net due date. You can also use detail mode to group each invoice pay item with the same net due date on one draft.

For each group, the program assigns the draft number of the draft as a control number. The program also produces a report that includes a total for each group of invoices. This total is the amount of the draft.

The system processes only invoices that have an open amount and that have an empty Control/Statement field (CTL) in the F03B11 table. The system excludes invoices with record types *RI*, *R5*, or *RU*, as well as invoices for customers who have a Send Invoice To (SITO) value of *N* for Company 00000 in the Customer Master by Line of Business table (F03012).

Note. You must group records in the Invoice Group by Draft program in the same way that you process records in the Print Drafts from Invoices program. For example, if you set the processing options on the Invoice Group by Draft program to group by customer, you must also set the processing options on the Print Drafts from Invoices program to process by customer. If you specify the Print Drafts with Invoices program in the processing options of the Invoice Group by Draft program, the processing option value for grouping does not get passed from the Invoice Group by Draft program to the Print Drafts with Invoices program. You must set up matching processing options for both programs.

Printing Drafts

You can use the processing options on the Invoice Group by Draft program to run a program that prints the drafts, such as the Print Drafts from Invoices program (R74S502). You can also print the drafts separately after running the Invoice Group by Draft program.

You can use the processing options on the Invoice Group By Draft program (R03B5052) to run either of these draft print programs:

- Print Receipt with Letter (R74S500)
- Print Drafts from Invoices (R74S502)

Both of these programs create drafts based on invoices (document type *RI*). Print Receipt with Letter does not group invoices according to their stamp fees, whereas Print Drafts from Invoices does.

Understanding the Print Receipt with Letter Program

The Print Receipt with Letter program prints statements of invoices and their corresponding drafts using the groupings that are produced by the Invoice Group by Draft program (R03B5052).

The system uses the customer number to retrieve bank transit information from the Bank Transit Master table (F0030). The system first looks for a record with a bank type of *D* (A/R Drafts, Auto Debit). If no record with a bank type of *D* exists, the system looks for a record with a bank type of *C* (Customer Bank Account). The system retrieves additional bank information from the A.E.B. Bank - Spain table (F74SCSB) by cross-referencing the transit number from the F0030 table with a bank code and control digit in table F74SCSB.

If no record with a bank type of either *D* or *C* exists for the customer in the F0030 table, the system does not print bank transit information on the draft.

Note. You must process records in the Print Receipt with Letter program in the same way that you group records in the Invoice Group by Draft program. For example, if you set the processing options for the Invoice Group by Draft program to group by customer, you must also set the processing options for the Print Receipt with Letter program to process by customer. If you specify the Print Receipt with Letter program in the processing options for the Invoice Group by Draft program, the processing option value for grouping does not get passed from the Invoice Group by Draft program to the Print Receipt with Letter program. You must set up matching processing options for both programs.

The Print Receipt with Letter program retrieves information from the F03B11 table.

Understanding the Print Drafts from Invoices Program

The Print Drafts from Invoices program (R74S502) uses the groups that are produced by the Invoice Group by Draft program (R03B5052) to print drafts. The total amount of each draft, which is the total open amount of each group of invoices, determines the amount of the stamp that is required on the draft.

The system retrieves fee amounts from these tables:

- Stamps (Timbres) Fee Detail (F74S502)
- Stamps (Timbres) Fee Header (F74S505)

If the system cannot find a fee that corresponds to the draft amount, it sends an error message to the work center and does not print the draft.

The Print Drafts from Invoices program produces one printer spool file for each fee amount. All of the drafts that have the same fee amount are included in one printer spool file. This grouping enables you to load the paper with the appropriate stamp for each group of drafts.

Note. You must group records in the Print Drafts from Invoices program in the same way that you group records in the Invoice Group by Draft program. For example, if you set the processing options for the Invoice Group by Draft program to group by customer, you must also set the processing options for the Print Drafts from Invoices program to group by customer. If you specify the Print Drafts with Invoices program in the processing options for the Invoice Group by Draft program, the processing option value for grouping does not get passed from the Invoice Group by Draft program to the Print Drafts with Invoices program. You must set up matching processing options for both programs.

The Print Drafts from Invoices program selects *R/I* documents from the F03B11 table.

Data Selection

It is recommended that you set up data selection based on a currency code.

Prerequisites

Before you complete the tasks in this section:

- Set up the fee table for draft stamps.

See [Chapter 103, “\(ESP\) Setting Up Functionality for Spain,” Setting Up Draft Stamps for Spain, page 1701](#).

- Enter bank information for Spanish customers in the AEB Bank Revisions - Spain program (P74SCSB) and in the Bank Accounts by Addresses program (P0030A). The bank transit number in the Bank Accounts Addresses program corresponds to the bank code and office code in the AEB Bank Revisions - Spain

program. The first four digits of the bank transit number are the bank code, and the second four digits are the office code.

See [Chapter 104, “\(ESP\) Working With Functionality for Spain,” Entering A.E.B. Customer and Supplier Bank Information for Spain, page 1724.](#)

Grouping Invoices for Drafts

Select Spanish Draft Processing (G74S03B161), Invoice Group by Draft.

Setting Processing Options for Invoice Group by Draft (R03B5052)

Processing options enable you to specify the default processing for programs and reports.

Defaults

This processing option specifies a default value for the pay status code on R1 draft records.

- | | |
|---------------------------|--|
| 1. Pay Status Code | Specify the Payment Status code (UDC 00/PS) that the system assigns to processed invoices. |
|---------------------------|--|

Process

These processing options specify how the system selects invoices for payment.

- | | |
|----------------------------|--|
| 1. Process Mode | <p>Specify how the system groups invoices and assigns draft numbers when it processes invoices. You can specify that the system process the invoices in detail mode, in which case the system assigns one draft number to each invoice or group of pay items with the same net due date. For example, for an invoice with two pay items whose net due dates differ, the system generates two drafts. For an invoice with two pay items whose net due dates are the same, the system generates only one draft.</p> <p>Alternatively, you can group invoices by customer and assign one draft number to all invoices that have the same company, currency code, net due date, and customer number.</p> <p>Finally, you can group invoices by payor and assign one draft number to all invoices that have the same company, currency code, net due date, and payor number.</p> <p>Values are:</p> <p>Blank: Process invoices in detail mode.</p> <p>1: Group invoices by customer (AN8).</p> <p>2: Group by invoices payor (PYR).</p> |
| 2. Threshold Amount | <p>Specify the threshold amount that the system uses to suppress draft creation. If the total draft amount for the group of invoices is less than this threshold amount, no draft number is assigned to the invoices in the group. The system compares the threshold amount that you enter to the total domestic open amount, regardless of the currency code.</p> |

Versions

These processing options specify the program number and version to use to print drafts.

- 1. Program ID** Specify the program that the system uses to print the drafts that are generated by this program. If you leave this processing option blank, you must manually run a draft print program to print the drafts.
- 2. Version ID** Specify the version of the program that you specified in the Program ID processing option that the system uses to print drafts. If you leave this processing option blank, the system runs version ZJDE0001. If the ZJDE0001 version does not exist, the report does not run. If the Program ID processing option is blank, the system disregards this processing option.

Printing Drafts with Letters

Select Spanish Draft Processing (G74S03B161), Print Receipt with Letter.

Setting Processing Options for Print Receipt with Letter (R74S500)

Processing options enable you to specify the default processing for programs and reports.

Defaults

- 1. Creation Date** Use this processing option to enter the date that you want to appear on the receipt and letter. If you leave this processing option blank, the program uses the current system date.
- 2. City of Origin** Specify the city of origin of the receipt. The system prints the city that you enter here on the receipt. If you leave this processing option blank, no city of origin appears on the receipt.

Process

- 1. Address Number** Specify the address number that the system uses to determine where to send the receipt. Values are:
Blank: Use the customer number (AN8).
I: Use the payor number (PYR).

Print

- 1. Print Tax Amounts** Use this processing option to indicate whether you want tax amounts to appear on the letter. Values are:
Blank: Do not print tax amounts.
I: Print tax amounts.
- 2. Print Currency** Specify whether the system prints the invoice currency code and currency amounts on the receipt and the letter. Values are:
Blank: Do not print currency information.
I: Print currency information.

If you enter *I*, the system prints foreign invoices with foreign amounts. If currency processing is not enabled, the system prints invoices with domestic amounts.

3. Print Attachments

Use this processing option to indicate whether you want generic text associated with an invoice to be printed on the letter. Values are:

Blank: Do not print associated generic text.

I: Print associated generic text.

Printing Drafts from Invoices

Select Spanish Draft Processing (G74S03B161), Print Drafts from Invoices.

Setting Processing Options for Print Drafts from Invoices (R74S502)

Processing options enable you to specify the default processing for programs and reports.

Defaults

- | | |
|--------------------------|---|
| 1. Creation Date | Use this processing option to indicate the date when the draft is created. If you leave this processing option blank, the program uses the current system date. |
| 2. City of Origin | Specify the city of origin of the draft. The system prints the city name on the draft. If you leave this processing option blank, no city of origin appears on the draft. |
| 3. Clause | Use this processing option to enter a plain text clause. If you leave this processing option blank, no clause appears on the draft. |

Process

- | | |
|--------------------------|--|
| 1. Address Number | <p>Specify the address number that the system uses to determine where the draft is sent. Values are:</p> <p>Blank: Use the customer number (AN8).</p> <p><i>I</i>: Use the payor number (PYR).</p> <p>If you grouped invoices by customer when you ran the Invoice Group by Draft program (R03B5052), you should leave this processing option blank. If the Invoice Group by Draft program grouped invoices by payor, you should set the value of this processing option to <i>I</i>. If you ran the Invoice Group by Draft program in detail mode, you can set the value of this processing option to either blank or <i>I</i>.</p> |
|--------------------------|--|

Reprinting Drafts for Spain

This section provides an overview of draft reprinting, lists prerequisites, and discusses how to:

- Reprint drafts by receipt with letters.

- Set processing options for Print Draft (R1) by Receipt with Letter (R74S520).
- Reprint drafts by receipt.
- Set processing options for Print Draft (R1) by Receipt (R74S521).
- Reprint drafts based on stamp fees.
- Set processing options for Print Drafts from R1 by Efecto (R74S522).

Understanding Draft Reprinting

After you have originated drafts and printed them with either the Print Receipt with Letter program (R74S500) or the Print Drafts from Invoices program (R74S502), you can reprint drafts using these programs:

- Print Draft (R1) by Receipt with Letter (R74S520).
- Print Draft (R1) by Receipt (R74S521).
- Print Draft from R1 by Efecto (R74S522).

These programs print drafts based on existing draft (R1) documents. The first two programs do not group drafts according to their stamp fees, whereas Print Draft from R1 by Efecto does.

Print Drafts (R1) by Receipt with Letter

The Print Drafts (R1) by Receipt with Letter program (R74S520) prints duplicate copies of drafts (R1 documents) that were generated by the Print Receipt with Letter program (R74S500), but that have not been voided or collected.

Print Drafts (R1) by Receipt

Similar to the Print Draft (R1) by Receipt with Letter program (R74S520), the Print Drafts (R1) by Receipt program (R74S521) prints duplicate copies of drafts (R1 documents) that were generated by the Print Receipt with Letter program (R74S500), but that have not been voided or collected. However, the Print Drafts (R1) by Receipt program prints only the receipt format; it does not print the associated letter.

Print Draft from R1 by Efecto

The Print Draft from R1 by Efecto program (R74S522) prints drafts for existing draft documents from the Receipts Header table (F03B13) and the Receipts Detail table (F03B14). You can also use this program to print duplicate copies of drafts that were generated by the Print Drafts from Invoices program (R74S502).

The Print Draft from R1 by Efecto program prints drafts that are based on the stamp fees for the drafts. The total amount of each draft determines the amount of the stamp that is required on the draft.

The system retrieves fee amounts from these tables:

- Stamps (Timbres) Fee Detail (F74S502)
- Stamps (Timbres) Fee Header (F74S505)

If the system cannot find a fee that corresponds to the draft amount, it sends an error message to the work center and does not print the draft.

The Print Draft from R1 by Efecto program produces one printer spool file for each fee amount. All of the drafts that have the same fee amount are included in one printer spool file. This grouping enables you to load the paper with the appropriate stamp for each group of drafts.

Prerequisites

Before you complete the tasks in this section:

- Group invoices using the Invoice Group by Draft program (R03B5052).

See [Chapter 104, “\(ESP\) Working With Functionality for Spain,” Grouping Invoices for Drafts, page 1718.](#)

- Print drafts using the Print Receipt with Letter program (R74S500).

Reprinting Drafts by Receipt with Letters

Select Spanish Draft Processing (G74S03B161), Print Draft (R1) by Receipt with Letter.

Setting Processing Options for Print Draft (R1) by Receipt with Letter (R74S520)

Processing options enable you to specify the default processing for programs and reports.

Defaults

- | | |
|----------------------------|---|
| 1. Emission Village | Specify the city of origin of the draft. The system prints the city name that you enter here on the draft. If you leave this processing option blank, no city of origin appears on the draft. |
|----------------------------|---|

Print

- | | |
|-----------------------------|---|
| 1. Print Tax Amount | Specify whether you want the system to print tax amounts on the letter. Values are: Blank: Do not print tax amounts. <i>1</i> : Print tax amounts. |
| 2. Print Currency | Specify whether the system prints the invoice currency code and currency amounts on the draft and the letter. Values are: Blank: Do not print currency information. <i>1</i> : Print currency information. If you enter <i>1</i> , the system prints foreign invoices with foreign amounts. If currency processing is not enabled, the system prints invoices with domestic amounts. |
| 3. Print Attachments | Use this processing option to indicate whether you want the system to print attachments associated with an invoice on the letter. Values are: Blank: Do not print associated attachments. <i>1</i> : Print associated attachments. |

Reprinting Drafts by Receipt

Select Spanish Draft Processing (G74S03B161), Print Draft (R1) by Receipt.

Setting Processing Options for Print Draft (R1) by Receipt (R74S521)

Processing options enable you to specify the default processing for programs and reports.

Defaults

1. **Emission Village** Specify the city of origin of the draft. The system prints the city name that you enter here on the draft. If you leave this processing option blank, no city of origin appears on the draft.

Print

1. **Print Currency** Specify whether to print the invoice currency code and currency amounts on the draft and the letter. Values are:
Blank: Do not print currency information.
I: Print currency information.
If you enter *I*, the system prints foreign invoices with foreign amounts. If currency processing is not enabled, the system prints invoices with domestic amounts.

Reprinting Drafts based on Stamp Fees

Select Spanish Draft Processing (G74S03B161), Print Draft from R1 by Efecto.

Setting Processing Options for Print Drafts from R1 by Efecto (R74S522)

Processing options enable you to specify the default processing for programs and reports.

Defaults

1. **City of Origin** Specify the city of the origin of the draft. The system prints the city name that you enter here on the draft. If you leave this processing option blank, no city of origin appears on the draft.
2. **Clause** Use this processing option to enter a plain text clause. If you leave this processing option blank, no clause appears on the draft.

Process

1. **Address Number** Specify the address number that the system uses to determine where the draft is sent. Values are:
Blank: Use the customer number (AN8).
I: Use the payor number (PYR).
If the Invoice Group by Draft program (R03B5052) grouped invoices by customer, you should leave this processing option blank. If the Invoice Group by Draft program grouped invoices by payor, you should set the value of this processing option to *I*. If the Invoice Group by Draft program grouped

invoices in detail mode, you can set the value of this processing option to either blank or *I*.

Entering A.E.B. Customer and Supplier Bank Information for Spain

This section provides an overview of A.E.B. bank account information, lists a prerequisite, and discusses how to:

- Enter A.E.B. bank account information.
- Upload A.E.B. bank account information.

Understanding A.E.B Bank Account Information

The Spanish Bank Authority (A.E.B.) provides valid bank account information including the bank code, office code, control digit, and sort number. The system uses this bank information when printing the draft formats for draft remittance and during automatic payment processing. You must enter this bank information in the A.E.B. Bank - Spain table (F74SCSB) to validate the bank account information for your Spanish customers and suppliers. You can enter the bank information manually or upload the bank information that is provided by the A.E.B. directly to the F74SCSB table.

The system uses the information in the Bank Code and Office Code fields of the F74SCSB table to validate bank account numbers. The Bank Code and Office Code in the F74SCSB table are used to validate the Bank Transit Number in the Bank Account Cross-Reference program (P0030A) or the Bank Account Information program (P0030G). The system validates the first four digits of the Bank Transit Number against the Bank Code, and the second four digits against the Office Code.

Prerequisite

Create an address book record for each bank, ensuring that both the name of the bank and the name of the local office are entered in the Alpha Name field.

See *JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide*, “Entering Address Book Records”.

Form Used to Enter A.E.B. Bank Account Information

| Form Name | FormID | Navigation | Usage |
|------------------------|----------|---|--|
| Bank Revision (A.E.B.) | W74SCSBB | Accounts Payable - Spain (G74S04), AEB Bank Revisions - Spain On the Work With Banks (A.E.B.) form, click Add. | Enter A.E.B. bank account information. |

Entering A.E.B. Bank Account Information

Access the Bank Revision (A.E.B.) form.

Bank Code Enter a valid four-digit code assigned by the A.E.B.

| | |
|---|--|
| Office Code | Enter a valid four-digit code assigned by the A.E.B. |
| Control Digit | Enter the control digit. This digit is a value generated by the A.E.B. using both the bank code and the office code. The bank or the A.E.B. must supply this number. |
| Sort Number | Enter a four-digit code that is assigned by the A.E.B. This code is used to sort the information for a specific Bank Number and Office Number. |
| Business Site Code | Enter a code that identifies the business site where the office is located. The code that you assign usually matches the city, but such a match is not strictly necessary. |
| Bank Name | Enter the name of the bank. This must be the proper name used by the bank in business. |
| Office Name | Enter the commercial name of the bank office. This is the name used in inquires or to look for a special commercial office of a bank. |
| Office Address | Enter the complete address of a particular commercial office of a bank. This is the suitable address to contact this office with any inquiry. |
| City in Castilian | Enter the Castilian proper name of the city where the office is located. |
| Zip | Enter the zip code of the bank office. |
| City Other Lang. (city other language) | Enter the proper name of the city where the office is located, as the region commonly uses it. |
| OT (office type) | Enter the type of the bank office, according to the A.E.B. criteria. |
| Phone Number | Enter the phone number of the bank office. |
| Telex Number | Enter the Telex number of the bank office, if available. |

Uploading A.E.B. Bank Information

To upload bank information provided by the A.E.B. directly to the A.E.B. Bank - Spain table (F74SCSB), you import the A.E.B. bank information file into the Text Processor Detail Table (F007111) using the Text File Processor program (P007101). When you import a file into the F007111 table, the system stores the contents of the imported file in the Text field (GPTX) of the F007111 table. Because the A.E.B. bank information file has no common format, you must create a custom batch program or table conversion to parse the value in the Text field (GPTX) of the F007111 table to correspond to the fields in the F74SCSB table and to update the parsed values to the F74SCSB table.

This table lists the fields in the F74SCSB table. You can use this information when creating a custom batch program or table conversion to parse the value in the Text field (GPTX) of the Text Processor Detail Table (F007111).

| Alias | Description | Length |
|-------|-------------|--------|
| SBCO | Bank Code | 4 |
| SOCO | Office Code | 4 |
| SSNU | Sort | 4 |

| Alias | Description | Length |
|-------|-----------------------------|--------|
| SBNA | Bank Name | 36 |
| SONA | Office Name | 36 |
| SOAD | Office Address | 40 |
| SCDI | Control Digit | 1 |
| SFI1 | Filler One | 1 |
| SCNC | City Name in Castilian | 40 |
| SCNL | City Name in Other Language | 40 |
| SOFT | Office Type | 1 |
| SBSI | Business Site Code | 9 |
| SACO | Area Code | 3 |
| SPNU | Phone Number | 7 |
| SENU | Extension Number | 7 |
| STNU | Telex Number | 7 |
| SZCO | Zip Code | 5 |
| SFI2 | Filler Two | 17 |

Chapter 106

(CHE) Setting Up Functionality for Switzerland

Chapter 107

(CHE) Working With Country-Specific Functionality for Switzerland

CHAPTER 105

(CHE) Understanding Country-Specific Functionality for Switzerland

This chapter provides an overview of Switzerland-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Switzerland-Specific Setup and Processes

This table lists the country-specific setup and functionality for Switzerland.

| Setup or Process | Description |
|---------------------------|---|
| User-defined codes (UDCs) | <p>In addition to the standard software UDCs, set up UDCs to work with:</p> <ul style="list-style-type: none">• Payment processing <p>See Chapter 106, “(CHE) Setting Up Functionality for Switzerland,” Setting Up UDCs for Payment Processing for Switzerland, page 1733.</p> <ul style="list-style-type: none">• European Union reporting.• Invoices with an attached International Payment Instruction (IPI).• Companies:<ul style="list-style-type: none">- Affiliated Companies (74/AC)- Code Number (74/30) <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for European Union Functionality, page 1220.</p> |

| Setup or Process | Description |
|---------------------|--|
| Invoice processing | <p>In addition to standard invoice processing, you can print invoices with an attached International Payment Instructions (IPI). To print these invoices and attachments:</p> <ul style="list-style-type: none"> • Set up UDCs for IPIs. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for International Payment Instructions, page 1220.</p> <ul style="list-style-type: none"> • Set processing options for the invoice print program. • Print invoices with attached IPIs. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing Invoices with an Attached International Payment Instruction, page 1245.</p> |
| Intrastat reporting | <p>To set up and use Intrastat reporting:</p> <ul style="list-style-type: none"> • Review the overview about European Union reporting. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding European Union Reporting, page 1241.</p> <ul style="list-style-type: none"> • Set up UDCs. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up UDCs for Intrastat Reporting, page 1221.</p> <ul style="list-style-type: none"> • Set up commodity codes. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Setting Up Commodity Code Information, page 1230.</p> <ul style="list-style-type: none"> • Set up cross-references between suppliers and items to show the country of origin. <p>See Chapter 65, “(Europe) Setting Up European Union Functionality,” Entering Cross-References for Items and Suppliers, page 1231.</p> <ul style="list-style-type: none"> • Set the processing options for the Intrastat workfiles programs. • Populate the workfiles. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Populating the Intrastat Workfile, page 1250.</p> <ul style="list-style-type: none"> • Revise the workfiles as necessary. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Revising Intrastat Information, page 1258.</p> |

| Setup or Process | Description |
|---------------------------------|---|
| Intrastat reporting (continued) | <p>To print and purge Intrastat records:</p> <ul style="list-style-type: none"> • Use the IDEP/IRIS Interface program (R0018I3) to generate an electronic Intrastat declaration in the format required for Switzerland. <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Using the IDEP/IRIS Interface for Intrastat Reporting, page 1264.</p> <ul style="list-style-type: none"> • Purge records from the Intrastat table (F0018T). <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Purging Records from the Intrastat Table (F0018T), page 1263.</p> |
| Other European Union reporting | <p>In addition to Intrastat reporting, you can generate these reports:</p> <ul style="list-style-type: none"> • EC Sales List Reports • EC Sales A/R Report <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Understanding EC Sales List Reports for European Reporting, page 1245.</p> <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sales List Report (R0018L), page 1273.</p> <p>See Chapter 66, “(Europe) Working With European Union Functionality,” Printing the EC Sale List - AR Report (R0018S), page 1276.</p> |
| ESR payment slips for invoices | <p>To print invoices with the <i>Einzahlungsschein (ESR)</i> payment slip:</p> <ul style="list-style-type: none"> • Review the overview of ESR payment slips. <p>See Chapter 107, “(CHE) Working With Country-Specific Functionality for Switzerland,” Understanding ESR Payment Slips for Switzerland, page 1739.</p> <ul style="list-style-type: none"> • Create a version of the Print Invoices program (R42565) or the Invoice Print program (R03B505) that calls the Maintain ESR Reference Number business function (B03B0220). • Upload ESR payment information for Switzerland to the F03B13Z1 table. <p>See Chapter 107, “(CHE) Working With Country-Specific Functionality for Switzerland,” Uploading ESR Payment Information for Switzerland to the F03B13Z1 Table, page 1740.</p> |

| Setup or Process | Description |
|----------------------------|--|
| Automatic debit processing | <p>In addition to the standard setup for debit processing, for Switzerland, set up debit formats.</p> <p>See Chapter 107, “(CHE) Working With Country-Specific Functionality for Switzerland,” Working With Automatic Debits for Switzerland, page 1742.</p> |
| Payment processing | <p>To process payments for Switzerland:</p> <ul style="list-style-type: none"> Review the overview about automatic payments for Switzerland. <p>See Chapter 107, “(CHE) Working With Country-Specific Functionality for Switzerland,” Understanding Automatic Payments for Switzerland, page 1740.</p> <ul style="list-style-type: none"> Set up payment formats. <p>See Chapter 106, “(CHE) Setting Up Functionality for Switzerland,” Setting Up Payment Formats for Switzerland for Switzerland, page 1734.</p> |
| Tax processing | <p>In addition to the standard processes for reporting value-added tax (VAT), to process VAT tax in Switzerland:</p> <ul style="list-style-type: none"> Review the overview of Swiss VAT. <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Working With VAT Processing,” (CHE) Processing Swiss VAT.</p> <ul style="list-style-type: none"> Print these VAT reports: <ul style="list-style-type: none"> Account Receivable VAT Report (R740380). Accounts Payable VAT Detail Report (R740480). <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (CHE) Reports for Switzerland, page 1900.</p> |

CHAPTER 106

(CHE) Setting Up Functionality for Switzerland

This chapter discusses how to set up:

- User-defined codes (UDCs)
- Payment formats

Setting Up UDCs for Switzerland

Setting up Switzerland-specific UDCs enables you to use Switzerland-specific functionality. You also set up some base software UDCs with Switzerland-specific values.

Setting Up UDCs for Payment Processing for Switzerland

Set up these UDCs to process payments:

Upload Text Program (03B/UP)

You set up the Upload Text Program UDC to specify the program that you use to upload text files from the Text File Processor program (P007101) to the F03B13Z1 table. To upload text files for ESR payment slip processing, specify R03B803 (Upload ESR Payments).

Bank Type Codes (00/BT)

In addition to setting up this UDC with standard values. For Switzerland, you must set up a bank type code for the Supplier Post Office Account, Bank Post Office Account, Supplier Bank Account, and Supplier ESR (*Einzahlungsschein*) Identification Account.

Swiss SOG Countries/Currencies (74/SS)

Set up valid country and currency combinations for each country that uses the Create A/P Post Office File-Swiss SOG program (R04572S3). When you set up UDC 74/SS, you need to consider:

- The first three characters of the Description 01 field are used for the country code that is required for SOG payments in record types 12, 14, and 25.

The dash followed by the country description is for information only.

- The values in the Description 02 field are the foreign record types that are enabled for the country and currency combination.

The system verifies whether this combination is valid. If you try to write a payment group with a different country and currency combination, the system displays an error message.

- The Special Handling Code field contains the two-digit country code that is assigned by the Swiss Post Office.

The two-digit country code should be used in the foreign record types 12, 14, and 25.

Setting Up Payment Formats for Switzerland for Switzerland

This section provides an overview of payment formats for Switzerland, lists prerequisites, and discusses how to set up processing options for:

- Create A/P Bank Diskette - Swiss (R04572S2).
- Create A/P Post Office File - Swiss SOG (R04572S3).

Understanding Payment Formats for Switzerland

In Switzerland, two payment systems are widely used by companies:

- The electronic funds transfer system (*Datenträger austausch* [DTA]), which is supported by the banking sector (Telekurs, Payserv).
- The *Service des Ordres Groupés* (SOG) system, which is supported by the Swiss Post Office (Postfinance).

DTA Payment Format

The Swiss electronic funds transfer system (DTA) is required by Telekurs (Payserv). The system includes a number of different formats. The Create A/P Bank Diskette - Swiss (R04572S2) program supports these three formats:

| Format | Description |
|--------|---|
| 826 | Domestic payments format for Switzerland (VESR processing) |
| 827 | Domestic payments format (Post or Bank) for Switzerland (non-VESR processing) |
| 830 | Foreign payments (foreign currency or CHF) format for Switzerland |

You can run each DTA format (826, 827, or 830) independently, creating a separate diskette for each payment format. You can also run two or more formats simultaneously in the same A/P Payment Tape (F04572OW) table.

To indicate which DTA formats you are processing, set up a unique payment instrument for each payment format (826, 827, and 830) that you are using. You set up payment instruments using processing option 1 of the Create A/P Bank Diskette - Swiss program (R04572S2).

For example, if you were processing both VESR and non-VESR domestic payments (826 and 827) in a single batch, you enter payment instrument numbers on the first and second lines of processing option 1. If your company uses only domestic payments with VESR processing, you enter a payment instrument number on only the first line of processing option 1 (for format 826).

These fields are required for format 826 - domestic payments format for Switzerland:

- Clearing Bank Account

- Beneficiary Bank Account Number
- First and Last Name of the Beneficiary
- Supplemental Identification of the Beneficiary
- Postal Routing Number of the Beneficiary
- Sender's Identification Number
- First and Last Name of the Payer
- Payer Supplemental Identification
- Date of Payment
- Invoice Reference
- Payment Amount

These fields are required for format 827 - domestic payments format (Post or Bank) for Switzerland:

- Clearing Bank Account
- Beneficiary Bank Account Number
- First and Last Name of the Beneficiary
- Supplemental Identification of the Beneficiary
- Postal Routing Number of the Beneficiary
- Sender's Identification Number
- First and Last Name of the Payer
- Payer Supplemental Identification
- Date of Payment
- Supplier Reference
- Payment Amount

These fields are required for format 830 - foreign payments (foreign currency or CHF) format for Switzerland:

- Bank Clearing Number
- Beneficiary Bank Account Number
- First and Last Name of the Beneficiary
- Supplemental Identification of the Beneficiary
- Postal Routing Number of the Beneficiary
- Sender's Identification Number
- First and Last Name of the Payer
- Payer Supplemental Identification
- Transaction Currency
- SWIFT Address
- Date of Payment
- Invoice Reference
- Beneficiary Bank

SOG Payment Format

The Create A/P Post Office File - Swiss SOG payment program (R04572S3) is similar to the Create A/P Bank Diskette - Swiss program (R04572S2) that you use for DTA, but it contains more record types. The record types for the SOG and the DTA are similar in content, even though the payment file layout differs.

The Create A/P Post Office File - Swiss SOG program supports these SOG record layouts for domestic payments:

- Record type 05
Transfer to Supplier Post Account
- Record type 08
Transfer with ESR/BVR Identification number.
- Record type 11
Postal transfer order (no account numbers).

The Accounts Payable print program supports these SOG record layouts for foreign payments:

- Record type 12
Payment to Post account to foreign countries (PostGiro).
- Record type 14
Post transaction to foreign country in CHF or foreign currency (PostCash).
- Record type 25
Payment to foreign bank.

Prerequisites

Before you complete the tasks in this section:

- To subscribe to the SOG system, request membership from the Post Office. Upon acceptance, you receive your account number, which is called a SOG Member ID. This identification number needs to be set up in the Bank Transit Master table (F0030) for the company address book record (account type G - GL Bank Account GLBA) for the Account to Debit and for the Account to Debit for Taxes.
- Set up the Swiss SOG Countries/Currencies (74/SS) UDC.

Setting Processing Options for Create A/P Bank Diskette - Swiss (R04572S2)

Processing options enable you to specify the default processing for programs and reports.

Record Format

826 = structured Invoice Number

Specify the payment instrument to be associated with the structured invoice number format (format 826). The value you enter must exist in UDC 00/PY.

827 = Normal Bank transfer

Specify the payment instrument to be associated with the normal bank transfer format (format 827). The value you enter must exist in UDC 00/PY.

830 = International Transfer

Specify the payment instrument to be associated with the international bank transfer format (format 830). The value you enter must exist in UDC 00/PY.

Remittance Advice

Enter *1* to always print a remittance advice. If you leave this processing option blank, the system prints remittance advice only if five or more detail records are created.

Identification

DTA Customer Identification

DTA Sender Identification

Enter the DTA sender identification.

DTA Customer Identification

Enter the DTA customer identification.

Bank Tape**Devise Name**

Specify the devise name

Tape Density

Specify the tape density.

Label Name

Specify the label name.

Block Size

Specify the block size.

New Volume Name

Specify the new volume name.

New Owner Name

Specify the new owner name.

File Name

Specify the file name.

Setting Processing Options for Create A/P Post Office File - Swiss SOG (R04572S3)

Processing options enable you to specify the default processing for programs and reports.

Print**1. Print SOG Order Attachment**

Specify whether the system prints the SOG Order attachment. Values are:

Blank: Print the SOG Order attachment. (default value)

1: Do not print the SOG Order attachment.

2. Post Office Address Book Number

Specify the address book number of the post office to which send the SOG Order. The system uses the address book number you enter to include the mailing address of the post office on the SOG Order attachment.

Account Types**1. Supplier Post Office Account Type**

Specify the supplier's post office account type. The system uses this account type code to retrieve the supplier's post office account number. Values are stored in the Bank Type Codes (00/BT) UDC table. If you leave this processing option blank, the system issues an error message and stops processing.

2. Bank Post Office Account Type

Specify the post office account type. The system uses this account type code to retrieve the post office account number. Values are stored in UDC 00/BT. If you leave this processing option blank, the system issues an error message and stops processing.

3. Supplier Bank Account Type

Specify the supplier's bank account type. The system uses this account type code to retrieve the supplier's bank account number. Values are stored in UDC 00/BT. If you leave this processing option blank, the system issues an error message and stops processing.

4. Supplier ESR Identification Account Type

Specify the supplier's ESR identification account type. The system uses this account type code to retrieve the ESR identification number. Values are stored in UDC 00/BT. If you leave this processing option blank, the system issues an error message and stops processing.

Bank Tape**1. Label Name**

Specify the data media for the SOG Order attachment.

2. Type of Data Media

Specify the type of data media for the SOG Order attachment.

CHAPTER 107

(CHE) Working With Country-Specific Functionality for Switzerland

This chapter provides overviews of ESR payment slips and automatic payment processing and discusses how to:

- Upload ESR payment information for Switzerland to the F03B13Z1 table.
- Work with automatic debits.

Understanding ESR Payment Slips for Switzerland

Einzahlungsschein (ESR) are preformatted payment slips that accompany the invoices that you send to customers. ESR payment slips contain a unique reference number that the Postfinance Bank uses when customers make electronic payments through that bank. Postfinance uses the reference number to refer to the payment transaction when it sends information to the payor and payee about the transfer of funds to satisfy the payment requirements. When Postfinance returns payment information to you, you use the ESR reference number to match receipts to invoices.

The ESR reference number consists of the document number (DOC), document company (KCO), and the document type (DCT) of the invoice, as well as the bank transit number (TNST) and a check digit that the system creates using an algorithm. The system concatenates these values to form one string. The document type is written in its ASCII code representation because the ESR reference number must be numerical characters.

The system formats the ESR reference number only when the company customizes either the Print Invoices program (R42565) or the Invoice Print program (R03B505) to call the Maintain ESR Reference Number business function (B03B0220), and you use the customized program to print invoices with attached ESR payment slips. The Maintain ESR Reference Number business function creates the ESR reference number.

When Postfinance sends you electronic media that confirms the payments that have been credited to you, you use the Text File Processor program (P007101) to process the electronic media. The Text File Processor program calls the Upload ESR Payments program (R03B803) to unformat the ESR reference number. You can use the Upload ESR Payments program to unformat the ESR reference number only if the Maintain ESR Reference Number business function was used to format the ESR reference line on the printed ESR payment slips.

When you run the Upload ESR Payments program, the system unformats the ESR reference number in the Text Processor Header table (F007101) and the Text Processor Detail Table (F007111), and parses it into the Document Number, Document Company, and Document Type fields in the Electronic Receipts Input table (F03B13Z1).

The ESR payment slip process includes these events:

1. You run the customized print invoices program to print invoices with ESR payment slips.
2. You send the invoices with ESR payment slips to customers using the postal service.

3. Customers forward the ESR payment slips to Postfinance Bank.
4. Postfinance withdraws the appropriate amount from the customer's account and deposits it into the company's account.
5. Postfinance creates electronic media that contains the payment information and sends it to you.
6. You upload the ESR payment information from the electronic media into the F007101 and F007111 tables by using the Text File Processor program.
7. You run the Upload ESR Payments program from the Text File Processor program to upload payment information from the F007101 and F007111 tables to the F03B13Z1 table.
8. You review and revise as necessary the information in the F03B13Z1 table by using the Work With Electronic Receipts Input program (P03B121).
9. You use the Known Invoice Match with Amount program (R03B50D) or the Known Invoice Match Without Amount program (R03B50E) to process accounts receivables. You must use one of these programs because the outbound ESR process creates one payment slip per invoice and you must use a program that applies one receipt to one invoice.

Understanding Automatic Payments for Switzerland

To conform to standard business practices in Switzerland, set these processing options on the Create Payment Control Groups program (R04570) as indicated:

- On the Process By tab, set the Payee processing to *I*.
- On the Summarize tab, set the Summarized Pay Item processing option to *I*.
- On the Summarize tab, set the Summary Description processing option to *I*.

To retrieve sender information from the DTA file format, you must enter your address book number in the Company Address Number field on the Company Setup form.

Uploading ESR Payment Information for Switzerland to the F03B13Z1 Table

This section provides an overview of the Upload ESR Payments program, list prerequisites, and discusses how to set processing options for Upload ESR Payments (R03B803).

Understanding the Upload ESR Payments Program

After you import the text file that Postfinance Bank sends to you to confirm ESR payments into the Text File Processor program (P007101), you can run the Upload ESR Payments program (R03B803) to upload the ESR payment information to the F03B13Z1 table. When you run the Upload ESR Payments program, the system unformats the ESR reference number in the Text Processor Header table (F007101) and the Text Processor Detail table (F007111); and parses it into the Document Number (DOC), Document Company (KCO), and Document Type (DCT fields) in the F03B13Z1 table. You can then use the Work With Electronic Receipts Input program (P03B121) to review and revise the information in the F03B13Z1 table.

Prerequisites

Before you complete the tasks in this section:

- Import the electronic media that Postfinance Bank sends to you into the text file processor tables.

See *JD Edwards EnterpriseOne Financial Management Solutions Application Fundamentals 8.12 Implementation Guide*, “Working with the Text File Processor”.

- Add the Upload ESR Payment program (R03B803) as a value in the Upload Text Program UDC table (03B/UP).

See *JD Edwards EnterpriseOne Tools 8.96 Foundation Guide*.

Setting Processing Options for Upload ESR Payments (R03B803)

Processing options enable you to specify the default processing for programs and reports.

Defaults

- | | |
|---------------------------------|--|
| 1. Receipt Currency Code | Specify the transaction currency code for the Upload ESR Payments program (R03B803). The system stores currency codes in the Currency Codes table (F0013). If you leave this processing option blank, the system uses the default value <i>CHF</i> . |
| 2. G/L Bank Account | Specify the G/L bank account for the electronic receipts. |
| 3. G/L Date | Specify the G/L date for each electronic receipt. Values are: Blank: Use the date entered in the Override G/L Date processing option. 1: Use the payment date from the ESR payment record. 2: Use the processing date from the ESR payment record. 3: Use the credit date from the ESR payment record. |
| 4. Override G/L Date | Specify the G/L date for the electronic receipts. The system uses the date that you specify here only if the G/L Date processing option is blank. If you leave this processing option blank as well, the system uses the current date. |
| 5. Receipt Date | Specify the receipt date for the electronic receipts. If you leave this processing option blank, the system uses the current date. |
| 6. Receipt Remark | Use this processing option to enter a receipt remark that appears on the electronic receipts that are created by the Upload ESR Payments program (R03B803). You can enter up to 30 characters. |

Working With Automatic Debits for Switzerland

This section provides an overview of automatic debits for Switzerland and discusses how to set processing options for Create Swiss Bank Diskette Format (R03B575SD).

Understanding Automatic Debits for Switzerland

The JD Edwards EnterpriseOne system provides these Swiss automatic debit formats:

- R03B575SD (Create Swiss Bank Diskette Format).

This program saves information to the F03B57OW table.

- R03B575SD1 (Swiss Bank Cover Sheet).

This program generates a bank table that adheres to the banking standards for automatic debits (LSV) in Switzerland.

Note. The Create Swiss Bank Diskette program calls the Swiss Bank Cover Sheet program automatically.

Setting Processing Options for Create Swiss Bank Diskette Format (R03B575SD)

Processing options enable you to specify the default processing for programs and reports.

Statement Print

1. Statement Print

Specify whether the system prints customer statements for automatic debits. Values are:

Blank: Print customer statements only when the number of invoice detail lines exceeds the maximum number of lines that can be included on the format.

I: Print customer statements for automatic debits.

2. Tape Density

Specify the tape density.

Identification

3. Bank Identification Information

Specify the LSV sender and subscriber identification information.

CHAPTER 109

(VEN) Understanding Country-Specific Functionality for Venezuela

This chapter provides an overview of Venezuela-specific setup and processes that you use in addition to the standard setup and processes provided in the base software.

Venezuela-Specific Setup and Processes

This table lists the country-specific setup and functionality for Venezuela.

| Setup or Process | Description |
|---------------------------|--|
| User-defined codes (UDCs) | <p>Setting up Venezuela-specific UDCs enables you to use Venezuelan-specific functionality. Set up UDCs for:</p> <ul style="list-style-type: none">• Accounts payable processing• Supplier withholding <p>See Chapter 110, “(VEN) Setting Up Country-Specific Functionality for Venezuela,” Setting Up UDCs for Venezuela, page 1753.</p> |
| Next numbers | <p>You must set up next numbers for system 76V (Venezuela) to process withholding for income taxes (<i>Impuesto sobre la Renta</i> [ISLR]) and municipal taxes.</p> <p>See Chapter 110, “(VEN) Setting Up Country-Specific Functionality for Venezuela,” Setting Up Next Numbers for Venezuela, page 1755.</p> |

| Setup or Process | Description |
|----------------------------------|--|
| Supplier withholding (setup) | <p>To work with supplier withholding for Venezuela, set up:</p> <ul style="list-style-type: none"> UDCs. <p>See Chapter 110, “(VEN) Setting Up Country-Specific Functionality for Venezuela,” Setting Up UDCs for Supplier Withholding for Venezuela, page 1754.</p> <ul style="list-style-type: none"> Next numbers. <p>See Chapter 110, “(VEN) Setting Up Country-Specific Functionality for Venezuela,” Setting Up Next Numbers for Venezuela, page 1755.</p> <ul style="list-style-type: none"> Set up withholding amount and tributary unit information for ISLR taxes. <p>See Chapter 110, “(VEN) Setting Up Country-Specific Functionality for Venezuela,” Setting Up Withholding for ISLR Taxes for Venezuela, page 1756.</p> <ul style="list-style-type: none"> Set up information for the withholding of municipal taxes (IM). <p>See Chapter 110, “(VEN) Setting Up Country-Specific Functionality for Venezuela,” Setting Up Withholding for Municipal Taxes for Venezuela, page 1758.</p> |
| Supplier withholding (processes) | <p>Run these programs to calculate withholding and print withholding certificates:</p> <ul style="list-style-type: none"> ISLR Withholding Calculation (R76V4580A) ISLR Withholding Certificate (R76VCRNP) IM Withholding Calculation (R76V4590A) <p>See Chapter 111, “(VEN) Working With Country-Specific Functionality for Venezuela,” Processing National and Municipal Withholding for Venezuela, page 1766.</p> <p>Run these reports to print certificates and obtain information about the withholding calculations:</p> <ul style="list-style-type: none"> ISLR Withholding Affidavit (R76VDJRN). IM Withholding Affidavit (R76VDJRM). AR-CV Withholding Certificate (R76VCRVP). Annual Withholding Affidavit - Diskette (R76VPART). Withholding Integrity - Create Historical (R76VIR02C). Withholding Integrity - Erase Historical (R76VIR01B). <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” (VEN) Reports for Venezuela, page 1902.</p> |

| Setup or Process | Description |
|--------------------|--|
| Voucher processing | <p>In addition to the standard processes for vouchers, for Venezuela:</p> <ul style="list-style-type: none">• Set up corresponding versions of the Voucher Entry (P0411) program and the PO - Voucher Entry (P0411) program (P76V4047). <p>See Chapter 111, “(VEN) Working With Country-Specific Functionality for Venezuela,” Setting Processing Option for PO - Voucher Entry (P0411) (P76V4047), page 1766.</p> • Enter information about income, municipal, and value-added taxes. <p>See Chapter 111, “(VEN) Working With Country-Specific Functionality for Venezuela,” Entering Vouchers for Venezuela, page 1764.</p> |

| Setup or Process | Description |
|--------------------|--|
| Invoice processing | <p>In addition to the standard invoice processing, for transactions in Venezuela, assign invoice control numbers.</p> <p>See Chapter 111, “(VEN) Working With Country-Specific Functionality for Venezuela,” Assigning Control Numbers to Invoices for Venezuela, page 1763.</p> |
| Tax processing | <p>To process VAT for Venezuela:</p> <ul style="list-style-type: none"> Review the overview of tax rate areas for Venezuela. <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “Setting Up Tax Information,” (ECU, PER, and VEN) Understanding Tax Rate/Areas for Ecuador, Peru, and Venezuela.</p> <ul style="list-style-type: none"> Set up withholding information for VAT. <p>See Chapter 110, “(VEN) Setting Up Country-Specific Functionality for Venezuela,” Setting Up Withholding Information for VAT for Venezuela, page 1760.</p> <ul style="list-style-type: none"> Use the VAT Withholding Calculation program to calculate VAT withholding. Use the VAT Withholding Certificate program to generate vouchers for the withholding of VAT. Use the VAT Withholding - TXT File Generation program to generate the flat file for tax reporting. <p>See Chapter 111, “(VEN) Working With Country-Specific Functionality for Venezuela,” Processing Withholding for VAT for Venezuela, page 1770.</p> <p>To generate VAT reports:</p> <ul style="list-style-type: none"> Print the Purchasing Book Report (R76VLC01). Print the Sales Book Report (R76VLV01). <p>See <i>JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide</i>, “(VEN) Tax Processing”.</p> |

CHAPTER 110

(VEN) Setting Up Country-Specific Functionality for Venezuela

This section provides an overview of address book information for Venezuela and discusses how to:

- Set up user-defined codes (UDCs).
- Set up next numbers.
- Set up corresponding versions.
- Set up withholding information for *Impuesto sobre la Renta* (ISLR) taxes.
- Set up withholding information for municipal taxes.
- Set up withholding information for value-added tax (VAT).

Understanding Venezuelan Address Book Information

When entering address book records for Venezuela, you must enter the R.I.F number in the Tax ID field on the Address Book Revision form and enter the N.I.T number in the Add'l Ind Tax ID field on the same form. When you enter the R.I.F number, do not enter any spaces or special characters.

When you click OK on the Address Book Revision form, the system displays the A/B Additional Information form. Use this form to enter the ISLR (*Impuesto sobre la Renta*), IM (municipal taxes), and VAT (value added tax) concepts for suppliers. The system uses the values that you enter when calculating supplier withholding taxes.

See Also

JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide, “Entering Address Book Records,” (VEN) Entering Additional Address Book Information

Setting Up UDCs for Venezuela

Setting up Venezuela-specific UDCs enables you to use Venezuela-specific functionality. You also set up some base software UDCs with Venezuela-specific values.

Set up UDCs for:

- Accounts payable processing
- Supplier withholding processing

Setting Up UDCs for Accounts Payable for Venezuela

Before processing vouchers and accounts payable taxes, set up these UDCs.

Document Type (00/DT and 00/DV)

Vouchers for imported goods must be entered using a document type that you set up in the Document Type – All Documents (00/DT) and Document Type - Vouchers Only (00/DV) UDC tables specifically for these transactions.

Payment Status Codes (00/PS)

Set up a payment status code to use to indicate when vouchers are ready for the calculation of ISLR (*Impuesto sobre la Renta*), IM (municipal taxes), and VAT (value-added tax) withholding taxes.

Group Type (74/DG)

Set up this UDC with document types that the system uses when processing vouchers for Venezuela. You must set up one or more document types that identify vouchers, and complete the Special Handling Code field with *01* for these document types. Set up one or more document types that identify debit notes and complete the Special Handling Code field with *02* for these document types. Set up one or more document types that identify credit notes and complete the Special Handling Code field with *03* for these document types.

Invoice Document Type (76V/FC)

Use this UDC to specify document types that you assign to invoices or vouchers.

Exportation Document Types (76V/EP)

Use this UDC to specify document types that you assign to exported goods.

Importation Document Type (76V/IP)

Use this UDC to specify document types that you assign to imported goods.

Credit Note Document Types (76V/NC)

Use this UDC to specify the document types that you assign to credit notes. The system uses the values in this UDC when you calculate withholding and when you produce the Purchasing Book report (R76VLC01) and the Sales Book report (R76VLV01).

Debit Note Document Types (76V/ND)

Use this UDC to specify the document types that you assign to debit notes. The system uses the values in this UDC when you calculate withholding and when you produce the Purchasing Book report (R76VLC01) and the Sales Book report (R76VLV01).

VAT Withholding Concept VE (76V/IV)

Use this UDC to specify the VAT withholding types that the system uses when you process VAT withholding.

Setting Up UDCs for Supplier Withholding for Venezuela

Set up these UDCs prior to processing supplier withholding.

Fee Codes (76V/CT)

Enter values in this UDC to identify fee codes for ISLR withholding.

I.M. Withholding Concept (76V/IM)

Enter values in this UDC to identify types of municipal tax withholding. You use these values when you enter information about municipal tax withholdings in the IM Withholding Setup (P76V4025) program.

ISLR Withholding Concept (76V/IS)

Enter values in this UDC to identify types of ISLR tax withholding. You use these values when you enter information about income tax withholdings in the ISLR Withholding Percentages (P76V4020) program.

VAT Withholding Concept VE (76V/IV)

Enter values in this UDC to identify types of VAT withholding.

VAT Legal Concept (76V/LC)

Enter values in this UDC to identify the types of VAT withholding. You use these values when you enter information about VAT withholding in the VAT Withholding Setup (P76V4030) program.

Setting Up Next Numbers for Venezuela

You must set up next numbers for system 76V (Venezuela) to process withholding for income taxes (*Impuesto sobre la Renta* [ISLR]) and municipal taxes. If the company constants are set to do so, the system first determines if there is a next numbering scheme set up for the company by fiscal year.

Set up the first record for ISLR taxes. The system uses this set of next numbers to assign a new number to the withholding document for ISLR withholding when the next numbers are not set up by company and fiscal year.

Set up the second record for municipal taxes. The system uses this set of next numbers to assign a new number to the withholding document for municipal withholding when the next numbers are not set up by company and fiscal year.

Set up the third and fourth records to add a next number to the VINV field in the F0411 table so that you can relate the withholding documents to the invoice when you calculate withholding. You set up the third and fourth records using different document types. Setting up these next numbers enables you to calculate records multiple times when the withholding record is voided.

Set up the fifth record for VAT taxes. The system uses this set of next numbers to assign a new number to the withholding document for VAT withholding when the next numbers are not set up by company and fiscal year.

Setting Up Corresponding Versions of Programs

Some country-specific functionality requires that you create versions of the same name for a country-specific programs and a base software program. For example, to have the system access the processing options for a country-specific voucher program, you might need to set up a version named XYZ for the country-specific voucher program, and a version named XYZ of the Standard Voucher Entry (P0411) program.

Set up corresponding versions for these programs:

| Country-Specific Program | Base Software Program |
|---------------------------------------|--------------------------------|
| PO - Voucher Entry (P0411) (P76V4047) | Standard Voucher Entry (P0411) |

Setting Up Withholding for ISLR Taxes for Venezuela

This section provide and overview of the setup for income taxes (ISLR), lists prerequisites, and discusses how to:

- Enter withholding amount information.
- Enter tributary unit information.

Understanding Setup for ISLR Taxes

The system calculates the withholding amounts for income taxes for suppliers when you run the ISLR Withholding Calculation (R76V4580A) program. Before you run the ISLR Withholding Calculation program, you must enter the information that the system uses in the calculations.

Tributary Units

Use the Tributary Unit Setup (P76V4010) program to set up tributary unit information for ISLR. The Tributary Unit Setup program enables you to enter for each company the effective dates and amounts. The system saves the values that you enter to the F76V4010 table. Use the Work With Tributary Unit form to view the information in this table.

Withholding Types and Percentages

Use the ISLR Withholding Percentages (P76V4020) program to enter information about withholding types, percentages, and effective dates for the ISLR. withholding. The ISLR Withholding Setup program enables you to set up by each company:

- ISLR withholding concept.
- ISLR fee code type.
- Minimum and maximum amounts for with to apply the withholding.
- Percentage of the amount subject to withholding.
- Withholding percentage.
- ICMS reduced tax amount.
- Effective dates.

The system saves the information that you enter to the ISLR Withholdings Setup - VEN (F76V4020) table. Use the Work With ISLR Withholdings Setup form to view the information in this table.

Prerequisites

Before you perform the tasks in this section:

- Verify that next numbers for withholding are set up for system 76V (Venezuela).

- Verify that appropriate values exist in the ISLR Withholding Concept (76V/IS) and Fee Codes (76V/CT) UDC tables.

Forms Used to Enter Withholding Information for Income Taxes

| Form Name | FormID | Navigation | Usage |
|-----------------------------------|-----------|---|---|
| Work With ISLR Withholdings Setup | W76V4020A | General ISLR Withholding Setup (G76V043), ISLR Withholding Percentages. | View and select existing records. |
| ISLR Withholding Setup | W76V4020B | Click Add on the Work With ISLR Withholdings Setup form. | Enter the withholding concept, effective dates, and withholding percentage. |
| Work With Tributary Unit | W76V4010A | General ISLR Withholding Setup (G76V043), Tributary Units Setup | View and select existing records. |
| Tributary Unit Setup | W76V4010B | Click Add on the Work With Tributary Unit form. | Enter effective dates and a tributary unit value for a company. |

Entering Withholding Amount Information

Access the ISLR Withholding Setup form. You must complete all fields on the form.

Setting Up Withholding for Municipal Taxes for Venezuela

This section provides an overview of the setup for municipal taxes, lists prerequisites, and discusses how to enter withholding information for municipal taxes.

Understanding Setup for Municipal Taxes

Use the IM Withholding Setup program (P76V4025) to set up information for the withholding of municipal taxes (IM). The IM Withholding Setup program enables you to set up for each supplier:

- IM withholding concept.

- Minimum and maximum amounts for which to apply the withholding.
- Percentage of the amount subject to withholding.
- Withholding percentage.
- Effective dates.

The system saves the information that you enter to the F76V4025 table. Access the Work with IM Withholdings Setup form to view the information in this table.

Prerequisites

Before you perform the tasks in this section:

- Verify that next numbers for withholding are set up for system 76V (Venezuela).
- Verify that appropriate values exist in the I.M. Withholding Concept (76V/IM) UDC table.

Forms Used to Enter Withholding Information for Municipal Taxes

| Form Name | FormID | Navigation | Usage |
|---------------------------------|-----------|--|---|
| Work With IM Withholdings Setup | W76V4025A | General I.M. Withholding Setup (G76V042), I.M. Withholding Percentages | View and select existing records. |
| IM Withholdings Setup | W76V4025B | Click Add on the Work With IM Withholdings Setup form. | Enter the withholding concept, effective dates, and withholding percentage. |

Entering Withholding Information for Municipal Taxes

Access the IM Withholdings Setup form. You must complete all fields on this form.

I.M. Withholding Percentages - IM Withholdings Setup

OK Cancel Tools

| | | |
|---------------------------------------|------------|--------------------------------|
| Company | 00001 | Financial/Distribution Company |
| IM Concept | 1 | Municipal Tax 1 |
| Minimum amount | | |
| Maximum Amount | 999,999.00 | |
| Percentage Amount Subject to Withhold | 100.00 | |

| IM Concept | Enter a value that exists in the Withholding Concept (76V/IM) UDC table to identify the type of tax. |
| Minimum Amount | Enter 0 to indicate the minimum amount on which the tax is calculated. |
| Maximum Amount | Enter the maximum amount on which the tax is calculated. To specify an infinite amount, enter 999.999.999.99. |
| Percentage Amount Subject to Withhold | Enter the percentage of the amount that is subject to withholding. For example, if the entire amount is subject to withholding, enter <i>100</i> . |
| Withholding Percentage | Enter the amount by which the system multiplies the amount subject to withholding to determine the amount to withhold. |

Setting Up Withholding Information for VAT for Venezuela

This section provides an overview of the set up for VAT, lists a prerequisite, and discusses how to set up withholding for VAT.

Understanding Setup for VAT

The system calculates VAT withholding when you run the VAT Withholdings Calculations (R76V04570) program. Before you process vouchers, you must set up the system with the information that the system uses in the calculations.

Use the VAT Withholding Setup (P76V4030) program to enter the VAT withholding concept, effective dates, and withholding percentages that the system uses to calculate VAT. The system saves the values that you enter in the VAT Withholding Setup program to the VAT Withholdings Setup - VEN (F76V4030) table, and reads the F76V4030 table when you run the VAT Withholdings Calculations program.

Prerequisite

Verify that appropriate values exist in the VAT Legal Concept (76V/LC) UDC table.

Forms Used to Setup Withholding Information for VAT

| Form Name | FormID | Navigation | Usage |
|--|-----------|--|--|
| Work With V.A.T. Withholding Percentages | W76V4030A | General VAT Withholding Setup (G76V044), VAT Withholding Percentages | View and select existing records. |
| VAT Withholding Percentages | W76V4030B | Click Add on the Work With V.A.T. Withholding Percentages form. | Enter the VAT withholding concept, effective dates, and withholding percentages. |

Entering Withholding Information for VAT

Access the VAT Withholding Percentages form. You must complete all fields on this form.

| | |
|--|---|
| VAT With. Concept (VAT withholding concept) | Enter a value that exists in the VAT Legal Concept (76V/IV) UDC table to identify the type of VAT to calculate. |
|--|---|

VAT With. Percentage
(VAT withholding
percentage)

Enter the amount by which the system multiplies the amount subject to withholding to determine the amount to withhold.

CHAPTER 111

(VEN) Working With Country-Specific Functionality for Venezuela

This chapter discusses how to:

- Assign control numbers to invoices.
- Enter vouchers.
- Enter credit notes and debit notes.
- Process national and municipal withholding.
- Process value-added tax (VAT).

Assigning Control Numbers to Invoices for Venezuela

Invoice control numbers are used by the Sales Book program (R76VLV01) to meet legal reporting requirements for Venezuela.

This section provides discusses how to assign invoice control numbers.

Forms Used to Assign Control Numbers to Invoices

| Form Name | FormID | Navigation | Usage |
|----------------------------------|-----------|--|---|
| Work With Invoice Control Number | W76VNCF1B | Accounts Receivable (G76V03B), Control Invoice Number | Locate invoices. |
| Invoice Control Number Revision | W76VNCF1A | On the Work With Invoice Control Number form, select an invoice and then click Select. | Assign, revise, and remove invoice control numbers. |

Assigning Invoice Control Numbers

Access the Invoice Control Number Revision form.

Invoice Ctrol.Number Enter the control number to assign to the invoice.
(invoice control number)

Entering Vouchers for Venezuela

This section provides an overview of vouchers for Venezuela and discusses how to enter additional information for Venezuela.

Understanding Voucher Entry for Venezuela

After you use the standard voucher entry programs to enter vouchers for Venezuela, the system displays the Withholding Additional Information form on which you enter information about income, municipal, and value-added taxes. The system stores the information that you enter in the F76V4011 table.

When completing the Pay Status field when entering vouchers in the Standard Invoice Entry program (P0411), enter the payment status that you defined in the UDC 00/PS to indicate when vouchers are ready for the calculation of ISLR (*Impuesto sobre la Renta*), IM (municipal taxes), and VAT (value-added taxes) withholding taxes.

Vouchers for Imported Goods

Vouchers for imported goods must be entered using a document type that you set up in the 00/DT and 00/DV UDC tables specifically for these transactions. When entering these vouchers, enter the customs statement (Form C) number and the import file number in the Invoice Control Number field, separated by a special character.

Vouchers with Withholdings

When you use the Standard Voucher Entry program to enter vouchers for Venezuela, the system launches the F0411 Tag File Maintenance (P76V4011) program when you click OK after entering a voucher. You can also access this program from the Regional Info option on the Form menu. You use this program to add codes that identify VAT, municipal, and income tax withholdings for each pay item. You also relate a control number or the import file number to the invoice.

When you add a voucher, the system accesses the tax withholding codes for the supplier that exist in the A/B Additional Info. Tag File (F76V1001) table and displays them in the Withholding Additional Information form. You can accept these default values, or change the values. The system saves the default values or the values that you enter in the A/P Ledger Tag File - VEN (F76V0411) table when you click OK on the Withholding Additional Information form.

Additionally, the systems launches the F0411 Tag File Maintenance program when you work with logged vouchers and voucher match.

When you delete a voucher for which withholding records exist, the system deletes the withholding information from the F76V4011 table and the Withholding Historical File - VEN (F76V4581) table.

Form Used to Enter Additional Information for Venezuela

| Form Name | FormID | Navigation | Usage |
|------------------------------------|-----------|---|--|
| Withholding Additional Information | W76V0411A | On the Enter Voucher - Enter Payment form, select Row, Regional Info. | Enter the withholding information for the voucher. |

Entering Additional Information

Access the Withholding Additional Information form.

| | |
|---|---|
| Invoice Control Number (invoice control number/file importation number) | Enter the invoice number from the supplier's invoice, or the importation number from the Form C for imported goods. |
| VAT Concept | Enter a code that exists in the VAT Withholding Concept (76V/IV) UDC table. |
| I.S.L.R. Concept (<i>Impuesto sobre la Renta</i>) concept | Enter a code that exists in the ISLR Withholding Concepts (76V/IS) UDC table. |
| Municipal Concept | Enter a code that exists in the IM Withholding Concepts (76V/IM) UDC table. |

Entering Credit Notes and Debit Notes for Venezuela

This section provides an overview of credit notes and debit notes for Venezuela, lists prerequisites, and discusses how to set processing options for PO - Voucher Entry (P0411) - VEN (P76V4047).

Understanding Credit and Debit Notes for Venezuela

A debit note, also called a debit memo, is a voucher that you enter when a supplier issues you a credit for a transaction. Similarly, a credit note (credit memo) is a voucher that you enter when you issue a credit to a customer. In Venezuela, companies often choose to associate the credit or debit note to the original voucher to assist with accounting practices.

Use the Credit and Debit Note Inquiry program (P76V4015) to select the voucher to which you associate a credit or debit note.

Prerequisites

Before you complete the tasks in this section:

- Set up corresponding versions of the Voucher Entry (P0411) program and the PO - Voucher Entry (P0411) program (P76V4047).
- Verify that appropriate values exist for credit notes and debit notes in the Credit Note Document Types (76V/NC) and the Debit Note Document Types (76V/DC) UDC tables.

Forms Used to Select a Related Voucher for a Credit or Debit Note

| Form Name | FormID | Navigation | Usage |
|--|-----------|--|---|
| Work With Credit/Debit Note - Voucher Relation | W76V4015A | Credit and Debit Note Relationship (G76V046), Credit and Debit Note Inquiry. | View and select existing records. |
| Credit/Debit Note - Voucher Relation | W76V4015B | Select a record, then click Select on the Work With Credit/Debit Note form. | Enter the related voucher for the credit or debit note. |
| Select Related Voucher | W76V4015C | Select Voucher from the Form menu on the Credit/Debit Note form. | Select the related voucher. When you click Select, the system displays the voucher number in the Credit/Debit Note - Voucher Relation form. |

Setting Processing Option for PO - Voucher Entry (P0411) (P76V4047)

Select Credit and Debit Note Relationship (G76V046), PO - Voucher Entry (P0411) - VEN.

Note. You must select the version to use and then click Select to access the processing option.

Default Values

Credit/Debit Note Enter *I* to specify that the voucher is for a credit or debit note.

Processing National and Municipal Withholding for Venezuela

This section provides an overview of withholding and discusses how to:

- Run the ISLR Withholding Calculation program.
- Set processing options for ISLR Withholding Calculation (R76V4580A).
- Run the ISLR Withholding Certificate program.
- Set processing options for ISLR Withholding Certificate (R76VCRNP).
- Run the IM Withholding Calculation program.
- Set processing options for IM Withholding Calculation (R76V4590A).

Understanding National and Municipal Withholding

JD Edwards EnterpriseOne software provides country-specific programs to process the withholding of national and municipal taxes.

Withholding Calculations

Run the ISLR Withholding Calculation (R76V4580A) program to calculate the withholding of Venezuelan income taxes (*Impuesto sobre la Renta* [ISLR]).

Run the IM Withholding Calculation program to calculate the withholding for municipal taxes.

When you run either of these programs, the system:

- Accumulates the taxable amounts by document or by supplier and by withholding concept, depending on the processing option values, and by withholding codes and currency.
- For the ISLR calculation, verifies the fee code type that is established in the ISLR Withholding Percentages (P76V4020) program.
- Calculates the basis amount according to the values that you set up in the ISLR Withholding Setup (P76V0420) program for income taxes and the IM Withholding Setup program (P76V4025) for municipal taxes.
- Calculates in the local currency the withholding amount according to the rate.

If related documents are in a foreign currency, the system makes the currency conversion at the rate that is in effect on the date that is specified in the processing options.

- Changes the payment status to the status specified in the processing options.
- Generates a report that lists the processed vouchers, the withholding documents, and the batch.

Other notes about these programs:

- If the invoice has value-added tax (VAT), the amount for the withholding calculation is the amount of the invoice without tax.
- If the withholding is for the total amount to be paid by the supplier, the program calculates the amount that is subject to withholding by adding all of the vouchers with the payment status that is indicated in the processing option and with the same withholding code and currency, without considering any other field selection value.

Therefore, Payment Status is the key field to determine whether a document must be considered for the withholding calculation.

- For the invoices that are entered in a foreign currency, the system uses the amount in the foreign currency as the basis for the withholding calculation.

The system calculates the amount in the local currency according to the exchange rate that is in effect for the date that appears in the processing option, unless the processing option item for the exchange rate is active. If the exchange rate is active, the system uses the exchange rate that was in effect when the invoice was entered.

- The withholding document is created with the same GL offset account to which the withholding is being applied.

In the event that there are several accounts payable, the withholding calculation must be made by GL offset.

- When creating each withholding document, the system updates the Withholding Historical File - VEN (F76V4581) table.

This table includes the values that are used for the calculation, as well as the related voucher. The system also updates the Withholdings I.S.L.R. Fee 2 (F76V4583) table for ISLR withholding when the fee type code is 2.

Withholding Reports

JD Edwards EnterpriseOne software provides these reports:

- ISLR Withholding Affidavit (R76VDJRN).

- IM Withholding Affidavit (R76VDJRM).
- AR-CV Withholding Certificate (R76VCRVP).
- Annual Withholding Affidavit - Diskette (R76VPART).
- Withholding Integrity - Create Historical (R76VIR02C).
- Withholding Integrity - Erase Historical (R76VIR01B).

See [Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” \(VEN\) Reports for Venezuela, page 1902.](#)

Prerequisites

Before you run these programs:

- Verify that the appropriate values for income tax and municipal taxes exist in the ISLR Withholdings Setup - VEN (F76V4020), F76V4581, and F76V4583 tables.

See [Chapter 110, “\(VEN\) Setting Up Country-Specific Functionality for Venezuela,” Setting Up Withholding for ISLR Taxes for Venezuela, page 1756.](#)

See [Chapter 110, “\(VEN\) Setting Up Country-Specific Functionality for Venezuela,” Setting Up Withholding for Municipal Taxes for Venezuela, page 1758.](#)

- Verify that appropriate codes exist in these UDC tables:
 - I.M. Withholding Concept (76V/IM).
 - ISLR Withholding Concept (76V/IS).
 - Fee Codes (76V/CT).

See [Chapter 110, “\(VEN\) Setting Up Country-Specific Functionality for Venezuela,” Setting Up UDCs for Supplier Withholding for Venezuela, page 1754.](#)

Running the ISLR Withholding Calculation Program

Select General WH Calculation Process (G76V045), ISLR Withholding Calculation.

Setting Processing Options for ISLR Withholding Calculation (R76V4580A)

Processing options enable you to specify the default processing for programs and reports.

I.S.L.R.

- | | |
|--|--|
| 1. Insert Payment Date | Enter the date that the withholding tax is remitted to the fiscal authority. If you leave this processing option blank, the system uses the current date. If the voucher is entered in a foreign currency, the system uses this date to determine the exchange rate. |
| 2. Municipal Withholding (OBSOLETE) | This processing option is obsolete. |
| 3. Withholding by Document | Enter <i>1</i> to calculate withholding by the total of each invoice. Leave this processing option blank to calculate withholding by the total of the invoices for the supplier. |

- | | |
|---|--|
| 4. Payment Status | Enter the payment status that the system uses to select records to process. If you leave this processing option blank, the system selects records with a payment status of <i>A</i> (approved). |
| 5. Document Type | Enter the document type that the system assigns to the withholding voucher. |
| 6. Account ID | Enter the short account number for the withholding. |
| 7. Payment Status for ISLR | Enter a value that exists in the Payment Status Codes (00/PS) UDC table to identify the payment status for the ISLR withholding document. |
| 8. P0400047 Version | Enter the version of the Voucher Entry MBF Processing Options program (P0400047) that the system uses when you run the ISLR Withholding Calculation program. If you leave this processing option blank, the system uses version ZJDE0001. |
| 9. P0900049 Version | Enter the version of the Journal Entry MBF Processing Options program (P04000479) that the system uses when you run the ISLR Withholding Calculation program. If you leave this processing option blank, the system uses version ZJDE0001. |
| 10. Exchange Rate | Enter <i>1</i> to use the exchange rate of the invoice. Leave this processing option blank to use the exchange rate in effect at the time the withholding voucher is created. |
| 11. Amount Tributary Unit (OBSOLETE) | This processing option is obsolete. |

I.M.

All of the processing options on the I.M. tab are disabled. Use the Withholding Calculation (R76V4590A) program to process municipal taxes.

Running the ISLR Withholding Certificate (R76VCRNP) Program

Select Monthly Reports (G76V047), ISLR Withholding Certificate.

Setting Processing Options for ISLR Withholding Certificate (R76VCNRP)

Processing options enable you to specify the default processing for programs and reports.

Range of Date

- | | |
|------------------|--|
| Date From | Enter the first date in a range of dates to select records to process. |
| Date To | Enter the last date in a range of dates to select records to process. |

Running the IM Withholding Calculation (R76V4590A) Program

Select General WH Calculation Process (G76V045), IM Withholding Calculation.

Setting Processing Options for IM Withholding Calculation (R76V4590A)

Processing options enable you to specify the default processing for programs and reports.

I.M.

| | |
|--|--|
| Insert Payment Date | Enter the date on which the withholding date is calculated. If you leave this processing option blank, the system uses the system date. |
| Withholding by Document | Enter <i>I</i> to calculate withholding by the total of each invoice. Leave this processing option blank to calculate withholding by the total of the invoices for the supplier. |
| Payment Status to Release | Enter the payment status to select records to process. If you leave this processing option blank, the system select records with a payment status of <i>A</i> (approved). |
| Document Type | Enter the document type that the system assigns to the withholding voucher. |
| Account ID | Enter the short account number for the withholding. |
| Payment Status for Withholding Document | Enter the payment status that the system uses to select records to process. If you leave this processing option blank, the system select records with a payment status of <i>A</i> (approved). |
| P0400047 Version | Enter the version of the Voucher Entry MBF Processing Options program (P0400047) that the system uses when you run the IM Withholding Calculation program. If you leave this processing option blank, the system uses version ZJDE0001. |
| P0900049 Version | Enter the version of the Journal Entry MBF Processing Options program (P04000479) that the system uses when you run the IM Withholding Calculation program. If you leave this processing option blank, the system uses version ZJDE0001. |
| Exchange Rate | Enter <i>I</i> to use the exchange rate of the invoice. Leave this processing option blank to use the exchange rate in effect at the time the withholding voucher is created. |

Processing Withholding for VAT for Venezuela

This section provides an overview of VAT for Venezuela, lists prerequisites, and discusses how to:

- Run the VAT Withholding Calculation program.
- Set processing options for VAT Withholding Calculation (R76V04570).
- Run the VAT Withholding - TXT File Generation program.
- Set processing options for VAT Withholding - TXT File Generation (R76VLO01).
- Run the VAT Withholding Certificate program.
- Set processing options for VAT Withholding Certificate (R76VLO03).

Understanding VAT for Venezuela

When you process VAT for Venezuela, you:

- Use the VAT Withholding Calculation program to calculate VAT withholding.
- Use the VAT Withholding Certificate program to generate vouchers for the withholding of VAT.
- Use the VAT Withholding - TXT File Generation program to write flat file data to the Text Processor Header (F007101) and Text Processor Detail (F007111) tables. You then use the Text File Processor program (P00710) to work with the data and generate the flat file for tax reporting.

VAT Withholding Calculation Program

When you run the VAT Withholding Calculation program, the system:

- Selects all vouchers that have a payment status defined as VAT withholding.
- Applies to the total tax amount the withholding percentage that is assigned to the supplier in the VAT Withholdings Setup - VEN (F76V4030) table.
- Changes the payment status of payment items to the payment status that is specified in the processing options.
- Creates the VAT withholding document with a negative amount so that the amount is deducted from the voucher payment.
- Creates the withholding record in the foreign currency when the voucher is in a foreign currency.
- Generates a report that lists the processed vouchers and shows the withholding document and the batch number.
- Changes only the document payment status if the withholding is not calculated.
- Leaves the payment status unchanged if the program runs with an error.

VAT Withholding - TXT File Generation

You run the VAT Withholding - TXT File Generation program to write flat file data to the Text Processor Header (F007101) and Text Processor Detail (F007111) tables. When you run this report for imported goods, only the information that you entered for Form C is reported. The system does not report the supplier purchasing transactions for imports.

The system includes import transactions only when you:

- Set up tax rate areas for imported goods to show the goods as VAT exempt.
- Define document types in UDCs 00/DT and 00/DV for imported goods.
- Enter the supplier invoices as VAT exempt.

Prerequisites

Before you complete the tasks in this section, verify that appropriate codes exist in these UDC tables:

- Codes for VAT withholding in the Document Type - All Documents (00/DT) and Document Type - Vouchers Only (00/DV) UDC tables.
- Codes for type of VAT in the VAT Legal Concept (76V/LC) UDC table.
- Payment status code to calculate VAT withholding in the Payment Status Codes (00/PS) UDC table.
- Codes for VAT Withholding Concept VE (76V/IV).

Running the VAT Withholding Calculation Program

Select General WH Calculation Process (G76V045), VAT Withholding Calculation.

Setting Processing Options for VAT Withholding Calculation (R76V04570)

Processing options enable you to specify the default processing for programs and reports.

VAT

| | |
|--|---|
| Withholding Document Date | Enter 1 to calculate VAT as of the document date. If you leave this processing option blank and complete the Payment Date processing option, the system uses the date that you enter in the Payment Date processing option. If you leave this processing option and the Payment Date processing option blank, the system uses the current date. |
| Payment Date | Enter the date on which the system calculates VAT. If you complete both this processing option and the Withholding Document Date processing option, the system uses the document date. If you leave this processing option blank and the Withholding Document Date processing option blank, the system uses the current date. |
| Document Type | Enter the document type that the system assigns to the VAT withholding voucher. |
| Account ID for Withholding | Enter the short account ID. |
| Payment Status for Release | Enter the payment status that the system uses to select records to process. |
| Payment Status for VAT | Enter the payment status that identifies payments for which VAT applies. |
| Payment Status for Withholding Document | Enter the payment status that the system assigns to the vouchers created. If you leave this processing option blank, the system assigns a payment status of A (approved). |
| P0400047 Version | Enter the version of the Voucher Entry MBF Processing Options program (P0400047) that the system uses when you run the VAT Withholding Calculation program. If you leave this processing option blank, the system uses version ZJDE0001. |
| P0900049 Version | Enter the version of the Journal Entry MBF Processing Options program (P04000479) that the system uses when you run the VAT Withholding Calculation program. If you leave this processing option blank, the system uses version ZJDE0001. |

Running the VAT Withholding Certificate Program

Select Monthly Reports (G76V047), VAT Withholding Certificate.

Setting Processing Options for VAT Withholding Certificate (R76VLO03)

Processing options enable you to specify the default processing for programs and reports.

Configuration

- | | |
|---|---|
| 1. Date From | Enter the first date in a range of dates that the system uses to select records to process. |
| 2. Date To | Enter the last date in a range of dates that the system uses to select records to process. |
| 3. Separating Character | Enter the special character that separates the invoice number from the control number in the Invoice Number field of the Additional Information - Venezuela form. |
| 4. Company | Enter the company for which the report is run. |
| 5. Document Type | Enter the document type that the system uses to select records to process. |
| 6. Address Number of Withholding Agent | Enter the address book number of the company that is withholding the VAT. |

Running the VAT Withholding - TXT File Generation Program

Select Monthly Reports (G76V047), VAT Withholding - TXT File Generation.

Setting Processing Options for VAT Withholding - TXT File Generation (R76VLO01)

Processing options enable you to specify the default processing for programs and reports.

Configuration

- | | |
|-----------------------------------|---|
| 1. Date From | Enter the first date in a range of dates that the system uses to select records to process. |
| 2. Date To | Enter the last date in a range of dates that the system uses to select records to process. |
| 3. RIF Contributor | Enter the tax ID number of the RIF contributor. Enter the number without spaces or special characters. |
| 4. Separating Character | Enter the special character that separates the invoice number from the control number in the Invoice Number field of the Additional Information - Venezuela form. |
| 5. Historical Sales | Enter <i>1</i> to save records in the sales history record. |
| 6. Company | Enter the company for which the report is run. |
| 7. Path | This processes option is not used. The system writes write flat file data to the Text Processor Header (F007101) and Text Processor Detail (F007111) tables. |
| 8. Document Type of Form C | Enter the document type from UDC 00/DT that identifies records for which an import form (Form C) exist. |

Configuration 2

| | |
|---|--|
| Reason Code for the Retained VAT (Sales) | Enter a code from the Reason Code (03B/RC) UDC table that identifies the retained VAT for sales. |
| Code of Importation VAT 1 | Enter a tax rate /area for the tax. |
| Include Sales | Enter <i>I</i> to save records in the sales history record. |

APPENDIX A

(ARG, CHL, PER) Mapping Fields for Batch Invoice Processing

This appendix discusses:

- (ARG) Mapping Fields in the Taxes - Tax Amounts by Invoice Suffix Batch Entry table (F76A19Z1) for Argentina.
- (CHL and PER) Mapping Fields in the F76H3B10 EDI Tag File – CHI - 03B table (F76H3B1Z) for Chile and Peru.
- (CHL and PER) Mapping Fields in the F76H3B15 EDI Tag File – CHI – 03B table (F76H3B5Z) for Chile and Peru.

See Also

JD Edwards EnterpriseOne Accounts Receivable 8.12 Implementation Guide, “Mapping Fields for Batch Invoice Processing”

(ARG) Mapping Fields in the Taxes - Tax Amounts by Invoice Suffix Batch Entry Table (F76A19Z1) for Argentina

These fields in the Taxes - Tax Amounts by Invoice Suffix Batch Entry table (F76A19Z1) are required for processing batch invoices for Argentina:

| Field Name | Alias | Type | Length | Values to Enter/Definition |
|---------------|--------|-------|--------|---|
| EDI - User ID | VKEDUS | Alpha | 10 | <p>Enter the user ID of the person who is running the process or the person who is receiving messages in the Employee Work Center.</p> <p>This field, with the EDI - Transaction Number (VKEDTN), the EDI - Batch Number (VKEDBT), and the EDI - Line Number (VKEDLN) fields, uniquely identifies an invoice.</p> |

| Field Name | Alias | Type | Length | Values to Enter/Definition |
|--------------------------|--------|--------|--------|--|
| EDI - Transaction Number | VKEDTN | Alpha | 22 | <p>Enter the source system's document number so that the transaction can be cross-referenced.</p> <p>This field, with the EDI - Line number field (VKEDLN), uniquely identifies each transaction. Each new transaction number identifies a new invoice. You cannot have more than one transaction with the same number in a batch unless the line number is different.</p> |
| EDI - Line Number | VKEDLN | Number | 7 | <p>Enter the pay item number only if a transaction has multiple pay items. If a transaction has only one pay item, you can leave this field blank.</p> <p>This field, with the EDI - Transaction Number field (VKEDTN), identifies each pay item of the invoice.</p> |
| EDI - Transaction Action | VKEDTC | Alpha | 1 | <p>Enter A in this field. No other values are valid.</p> <p>A code that specifies what the system must do with the transaction during final processing.</p> |
| EDI - Transaction Type | VKEDTR | Alpha | 1 | <p>Enter I (for invoices) in this field.</p> <p>A code that identifies a particular kind of transaction.</p> |

| Field Name | Alias | Type | Length | Values to Enter/Definition |
|--------------------|--------|-------|--------|---|
| EDI - Batch Number | VKEDBT | Alpha | 15 | <p>Enter a number to group transactions for processing.</p> <p>This field, with the EDI - Transaction Number (FKEDTN), the EDI - USER ID (VKEDUS), and the EDI - Line Number (VKEDLN) fields, uniquely identifies a transaction within a specific batch. This field also specifies a level break and causes the assignment of a new batch number each time that the value changes. To increase performance, assign one batch number for each group of transactions that is processed at one time.</p> |
| Document Company | VKKCO | Alpha | 5 | <p>Enter the same value that is entered in the corresponding field in the F03B11Z1 table.</p> <p>If you leave this field blank, the system uses the value entered the corresponding field (VJKCO) in the F03B11Z1 table.</p> |
| Document Type | VKDCT | Alpha | 2 | <p>Enter the same value that is entered in the corresponding field in the F03B11Z1 table.</p> <p>If you leave this field blank, you must also leave the corresponding field (VJDCT) blank in the F03B11Z1 table.</p> |

| Field Name | Alias | Type | Length | Values to Enter/Definition |
|---------------------------------|--------|--------|--------|---|
| Document Suffix | VKSFX | Alpha | 3 | Enter 1 in this field if the invoice has only one line. If the invoice has more than one line, enter consecutive numbers beginning with 1. |
| Tax Code | VKATXC | Alpha | 10 | Enter the description of the corresponding tax code. |
| Company | VKCO | Alpha | 5 | Enter the number of company to which the invoice belongs. This number must exist in the F0010 table and identify a reporting entity that has a complete balance sheet. |
| Address Number | VKAN8 | Number | 8 | Enter the address book number of the customer who is associated with the invoice transaction. The number that you enter must exist in the Address Book Master table (F0101). |
| Tax Amount in National Currency | VKATDA | Number | 15 | Enter the tax amount. |
| Tax Rate | VKTXR1 | Number | 7 | Enter the value of the tax rate. |

(CHL and PER) Mapping Fields in the F76H3B10 EDI Tag File – CHI - 03B table (F76H3B1Z) for Chile and Peru

This section contains a list of required and optional fields in the F76H3B1Z table that are used for batch invoice processing for Chile and Peru.

Required Fields

These fields in the F76H3B1Z table are required for processing batch invoices for Chile and Peru:

| Field Name | Alias | Type | Length | Values to Enter/Definition |
|--------------------------|--------|-------|--------|--|
| EDI — User ID | ZTEDUS | Alpha | 10 | <p>Enter the user ID of the person who is running the process or the person who is receiving messages in the Employee Work Center.</p> <p>This field, with the EDI - Transaction Number (ZTEDTN) and the EDI - Batch Number (ZTEDBT), uniquely identifies an invoice.</p> |
| EDI — Transaction Number | ZTEDTN | Alpha | 22 | <p>Enter the source system's document number so that the transaction can be cross-referenced.</p> <p>Each new transaction number identifies a new invoice.</p> |
| EDI — Batch Number | ZTEDBT | Alpha | 15 | <p>Enter a number to group transactions for processing.</p> <p>This field, with the EDI - Transaction Number (ZTEDTN) and the EDI - USER ID (ZTEDUS) fields, uniquely identifies a transaction within a specific batch. This field also specifies a level break and causes the assignment of a new batch number each time that the value changes. To increase performance, assign one batch number for each group of transactions that is processed at one time.</p> |

Optional Fields

These fields in the F76H3B1Z table are optional for batch invoice processing for Chile and Peru. You can use the fields to provide additional information about invoices:

| Field Name | Alias | Type | Length | Vales to Enter /Definition |
|--|-----------|--------|--------|--|
| Legal Company | ZTH76LECO | Alpha | 5 | Enter the same value that is in the corresponding field (VJCO) in the F03B11Z1 table. |
| Legal Document Type | ZTH76LEDT | Alpha | 3 | Enter a value that corresponds to an invoice. |
| Emission Serial | ZTH76EMS | Alpha | 4 | Enter a value that corresponds to CB if the processing option is set to verify sequence numbers. |
| Legal Number | ZTH76LENU | Number | 10 | Enter the legal number. |
| Printed Invoice Flag | ZTH76IPRT | Alpha | 1 | Enter <i>Y</i> to require a value in the Printed Invoice Date field (ZTH76IDPT). Enter <i>N</i> to not require a date. |
| Printed Invoice Date | ZTH76IDPT | Date | 6 | Enter the date that the invoice was printed. |
| Entered Invoice Flag in Vat Sales Subledger | ZTH76IRPT | Alpha | 1 | Enter <i>Y</i> to require a value in the Date Invoice Reported field (ZTH76IDPR). Enter <i>N</i> to not require a date. |
| Date Invoice Reported | ZTH76IDPR | Date | 6 | Enter the date that the invoice was included in the VAT sales ledger. |
| Entered Invoice Flag in the magnetic support | ZTH76IRMA | Alpha | 1 | Enter <i>Y</i> to require a value in the Date Invoice Magnetic Reported field (ZTH76IDRM). Enter <i>N</i> to not require a date. |
| Date Invoice Magnetic Reported | ZTH76IDRM | Date | 6 | Enter the date that the invoice was reported on magnetic media. |

| Field Name | Alias | Type | Length | Vales to Enter /Definition |
|------------------------|--------|--------|--------|---|
| Transaction Originator | ZTTORG | Alpha | 10 | This field should be left blank. The system updates this field when the transaction is processed. |
| User ID | ZTUSER | Alpha | 10 | This field should be left blank. The system updates this field when the transaction is processed. |
| Program ID | ZTPID | Alpha | 10 | This field should be left blank. The system updates this field when the transaction is processed. |
| Date - Updated | ZTUPMJ | Date | 6 | This field should be left blank. The system updates this field when the transaction is processed. |
| Time - Last Updated | VJUPMT | Number | 6 | This field should be left blank. The system updates this field when the transaction is processed. |
| Work Station ID | VJJOBN | Alpha | 10 | This field should be left blank. The system updates this field when the transaction is processed. |

(CHL and PER) Mapping Fields in the F76H3B15 EDI Tag File – CHI – 03B table (F76H3B5Z) for Chile and Peru

These fields in the F76H3B15 EDI Tag File – CHI – 03B table (F76H3B5Z) are required for processing batch invoices for Chile and Peru:

| Field Name | Alias | Type | Length | Values to Enter/Definition |
|--------------------------|--------|-------|--------|--|
| EDI – User ID | IREBUS | Alpha | 10 | <p>Enter the user ID of the person who is running the process or the person who is receiving messages in the Employee Work Center.</p> <p>This field, with the EDI - Transaction Number (IREDTN), the EDI - Batch Number (IREDBT), and the EDI - Line Number (IREDLN) fields, uniquely identifies an invoice.</p> |
| EDI – Transaction Number | IREDTN | Alpha | 22 | <p>Enter the source system's document number so that the transaction can be cross-referenced.</p> <p>This field, with the EDI - Line number field (IREDLN), uniquely identifies each transaction. Each new transaction number identifies a new invoice. You cannot have more than one transaction with the same number in a batch unless the line number is different.</p> |

| Field Name | Alias | Type | Length | Values to Enter/Definition |
|---------------------|-----------|--------|--------|---|
| EDI – Batch Number | IREDBT | Alpha | 15 | <p>Enter a number to group transactions for processing.</p> <p>This field, with the EDI - Transaction Number (IREDTN), the EDI - USER ID (IREBUS), and the EDI - Line Number (IREDLN) fields, uniquely identifies a transaction within a specific batch. This field also specifies a level break and causes the assignment of a new batch number each time that the value changes. To increase performance, assign one batch number for each group of transactions that is processed at one time.</p> |
| EDI – Line Number | IREDLN | Number | 7 | <p>Enter the pay item number only if a transaction has multiple pay items. If a transaction has only one pay item, you can leave this field blank.</p> <p>This field, with the EDI - Transaction Number field (IREDTN), identifies each pay item of the invoice.</p> |
| Legal Company | IRH76LECO | Alpha | 5 | Enter the same value that is in the corresponding field (VJCO) in the F03B11Z1 table. |
| Legal Document Type | IRH76LEDT | Alpha | 3 | Enter a value that corresponds to an invoice. |

| Field Name | Alias | Type | Length | Values to Enter/Definition |
|-----------------|-----------|--------|--------|--|
| Emission Serial | IRH76EMS | Alpha | 4 | Enter a value that corresponds to CB if the processing option is set to verify sequence numbers. |
| Legal Number | IRH76LENU | Number | 10 | Enter a legal number. Note. This field is required if the processing option is set to require legal numbers. |

APPENDIX B

(CHL and PER) Mapping Fields for Address Book Batch Processing

This appendix discusses mapping fields for the EDI - A/B Tag File - CHI - 76H (F76H101Z) and EDI - A/B Tag File - PER - 76P (F76P101Z) tables.

JD Edwards EnterpriseOne Address Book 8.12 Implementation Guide, “Mapping Fields for Batch Processing”

Mapping Fields for the F76H101Z and F76P101Z Tables

The F76H101Z and F76P101Z tables include required fields and optional fields.

Required Fields

These fields in the F76H101Z and F76P101Z tables are required for processing batch address book records for Chile and Peru:

| Field Name | Alias | Type | Length | Definition |
|------------------|-------|-------|--------|--|
| EDI User Id | EDUS | Alpha | 10 | A user defined identification number. Enter the User Id of the person who runs the Address Book Batch Upload program. This field, in conjunction with SZEDTN and SZEDBT, uniquely identifies a specific transaction. This field must match the corresponding field in the F0101Z2 table. |
| EDI Batch Number | EDBT | Alpha | 15 | A number assigned to each batch by the person who runs the Address Book Batch Upload program. The system assigns a new batch number whenever this field changes. You can significantly increase performance by assigning one batch number for each group of transactions that you process. This field must match the corresponding field in the F0101Z2 table. |

| Field Name | Alias | Type | Length | Definition |
|-------------------------|---------|---------|--------|---|
| EDI Transaction Number | EDTN | Alpha | 22 | A number that identifies each transaction. A new transaction number indicates a different address book record. You cannot have more than one transaction with the same number in a batch. This field often contains the document number of the source system so that the sender can readily identify the transaction. This field must match the corresponding field in the F0101Z2 table. |
| EDI Line Number | EDLN | Numeric | 7 | This is the line number you assign when originating an EDI transaction. This field must match the corresponding field in the F0101Z2 table. |
| A/B Legal Document Type | H76ABDT | Alpha | 3 | A user defined code used to classify the Address Number Tax Id. |

Optional Fields

These fields in the F76H101Z and F76P101Z tables are optional for processing batch address book records for Chile and Peru:

| Field Name | Alias | Type | Length | Definition |
|---|-------------------------|-------|--------|--|
| Professional Fee Constance | H76PFC | Alpha | 1 | This field indicates if a professional services supplier presented the non-withholding certificate. This certificate is issued by the fiscal authority and applies only to the professional fees withholding. |
| Professional Fee Due Date | H76PFD | Date | 6 | This field indicates the due date for the non-withholding certificate presented by the supplier. This applies only for professional fees withholding. If this field is blank, the exemption is always in effect. |
| Description Line 2 | DSC2 | Alpha | 30 | A field to store the name of the beneficiary of the payment order. |
| Description Line 3 | DSC3 | Alpha | 30 | A field to store additional characters of the name of the beneficiary of the payment order. |
| Category Code 01 | H76CC01 | Alpha | 3 | A user-defined category code. It is associated with UDC 76H/01. |
| Category Code 02 | H76CC02 | Alpha | 3 | A code that specifies whether the supplier or customer is a registered taxpayer for value-added taxes (VAT). For customers, this category code is used when you issue invoices. It is associated with UDC 76H/02. |
| Category Code 03 through Category Code 10 | H76CC03 through H76CC10 | Alpha | 3 | A user-defined category code. It is associated with UDCs 76H/03 through 76H/10. |

| Field Name | Alias | Type | Length | Definition |
|----------------------|--------|--------|--------|-------------------------------|
| Future Use Amount | H76FUA | Number | 15 | This field is for future use. |
| Future Use Code | H76FUC | Alpha | 10 | This field is for future use. |
| Future Use Date | H76FUD | Date | 6 | This field is for future use. |
| Future Use Reference | H76FUR | Alpha | 15 | This field is for future use. |
| Future Use Flag | H76FUF | Alpha | 1 | This field is for future use. |

APPENDIX C

JD Edwards EnterpriseOne Country-Specific Reports

This appendix includes reports for these countries:

- Argentina
- Australia
- Belgium
- Brazil
- Canada
- Chile
- Colombia
- France
- Germany
- Great Britain
- Italy
- Japan
- Peru
- Poland
- Russia
- Spain
- Switzerland
- Venezuela

(ARG) Reports for Argentina

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Argentina:

| Report ID and Report Name | Description | Navigation |
|---|--|--|
| R76A0024 AR SOP Credit Invoice Ledger | Use the AR SOP Credit Invoice Ledger program to print a report that lists the credit invoices that you have issued for customers. You specify the date range to print in the processing options. | Credit Invoice System Set Up (G76A00D), AR SOP Credit Invoice Ledger |
| R76A8510 (ARG, CHL and PER) Report Control Draft - ARG - 03B | Prints a list of all receipts with the Lecops payment instrument. No processing options exist for this report. | Run this report from the Batch Versions program. |

Processing Options for AR SOP Credit Invoice Ledger (R76A0024)

Processing options enable you to specify the default processing for programs and reports.

Default

Date From Enter the beginning of the range of dates for which you run the report.

Date To Enter the end of the range of dates for which you run the report.

(AUS) Reports for Australia

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Australia.

| Report ID and Report Name | Description | Navigation |
|--|--|--|
| R75A0210 Print Tax Invoice/Adjustment Note | Use this program to print a tax invoice in the approved format that corresponds to a customer's purchase, or a statement of adjustments made to the payment of an invoice (such as discounts). | Australian GST (G75A031), Print Tax Invoice/Adjustment Note |
| R75A0220 Print Withholding Tax Summary Report | Use this program to print a summary of tax withheld from a supplier who has not provided an ABN number. | Australian GST (G75A031), Print Withholding Tax Summary Report |

| Report ID and Report Name | Description | Navigation |
|---|--|---|
| R75A0230 Print Recipient Created Tax Invoice | Use this program to print a tax invoice in the approved format that is produced by the recipient of goods or services, rather than by the supplier, as the result of an agreement between the customer and the supplier. | Australian GST (G75A031), Print Recipient Created Tax Invoice |
| R75A0240 Print RCTI Adjustment Notes | Use this program to print statement of adjustments made to the payment of a recipient-created tax invoice (such as short-supply). | Australian GST (G75A031), Print RCTI Adjustment Notes |

R75A0210 - Print Tax Invoice/Adjustment Note

Use the Print Tax Invoice/Adjustment Note program (R75A0210) to print tax invoices or adjustments to tax invoices that you send to the customers.

When you adjust an original tax invoice that you have sent to a customer, you must create an adjustment note to reflect the change. You might adjust invoices because the customer has underpaid the invoice, or has claimed a discount when paying the invoice, or has some similar event. You must assign a unique identifier to each adjustment note that you produce.

The program prints adjustment notes for changes to invoices that arise from discounts, minor adjustments, or write-offs. These adjustments arise from AR cash receipts transactions with batch type RB and include:

- Settlement discounts taken (matching document type RC).
- Adjustments and minor amounts written off (matching document type RC).

The program excludes adjustments that were entered as either sales orders or credit orders in the JD Edwards EnterpriseOne Sales Order Management system.

The report includes this, as required by the Australian Tax Office:

- Australian Business Number (ABN) of issuer (supplier).
- The words adjustment note and tax invoice.
- The name of the supplier.
- The name of the recipient.
- The address or ABN of the recipient.
- The issue date of the adjustment note.
- The difference between the price of the supply before the adjustment event and the new price of the supply.
- A brief explanation of the discount.
- The amount of the adjustment to the GST payable amount.

You run the Print Tax Invoice/Adjustment Note program after you process customer receipts. The Tax Invoice / Adjustment Note program can produce either tax invoices or tax invoice adjustment notes. These two output forms cannot be produced concurrently.

You use the processing options to indicate whether you are printing a proof copy, a final (update) copy, or reprinting tax invoices or adjustment notes. To reprint specific adjustments, you must specify the print control number from the original adjustment note. You can use the Enquire Tax/Adjustment Print Control program (P75A0200) to locate the print control number of previously printed adjustment notes. To print a tax invoice, you must specify a document type in at least one of the processing option fields for document type, and enter blank or zero in the Adjustments processing option field.

The Print Tax Invoice/Adjustment Note program retrieves information from the F03B11 table and the F03B14 table. The program retrieves only posted invoices and receipts.

Note. When you reprint an adjustment note, you must specify the print control number of the original adjustment note. The print control number of the original adjustment note appears in the Print Ref. field on the Find/Browse Adjustment Note Print Control form of the Enquire Tax/Adjustment Print Control program (P75A0200).

Processing Options for Tax Invoice / Adjustment Note (R75A0210)

Use these processing options to specify how the system prints and reprints tax invoices and adjustment notes. The processing options that you complete determine the information that you print.

To print tax invoices in proof or update mode:

- Set processing option 1 (Report Mode) to blank or *1*.
- Complete processing option 3 (Invoice Selection) and as many of processing options 4 through 8 (Document Types) as necessary.

To reprint tax invoices:

- Set processing option 1 (Report Mode) to *2*.
- Complete processing option 3 (Invoice Selection) and as many of processing options 4 through 8 (Document Types) as necessary.
- Use data selection to specify the tax invoices to be reprinted.

To print adjustment notes in proof or update mode:

- Set processing option 1 (Report Mode) to blank or *1*.
- Set processing option 9 (Adjustments) to *1*.

To reprint adjustment notes:

- Set processing option 1 (Report Mode) to blank or *1*.
- Complete processing option 2 (Print Control Reference).
- Set processing option 9 (Adjustments) to *1*.

Important! Completing any combination of the mutually exclusive processing options (for example, processing options 2 and 3) produces a blank report.

Default

Use these processing options to specify how the system prints and reprints tax invoices and adjustment notes.

- | | |
|---|--|
| 1. Report Mode | <p>Specify whether you want to run the report in proof mode, update mode, or reprint mode. Running the report in proof mode does not update the F75A200 table. Values are:</p> <p>Blank: Run the report in proof mode.</p> <p><i>1</i>: Update mode.</p> <p><i>2</i>: Reprint mode.</p> <hr/> <p>Note. When you run the report in reprint mode, you must enter the print control reference number of the original adjustment note in the Print Control Reference processing option.</p> <hr/> |
| 2. Print Control Reference. | Specify the print control reference number of the original GST tax invoice or adjustment note that you are reprinting if you are reprinting an adjustment note. |
| 3. Invoice Selection | <p>Specify the types of invoices that you want to create. Values are:</p> <p><i>1</i>: Create sales invoices and AR invoices.</p> <p><i>2</i>: Create AR invoices only.</p> |
| 4. Document Type 1, 5. Document Type 2, 6. Document Type 3, 7. Document Type 4, and 8. Document Type 5 | Specify the document type that you want to use to select the transactions for which you are creating GST tax invoices. |
| 9. Adjustments | <p>Specify whether to create adjustment notes for tax invoices. When you pay an invoice, you should create an adjustment record if a discount is taken or if the invoice is underpaid. These adjustments necessitate a write-off and must be reported to the Australian Tax Office (ATO) as adjustments to the original invoice.</p> <p>Values are:</p> <p>Blank: Do not create.</p> <p><i>1</i>: Create.</p> |

Processing Options for Print Withholding Tax Summary Report (R75A0220)

Processing options enable you to specify the default processing for programs and reports.

Defaults

Payment Summary Enter *1* to print payment summary forms.

R75A0230 - Print Recipient-Created Tax Invoices

A recipient-created tax invoice (RCTI) is required when an arrangement exists between the customer and the supplier, specifying that the customer will produce the tax invoice when the goods or services are received. This customer-produced tax invoice is considered a legal document that complies with the Australian Tax Reform requirements. A copy of the RCTI must be sent to the supplier. The customer retains a copy of the RCTI, which must be available on request to validate tax input credits.

You use the Print Recipient-Created Tax Invoices program (R75A0230) to print RCTIs for the suppliers.

You can match RCTIs to purchase orders based on any of these scenarios:

- Purchase order, inventory, and voucher (three-way match).
- Purchase order (nonstock) and voucher (two-way match).
- Voucher only.

The Recipient Created Tax Invoice program retrieves information from the F0411 table. The program retrieves only posted vouchers.

Processing Options for Recipient Created Tax Invoice (R75A0230)

Processing options enable you to specify the default processing for programs and reports.

Defaults

Specify whether to run the report in proof mode, update mode, or reprint mode.

- 1. Report Mode.** Specify whether to run the report in proof mode, update mode, or reprint mode. Running the report in proof mode does not update the F75A0201 table. Values are:
- Blank: Run the report in proof mode.
- 1: Update mode.
- 2: Reprint mode.

R75A0240 - Print RCTI Adjustment Notes

When you adjust an original receipt-created tax invoice (RCTI) that you have sent to a supplier, you must create an adjustment note to reflect the change. For example, you might adjust an RCTI when a shipping note indicates that goods have been short-supplied. The Australian Tax Office requires an adjustment note to document the invoice process.

You use the Print RCTI Adjustment Notes program (R75A0240) to print RCTI adjustment notes for the suppliers.

The Print RCTI Adjustment Notes program retrieves information from the F0414 table. The program retrieves only posted payments.

Processing Options for Print RCTI Adjustment Notes (R75A0240)

Processing options enable you to specify the default processing for programs and reports.

Defaults

Specify whether to run the report in proof mode, update mode, or reprint mode.

- 1. Report Mode.** Specify whether to run the report in proof mode, update mode, or reprint mode. Running the report in proof mode does not update the F75A0202 table. Values are:
- Blank: Run the report in proof mode.

1: Update mode.

2: Reprint mode.

(BEL) Reports for Belgium

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Belgium.

| Report ID and Report Name | Description | Navigation |
|---|---|--|
| R74B100 Monthly VAT Payable Report - Belgium | Use this report to obtain an overview of the VAT and Taxable amounts, and the totals for the different VAT codes. This report provides information about reports codes 00, 01, 02, 03, 45, 46, 47, 48, 49, 54, 64, and 98 (future use). | Belgium Localization (G74B), Monthly VAT Payable Report - Belgium |
| R74B110 Monthly VAT Recoverable Report | Use this report to obtain an overview of the VAT and Taxable amounts, and the totals for the different VAT codes. This report provides information about reports codes 55, 56, 57, 59, 61, 62, 63, 81, 82, 83, 84, 85, 86, 87, and 99 (future use). | Belgium Localization menu (G74B), Monthly VAT Recoverable Report |
| R74B150 Yearly VAT Report (Paper) | This report provides this information: <ul style="list-style-type: none"> Creates a flat file for the yearly VAT report for Belgium. The system only selects Belgian customers. Checks the VAT number; if any errors are located, displays the errors in an exceptions report. Creates a cover letter for the flat file. | Belgium Localization menu (G74B), Yearly VAT Report (Paper) |
| R74B200 Yearly VAT Report (Flat File) | This report: <ul style="list-style-type: none"> Creates the listing for the yearly VAT report for Belgium Creates a cover letter for the Belgian authorities | Belgium Localization menu (G74B), Yearly VAT Report (Flat File) |

| Report ID and Report Name | Description | Navigation |
|---|--|---|
| R74B250 Quarterly VAT Report (Flat File) | Use this report to create a hard copy report, in addition to the standard electronic flat file output. The report lists VAT numbers that are incorrect; the directory and file name of the electronic flat file output; and a cover letter for the Belgian Authorities, which is submitted along with the electronic flat file output. | Belgium Localization menu (G74B), Quarterly VAT Report (Flat File) |
| R74B300 Quarterly VAT Report (Paper) | Use this report to generate a customer detail report along with a separate cover letter. You must customize this program to populate the fields on the report with the information you want to view. No processing options exist for this report. | Belgium Localization menu (G74B), Quarterly VAT Report (Paper) |

R74B100 - Monthly VAT Payable Report - Belgium

The Belgian Tax Authorities require monthly VAT reports on the detail of the VAT amounts that are declared on all of the customer invoices. All customers must be included on the report, including Belgian customers, European Union (EU) member customers, and non-EU customers.

The Monthly VAT Payable Report - Belgium (R74B100) includes:

- Amounts at the document number levels.
- Summary VAT Report code totals.

The report consists of two parts:

- Detail information at the document number levels.
- Summary totals per VAT Report Code.

You should know these key concepts about monthly VAT reports:

| Concept | Description |
|--------------|--|
| Legal Format | The reports must be printed in the legal format. The government authority does not allow any format other than its official paper documents. You should obtain the official paper documents from the Belgian authorities. |
| Reporting | VAT returns must be completed for each month on a special form and filed with the local tax office before the 20th day of the following month. You must also pay any excess collected VAT over deductible VAT before that day. |
| GL Date | All vouchers and invoices are included in the monthly reports, based on their GL date. |

Processing Options for Monthly VAT Payable Report - Belgium (R74B100)

Processing options enable you to specify the default processing for programs and reports.

Process

These processing options customize which data the system includes in the report and whether to update the F0018 table.

- | | |
|---|---|
| 1. Period starting date and 2. Period end date | Specify the first day of the month or the last day of the month being reported. |
| 3. Print Flag | Specify whether to update each individual Print Flag field in the F0018 table. If you leave this processing option blank, the system updates each individual PrintYN (alias TDPRT1) field in the Taxes table with a <i>Y</i> . This processing option enables you to use the Print (Y/N) field in the Data Selection of the report to exclude previously printed VAT amounts. If you enter <i>I</i> in this processing option, the system does not update this field. You do not have to update the Print Flag field. Values are: Blank: Updates. <i>I</i> : Does not update. |
| 4. Company | Specify the company for which the system runs the report. You can include only one company per report. You must run this report multiple time for multiple companies. |
| 5. Company Address Number | Specify the address book number associated with the Company address that you want to appear in the header section on each page of the report. |

R74B110 - Monthly VAT Recoverable Report

The Belgian Tax Authorities require monthly VAT reports on the detail of the VAT amounts that are declared on all of the supplier vouchers. All suppliers must be included on the report, including Belgian suppliers, European Union (EU) member suppliers, and non-EU suppliers.

The Monthly VAT Recoverable Report (R74B110) includes:

- Amounts at the document number levels.
- Summary VAT Report code totals.

The report consists of two parts:

- Detail information at the document number levels.
- Summary totals per VAT Report Code.

You should know these key concepts about monthly VAT reports:

| Concept | Description |
|--------------|--|
| Legal Format | The reports must be printed in the legal format. The government authority does not allow any format other than its official paper documents. You should obtain the official paper documents from the Belgian authorities. |
| Reporting | VAT returns must be completed for each month on a special form and filed with the local tax office before the 20th day of the following month. You must also pay any excess collected VAT over deductible VAT before that day. |
| GL Date | All vouchers and invoices are included in the monthly reports, based on their GL date. |

Tax Code Columns in the Monthly VAT Recoverable Report

The two columns on the right of the Monthly VAT Recoverable Report automatically include the appropriate VAT Legal Code values on those voucher detail items that have been assigned a Tax Rate/Area that includes a Legal Code column not already on the report. The other columns on the report include the most common listing of VAT Legal Code values.

The Code and Amount columns automatically include the voucher VAT tax detail that is not included in the list of columns already on the report. For example, a Tax Rate/Area can be defined to include a Legal VAT code that is not in the original columns.

Note. The Code column header never appears on the report. However, the legal VAT code always appears on the same line as the amount and to the left of the Amount column.

Processing Options for Monthly VAT Recoverable Report - Belgium (R74B110)

Processing options enable you to specify the default processing for programs and reports.

Process

These processing options customize which data the system includes in the report and whether to update the F0018 table.

- | | |
|--|---|
| <p>1. Period starting date and 2. Period end date</p> | <p>Specify the first day of the month or the ending day of the month being reported.</p> |
| <p>3. Print Flag</p> | <p>Specify whether to update each individual Print Flag field in the F0018 table. If you leave this processing option blank, the system updates each individual PrintYN (alias TDPRT1) field in the Taxes table with a Y. This processing option enables you to use the Print (Y/N) field in the Data Selection of the report to exclude previously printed VAT amounts. If you enter 1 in this processing option, the system does not update this field. You do not have to update the Print Flag field. Values are:</p> <p>Blank: Updates.</p> <p>1: Does not update.</p> |

4. Company

Specify the company for which the system runs the report. You can include only one company per report. You must run this report multiple time for multiple companies.

5. Company Address Number

Specify the address book number associated with the Company address that you want to appear in the header section on each page of the report.

R74B150 - Yearly VAT Report (Paper)

The Belgian Tax Authorities require yearly reports that include VAT amounts for all of the customers who were invoiced during the fiscal year. Only Belgian customers need to be reported. The Belgian Tax Authorities require that this information be submitted in electronic form. JD Edwards EnterpriseOne software provides both paper and electronic output for this report.

You should know these key concepts about the Yearly VAT Report (Paper) (R74B150):

| Concept | Description |
|--------------------|---|
| Output | <p>The Yearly VAT Report (Paper) produces a hard copy report in addition to the standard electronic flat file output. Hard copies of the report contain VAT numbers that are incorrect, the directory and file name of the electronic flat file output, and a cover letter for the Belgian Authorities that is submitted along with the electronic flat file output.</p> <p>You should print two copies of the final report. You give one copy to the government authorities, and you keep one copy on file for audit purposes. Contact the Belgian tax authorities for more information regarding Belgian tax practices.</p> |
| Processing Options | <p>A processing option enables the user to produce an equivalent hard copy of the Yearly VAT Report (Flat File) report (R74B200), which can be printed in the format chosen by the user. This report lists Total Sales by Customer (excluding VAT amounts) and Total VAT amounts by Customer. You can specify the version of the Yearly VAT Report (Paper) report to be printed.</p> <p>You should not include zero VAT amounts in the electronic flat file. You can set the Minimum Taxable Amount to Report processing option on the Process tab to exclude all customers under specified amounts.</p> |

| Concept | Description |
|--------------------|---|
| Report Execution | <p>The report should be executed locally to successfully create the electronic flat file. Two methods are:</p> <ul style="list-style-type: none"> • Users can override the default report execution logic settings by choosing Advanced from the Row menu when submitting the report. • Select the LOCAL option. By selecting the LOCAL option, you direct the report to run locally and enable the creation of the electronic flat file in the local PC directory that is indicated. <p>Object Configuration Manager (P986110) can be configured so that the execution logic for this program always occurs locally.</p> |
| Running the Report | <p>Each time that you run the report, you must indicate a unique file name for the output. If you run the same report twice with the same file name indicated, you double the data that is contained in the electronic flat file.</p> |
| Report Validation | <p>This report validates the VAT number, or Tax Identification number, of each customer.</p> <p>Validation occurs when the report is submitted. If an incorrect VAT number is encountered, the first page of the report output describes the number and the type of error that are encountered.</p> <p>The VAT number, or Tax Identification number, is stored in the TaxId field (Alias TAX) field that is located in the F0101 table.</p> <p>If invalid VAT numbers are associated with customer records, you must correct those numbers and rerun the report to avoid a government-assessed penalty.</p> <p>Note. You should run the report in proof mode until all of the VAT validation issues are corrected.</p> |

| Concept | Description |
|----------------------------|--|
| VAT Numbers | <p>In some cases, such as recognized health care providers, you might not have a VAT number for that customer. In those cases, you can assign <i>99_NB</i> as a VAT/Tax ID value.</p> <p>In any case for which you do not know the VAT number, you can enter <i>99_unknown</i> or <i>99_onbekend</i> in the VAT/Tax ID field.</p> |
| Multiple Company Reporting | <p>The VAT Yearly program supports multiple company reporting for the paper report and the electronic file. You select multiple company reporting by including multiple companies in the data selection.</p> <p>Note. For electronic reporting, the program produces a flat file in the format that is accepted by the Belgian authorities. However, for paper reporting, you might need to submit a separate cover letter to the Belgian authorities that includes a description of each of the companies and its VAT information.</p> |

The Yearly VAT Report (Paper) output includes:

- Errors encountered by the VAT validation routine (N74B0150), as well as associated error codes. In this example, BE0003 and BE0001 are the error codes. If the VAT numbers are correct, the first section is blank.
- Errors encountered by the VAT validation routine (N74B0150), as well as associated error codes.
- A message indicating that data was successfully recorded in the electronic flat file output.
- The local PC directory and file name of the electronic flat file output.

Note. The Yearly VAT Report (Paper) output contains a cover letter to submit along with the electronic file output. The cover letter detail is normally translated into either French or Dutch by the customer. JD Edwards EnterpriseOne does not provide a translated version of these reports.

Processing Options for Yearly VAT Report (Paper) (R74B150)

Processing options enable you to specify the default processing for programs and reports.

Process

- | | |
|--|---|
| 1. Start date and 2. End date | Specify the first day of the year or the ending day of the year for which you are running the report. |
| 3. Tax exemption | <p>Specify whether an exemption is applicable. Most companies do not claim a tax exemption, although certain smaller companies are eligible. Values are:</p> <p>Blank: Not applicable.</p> <p>1: Applicable.</p> |
| 4. Article 6 of royal decree nr. 50 | <p>Specify whether an article 6 of royal decree nr. 50 is applicable. This decree generally applies to small companies and industries, such as small farm operations. Values are:</p> <p>Blank: Not applicable.</p> |

| | |
|--|--|
| | <i>I</i> : Applicable. |
| 5. Minimum Taxable Amount to Report | Specify the minimum taxable amount that must be reported. |
| 6. Final Mode | Specify whether the system executes the report in proof or final mode. Values are: Blank: Proof mode <i>I</i> : Final mode |

Processing Options for Yearly VAT Report (Flat File) (R74B200)

Processing options enable you to specify the default processing for programs and reports.

Options

| | |
|--|---|
| 1. Tax exemption | Specify whether an exemption is applicable. Most companies do not claim a tax exemption, although certain smaller companies are eligible. Values are: Blank: Not applicable. <i>I</i> : Applicable |
| 2. Start date for exemption | Specify the effective date of the tax exemption. |
| 3. Article 6 or royal decree nr. 50 | Specify whether an article 6 of royal decree nr. 50 is applicable. This decree generally applies to small companies and industries such as small farm operations. Values are: Blank: Not applicable. <i>I</i> : Applicable. |
| 4. Intrastat tax return | Specify whether an Intrastat tax return is applicable. Only companies for which the article 6 of royal decree nr. 50 is applicable may have to declare an Intrastat tax return. Values are: Blank: Not applicable. <i>I</i> : Applicable. |

R74B250 - Quarterly VAT Report (Flat File)

The Belgian Tax Authorities require quarterly reports that include VAT amounts for all customers who are located in European Union (EU) member countries, except Belgium. Only non-Belgian EU member customers who are invoiced during the fiscal quarter need to be reported. The Belgian Tax Authorities require that this information be submitted in electronic file output. JD Edwards EnterpriseOne provides both a paper and electronic version of this report.

You should know these key concepts about the Quarterly VAT Report (Flat File) program (R74B250):

| Concepts | Description |
|--------------------|---|
| Reporting Year | Quarterly reports must be based on the calendar year, not the fiscal year that is associated with a particular company. The date range is specified in the processing options of the report. |
| Output | <p>The Quarterly VAT Report (Flat File) program produces a hard copy report, in addition to the standard electronic flat file output. Hard copies of the report contain VAT numbers that are incorrect; the directory and file name of the electronic flat file output; and a cover letter for the Belgian Authorities, which is submitted along with the electronic flat file output. This feature is equivalent to that provided in the Yearly VAT Report (Paper) program (R74B150).</p> <p>You should print two copies of the final report. You give one copy to the government authorities, and you keep one copy on file for audit purposes. Contact the Belgian tax authorities for more information regarding Belgian tax practices.</p> |
| Processing Options | <p>A processing option enables the user to produce an equivalent hard copy of the Quarterly VAT Report (Paper) program (R74B300), which can be printed in the format chosen by the user. You can specify the version of the Quarterly VAT Report (Flat File) report to be printed.</p> <p>You should not include zero VAT amounts in the electronic flat file. You can set the Minimum Taxable Amount to Report processing option on the Process tab to exclude all customers under specified amounts.</p> |
| Report Execution | <p>The report should be executed locally for the successful creation of the electronic flat file. Two methods are:</p> <ul style="list-style-type: none"> • Users can override the default report execution logic settings by choosing Advanced from the Row menu when submitting the report. • Selecting the LOCAL option. By selecting the LOCAL option, you direct the report to run locally and enable for the creation of the electronic flat file in the local PC directory that is indicated. <p>Object Configuration Manager (P986110) can be configured so that the execution logic for this program always occurs locally.</p> |
| Running the Report | Each time that you run the report, you must indicate a unique file name for the output. If you run the same report twice with the same file name indicated, you double the data that is contained in the electronic file output. |

| Concepts | Description |
|----------------------------|---|
| Report Validation | <p>This report validates the VAT number, or Tax Identification number, of each customer, according to the validation routines that are appropriate to each EU country.</p> <p>Validation occurs when the report is submitted. If an incorrect VAT number is encountered, the first page of the report output describes the number and the type of error that are encountered.</p> <p>The VAT number, or Tax Identification number, is stored in the TaxId field (Alias TAX) field that is located in the F0101 table.</p> <p>If invalid VAT numbers are associated with customer records, you must correct those numbers and rerun the report to avoid the government-assessed penalty.</p> <p>Note. You should run the report in proof mode until all of the VAT validation issues are corrected.</p> |
| VAT Numbers | <p>In some cases, such as recognized health care providers, you might not have a VAT number for that customer. In those cases, you can assign <i>99_NB</i> as a VAT/Tax ID value.</p> <p>For any case for which you do not know the VAT number, you can enter <i>99_unknown</i> or <i>99_onbekend</i> in the VAT/Tax ID field.</p> |
| Multiple Company Reporting | <p>The Quarterly VAT Report (Flat File) program supports multiple company reporting for the paper report and the electronic file. You select multiple company reporting by including multiple companies in the data selection.</p> <p>Note. For electronic reporting, the program produces a flat file in the format that is accepted by the Belgian authorities. However, for paper reporting, you might need to submit a separate cover letter to the Belgian authorities that includes a description of each of the companies and its VAT information.</p> |

When you run the report, the system display:

- Errors encountered by the VAT Validation routine (N74B0150), as well as its associated error code. Specifically, this routine verifies this information for these current EU member countries:

| Country | Country Code | VAT Number Length |
|---------------|--------------|-------------------|
| Denmark | <i>DK</i> | 8 positions |
| Germany | <i>DE</i> | 9 positions |
| Finland | <i>FI</i> | 8 positions |
| France | <i>FR</i> | 11 positions |
| Great Britain | <i>GB</i> | 9 positions |

| Country | Country Code | VAT Number Length |
|-------------|--------------|-------------------|
| Ireland | <i>IE</i> | 8 positions |
| Italy | <i>IT</i> | 11 positions |
| Luxembourg | <i>LU</i> | 8 positions |
| Netherlands | <i>NL</i> | 11 positions |
| Austria | <i>AT</i> | 9 positions |
| Portugal | <i>PT</i> | 9 positions |
| Spain | <i>ES</i> | 9 positions |

- If customers from those countries have incorrect address book information according to this criteria, an error is returned; and the customer address book record must be adjusted.
- If the VAT numbers are correct, the first section is blank.
- A message indicating that data was successfully recorded in the electronic flat file output.
- The local PC directory and file name of the electronic flat file output.

The Quarterly VAT Report, as with the Yearly VAT Report, produces a cover letter that is submitted along with the electronic file output.

Note. The cover letter detail is normally translated into either French or Dutch by the customer. JD Edwards EnterpriseOne does not provide a translated version of these reports.

Processing Options for Quarterly VAT Report (Flat File) (R74B250)

Processing options enable you to specify the default processing for programs and reports.

Process

These processing options customize which data the system includes in the report.

- | | |
|---|--|
| 1. Start date and 2. End date | Specify the first day of the quarter or the ending day of the quarter being reported. |
| 3. Quarter | Specify the reporting quarter. You must specify the quarter by using a value that is set up in the Processing Quarter UDC (07/QU). |
| 4. Minimum Taxable Amount to Report | Specify the minimum taxable amount to report. |
| 5. Proof or Final Mode. Enter 1 to run in Final Mode | Specify whether the system runs the report in proof or final mode. Values are: Blank: Proof mode <i>1</i> : Final mode |

R74B300 - Quarterly VAT Report (Paper)

The Quarterly VAT Report (Paper) (R74B300) can also be submitted to the Belgian Tax Authorities. The Yearly VAT Listing produces a separate cover letter and customer detail report.

The Quarterly VAT Report (Paper) report includes Codes and Note Columns that provide you with the ability to report this information to the Belgian authorities. If you need to report information from these columns to the Belgian authorities, you must customize them. The Quarterly VAT Report (Paper) report is not set up to populate these columns.

Some typical uses of the Code and Notes column are:

| Column | Use |
|--------------|---|
| Code Column | <p>You might want to use the code blank or T. The three countries involved must be European member states.</p> <ul style="list-style-type: none"> • Company A in country 1 sells and invoices goods to Company B in country 2. • Company B in country 2 sells and invoices the goods to Company C in country 3. • Company A in country 1 ships the goods directly to Company C in country 3, and Company B assigns C as the entity that is responsible for VAT registration. <p>Case 1 - Country 1 = Belgium</p> <p>Company A reports this as a Category 1 transaction, so the Code field is blank.</p> <p>Case 2 - Country 2 = Belgium</p> <p>Company B reports this as a Category 2 transaction, so the Code field is updated with T.</p> <p>Case 3 - Country 3 = Belgium</p> <p>Company C has nothing to declare because it does not sell to the EC.</p> <p>Summary:</p> <p><i>T</i> is used if goods are invoiced and delivered to a customer in another EC member state (bill-to and ship-to), and the goods themselves are purchased and shipped immediately from a vendor in another EC member state. The goods do not arrive in the warehouses of the reporting company.</p> |
| Notes Column | <p>You might want to use this column to indicate that manual adjustments have been made to this customer's sales total.</p> |

(BRA) Reports for Brazil

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Brazil.

| Report ID and Report Name | Description | Navigation |
|---|---|---|
| R76321B Transaction Journal | Lists and totals all of the journal entries in the Journal Entry Book by company, day, and accounting period. The system prints an ending balance for each page and carries that balance forward to the next page so that each page of the journal can stand alone. | G/L Report - Brazil (G76B09), Transaction Journal |
| R76B09410 Four Columns Trial Balance | Prints a trial balance report that shows total debits and credits for each account. | G/L Reports - Brazil (G76B09), Four Columns Trial Balance |
| R76B420 General Ledger | Lists all transactions by company and general ledger account for a specific accounting period. The report includes all general ledger accounts with a post edit code, even if the amount for the account is zero. | G/L Reports - Brazil (G76B09), General Ledger |

R76321B - Transaction Journal

To comply with specific Brazilian legal requirements and business practices, companies must keep detailed records of all transactions. The Brazilian government can audit companies at any time to verify that commercial transactions are being performed within legal requirements.

The General Ledger (*Livro Razo*) and the Transaction Journal (*Dirio Geral da Contabilidade*) are two of the basic elements that companies are required to maintain and submit for auditing.

You print the Brazilian Transaction Journal to list and total all of the journal entries in the Journal Entry Book by company, day, and accounting period. The system prints an ending balance for each page and carries that balance forward to the next page so that each page of the journal can stand alone.

The Brazilian Transaction Journal report includes an opening statement (*Termo de Abertura*) for the first page and a closing statement (*Termo de Encerramento*) for the last page. The opening and closing statements include this company information:

- Purpose of the book.
- Number of the book.
- Number of pages.
- Business to which the book pertains.
- Business name.
- Business address.
- Number assigned to the business by the Junta Comercial.
- Taxpayer identification number.
- Company administrator and accountant authorization of the closing of the accounting period.

The statements also include information about the journal, such as the fiscal book number and the total number of pages.

Processing Options for Transaction Journal (R76321B)

Processing options enable you to specify the default processing for reports.

Print Options

1. **Mode**
Enter 1 to run the report in final mode. The system updates the next number of the fiscal book that is based on the next numbers which you have set up for the company.
If you leave this processing option blank, the report does not update the page number.
2. **Opening and Closing Statement**
Enter 1 to print Opening Statement and Closing Statement on the report. If you are running the report in final mode, you must enter 1 for this processing option.
3. **Subledgers**
Enter 1 to print subledgers on the report.
4. **JE Explanation**
Specify one of these values:
1: Print JE explanation 1
2: Print JE explanation 2
If you leave this processing option blank, both explanation 1 and explanation 2 print on the report.
5. **Pages**
Enter the number of pages to include between the last page and Closing Statement.
6. **Statement Codes**
Enter statement codes in the Opening and Closing processing options. Values are:
A: Opening statement codes (default).
E: Closing statement codes.

Dates

1. **Report Date**
Enter the report (issue) date. If you leave this processing option blank, the system date is used. This date will be updated in the next numbers table if you run the report in final mode.
2. **Beginning Date** and 3. **Ending Date**
Enter the beginning and ending date to use for the transactions.
4. **Reference Month** and 5. **Reference Year**
Enter the reference month and year to print in the report header.
6. **Suppress Printing**
Enter 1 to not print the transaction date in the report header or leave this processing option blank to print the transaction date.

Company

1. **Company**
Enter the company to print in the report header. This processing option is required.

Book Code

1. Book Code Enter the book code or leave this processing option blank for DG.

R76B09410 - Four Columns Trial Balance

The Four Column Trial Balance report is a balance report that prints debit and credit total amounts for each account. The debit/credit format is a legal requirement in Brazil and allows accountants and auditors to quickly locate the source of any discrepancies within a company's accounts.

The Four Column Trial Balance report uses information from the F0902 table, which includes fields for Amount Net Debit Posting 01 - Amount Net Debit Posting 14. The report includes these columns:

- Beginning Balance
- Total Debits
- Total Credits
- Actual Balance

You cannot change the data sequencing for this program.

Processing Options for the Four Columns Trial Balance Report (R76B09410)

The processing options for the Four Column Trial Balance report are similar to those for other trial balance reports.

Period

1. Fiscal Year and Period Number

For the fiscal year, specify the last two digits of the fiscal year, for example, enter 07 for 2007. If you complete the Fiscal Year processing option, you must also complete the Period Number processing option.

For the period number, specify the period. If you complete the Period Number processing option, you must also complete the Fiscal Year processing option.

Print

Print

Specify whether to include accounts with zero balances for the specified period. Values are:

Blank. Include accounts with zero balances.

1: Do not include accounts with zero balances.

Accounts that are assigned a posting edit code N print even when you set this processing option to 1. Accounts that are assigned a posting edit code N are header accounts, which do not have balances.

LOD

Level of Detail

Specify the lowest level of detail (3–9) to print on the report. For example, if you specify level 7 as the lowest level and your chart of accounts includes levels 8 and 9, level 7 will include the totals for accounts with level 8 and 9 amounts, but the system will not print the detail for levels 8 and 9. If your

chart of accounts skips levels, the system might produce inaccurate results when it rolls up detail levels.

Alternatively, you can leave this processing option blank to print all levels of detail on the report.

Ledger

Ledger Type

Specify the type of ledger. Enter a value from UDC table 09/LT. If you do not complete this processing option, the system prints amounts for ledger type AA.

If you specify the CA ledger type and the CA ledger type includes amounts for multiple currencies, the totals will be meaningless.

Currency

Currency Code

Specify the currency that the system includes in the report when you post account balances by currency. To limit the report to amounts for a specific currency code, enter the code for the currency. The value that you enter must exist in the F0013 table. To include amounts for all currencies, enter *.

Leave this processing option blank if you do not post balances by currency.

R76B420 - General Ledger

To comply with specific Brazilian legal requirements and business practices, companies must keep detailed records of all transactions. The Brazilian government can audit companies at any time to verify that commercial transactions are being performed within legal requirements.

The General Ledger (Livro Razo) and the Transaction Journal (Dirio Geral da Contabilidade) are two of the basic elements that companies are required to maintain and submit for auditing.

You can print the General Ledger report to list all transactions by company and general ledger account for a specific accounting period. The report includes all general ledger accounts with a posting edit code, even if the amount for the account is zero. In addition, the report includes totals by transaction, period, account, and company. If the list of transactions for an account is interrupted by a page break, the system prints an ending balance on the page and continues on the next page with a balance carried forward amount.

Processing Options for General Ledger (R76B420)

Processing options enable you to specify the default processing for reports.

From/Thru Date

1. From Period/Date

Specify a from period or enter a from date in which to begin printing account balances in detail. For a from period, values are:

0: Year to date.

1: Current period.

2: Inception to date.

2. Thru Fiscal Year/Period or Thru Date

Specify a through fiscal year and fiscal period or enter a through date in which to print account balances in detail. for which the account balances are to be shown in detail.

Print

1. **Account Number** Specify one of these account formats to use to print account numbers on the report:
1: Account number (default).
2: Short account ID.
3: Unstructured account.
2. **Print Units (FUTURE)** Reserved for future use.
3. **New Page** Enter *1* to skip to a new page when a new business unit is printed or leave this processing option blank to print without page breaks.
4. **Omit Accounts** Enter *1* omit accounts that have no balance or detail for the selected period to print on the report.

Document

1. **Ledger Type** Enter a ledger type code from UDC table 09/LT or leave this processing option blank to include ledger type AA.
2. **Document Type (FUTURE)** Reserved for future use.
3. **Posted/Unposted** Enter *1* to print both posted and unposted transactions or leave this processing option blank to print only posted transactions.

Subledger

1. **Subledger and 2. Subledger Type** Enter a specific subledger or enter *** to print include all subledgers. If you enter a specific subledger, you must also enter a subledger type.
3. **Print Subledger** Enter *1* to print the subledger on the report or leave this processing option blank if you do not want subledger to print.

Currency

1. **Currency Code (FUTURE)** Reserved for future use.

Summary

1. **Summary** Specify a specific business unit type for object range summarization or enter *+* to include all types or *** to include all nonblank types.
2. **Business Unit Type** Enter a beginning and an ending object for the object account range for account summarization.

Date Order

1. **Date Order** Enter *1* to print detail information in ascending date order or leave this processing option blank to print in descending date order.

Company

1. Company Number Enter a company number to print for each page heading.

(CAN) Reports for Canada

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Canada.

| Report ID and Report Name | Description | Navigation |
|---------------------------|--|---|
| R0018P8 GST/PST Tax | Use this program to print GST/PST tax amount for each tax authority. The report lists GST and PST and subdivides PST into seller-assessed PST and self-assessed PST. | Tax Processing and Reporting (G0021), GST/PST Tax |

R0018P8 - GST/PST Tax

The GST/ PST Tax report is specifically designed to meet Canadian reporting needs. For each address book number, the report lists GST and PST and subdivides PST into seller-assessed PST and self-assessed PST.

This report lists information by company and tax explanation code. Within each tax explanation code, the report separates taxes into categories such as taxable, nontaxable, GST, seller-assessed PST, and self-assessed PST.

Amounts for these fields are positive for vouchers and negative for invoices:

- Taxable Amount
- Non-Taxable
- Tax

This is the sum of GST, self-assessed PST, and seller-assessed PST.

- GST
- Self-Assessment Tax

This is the total payable to provincial governments for self-assessed PST. A processing option enables you to display the amount with the sign reversed.

- Sales Tax

This is the total payable to provincial governments for seller-assessed PST.

Processing Options for GST/PST Tax (R0018P8)

Processing options enable you to specify the default processing for programs and reports.

Update Options

1. Detail Records Enter a *1* to flag the detail records as having been printed.

Display

1. Tax Identification

1. Enter the form of tax identification displayed on the report.

Blank. No ID displayed

1. European Company ID

2. European Individual ID

3. Tax ID

2. Tax Amount

Enter a *1* to reverse the sign on the Self Assessment (Use) Taxes. If left blank, the tax amount will print with the sign in the tax file.

(CHL and PER) Reports for Chile and Peru

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Chile and Peru.

| Report ID and Report Name | Description | Navigation |
|---|---|---|
| R76H4020 (CHL) Rents Withholding Ledger | Use this report to review the posted transactions for which income tax withholding applies for a specified period. The report is sorted by voucher date, internal document type, and number. | Accounts Payable (G76H04), Rents Withholding Ledger |
| R76H4030 (CHL) Rents Withholding Certificate | Use this report to obtain the annual fees withholding certificate by supplier and legal company for the specified year. This report includes the fees paid for each month. | Accounts Payable (G76H04), Rents Withholding Certificate |
| R76H9001 (CHL and PER) Account Balance by Object Account | Lists all accumulated balances for a fiscal period by object account. This report shows debit and credit balances from the F76H902T table. Information in this table is updated when you update the F0902 table. | General Accounting (G76H09) or General Accounting (G76P09), Account Balance by Object Account |
| R76H9003 (CHL and PER) General Journal | Lists all journal entries for a specific period and assigns the legal number to each entry. | General Accounting (G76H09) or General Accounting (G76P09), General Journal |

| Report ID and Report Name | Description | Navigation |
|--|--|--|
| R76H9005 (CHL and PER) Print Number (folio) Blank Pages | <p>Prints legal company information, report heading titles, and page numbers, based on processing option settings.</p> <p>The decimal position for amounts that appear on this general ledger legal report are defined for each currency in the Designate Currency Codes program (P0013). You can print unique page numbers for all reports or unique page numbers for individual reports and, if necessary, you can print page numbers on blank pages. Do not enter data selection.</p> | General Accounting (G76H09) or General Accounting (G76P09), Print Number (folio) Blank Pages |
| R76H9421 (CHL and PER) Account Ledger by Object Account | <p>Lists all transactions for a specific period by object account.</p> <p>This report uses the standard processing options available for the General Ledger by Object Account report as well as specific processing options for localization. Processing Options for Rents Withholding Ledger (R76H4020)

Processing options for reports enable you to specify the information that appears on the reports.

General

| | |
|--------------------------|---|
| Mode | Enter <i>1</i> to print in final mode and update tables. Leave this processing option blank to print in proof mode. |
| Legal Company | Enter the legal company for which you run the report. |
| Reprint Documents | Enter <i>1</i> to reprint document which have been printed. Enter <i>2</i> to include in the report transactions which have not been printed, and transaction which have been printed. Leave this processing option blank to print the transaction which have not been printed. |

Dates

| | |
|------------------|---|
| Date From | Enter the first date of a range of dates that the system uses to select records to process. |
| Date Thru | Enter the last date of a range dates that the system uses to select records to process. |

Print

| | |
|----------------------|---|
| Document Type | Enter a document type which exists in the Document Type (00/DT) UDC table that the system uses to determine the next legal number used for the folio. If you leave this processing option blank, the system does not assign a folio number. |
| Report Title | Enter <i>1</i> in the first field to suppress printing of a report title. Leave the first field blank to print the report title that you enter in the second and third fields. You can enter up to 40 characters each in the second and third fields. |

Legal Company Printed in Header Leave this processing option blank to print information about the legal company in the report header. Enter *1* to suppress printing of the legal company information.

(CHL) Processing Options for Rents Withholding Certificate (R76H4030)

Processing options for reports enable you to specify the information that appears on the reports.

General

Proof or Final Mode Enter *1* to print in final mode and update tables. Leave this processing option blank to print in proof mode.

Legal Company Enter the legal company for which you run the report.

Adjustment Code Enter a value from the Adjustment Code (76A/CA) UDC table to specify the inflation index code that the system uses to select records to process.

Document Type Enter a value from the Document Types (00/DT) UDC table to specify the document type that the system uses to select records to process.

Year - Calendar Year Enter a one-digit or two-digit number for the calendar year for which you run the report.

Print

City Enter the city from which the certificate is issued. If you leave this processing option blank, the system uses the city of the company as specified in the address book record for the company.

Issue Date Enter the issue date of the certificate. If you leave this processing option blank, the system uses the system dates.

Report Title Leave this processing option blank to print the report title that you enter in the Report Title Line 1 and the Report Title Line 2 processing options. Enter *1* to suppress printing of a report title.

Report Title Line 1 Enter up to 40 characters that the system prints as the report title.

Report Title Line 2 Enter up to 40 characters that the system prints as additional text for the report title.

Print Company Header Information Leave this processing option blank to print information about the legal company in the report header. Enter *1* to suppress printing of the legal company information.

Print Footer Information Leave this processing option blank to print the footer message. Enter *1* to suppress printing of the footer message.

Concept Description Enter a description for the rent withholding concept.

Processing Options for Balance by Object Account (R76H9001)

Use these processing options to specify how to print cost centers, the level of detail in which to summarize balances, the process method, and so on.

Process

- 1. Cost Center** Specify how to print cost centers. Values are:
Blank: Print detail by cost center.
I: Print all of the cost centers for a legal company and print summary information for the object and subsidiary account.
- 2. Level of Detail** Specify the level of detail. The system summarizes all general ledger balances by the account level of detail specified. Values are 3–9. The default value is 9.
- 3. Legal Company** Specify the company number in which to retrieve general ledger balances.
- 4. Process Method** Specify the process method. Values are:
Blank: Print asset and liabilities according to the operation sign. Asset accounts appear with a positive sign in the Asset column and liabilities appear with a negative sign in the Liability column.
A: Print asset accounts in the Asset column and liability accounts in the Liability column according to AAI items GLG2 (Beginning Assets) and GLG3 (Beginning Liabilities).
- 5. Mode** Specify the processing mode in which to run the report. Values are:
Blank: Proof (trial) mode.
I: Final mode.
- 6. Business Unit** Specify the business unit in which to print object and subsidiary accounts.
- Ledger Type** Specify the ledger type code from the UDC table 76H/XX (76H is the product code, and XX is the user-defined code). The system uses LL (ledger types to process) as the default value.
- Category Code** Specify the category code (UDC table 09/21–09/23) in which to group the general ledger accounts. The category code description appears on the report instead of the general ledger account.

If you leave this processing option blank, balances are grouped by object and subsidiary account.

Print Options

- Document Type** Specify the document type to use to retrieve the next number by company. The document type must exist in UDC table 00/DT. The system uses next numbers by company and document type to assign the page number on the report.

If you leave this processing option blank, no page number is assigned.
- Print Report Title** Specify whether to print the report title.

Blank: Print the report title. The system uses the titles from the Report Title and Report Title Continuation processing options.
I: Do not print the report title.
- Report Title** Enter the report title that you want to appear in the report heading.
- Report Title Continuation** Enter the remainder of the report title, if applicable.

Legal Company Information

Specify whether to print legal company information.

Blank: Print the legal company information on the report. The system uses the legal company information from the JD Edwards EnterpriseOne Address Book system, which includes registered name, address, company's line of business, agents, and representatives.

/ Do not print the legal company information on the report.

Accounts with Zero Amounts

Specify whether to print accounts with zero amounts.

Blank: Do not print accounts with zero amounts.

/ Print accounts with zero amounts.

2: Do not print accounts with zero amounts and with the same level of detail that is specified in the Level of Detail processing option.

Dates**Period Number**

Specify the tax period to print on the report.

Fiscal Year

Specify the fiscal year to print on the report.

R76H9003 - (CHL and PER) General Journal

Before you print this report, you can access the information online. Select General Accounting (G76H09) or General Accounting (G76P09), Journal Entries Inquiry by Legal. Number.

This form displays the initial legal number for the company by fiscal year. When you run the General Journal report, this number appears on the report. The Debit and Credit balances that appear on the form are the accumulated balances for the corresponding period. When you run the General Journal report, these amounts appear on the report. You can modify them manually on the form, if necessary.

Processing Options for General Journal (R76H9003)

Use these processing options to specify the processing mode, the document type to use for page numbers on the report, and so on.

Mode**Mode**

Specify the processing mode in which to run the report. Values are:

Blank: Proof mode. The system starts the page numbering with 1.

/: Final mode. The system uses the next number of the company and document type for the page number

Print Options**1. Document Type**

Specify the document type to use to retrieve the next number by company. The document type must exist in UDC table 00/DT. The system uses next numbers by company and document type to assign the page number on the report.

If you leave this processing option blank, no page number is assigned.

2. Print Report Title

Specify whether to print the report title.

Blank: Print the report title. The system uses the titles from the Report Title and Report Title Continuation processing options.

I: Do not print the report title.

3. Report Title

Enter the report title that you want to appear in the report heading.

4. Report Title Continuation

Enter the remainder of the report title, if applicable.

Dates

1. From Date and 2. Thru Date

Specify the beginning and ending dates in which to print detailed journal entries for this report.

Company

1. Legal Company

Specify the company number in which to retrieve general ledger balances. If you leave this processing option blank, the system uses company 00000.

2. Ledger Type

Specify the ledger type code from the UDC table 76H/XX (76H is the product code, and XX is the user-defined code). The system uses LL (Ledger types to process) as the default value.

Options

1. Account Number Category Code

Specify the account number category code to print on the report. Values are 21, 22, and 23.

If you leave this processing option blank, the system prints the account number.

Adjustments

1. Adjustment Registration Date

Specify a registration date to use for the report. If you leave this processing option blank, the system uses the general ledger date of the adjustment.

2. Registration Entry

Specify how the system determines the next available registration number for adjustments. Values are:

Blank: Use the fiscal year from the registration date in the Adjustment Registration Date processing option.

I: Use the fiscal year from the general ledger date of the adjustment. This value is not recommended.

Currency

1. As if Currency

Specify the currency code to use for *as if* currency reporting. Use this processing option to convert and print amounts in a currency different from the currency in which they were originally entered. If you leave this processing option blank, amounts print in the domestic currency of the company.

2. As if Date

Enter the *as if* date to use to retrieve the exchange rate for the currency specified in the As if Currency processing option.

If you leave this processing option blank, the system uses the system date to retrieve the exchange rate.

(CHL and PER) Processing Options for Print Number (folio) Blank Pages (R76H9005)

Use these processing options to specify information such as company, from where to retrieve the initial page number, and information to include in the report heading.

General

- | | |
|--------------------------|--|
| 1. Legal Company | Specify the company number in which to retrieve the transactions. |
| 2. Document Type | <p>Specify the document type to use to retrieve the next number by company. The document type must exist in UDC table 00/DT. The system uses next numbers by company and document type to assign the page number on the report.</p> <p>If you leave this processing option blank, the number specified in the Initial Number processing option is used as the initial page number.</p> |
| 3. Initial Number | <p>Enter the initial page number to use. Ensure that the Document Type processing option is blank.</p> <p>If you leave this processing option blank, the system uses next numbers by company for the document type specified in the Document Type processing option.</p> |

Printing

- | | |
|-------------------------------------|---|
| 1. Pages Quantity | Specify the number of pages to print. |
| 2. Titles | <p>Specify whether to print the report title.</p> <p>Blank: Print the report title. The system uses the titles from the Legal Company Information and Report Title processing options.</p> <p><i>/</i>: Do not print the report title.</p> |
| 3. Legal Company Information | <p>Specify whether to print legal company information.</p> <p>Blank: Print the legal company information on the report. The system uses the legal company information from the JD Edwards EnterpriseOne Address Book system, which includes registered name, address, company's line of business, agents, and representatives.</p> <p><i>/</i>: Do not print the legal company information on the report.</p> |
| 4. Report Title | Enter the report title to appear in the report heading. |
| 5. Report Title Continuation | Enter the remainder of the report title, if applicable. |

(CHL and PER) Processing Options for Account Ledger by Object Account (R76H9421)

These processing options are specific for localizations.

Localization options

- 1. Document Type** Specify the document type to use to retrieve the next number by company. The document type must exist in UDC table 00/DT. The system uses next numbers by company and document type to assign the page number on the report.
If you leave this processing option blank, no page number is assigned.
 - 2. Print Report Title** Specify whether to print the report title.
Blank: Print the report title. The system uses the titles from the Report Title and Report Title Continuation processing options.
I: Do not print the report title.
 - 3. Report Title** Enter the report title that you want to appear in the report heading.
 - 4. Report Title Continuation** Enter the remainder of the report title, if applicable.
 - 5. Legal Company Information** Specify whether to print the legal company information in the heading of the report.
Blank: Print the legal company information in the heading of the report. The system uses the legal company information from the JD Edwards EnterpriseOne Address Book system, which includes registered name, address, company's line of business, agents, and representatives.
I: Do not print the legal company information in the heading on the report.
- Legal Company** Specify the company number in which to retrieve the transactions.
- Mode** Specify the processing mode in which to run the report. Values are:
Blank: Proof mode. The system starts the page numbering with 1.
I: Final mode. The system uses the next number of the company and document type for the page number

(CHL and PER) Processing Options for Account Ledger by Category Code (R76P9470)

These processing options are specific for localizations.

Localization

- 1. Document Type** Specify the document type to use to retrieve the next number by company. The document type must exist in UDC table 00/DT. The system uses next numbers by company and document type to assign the page number on the report.
If you leave this processing option blank, no page number is assigned.
- 2. Print Report Title** Specify whether to print the report title.
Blank: Print the report title. The system uses the titles from the Report Title and Report Title Continuation processing options.
I: Do not print the report title.
- 3. Report Title** Enter the report title that you want to appear in the report heading.

- | | |
|-------------------------------------|---|
| 4. Report Title Continuation | Enter the remainder of the report title, if applicable. |
| 5. Legal Company Information | Enter the legal company. |
| 6. Legal Company | <p>Specify whether to print the legal company information in the heading of the report.</p> <p>Blank: Print the legal company information in the heading of the report. The system uses the legal company information from the JD Edwards Enterprise One Address Book system, which includes registered name, address, company's line of business, agents, and representatives.</p> <p>/ Do not print the legal company information in the heading on the report.</p> |

R76P4040 - (PER) IGV Withholding Ledger

The IGV Withholding Ledger report lists transactions for which IGV tax was withheld. For the Payments section of the report, the system selects the payments affected by IGV tax within the range of dates defined in the processing options. For the Purchasing section, the total amount corresponds to the total amount of the paid invoices. The Adjustment section of the report includes information relating to currency exchange difference. The Withholding section includes the total amount for the income tax withheld.

(PER) Processing Options for IGV Withholding Ledger (R76P4040)

Processing options for reports enable you to specify the information that appears on the reports.

Processing

- | | |
|----------------------------|---|
| Proof or Final Mode | Enter / to print in final mode and update tables. Leave this processing option blank to print in proof mode. |
| Legal Company | Enter the legal company for which you run the report. |
| Reprint | Enter / to reprint previously printed vouchers. Leave this processing option blank to suppress printing of previously printed vouchers. |

Print

- | | |
|---|---|
| Document Type | Enter a value from the Document Types (00/DT) UDC table to specify the document type that the system uses to select records to process. |
| Title | Leave this processing option blank to print the report title that you enter in the Report Title Line 1 and the Report Title Line 2 processing options. Enter / to suppress printing of a report title |
| Title First Line | Enter up to 40 characters that the system prints as the report title. |
| Title Second Line | Enter up to 40 characters that the system prints as a second line of the report title. |
| Print Company Header Information | Leave this processing option blank to print information about the legal company in the report header. Enter / to suppress printing of the legal company information. |

Dates

| | |
|------------------|---|
| Date From | Enter the first date of a range of dates that the system uses to select records to process. |
| Date Thru | Enter the last date of a range of dates that the system uses to select records to process. |

(PER) Processing Options for Profit Withholding Certificate (R76P4050)

Processing options for reports enable you to specify the information that appears on the reports.

General

| | |
|----------------------|---|
| Legal Company | Enter the legal company for which you run the report. |
|----------------------|---|

Dates

| | |
|--------------------|---|
| Fiscal Year | Enter a one-digit or two-digit number for the calendar year for which you run the report. |
|--------------------|---|

Print

| | |
|--|---|
| Report Title | Leave this processing blank to print the text that you enter in the Title processing options. Enter <i>/</i> to suppress printing of the report title. |
| Title | Enter the text that the system prints as the report title. You can enter up to 40 characters. |
| Title (continued) | Enter additional text that the system appends to the text that you enter in the Title processing option. You can enter up to 40 characters. |
| Print Legal Company Information | Leave this processing option blank to print information about the legal company in the report header. Enter <i>/</i> to suppress printing of the legal company information. |

R76P4510 - (PER) IGV PDT

Use the general sales tax electronic media (IGV) (*Programa de Declaración Telemática* [PDT]) program write records to the Text Processor Header (F007101) and Text Processor Detail (F007111) tables. You then use the Text File Processor program (P00710) to work with the records and generate a flat file for IGV withholding.

(PER) Processing Options for IGV PDT (R76P4510)

Processing options for reports enable you to specify the information that appears on the reports.

General

| | |
|----------------------|--|
| Legal Company | Enter the legal company for which you run the report. |
| Century | Enter the first two digits of the calendar century associated with the year. |

| | |
|--------------------------------|--|
| Fiscal Year | Enter a one-digit or two-digit number for the calendar year for which you run the report. |
| Period Number | Enter the number of the accounting period for which you run the report. |
| Mother's Name Type Code | Enter a value from the Type Code (01/W0) UDC table that identifies the supplier's mother's name. You complete this option only when the supplier is an individual. |
| Father's Name Type Code | Enter a value from the Type Code (01/W0) UDC table that identifies the supplier's father's name. You complete this option only when the supplier is an individual. |
| Proof or Final Mode | Enter <i>I</i> to print in final mode and update tables. Leave this processing option blank to print in proof mode. |

(PER) Processing Options for IGV Withholding Report (R76P4600)

Processing options for reports enable you to specify the information that appears on the reports. For example, you set a processing option to include the fiscal year or the number of aging days on a report.

Print

| | |
|----------------|---|
| Reprint | Enter <i>Y</i> to generate a certificate with a new legal number. Leave this processing option blank to use the same legal number when you reprint. |
|----------------|---|

(COL) Reports for Colombia

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Colombia.

| Report ID and Report Name | Description | Navigation |
|---------------------------------|--|---|
| R76C0001 Rent Withholding | Use version ZJDE0001 to view rent withholding certificates, version ZJDE0002 to view to view rent withholding by GL offset, and version ZJDE0003 to view rent withholding by tax area. | Tax Reports (G76C13), Rent Withholding |
| R76C0002 Withholdings Report | Use version ZJDE0001 to view withholding transactions by document and version ZJDE0002 to view withholding transactions for which payment was made to a third-party. | Tax Reports (G76C13), Withholdings Report |
| R76C0003 VAT Withholding | Use version ZJDE0001 to view VAT withholding by account, version ZJDE0002 to view VAT withholding by GL offset, and version ZJDE0003 to view VAT withholding by tax area. | Tax Reports (G76C13), VAT Withholding |

| Report ID and Report Name | Description | Navigation |
|---|---|--|
| R76C0004 Timbre Withholding | Use this report to print the withholding certificate. | Tax Reports (G76C13), Timbre Withholding |
| R76C0911 General Journal by Category Code | Prints balance information for category 21, 22, or 23. This report is useful for statutory accounting. | Fiscal Books by Category Code (G76C15), General Journal by Category |
| R76C0911A G/L with Total by Object Account | Prints a daily book that has been developed according to the DIAN reports requirements. | Fiscal Books without Category Code (G76C152), G/L with Total by Object Account |
| R76C094 Inventory and Balance Sheet by Category Code | Generates the inventory and balance fiscal book by category code. | Fiscal Books by Category Code (G76C15), Inventory and Balance by Category Code |
| R76C094B Inventory and Balance Sheet by Object Account | Generates the inventory and balance fiscal book by account. | Fiscal Books without Category Code (G76C152), Inventory and Balance by Object Account |
| R76C0941 Trial Balance by Category Code | Prints a report if the PUC is assigned category code 21, 22, or 23 in the chart of accounts. | Fiscal Books by Category Code (G76C15), Trial Balance by Category Code |
| R76C09411 Debits and Credits T/B by Object Account | <p>Prints a general ledger report by account and has been developed according to DIAN reports requirements.</p> <p>This report prints if the PUC is assigned category code 21, 22, or 23 in the chart of accounts. The PUC is specified in the object account.</p> <p>Review the data selection for this report to ensure that it corresponds to the processing options that you set for the report. For the process number, specify the next number from UDC table 76C/02.</p> | Fiscal Books without Category Code (G76C152), Debits and Credits T/B by Object Account |
| R76C094211 G/L with Subledger Totals | Prints only subledgers with activity during the specified period. | Fiscal Books by Category Code (G76C15), G/L with Subledger Totals |

| Report ID and Report Name | Description | Navigation |
|--|--|--|
| R76C9415B Daily Book by Complete Document | Prints a general ledger report with debit and credit amounts. Print this report to satisfy the DIAN (<i>Direccion de Impuestos y Aduanas Nacionales de Colombia</i>) requirements of producing a report showing all accounting transactions with matching documents. No processing options exist for this report. | Fiscal Books without Category Code (G76C152), Daily Book by Complete Document |
| R76C9422 G/L by Object Account with Subledger Total | This report prints a general ledger with subledger totals for active subledgers for the period specified in the processing options. The report includes previous balances by subledger. The report has been developed according to the DIAN reports requirements | Fiscal Books without Category Code (G76C152), G/L by Object Account with Subledger Total |

Processing Options for R76C0001 and R76C0003

These processing options apply to:

- Version ZJDE0001 (Rent Withholding by Account) of R76C0001.
- Version ZJDE0002 (Rent Withholding by G/L Offset) of R76C0001.
- Version ZJDE0003 (Rent Withholding by Tax Area) of R76C0001.
- Version ZJDE0001 (VAT Withholding by Account) of R76C0003.
- Version ZJDE0002 (VAT Withholding by G/L Offset) of R76C0003.
- Version ZJDE0003 (VAT Withholding by Tax Area) of R76C0003.

Print

Period

Enter the period for which you run the report. You must enter a range of dates in the data selection.

Issue Date

Enter the issue date to be printed on the certificate. If you leave this processing option blank, the system uses the system date.

City

Enter the city where the deposit for the withholding was made.

Print City

Enter 1 to print on the certificate the city in which the withholding occurred.

Level and Company

Level

Enter the level break that is specified in the data sequence. Enter 1 to break on account. Enter 2 to break on tax area. Enter 3 to break on GL offset. If you do not complete this processing option, the system breaks the report on the account.

| | |
|-------------------------------|--|
| Company | Enter the company that the system uses when generating or regenerating records. If you leave this processing option blank, the system processes records for all companies. |
| Responsible | |
| Name | Enter the name of the person who is responsible for the information shown in the certificate. |
| Additional Information | Enter additional information that appears on the certificate. |
| Display | |
| Print Percentage | Enter <i>1</i> to print on the certificate the percentage of the withholding. |
| Reverse Sign | Enter <i>1</i> to reverse the sign for the fiscal rate and the total tax amount. |
| Third Party | |
| Name | Specify the name of the third-party that the system prints on the certificate. Enter <i>1</i> to print the value from the Alpha Name field (ALPH). Enter <i>2</i> to print the value from the Address field (ADD1). Enter <i>3</i> to print the value from the Notes field (DS01). If you leave this processing option blank, the system prints the value from the Alpha Name field. |
| Reprocess | |
| Regenerate | Enter <i>1</i> to delete all data in the F76CT2 table. |
| Date From | Enter the first day of the range of dates that the system uses to select records from the F76CT2 table to delete. |
| Date To | Enter the last day of the range of dates that the system uses to select records from the F76CT2 table to delete. |
| Address Number | Enter the address number that the system uses to select records to delete from the F76CT2 table. |
| Title | |
| Title | Enter the title to print on the certificate. |
| Certificate | |
| IVA Withholding | Enter <i>1</i> to generate a certificate of IVA withholding (Print IVA Amount). Enter a different character to generate other certificates. |
| Consolidate | Enter <i>1</i> to print one certificate for all companies. |
| IVA Withheld | |
| Tolerance Level | Enter <i>1</i> to specify a percentage as a tolerance level in order to approach the percentage of the IVA withheld to a 50 percent or 100 percent. |
| Percentage | Enter the value to use as tolerance level for the print of the IVA withheld. |

Note. Enter the percentages in integers. For example, enter 3 percent as 3.

Processing Options for R76C0002

These processing options apply to version ZJDE0001 (Withholdings Report Detailed by Document) and version ZJDE0002 (Withholdings Report Summarized - 3rd Party).

Date

Date From Enter the first day of the range of dates that the system uses to select records to process.

Date Thru Enter the last day of the range of dates that the system uses to select records to process.

Display

Tax Area Description Enter 1 to print the tax area description at the top of the page. Enter 2 to print the account description.

Note. This parameter must be equal to the sequence order.

Reverse Sign Enter 1 to reverse the sign in A/R transactions.

Display and Company

Skip Lines Enter 1 to skip to lines when either the document number or GL date is not sequential.

Company to Generate or Regenerate Enter the company that the system uses when generating or regenerating records. If you leave this processing option blank, the system processes records for all companies.

Total

Totals by Document Enter 1 to print totals by document. A different value will print totals by third-party.

Print

A/P Tax Report Enter 1 to print an A/P Tax Report. A different value prints the A/R Tax Report.

Note. The batch type in the data selection of an AP tax report must be different from the batch type in the data selection of an A/R tax report.

Reprocess

Regenerate Enter 1 to delete all data in the F76CT2 table.

Date From Enter the first day of the range of dates that the system uses to select records from the F76CT2 table to delete.

| | |
|-----------------------|--|
| Date To | Enter the last day of the range of dates that the system uses to select records from the F76CT2 table to delete. |
| Address Number | Enter the address number that the system uses to select records to delete from the F76CT2 table. |
| Title | |
| Line Two | Enter the text that the system prints as line two of the report title. This processing option is optional. |
| Line Three | Enter the text that the system prints as line three of the report title. This processing option is optional. |

Processing Options for R76C0003

The processing options for this program are the same as for R76C0001.

See [Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” Processing Options for R76C0001 and R76C0003, page 1826.](#)

Processing Options for Timbre Withholding (R76C0004)

Processing options for reports enable you to specify the information that appears on the reports.

Print

| | |
|-------------------|--|
| Period | Enter the period for which you run the report. You must enter a range of dates in the data selection. |
| Issue Date | Enter the issue date to be printed on the certificate. If you leave this processing option blank, the system uses the system date. |
| City | Enter the city where the deposit for the withholding was made. |
| Print City | Enter <i>1</i> to print on the certificate the city in which the withholding occurred. |

Level

| | |
|--------------|--|
| Level | Enter the level break that is specified in the data sequence. Enter <i>1</i> to break on account. Enter <i>2</i> to break on tax area. Enter <i>3</i> to break on GL offset. If you do not complete this processing option, the system breaks the report on the account. |
|--------------|--|

Responsible

| | |
|-------------------------------|---|
| Name | Enter the name of the person who is responsible for the information shown in the certificate. |
| Additional Information | Enter additional information that appears on the certificate. |

Display

| | |
|-------------------------|---|
| Print Percentage | Enter <i>1</i> to print on the certificate the percentage of the withholding. |
|-------------------------|---|

Reverse Sign Enter *1* to reverse the sign for the fiscal rate and the total tax amount.

Third Party

Name Specify the name of the third-party that the system prints on the certificate. Enter *1* to print the value from the Alpha Name field (ALPH). Enter *2* to print the value from the Address field (ADD1). Enter *3* to print the value from the Notes field (DS01). If you leave this processing option blank, the system print the value from the Alpha Name field.

Reprocess

Regenerate Enter *1* to delete all data in the F76CT2 table.

Date From Enter the first day of the range of dates that the system uses to select records from the F76CT2 table to delete.

Date To Enter the last day of the range of dates that the system uses to select records from the F76CT2 table to delete.

Address Number Enter the address number that the system uses to select records to delete from the F76CT2 table.

Title

Title Enter the title to print on the certificate.

Certificate

VAT Withholding Enter *1* to generate a certificate of VAT withholding. Enter a different character to generate other certificates.

Consolidate Enter *1* to print one certificate for all companies.

VAT Withheld

Tolerance Level Enter *1* to specify a percentage as a tolerance level in order to approach the percentage of the VAT withheld to a 50 percent or 100 percent.

Percentage Enter the value to use as tolerance level for the print of the VAT withheld.

Note. Enter the percentages in integers. For example, if the value is 3 percent, enter 3.

Processing Options for General Journal by Category Code (R76C0911)

Set the processing options for the General Journal by Category Code 21, General Journal by Category Code 22, or General Journal by Category Code 23.

Dates

Dates From and Dates To Enter the date range in which to print transactions.

Cat. Code

Category Code Enter the category code 21, 22, or 23 in which the PUC is specified.

Processing Options for General Ledger with Total by Object Account (R76C0911A)

Set these processing options for the General Ledger with Total by Object Account.

Dates

Dates From and Dates To Enter the date range in which to print transactions.

R76C094 - Inventory and Balance Sheet by Category Code

To ensure that accounts without balances do not print on the Inventory and Balance Sheet by Object Account report, enter *N* (inactive PUC accounts) in the Description 02 field of the code in UDC tables 09/21, 09/22, and 09/23.

Before you run this report, run these required programs from Fiscal Books by Category Code (G76C151):

- Update Level in Category Code program (R76C0907) from Fiscal Books by Category Code (G76C151).
This program updates the detail level of the accounts in category code 13 from UDC table 09/13 to generate reports by category code. Running the update program makes the Inventory and Balance Sheet by Object Account report process faster. This update program might take several hours to process records.
- Data File Generation A/P program (R04901A).
In the processing options, enter the as of date in which you will run the Inventory and Balance Sheet by Object Account report.
- Data File Generation A/R program (R76C03B11).
In the processing options, enter the as of date in which you will run the Inventory and Balance Sheet by Object Account report.

Processing Options for Inventory and Balance Sheet by Category Code (R76C094)

Set these processing options for the Inventory and Balance Sheet by Object Account report.

The Inventory and Balance Sheet by Object Account (R76C094B) report also use these processing options.

Period

- 1. Period** Enter the fiscal year and period number to generate the report. These dates must match the dates entered for the Data File Generation A/R and Data File Generation A/P programs.

Print Options

- 1. Zero Accounts** Leave this processing option blank to include active accounts with zero amounts in the report. Enter *1* to suppress printing of accounts with zero amounts.

- | | |
|---|---|
| 2. A/P Third Party (accounts payable third party) | Leave this processing option blank to include detailed balances by accounts payable subledger. Enter <i>1</i> to suppress printing of detailed balances. |
| 3. A/R Third Party | Leave this processing option blank to include detailed balances by accounts receivable subledger. Enter <i>1</i> to suppress the printing of detailed balances. |
| 4. Other Third Party | Leave this processing option blank to include detailed balances for accounts different from accounts payable and accounts receivable. Enter <i>1</i> to suppress printing of detailed balances. |

Level

- | | |
|---------------------------|---|
| 1. Level of Detail | Enter the detail level for category code 21 for which inventory and balance report generation is required. If you leave this processing option blank, the system prints all levels. |
|---------------------------|---|

Ledger

- | | |
|-----------------------|--|
| 1. Ledger Type | Enter the ledger type from UDC table 09/LT in which to generate the report. If you generate more than one ledger type (book), separate the ledgers with a comma. If you leave this processing option blank, the system uses ledger type AA. |
|-----------------------|--|

Cat Code

- | | |
|---|---|
| PUC Category Code - Colombia | Enter the category code (<i>21</i>) from which information is retrieved for the report. |
| Category Code used for PUC levels - Colombia | Enter <i>13</i> for this processing option. This value is required. It corresponds to category code 09/13 and contains PUC level accounts, which are updated by the Update Level in Category Code programs. |

Processing Options for Inventory and Balance Sheet by Object Account (R76C094B)

The processing options for this report are the same as those for the Inventory and Balance Sheet by Category Code report.

See Appendix C, "JD Edwards EnterpriseOne Country-Specific Reports," Processing Options for Inventory and Balance Sheet by Category Code (R76C094), page 1831.

Processing Options for Trial Balance by Category Code (R76C0941)

Set these processing options for the Trial Balance by Category Code report.

Period

- | | |
|---|--|
| 1. Fiscal Year and Period Number | Enter the fiscal year and period number in which to generate the report. |
|---|--|

1. Level

Printing Level

Specify the account level of detail for category code 21. Ensure that you associate a level to the category code to print header and total lines.

If you leave this processing option blank, the system prints all levels.

Ledger

1. Ledger Types

Enter the ledger type from UDC table 09/LT in which to generate the report. If you generate more than one ledger type (book), separate the ledgers with a comma.

If you leave this processing option blank, the system uses ledger type AA.

Cat Code

PUC Category Code - Colombia

Enter the category code (21) from which information is retrieved for the report.

Category Code used for PUC levels - Colombia

Enter 13 for this processing option. This value is required. It corresponds to category code 09/13 and contains PUC level accounts, which are updated by the Update Level in Category Code programs.

Processing Options for Debits and Credits T/B by Object Account (R76C09411)

The processing options for this report are the same as those for the Trial Balance Report (R09410), except for the additional processing options described in this section.

See *JD Edwards EnterpriseOne General Accounting 8.12 Implementation Guide*, “JD Edwards EnterpriseOne General Accounting Reports,” Processing Options for Trial Balance Report (R09410).

Process

1. Regenerate F76C0902

Enter 1 to regenerate the F76C0902 table and print the report with a new data selection. If you enter any other value, the report does not regenerate the table.

2. Company

Specify the company in which to generate the report. If you leave this processing option blank, the report includes all companies (consolidation).

3. Purge Files

Specify whether to purge tables for the company specified in the Company processing option. Values are:

Blank: Do not purge tables

1: Purge tables.

Group

1. Group

Specify how to group the report. Values are:

1: Group by business unit

2: Group by company

3: Group all companies

Title

1. Optional Report Title Enter a title for the report in the processing options for Line 1 and Line 2.

Version

1. Version Enter the version for the R76C0902A

Processing Options for G/L with Subledger Totals (R76C094211)

Set these processing options for the G/L with Subledger Totals report.

Ledger Type

Ledger Type I, Ledger Type II, Ledger Type III, and Ledger Type IV Specify a ledger type from UDC table 09/LT. You can specify up to four ledger types.

Subledger

Subledger Specify the general ledger subledger. If you leave this processing option blank, the system uses * for all subledgers.

R76C9415B - Daily Books by Complete Document Report

This report prints a general ledger that includes all accounting transactions with matching documents.

When you run this report, the system stores the selected data from the F0911 table to a temporary table (F76C9415), then sorts the data by company, document type, batch type, and account number. The system uses these fields as level breaks in the report. The report includes three columns: Account Number and Description, Debits, and Credits.

Note. Use Data Selection to limit the records selected from the F0911 table. For example, you might specify the dates of the records to select. If you do not use limit the data selection, the processing time might be excessive.

Processing Options for G/L by Object Account with Subledger Total (R76C9422)

Set these processing options for the G/L by Object Account with Subledger Total report.

Content

1. Report Content Specify the transactions to show in detail (not summarized as a balance forward). Values are:

- 0: Year to date.
- 1: Current period.
- 2: Inception to date.
- 3: Period Range. (You must enter dates in the second processing on the Dates tab.

Dates

- 1. Fiscal Year and Period** Enter the fiscal year and period for which the general ledger is to be prepared. If you leave this processing option blank, the system uses the financial reporting year and period for the company.
- 2. Fiscal Year and Period** Enter the fiscal year and period number if the Report Content processing option is 3.

Print

- 1. Account Format** Specify the account number to print.
1: Account number.
2: Short account ID.
3: Unstructured account.
- 2. Print Units** Specify whether to print units. Values are:
Blank: Do not print units. (Print amounts only.)
1: Print units.
- 3. Omit Zero Balance** Specify whether to include accounts that have no balance and no detail for the specified period. Values are:
Blank: Include accounts.
1: Omit accounts.

Document

- 1. Document Type** Specify whether to include a document type if a specific ledger is used. If you leave this processing option blank, all document types are included.
- 2. Subledger** Enter a specific subledger or enter * for all subledgers.
- 3. Subledger Type** Enter the subledger type if you entered a specific subledger in the Subledger processing option.

Currency

- 1. Currency Code** Enter a specific currency code or enter * for all currency codes.

Ledger Type

- 1. Ledger Types** Enter the ledger types to print on the report. If you leave the first processing option blank, the system uses ledger type AA.
Enter values for the three remaining Ledger Type processing options, if applicable.

(FRA) Reports for France

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for France.

| Report ID and Report Name | Description | Navigation |
|---|---|--|
| R00314 (FRA) Bank Account Exception Report | Lists any drafts with an invalid bank transit number, customer bank account number, or control digit. | Draft Remittance and Collection (G03B162), Bank Account Exception Report |
| R09473 (FRA, ITA, USA) Debit/Credit T/B by Object | Verifies the accuracy of transactions in individual account ledgers. When all of the transactions are accurate, the totals in this report equal the totals in the G/L reports and the G/L Registration Report (R09404). | French Reports (G093151), T/B by Object and Subsidiary |
| R70470 (ESP, FRA, ITA) G/L by Category Code | Validates information in legal reports and can be used as the basis for internal auditing. You can also use the report as a basis for external auditing by a third-party, such as a fiscal authority or auditing firm. | French Reports (G093151), G/L by Category Code |
| R70472 (FRA, ITA) T/B by Category Code | Verifies the accuracy of transactions in individual account ledgers. When all of the transactions are accurate, the totals in this report equal the totals in the General Ledger report and the General Ledger Registration report. | French Reports (G093151), T/B by Category Code |
| R7403B926 (FRA, ITA) A/R Inventory Book | The A/R Inventory Book report lists the total open amount for each customer by company. If a customer has open amounts in more than one company, the open amount for each company is listed separately. | French Reports (G093151), A/R Inventory Book. |
| R7404026 (FRA, ITA) A/P Inventory Book | The A/P Inventory Book report lists the total open amount for each supplier by company. If a supplier has open amounts in more than one company, the open amount for each company is listed separately. | French Reports (G093151), French Reports. |
| R74099A (FRA, ITA) Sequential Number Report - Tax File | Use this report to verify that document numbers are in sequential order without interruptions, the system prints a report based on the Taxes table (F0018). | French Reports (G093151), Sequential Number Report - Tax File. |

| Report ID and Report Name | Description | Navigation |
|---|---|--|
| R74099B (FRA, ITA) Sequential Number Report - A/P Ledger | Use this report to verify that document numbers are in sequential order without interruptions, the system prints a report based on the Accounts Payable Ledger (F0411). | French Reports (G093151), Sequential Number Report - A/P Ledger. |
| R74099C (FRA, ITA) Sequential Number Report - A/R | Use this report to verify that document numbers are in sequential order without interruptions, the system prints a report based on the Customer Ledger (F03B11). | French Reports (G093151), Sequential Number Report - A/R |
| R7409C1 (ESP, FRA, ITA) G/L by Object and Subsidiary | Validates information in legal reports and can be used as the basis for internal auditing. You can also use this report as a basis for external auditing by a third-party, such as a fiscal authority or auditing firm. | French Reports (G093151), G/L by Object and Subsidiary. |
| R7409C3 (FRA, ITA) T/B by Object and Subsidiary | Verifies the accuracy of transactions in individual account ledgers. When all of the transactions are accurate, the totals in this report equal the totals in the General Ledger report and the General Ledger Registration report. | French Reports (G093151), T/B by Object and Subsidiary. |
| R7409C5 (FRA) General Journal | Prints transactions chronologically by the date when the entries were posted to the general ledger. Within the same date, the entries are ordered by: <ul style="list-style-type: none"> • Time when the entries are entered or posted • Type of transaction, such as purchase, sale, and miscellaneous expense • Account number order | French Reports (G093151), General Journal. |

(FRA) Processing Options for Bank Account Exception Report (R00314)

Processing option enable you to set default values for processing.

Validation

Country or 'B' type

Enter *I* to validate the bank transit number based on the B bank type method. If you do not complete this processing option, the system validates the transit number based on the available country specific validation rules.

R09473 - (FRA, ITA, USA) Debit/Credit T/B by Object

Use the Debit/Credit T/B by Object report to verify the accuracy of transactions in individual account ledgers. When all of the transactions are accurate, the totals for this report equal the totals in the general ledger reports and the G/L Registration report.

Businesses often print the Debit/Credit T/B by Object report to facilitate internal audits by verifying one or more accounts. Businesses also use this report for external audits, as required by a fiscal authority or auditing firm.

You can print the Debit/Credit T/B by Object report to review the total debit and credit amounts for each account in any given ledger. You can also find errors that cause the general ledger to be out of balance. Possible errors include incorrect entries or missing transactions.

The report provides the current balances from the F0902 table and compares these totals with the YTD transaction information from the F0911 table.

You can also total groups of accounts, such as assets, liabilities, year-to-date income, revenues, cost of goods sold, other income, or other expenses, depending on the account ranges that you set up in your AAIs.

Processing Options for Debit/Credit T/B by Object (R09473)

Processing options enable you to specify the default processing for reports.

Select

| | |
|--|---|
| Period Number | Specify the period for which the trial balance prints. If you complete this processing option, you must also specify the fiscal year for the period in the Fiscal Year processing option. If you leave this processing option blank, the program uses the current period defined on the Set Up Company form and recorded in the F0010 table. |
| Fiscal Year | Specify the last two digits of the fiscal year for which the trial balance prints, for example, enter 07 for 2007. If you complete this processing option, you must also complete the Period Number processing option. If you leave this processing option blank, the program uses the current fiscal year defined for the JD Edwards EnterpriseOne General Accounting system and recorded in the F0010 table. |
| Ledger Type 1, Ledger Type 2, and Ledger Type 3 | Specify the first, second, and third ledger type on which you want to report. Enter a value from UDC table 09/LT. |

Print

| | |
|--|--|
| 1. Accounts with Zero Balances | Specify whether to include accounts with zero balances in the selected period. |
| 2. Balance and Difference Columns | Specify if you want a Balance and a Difference column print on the report. The Balance column prints the account's current balance, calculated from the table. This Balance column is then compared to the Cumulative YTD Total column on the report, which is calculated from the F0911 table. Any differences found between the Cumulative YTD Total column and the Balance column are printed in the Difference column on the report. |
| 3. Summarize Subsidiary Accounts | Specify whether the system summarizes all subsidiary accounts into one object account. |

4. Total by GLG AAI Account Ranges

Specify if you want totals for the GLGx AAI ranges to print on the report. These totals print after the appropriate object account, according to the account ranges set up for the default company (company 00000) in AAI item GLGx. Totals are printed for these account ranges:

GLG2 - GLG3: Assets.

GLG3 - GLG5: Liabilities.

GLG5: YTD Income.

GLG6 - GLG7: Revenues.

GLG8 - GLG9: Cost of Goods Sold (COGS).

GLG11 - GLG13: Other Income.

GLG13 - GLG12: Other Expenses.

5. Class Total Level

Specify how the system classifies accounts for purposes of subtotalling. The report classifies accounts by account number. You can classify by one, two, three, or four digits of the account number. The report includes a class total for each classification.

For example, if you classify accounts by two digits, the report includes a class total for accounts 1000 through 1099, another class total for accounts 1100 through 1199, and so on. If you classify accounts by three digits, the report includes a class total for accounts 1100 through 1110, another class total for accounts 1111 through 1119, and so on.

If you classify accounts by all four digits, each object account has its own class total; subsidiary accounts to a single object are included in the class total.

The system includes class totals at the level that you specify and at lower levels. For example, if you classify accounts by two digits, the report includes a class total for accounts 1000 through 1999, in addition to the class totals for accounts 1000 through 1099, 1100 through 1199, and so on.

Process

1. Mode

Specify the mode in which you want to run this report.

Note. You can run this report in final mode only once for the selected period and fiscal year. The transactions that are printed in final mode do not appear if you run the report again.

Currency

1. As-If Currency

Specify an *as if* currency code in which to print amounts for this report. This processing option allows you to review amounts in a currency other than the currency in which they are stored. Only amounts associated with the AA ledger type are converted to the *as if* currency. If you leave this processing option blank, amounts do not print in an *as if* currency.

If you leave this processing option blank, the As If Currency column does not appear on the report.

2. As-Of Date

Specify the date on which to retrieve the exchange rate for the *as if* currency from the F0015 table. If you enter a value for the As If Currency Code

processing option and leave this processing option blank, the system uses the date specified in the Thru Date processing option for the exchange rate.

R70470 - (ESP, FRA, ITA) G/L by Category Code

You can use the G/L by Category Code report as a basis for internal auditing to validate information in legal reports. You can also use this report as a basis for external auditing by a third-party, such as a fiscal authority or auditing firm.

The G/L by Category Code report includes detailed information about account transactions. You can use the report to:

- Review transactions within individual accounts.
- Research accounts that are out-of-balance.
- Verify account accuracy.
- Open and audit accounts with the same control totals as the journal report.

The report includes this information:

- All of the transactions that are printed on the General Journal report (R7409C5).
- A period debit and credit total for each account.
- A total balance in debit and credit format.
- Beginning and ending balances for each account.
- A balance forward for each account.
- Accumulation of amounts from different ledger types for the same account.
- Transactions that are based on a period selection or a date range selection.
- General ledger registration numbers for each transaction.
- Currency codes for each transaction.
- Company codes and names on the header of the report.
- Business units (optional).
- Accounts with zero balances (optional).

You can print the G/L by category report by object and subsidiary, or by category code, depending on whether accounts are defined in the F0901 table by object and subsidiary, or in category codes 21, 22, or 23.

Note. If you print this report by object and subsidiary, you can review the accumulation of up to three ledger types for the same account. You specify which ledger types to include on the report in the processing options. The Ledger Type processing option replaces the code from UDC table 74/LT.

Processing Options for G/L by Category Code (R70470)

Processing options enable you to specify the default processing for reports.

Select

1. Fiscal Dates

Specify the fiscal dates in which to print the report in four processing options.

| | |
|---|---|
| Beginning Period Number, Beginning Fiscal Year, Ending Period Number, and Ending Fiscal Year | <p>Use these processing options to specify:</p> <p>The first period and the fiscal year of the first period in which to print the report.</p> <p>The last period and the fiscal year of the last period in which to print the report.</p> |
| 2. Ledger Types | Specify the ledger types to include on the report in three processing options. |
| Ledger Type 1, Ledger Type 2, and Ledger Type 3 | Specify the first, second, and third ledger type to include in the report. Enter valid ledger types from UDC table 09/LT. |
| Print | |
| 1. Account Category Code (21–43) | Use this processing option to include account numbers from an alternate chart of accounts on the report. Enter the category code that contains the alternate chart of accounts as R0xx, where xx is the category code number. If you leave this processing option blank, the system uses R021. |
| 2. Subledger/Type | Specify whether you want to print the Subledger and Subledger Type columns on the report. |
| 3. Business Unit | Specify whether you want the report to include a column that lists the business unit for each account. |
| 4. Accounts with Zero Balances | <p>Specify whether to include accounts with zero balances in the selected period. Values are:</p> <p>Blank: Do not include accounts with zero balances.</p> <p><i>I</i>: Include accounts with zero balances.</p> |
| 5. Unposted Transactions | Specify whether to print unposted transactions on the report. |
| 6. Total for Posted and Unposted Transactions | <p>Specify whether separate totals for posted and unposted transactions should print on the report.</p> <p>You can print totals for posted and unposted transactions only if you have set the Unposted Transactions processing option accordingly.</p> |
| 7. First Profit and Loss Account | <p>Specify where the balance sheet accounts end and the profit and loss accounts begin in the alternate chart of accounts.</p> <p>If you complete this processing option, the report includes subtotals for balance sheet and profit and loss accounts.</p> |
| 8. Column Format | Specify which optional columns to include on the report. |
| 9. Report Sequence | <p>Specify the data sequencing for the system to use when processing this report. All options include category code as the first item of sequencing. Values are:</p> <p>Blank: Sequence by next number. Records are sorted in order of general ledger date and assigned a next number for each Account ID. Period totals do not print on the report.</p> <p><i>I</i>: Sequence by period. Records are printed on the report in ascending order by general ledger date. Period totals and period end balances print on the report.</p> |

Process

| | |
|----------------|---|
| 1. Mode | Specify the mode in which you want to run the report. |
|----------------|---|

When you run this report in final mode, only those records that have been printed in final mode on a trial balance report (R7409C3 or R70472) print.

R70472 - (FRA, ITA) T/B by Category Code

Use the T/B by Category Code report to verify the accuracy of transactions in individual account ledgers. When all of the transactions are accurate, the totals in this report equal the totals in the G/L by Category Code and G/L Registration reports.

Businesses often print the trial balance report to facilitate internal audits by verifying one or more accounts. Businesses also use the T/B by Category Code report for external audits, as required by a fiscal authority or auditing firm.

You can print this report to review the total debit and credit amounts for each account in any given ledger. You can also find errors that cause the general ledger to be out of balance. Possible errors might include incorrect entries or missing transactions.

The format and contents of the localized trial balance report differs from the base software trial balance reports for system 09. For example, the localized trial balance reports include this information that the base trial balance reports do not include:

- A total for each account and subtotals for account classes.
- Transaction detail in debit and credit format.
- Accumulation of different ledger types for the same account.
- Information that is specific to a period (month and year) selection.

Note. The T/B by Category Code report (R70472) includes balance forward amounts only for balance sheet accounts, not for profit and loss accounts.

You can print the French T/B by Category Code report by object and subsidiary, or by category code, depending on whether accounts are defined in the object.subsidiary or in category codes 21, 22, or 23.

Note. If you print the T/B by Category Code report by object and subsidiary, you can review the accumulation of up to three ledger types for the same account. To do this review, specify which ledger types to include on the report in the processing options. The Ledger Type processing option replaces the code in UDC table 74/LT.

Processing Options for T/B by Category Code (R70472)

Processing options enable you to specify the default processing for reports.

Select

1. Period Number and 2. Fiscal Year

Specify the period and the two-digit fiscal year for which to print the trial balance.

If you leave these processing option blanks, the program uses the current period and current fiscal year that is defined for the JD Edwards EnterpriseOne General Accounting system on the Set Up Company form and recorded in the F0010 table.

3. Ledger Type 1, 4. Ledger Type 2, and 5. Ledger Type 3

Specify the first, second, and third ledger type to include in the report. Enter a valid code from UDC table 09/LT. If you leave all three of the ledger types blank, the system includes only ledger type AA.

Print

- 1. Account Category Code** Use this processing option to include account numbers from an alternate chart of accounts. Specify the category code that contains the alternate chart of accounts. Values are:

R021: Category code 21.

R022: Category code 22.

R023: Category code 23.
- 2. Accounts with Zero Balances** Specify whether to include accounts with zero balances. Values are:

Blank: Include accounts with zero balances.

1: Do not include accounts with zero balances.
- 3. Class Total Level** Specify how the system should classify accounts for purposes of subtotalling. The report classifies accounts by account number.

Enter a number that corresponds to the number of account number digits you want to use to classify accounts. You can classify by one, two, three, or four digits of the account number. The report includes a class total for each classification. Values are:

1: Classify by the first digit of the account number.

2: Classify by the first two digits of the account number.

3: Classify by the first three digits of the account number.

4: Classify by all four digits of the account number.

If you leave this processing option blank, the report will not include any class totals.

You can use this processing option in conjunction with the Last Balance Sheet Account processing option to include subtotals for balance sheet and profit-and-loss accounts. If you do not specify a Class Total Level, the report will not include subtotals for balance sheet and profit-and-loss accounts.

For example, if you classify accounts by two digits, the report will include a class total for accounts 1000 through 1099, and another class total for accounts 1100 through 1199, and so on. If you classify accounts by three digits, the report will include a class total for accounts 1100 through 1110, and another class total for accounts 1111 through 1119, and so on. If you classify accounts by all four digits, each object account will have its own class total; subsidiary accounts to a single object will be included in the class total.

The system includes class totals at the level you specify and at lower levels.

For example, if you classify accounts by two digits, the report will include a class total for accounts 1000 through 1999 in addition to the class totals for accounts 1000 through 1099, 1100 through 1199, and so on.
- 4. Last Balance Sheet Account** Specify where the balance sheet accounts end and the profit and loss accounts begin in the alternate chart of accounts.

This processing option works in conjunction with the Class Total Level processing option. The system ends the balance sheet accounts and begins the profit and loss accounts at the end of the class that contains the account number you specify. For example, if you specify account number 622000

with Class Total Level 1, the system ends the balance sheet accounts with class 6 (the first digit of 622000). If you specify account number 622000 with Class Total Level 2, the system ends the balance sheet accounts with class 62 (the first two digits of 622000).

If you do not specify a Class Total Level the report will not include subtotals for balance sheet and profit-and-loss accounts.

Process

1. Mode

Specify the mode in which to run this report. Values are:

0: Proof mode.

1: Final mode.

Note. You can run this report in final mode only once for the selected period and fiscal year. The transactions that are printed in final mode will not print appear if you run the report again.

R7403B926 - (FRA, ITA) A/R Inventory Book

The A/R Inventory Book report lists the total open amount for each customer by company. If a customer has open amounts in more than one company, the open amount for each company is listed separately.

You use a processing option to indicate whether the report lists customers with positive open amounts or customers with negative open amounts. The system prevents you from including both positive and negative open amounts on the same report. A customer with a positive open amount has unpaid invoices. A customer with a negative open amount has overpaid.

Note. In Italy, businesses are required to report customer and supplier open amounts at year end. To report this information, print open amount reports for the customers. You are required by Italian law to include these reports as attachments to the Balance Sheet.

Processing Options for A/R Inventory Book (R7403B026)

Processing options enable you to specify the default processing for programs and reports.

Print

Use this processing option to include customers with a negative balance on the A/R Open Amounts report.

1. Balances

Specify whether to include customers with a negative balance on the A/R Open Amounts Report. If a customer has a negative balance, that customer has overpaid you. Values are:

Blank: Positive balance.

1: Negative balance.

Currency

Use these processing options to show amounts in a currency other than the currency in which the amounts are stored on the system.

1. As-If Currency

Specify whether to show amounts in a currency other than the currency in which the amounts are stored on the system. The system translates and shows domestic amounts in this As-If currency. For example, an amount in FRF can appear as-if it is in EUR.

Enter the code for As-If currency or leave this processing option blank if you do not want to show amounts in an alternate currency.

Note. This processing option allows you to view amounts in a different currency as a hypothetical scenario only. The amounts that appear in the different currency are not saved to the system.

2. As-Of Date

Specify an As-Of date if you enter a currency code for the As-If Currency processing option. This option processes the exchange rate as of the date you specify.

Enter the As-Of date, or leave this processing option blank to use the system date.

Note. A valid exchange rate must exist in the exchange rate table between the two currencies based on the As-Of date.

R7404026 - (FRA, ITA) A/P Inventory Book

The A/P Inventory Book report lists the total open amount for each supplier by company. If a supplier has open amounts in more than one company, the open amount for each company is listed separately.

You use a processing option to indicate whether the report lists suppliers with positive open amounts or suppliers with negative open amounts. The system prevents you from including both positive and negative open amounts on the same report. A supplier with a positive open amount has unpaid invoices. A supplier with a negative open amount has been overpaid.

You can use the processing options to display amounts in the euro.

Note. In Italy, businesses are required to report supplier open amounts at year end. To report this information, print the open amounts reports for the suppliers. You are required by Italian law to include these reports as attachments to the Balance Sheet.

Processing Options for the A/P Inventory Book (R7404026)

Processing options enable you to specify the default processing for programs and reports.

Print

Use this processing option to include suppliers with a negative balance on the A/P Open Amounts report.

1. Balances

Specify whether to include suppliers with a negative balance on the A/P Open Amounts Report. If you have a supplier has a negative balance, you have overpaid that supplier. Values are:

Blank: Positive balance.

I: Negative balance.

Currency

Use these processing options to show amounts in a currency other than the currency in which the amounts are stored on the system.

1. As-If Currency

Specify whether to show amounts in a currency other than the currency in which the amounts are stored on the system. The system translates and shows domestic amounts in this As-If currency. For example, an amount in FRF can appear as-if it is in EUR.

Enter the code for as-if currency, or leave this processing option blank if you do not want to show amounts in an alternate currency.

Note. This processing option allows you to view amounts in a different currency as a hypothetical scenario only. The amounts that appear in the different currency are not saved to the system.

2. As-Of Date

Specify an As-Of date if you enter a currency code for the As-If Currency processing option. This option processes the exchange rate as of the date you specify.

Enter the As-Of date, or leave this processing option blank to use the system date.

Note. A valid exchange rate must exist in the exchange rate table between the two currencies based on the As-Of date.

R74099A - (FRA, ITA) Sequential Number Report - Tax File

Businesses in France and Italy are required by law to number each original fiscal document both sequentially and chronologically. Fiscal documents include VAT taxes, such as accounts payable vouchers and accounts receivable invoices. Because each revenue and expense event must be documented in chronological order, businesses must include the numeric sequencing of each document number in the VAT registers.

Use the Sequential Number - Tax File report to identify any document numbers that are out of sequence. When you print the report, the system checks the number for each document that includes a VAT amount in the Taxes table (F0018).

The report prints the appropriate error message for each document that meets these conditions:

- The document number is not sequential.
- The general ledger date is lower than that of the previous document.

It is recommended that you print the Sequential Number Report - Tax File daily; if not daily, at least before you change the general ledger date.

You must manually correct any errors in the sequential numbering or justify the gap in the numbering of the documents.

Processing Options for the Sequential Number Report - Tax File (R74099A)

Processing options enable you to specify the default processing for programs and reports.

Select

Use these processing options to enter the range of dates for which you want to examine transactions for sequential numbering. The system will examine all transactions with a general ledger date that is within the range that you specify.

1. From Date and 2. Thru Date Specify the beginning or the end of the range of general ledger dates from which you want to select transactions.

R74099B - (FRA, ITA) Sequential Number Report - A/P Ledger

Businesses in France and Italy are required by law to number each original fiscal document both sequentially and chronologically. Fiscal documents include VAT taxes, such as accounts payable vouchers and accounts receivable invoices. Because each revenue and expense event must be documented in chronological order, businesses must include the numeric sequencing of each document number in the VAT registers.

Use the Sequential Number - A/P Ledger report to identify any document numbers that are out of sequence. When you print the report, the system checks the number for each document that includes a VAT amount in the Accounts Payable Ledger table (F0411).

The report prints the appropriate error message for each document that meets these conditions:

- The document number is not sequential.
- The general ledger date is lower than that of the previous document.

It is recommended that you print the Sequential Number Report - A/P Ledger daily; if not daily, at least before you change the general ledger date.

You must manually correct any errors in the sequential numbering or justify the gap in the numbering of the documents.

Processing Options for the Sequential Number Report - A/P Ledger (R74099B)

Processing options enable you to specify the default processing for programs and reports.

Select

Use these processing options to enter the range of dates for which you want to examine transactions for sequential numbering. The system will examine all transactions with a general ledger date that is within the range that you specify.

1. From Date and 2. Thru Date Specify the beginning or the end of the range of general ledger dates from which you want to select transactions.

R74099C - (FRA, ITA) Sequential Number Report - A/R

Businesses in France and Italy are required by law to number each original fiscal document both sequentially and chronologically. Fiscal documents include VAT taxes, such as accounts payable vouchers and accounts receivable invoices. Because each revenue and expense event must be documented in chronological order, businesses must include the numeric sequencing of each document number in the VAT registers.

Use the Sequential Number - A/R report to identify any document numbers that are out of sequence. When you print the report, the system checks the number for each document that includes a VAT amount in the Customer Ledger (F03B11) table.

The report prints the appropriate error message for each document that meets these conditions:

- The document number is not sequential.
- The general ledger date is lower than that of the previous document.

It is recommended that you print the Sequential Number Report - A/R daily; if not daily, at least before you change the general ledger date.

You must manually correct any errors in the sequential numbering or justify the gap in the numbering of the documents.

Processing Options for the Sequential Number Report - A/R Program (R74099C)

Processing options enable you to specify the default processing for programs and reports.

Select

Use these processing options to enter the range of dates for which you want to examine transactions for sequential numbering. The system will examine all transactions with a general ledger date that is within the range that you specify.

- 1. From Date and 2. Thru Date** Specify the beginning or the end of the range of general ledger dates from which you want to select transactions.

R7409C1 - (ESP, FRA, ITA) G/L by Object and Subsidiary

You can use the G/L by Object and Subsidiary report as a basis for internal auditing to validate information in legal reports. You can also use this report as a basis for external auditing by a third-party, such as a fiscal authority or auditing firm.

The G/L by Object and Subsidiary report includes detailed information about account transactions. You can use the report to:

- Review transactions within individual accounts.
- Research accounts that are out-of-balance.
- Verify account accuracy.
- Open and audit accounts with the same control totals as the journal report.

The report includes this information:

- All of the transactions that are printed on the General Journal report (R7409C5).
- A period debit and credit total for each account.
- A total balance in debit and credit format.
- Beginning and ending balances for each account.
- A balance forward for each account.
- Accumulation of amounts from different ledger types for the same account.
- Transactions that are based on a period selection or a date range selection.
- General ledger registration numbers for each transaction.

- Currency codes for each transaction.
- Company codes and names on the header of the report.
- Business units (optional).
- Accounts with zero balances (optional).

You can print the G/L by Object and Subsidiary report by object and subsidiary, or by category code, depending on whether accounts are defined in the F0901 table by object and subsidiary, or in category codes 21, 22, or 23. If you print this report by object and subsidiary, you can review the accumulation of up to three ledger types for the same account. You specify which ledger types to include on the report in the processing options. The Ledger Type processing option replaces the code from the UDC table 74/LT.

Processing Options for G/L by Object and Subsidiary (R7409C1)

The processing options for the G/L by Object and Subsidiary report are the same as those for the G/L by Category Code report, except for those described in this section.

See *JD Edwards EnterpriseOne General Accounting 8.12 Implementation Guide*, “JD Edwards EnterpriseOne General Accounting Reports,” Processing Options for G/L by Category Code (R09470).

Print

- | | |
|--|--|
| 3. Level Break on Business Unit | Specify whether to begin a new business unit on a new page. |
| 4. Model Business Unit | Specify the model business unit that contains the account descriptions you want to use. If you leave this processing option blank, the transaction account descriptions will be used. |
| 5. Accounts with Zero Balances | Specify whether the system should include accounts with zero balances. Values are: Blank: Include accounts with zero balances. I: Do not include accounts with zero balances. |

Versions

- | | |
|-------------------|---|
| 1. Version | Specify either the French or Italian version of the G/L by Object and Subsidiary report. Values are: Blank: French version. Lists the batch number and batch type for each transaction. I: Omits the batch number and batch type columns and instead lists the general ledger registration number and currency code for each transaction. |
|-------------------|---|

Process

- | | |
|----------------|--|
| 1. Mode | Specify the mode in which to run the report. Values are: Blank: Proof mode. I: Final mode. |
|----------------|--|

Note. When you run this report in final mode, only those records that have been printed in final mode on a trial balance report (R7409C3 or R70472) will be printed.

Currency

1. As-If Currency

Specify an *as if* currency code in which to print amounts for this report. This processing option allows you to review amounts in a currency other than the currency in which they are stored. Only amounts associated with the AA ledger type are converted to the *as if* currency. If you leave this processing option blank, amounts do not print in an *as if* currency.

If you leave this processing option blank, the As If Currency column does not appear on the report.

2. As-Of Date

Specify the date on which to retrieve the exchange rate for the *as if* currency from the F0015 table. If you enter a value for the As If Currency Code processing option and leave this processing option blank, the system uses the system date.

R7409C3 - (FRA, ITA) T/B by Object and Subsidiary

Use the T/B by Object and Subsidiary report to verify the accuracy of transactions in individual account ledgers. When all of the transactions are accurate, the totals in this report equal the totals in the G/L by Category Code and the G/L Registration report.

Businesses often print the trial balance report to facilitate internal audits by verifying one or more accounts. Businesses also use this report for external audits, as required by a fiscal authority or auditing firm.

You can print the T/B by Object and Subsidiary report to review the total debit and credit amounts for each account in any given ledger. You can also find errors that cause the general ledger to be out of balance. Possible errors might include incorrect entries or missing transactions.

The format and contents of the localized trial balance report differs from the base trial balance reports in system 09. For example, the localized trial balance reports include this information that the base trial balance reports do not include:

- A total for each account and subtotals for account classes.
- Transaction detail in debit and credit format.
- Accumulation of different ledger types for the same account.
- Information that is specific to a period (month and year) selection.

Note. The T/B by Category Code report includes balance forward amounts only for balance sheet accounts, not for profit and loss accounts.

You can run the French T/B by Object and Subsidiary report by object and subsidiary, or by category code, depending on whether accounts are defined in the object.subsidiary or in category codes 21, 22, or 23. If you print Trial Balance reports by object and subsidiary, you can review the accumulation of up to three ledger types for the same account. To do this review, specify which ledger types to include on the report in the processing options. The Ledger Type processing option replaces the code in UDC table 74/LT.

Processing Options for T/B by Object and Subsidiary (R7409C3)

The processing options for T/B by Object and Subsidiary are the same as those for T/B by Category Code, except for those described in this section

Print

- | | |

| 1. Model Business Unit | Specify the model business unit that contains the account descriptions you want to use. If you leave this processing option blank, the transaction account descriptions will be used. |
| 3. Summarize Subsidiary Accounts | <p>Specify whether to summarize all subsidiary accounts into one object account. Values are:</p> <p>Blank: Do not summarize subsidiary accounts.</p> <p>1: Summarize subsidiary accounts.</p> |
| 4. Class Total Level | <p>Specify how the system should classify accounts for purposes of subtotalling. The report classifies accounts by account number.</p> <p>Enter a number that corresponds to the number of account number digits you want to use to classify accounts. You can classify by one, two, three, or four digits of the account number. The report includes a class total for each classification. Values are:</p> <p>1: Classify by the first digit of the account number.</p> <p>2: Classify by the first two digits of the account number.</p> <p>3: Classify by the first three digits of the account number.</p> <p>4: Classify by all four digits of the account number.</p> <p>If you leave this processing option blank, the report will not include any class totals.</p> <p>You can use this processing option in conjunction with the Last Balance Sheet Account processing option to include subtotals for balance sheet and profit-and-loss accounts. If you do not specify a Class Total Level, the report will not include subtotals for balance sheet and profit-and-loss accounts.</p> <p>For example, if you classify accounts by two digits, the report will include a class total for accounts 1000 through 1099, and another class total for accounts 1100 through 1199, and so on. If you classify accounts by three digits, the report will include a class total for accounts 1100 through 1110, and another class total for accounts 1111 through 1119, and so on. If you classify accounts by all four digits, each object account will have its own class total; subsidiary accounts to a single object will be included in the class total.</p> <p>The system includes class totals at the level you specify and at lower levels.</p> <p>For example, if you classify accounts by two digits, the report will include a class total for accounts 1000 through 1999 in addition to the class totals for accounts 1000 through 1099, 1100 through 1199, and so on.</p> |

Currency

- | | |
|--------------------------|---|
| 1. As-If Currency | Specify an <i>as if</i> currency code in which to print amounts for this report. This processing option allows you to review amounts in a currency other than the |
|--------------------------|---|

currency in which they are stored. Only amounts associated with the AA ledger type are converted to the *as if* currency. If you leave this processing option blank, amounts do not print in an *as if* currency.

If you leave this processing option blank, the As If Currency column does not appear on the report.

2. As-Of Date

Specify the date on which to retrieve the exchange rate for the *as if* currency from the F0015 table. If you enter a value for the As If Currency Code processing option and leave this processing option blank, the system uses the system date.

R7409C5 - (FRA) General Journal

According to commercial law and the French 1982 Chart of Accounts, businesses in France are required to maintain a record of all accounting entries in the General Journal. These entries must be recorded in the General Journal chronologically by the date when the entries are posted to the general ledger. Within the same date, the entries must be ordered by:

- Time when the entries are entered or posted.
- Type of transaction, such as purchase, sale, and miscellaneous expense.
- Account number order.

Businesses also have the option to use the General Journal to centralize all of the accounting entries that are recorded in auxiliary journals. In this case, the entries in the General Journal are a monthly summary of the detailed entries in the auxiliary journals. The requirement for recording accounting entries in the auxiliary journals is the same as for the General Journal, that is, all entries must be chronological. The General Journal can be divided into as many auxiliary journals as the business requires. You define auxiliary journals according to data selection on batch type and document type. For example:

- Purchases Auxiliary Journal (*journal des achats*)
- Sales Auxiliary Journal (*journal des ventes*)
- Cash Auxiliary Journal (*journal de banque*)

Based on the legislation of the General Chart of Accounts, the summary of the General Journal program should be presented in debit and credit format, and not on a cumulative balance. In addition, businesses can summarize the journal under the condition that all documents which are required to verify the daily entries are kept on file.

The format of the General Journal has not been completely defined by the law. However, for an information system, the General Journal should be in the form of electronic documents that are printed on a report. The electronic documents should offer all of the guarantees in terms of disallowing the modification or deletion of the accounting entries once the entries have been validated. The General Journal must be kept in French.

When you run the General Journal program, the system:

- Prints a report of all the entries in the F0911 table in chronological order.
The entries are the same entries that are printed on the General Ledger report, but they are sorted by general ledger date rather than by account.
- Prints the entries in detail, with one line for each account, and one line for each document number and type.

Additional features of the General Journal report include:

- Option to print by period and fiscal year, or by date range.
- Ability to accumulate multiple ledger types.

- Inclusion of the company in the header.
- Option to print by object and subsidiary, or category code.
- User-defined report totals, including:
 - General total
 - Total by company
 - Total by period
 - Total by batch type
- User-defined date sequencing, including:
 - Sequence by G/L date, document number, and document type.
 - Sequence by batch, document number, and document type.

Processing Options for General Journal (R7409C5)

Processing options enable you to specify the default processing for reports.

Select

**Beginning Period Number,
Beginning Fiscal Year,
Ending Period Number, and
Ending Fiscal Year**

Specify the first period and the fiscal year of the first period in which to print the general journal.

Specify the last period and the fiscal year of the last period in which to print the general journal.

You can leave these processing options blank and complete the Beginning Date and Ending Date processing options instead.

**Beginning Date and Ending
Date**

Specify the beginning date and ending date of the time period in which to print the general journal.

You can leave these processing options blank and complete the four processing options for fiscal dates instead.

**3. Ledger Type 1, 4. Ledger
Type 2, and 5. Ledger
Type 3**

Specify the first, second, and third ledger type to include in the report. Enter a valid code from UDC table 09/LT. If you leave all three of the ledger types blank, the system includes only ledger type AA.

Print

1. Account Category Code

Specify whether to print account numbers from an alternate chart of accounts on the report. Enter the number of the category code that contains the alternate chart of accounts. The system uses the account descriptions from the category code table.

Leave this processing option blank to use default account numbers. You can specify a model business unit that contains the account descriptions you want to appear on the report.

2. Model Business Unit

If you use default account numbers, use this processing option to specify the model business unit that contains the account descriptions to print on the report. If you use default account numbers and you leave this processing option blank, the transaction account descriptions will print.

If you use an alternate chart of accounts, you do not have to complete this processing option. The system uses the account descriptions from the category code table.

3. Multiple Account Summarization

Specify whether to summarize entries to the same account in multiple business units. Regardless of whether you summarize accounts, debits and credits will not be summarized. Values are:

Blank: Print entries in detail.

Y: Summarize entries to the same account in multiple business units.

4. Business Unit

Specify whether the report includes a column that lists the business unit for each account. Values are:

Blank: Do not include the Business Unit column.

Y: Include the Business Unit column.

5. Subledger/Type

Specify whether to print the Subledger and Subledger Type columns on the report. Values are:

Blank: Do not print the columns.

Y: Print the columns.

Process

1. Mode

Specify the mode in which you want to run the report. Values are:

0: Proof mode.

1: Final mode. Only those records that have been printed in final mode on the Trial Balance report (R7409C3 or R7409C4) will be printed.

Currency

1. As-If Currency

Specify an *as if* currency code in which to print amounts for this report. This processing option allows you to review amounts in a currency other than the currency in which they are stored. Only amounts associated with the AA ledger type are converted to the *as if* currency. If you leave this processing option blank, amounts do not print in an *as if* currency.

If you leave this processing option blank, the As If Currency column does not appear on the report.

2. As-Of Date

Specify the date on which to retrieve the exchange rate for the *as if* currency from the F0015 table. If you enter a value for the As If Currency Code processing option and leave this processing option blank, the system uses the system date.

(DEU) Reports for Germany

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Germany.

| Report ID and Report Name | Description | Navigation |
|---|--|---|
| R741201A Asset Master List | The Asset Master List report (R741201A) provides a detailed asset analysis. | German Localization (G74D), Asset Master List |
| R741201B Asset Master Acquisitions | The Asset Master Acquisitions report (R741201B) provides a detailed asset acquisition analysis. | German Localization (G74D), Asset Master Acquisitions |
| R741202A2 <i>Anglangengitter</i> Report: Value Adjustments | Print this <i>Anglangengitter</i> report to review changes in the value of an asset. Use this report for side-by-side comparison with the Acquisition Cost report (R741202A1). | German Localization (G74D), Value Adjustments |
| R741202A1 <i>Anglangengitter</i> Report: Acquisition Cost | Print this <i>Anglangengitter</i> report to review asset acquisition information. Use this report for side-by-side comparison with the Value Adjustments report (R741202A2). | German Localization (G74D), Acquisition Cost |

Processing Options for the Asset Master List (R741201A) Report

Use these processing options to specify the level of detail, and the year or period to run the report.

Selection

Specify the fiscal dates, company, and current accounting period to print on the report.

Century

Specify the calendar century associated with the year. Enter the first two digits of the year. For example, 19 indicates any year beginning with 19 (1998, 1999), 20 indicates any year beginning with 20 (2000, 2001), and so on.

Fiscal Year

Specify the number that identifies the fiscal year. Generally, you can either enter a number in this field or leave it blank to indicate the current fiscal year (as defined on the Company Setup form).

Specify the year at the end of the first period rather than the year at the end of the fiscal period. For example, a fiscal year begins October 1, 1998 and ends September 30, 1999. The end of the first period is October 31, 1998. Specify the year 98 rather than 99.

Company

Specify the code that identifies a specific organization, fund, or other reporting entity. The company code must already exist in the Company Constants table (F0010) and must identify a reporting entity that has a complete balance sheet. At this level, you can have intercompany transactions.

Note. You can use company 00000 for default values such as dates and AAIs. You cannot use company 00000 for transaction entries.

Month of Period End (1 - 12)

Specify the number indicating the current accounting period. This number, used in conjunction with the Company Constants table (F0010) and the General Constants table (F0009), enables the user to define up to 14 accounting periods. See General Ledger Date. The current period number is used to

determine posted before and posted after cut off warning messages. It is also used as the default accounting period in the preparation of financial reports.

Settings

Use these processing options to specify the totals to print on the report.

| | |
|--|---|
| Totals on Company (For YES type 1) | Specify whether to print the totals by company on the report. Values are: Blank: Do not print the totals. 1: Print the totals. |
| Totals on Business Unit (For YES type 1) | Specify whether to print the totals by business unit on the report. Values are: Blank: Do not print the totals. 1: Print the totals. |
| Totals on Accounting Class (For YES type 1) | Specify whether to print the totals by accounting class on the report. Values are: Blank: Do not print the totals. 1: Print the totals. |
| Totals on Parent (For YES type 1) | Specify whether to print the totals by parent on the report. Values are: Blank: Do not print the totals. 1: Print the totals. |

Processing Options for the Asset Master Acquisitions (R741201B) Report

Use these processing options to specify the level of detail, and the year or period to run the report.

Selection

Specify the fiscal dates, company, and current accounting period to print on the report.

| | |
|--------------------|---|
| Century | Specify the calendar century associated with the year. Enter the first two digits of the year. For example, 19 indicates any year beginning with 19 (1998, 1999), 20 indicates any year beginning with 20 (2000, 2001), and so on. |
| Fiscal Year | Specify the number that identifies the fiscal year. Generally, you can either enter a number in this field or leave it blank to indicate the current fiscal year (as defined on the Company Setup form). Specify the year at the end of the first period rather than the year at the end of the fiscal period. For example, a fiscal year begins October 1, 1998 and ends September 30, 1999. The end of the first period is October 31, 1998. Specify the year 98 rather than 99. |
| Company | Specify the code that identifies a specific organization, fund, or other reporting entity. The company code must already exist in the Company Constants table (F0010) and must identify a reporting entity that has a complete balance sheet. At this level, you can have intercompany transactions. |

Note. You can use company 00000 for default values such as dates and AAIs. You cannot use company 00000 for transaction entries.

Month of Period End (1 - 12)

Specify the number indicating the current accounting period. This number, used in conjunction with the Company Constants table (F0010) and the General Constants table (F0009), enables the user to define up to 14 accounting periods. See General Ledger Date. The current period number is used to determine posted before and posted after cut off warning messages. It is also used as the default accounting period in the preparation of financial reports.

Settings

Use these processing options to specify the information to print on the report.

Totals on Company (For YES type 1)

Specify whether to print the totals by company on the report. Values are:

Blank: Do not print the totals.

I: Print the totals.

Totals on Business Unit (For YES type 1)

Specify whether to print the totals by business unit on the report. Values are:

Blank: Do not print the totals.

I: Print the totals.

Totals on Accounting Class (For YES type 1)

Specify whether to print the totals by accounting class on the report. Values are:

Blank: Do not print the totals.

I: Print the totals.

Totals on Parent (For YES type 1)

Specify whether to print the totals by parent on the report. Values are:

Blank: Do not print the totals.

I: Print the totals.

Show Depreciation (For YES type '1')

Specify whether to display depreciation on the report. Values are:

Blank: Do not display depreciation.

I: Display depreciation.

Processing Options for the Acquisition Cost (R741202A1) and Valued Adjustments (R741202A2) Reports

Set these processing options before you run these reports.

Process

Use these processing options to specify the period number and fiscal year to print on the report.

1. Period Number

Specify the period number for the report. If you leave this processing option blank, the system uses the financial reporting date.

Note. If you want the financial reporting date to be company-specific, you must sequence by asset number, company, or business unit.

2. Fiscal Year

Specify the period number for the report. If you leave this processing option blank, the system uses the financial reporting date.

Note. If you want the financial reporting date to be company-specific, you must sequence by asset number, company, or business unit.

JE Creation

Use these processing options to specify the journal entry information to print on the report.

1. Report Journal Entry Creation Mode

Specify whether to run the program in preliminary or final mode. Values are:
Blank: Preliminary Mode.
I: Final Mode.

2. JE G/L Date

Specify the GL date for journal entries that the system creates.

3. Reverse Journal Entries

Specify whether the system creates reversing journal entries. Values are:
Blank: Do not create reversing entries.
R: Create reversing entries.

4. JE Document Type

Specify the document type that the system uses when it creates journal entries.

5. JE Name - Alpha Explanation

Use the processing option to specify whether the system uses flexible accounting. Values are:
Blank: Do not use flex accounting.
I: Use flex accounting.

(GBR) Reports for Great Britain

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Great Britain.

| Report ID and Report Name | Description | Navigation |
|---|---|---|
| R74U0137 End of Year Return CIS36 | Generates an annual report that summarizes payments and deductions made during the tax year to all CIS subcontractors, regardless of the card or certificate that they hold. You can use the data selection to select subcontractors who hold specific cards or certificates, or you can select all subcontractors. | Periodic Processing (G74U0220), End of Year Return CIS36 |
| R74U137A End of Year Return CIS36 - CIS4 | Generates an annual report that summarizes payments and deductions made during the tax year to CIS subcontractors who hold CIS4 registration cards. | Periodic Processing (G74U0220), End of Year Return CIS36 - CIS4 |

| Report ID and Report Name | Description | Navigation |
|--|---|---|
| R74U0137B End of Year Return CIS36 - CIS5 | Generates an annual report that summarizes payments and deductions made during the tax year to CIS subcontractors who hold CIS5 construction tax certificates. | Periodic Processing (G74U0220), End of Year Return CIS36 - CIS5 |
| R74U0137C End of Year Return CIS36 - CIS6 | Generates an annual report that summarizes payments and deductions made during the tax year to CIS subcontractors who hold CIS6 subcontractor tax certificates. | Periodic Processing (G74U0220), End of Year Return CIS36 - CIS6 |
| R74U0138 Supplier Analysis Report | Use this report to review a detailed list of your CIS subcontractors, including information about their CIS subcontractor documents. The report includes warning messages for missing, expired, or invalid documents. | Accounts Payable Reports (G74U0214), Supplier Analysis Report |

Processing Options for End of Year Return CIS36 (R74U0137, R74U0137A, R74U0137B, and R74U0137C)

Processing options enable you to specify the default processing for programs and reports.

Dates

- 1. Date - From and 2. Date - Thru** Enter the beginning and ending dates in which to include data for the report in these processing options.

Process

- 1. Mode** Enter *I* to print the report in final mode or leave this processing option blank to print it in proof mode.
- 2. CIS Voucher Status** Enter the CIS voucher status.

(ITA) Reports for Italy

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Italy.

| Report ID and Report Name | Description | Navigation |
|---|---|---|
| R00400 (ITA) VAT Report by Tax Area Code | Prints a report of VAT by tax area code. This report includes the VAT for Accounts Payable and Accounts Receivable transactions in two separate columns. You must print the report on a special legal form that is prenumbered and approved by the tax authorities. | Italian VAT Processing (G00213), VAT Report by Tax Area Code |
| R004051 (ITA) Monthly VAT Report | Print a report that includes accounts payable and accounts receivable VAT. You print the report on a required form. | Italian VAT Processing (G00213), Monthly VAT Report |
| R09404 (ITA) G/L Registration Report | Prints a list of the general ledger transactions for each month in chronological and sequential order | Italian Reports (G093152), G/L Registration Report |
| R09473 (FRA, ITA, USA) Debit/Credit T/B by Object See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” R09473 - (FRA, ITA, USA) Debit/Credit T/B by Object, page 1838. See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” Processing Options for Debit/Credit T/B by Object (R09473), page 1838. | Verifies the accuracy of transactions in individual account ledgers. When all of the transactions are accurate, the totals in this report equal the totals in the G/L reports and the G/L Registration report (R09404). | Italian Reports (G093152), T/B by Object & Subsidiary. |
| R70470 (ESP, FRA, ITA) G/L by Category Code See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” R70470 - (ESP, FRA, ITA) G/L by Category Code, page 1840. See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” Processing Options for G/L by Category Code (R70470), page 1840. | Validates information in legal reports and can be used as the basis for internal auditing. You can also use the report as a basis for external auditing by a third-party, such as a fiscal authority or auditing firm. | Italian Reports (G093152), G/L by Category Code |

| Report ID and Report Name | Description | Navigation |
|---|--|--|
| <p>R70472 (FRA, ITA) T/B by Category Code</p> <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” R70472 - (FRA, ITA) T/B by Category Code, page 1842.</p> <p>See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” Processing Options for T/B by Category Code (R70472), page 1842.</p> | <p>Verifies the accuracy of transactions in individual account ledgers. When all of the transactions are accurate, the totals in this report equal the totals in the General Ledger report and the General Ledger Registration report. | Italian Reports (G093152), T/B by Object and Subsidiary. |
| R74093 (ITA) Print VAT Summary Report | To review the total amount of VAT that is due to the Italian government, print the summary VAT report. | Italian Tax Processing (G002131), Print VAT Summary Report |

Processing Options for VAT Report by Tax Area Code (R00400)

Processing options enable you to specify the default processing for programs and reports.

GL Date

Enter the From and Through GL Dates: From Date or Through Date

Print Option

Suppress page headings Enter *1* to suppress report headings and page numbers. If left blank page headings will be printed.

Blank Line

Insert a Blank Line Enter *1* to insert a blank line when Tax Area Codes are skipped.

Reverse Sign

Reverse the Sign Option Enter *1* to reverse the sign on AR transactions.

R004051 - Monthly VAT Report

In Italy, businesses are required to print monthly reports to document accounts payable and accounts receivable VAT. The report must be printed on a form following the guidelines of art. 27 of the DPR 26 ottobre 1972 n.633.

You use the processing options on the Monthly VAT Report to create both an Accounts Payable and an Accounts Receivable version of the report. You should run both reports monthly.

You also need to indicate which rate from the Intra-Community VAT tax rate/area is included on the report. On the Accounts Payable version, include the positive tax rate. On the Accounts Receivable version, include the negative tax rate.

To number the pages of the report progressively by calendar year, specify the year and number for the first page in the processing options. The pages are numbered on the report by using the year and beginning with the number that you specify. For example, if you print two 1000-page reports during the year 2005, the pages should be numbered as:

- First report of 1000 pages - First page number 2005/1, last page number 2005/1000.
- Second report of 1000 pages - First page number 2005/1001, last page number 2005/2000.

In this example, you would specify a year of *05* and a first page number of *1* when you print the first report, and a year of *05* and a first page number of *1001* when you print the second report.

To run the report for suspended VAT, use data selection to select only documents with the document type for suspended VAT.

Processing Options for Monthly VAT Report (R004051)

Processing options enable you to specify the default processing for programs and reports.

Default

These processing options let you specify whether to generate the report in proof or final mode, whether to run the report for AP or AR, and whether to reverse the sign of transaction amounts on the report.

- | | |
|---------------------------|---|
| 1. Processing Mode | Specify whether to run the report in proof or final mode. Values are: Blank: Proof mode. <i>1</i> : Final mode. |
| 2. AP or AR Form | Specify whether to print the Monthly VAT Report (R004051) for AR or AP. Values are: Blank: Run the AR Monthly VAT Report. <i>1</i> : Run the AP Monthly VAT Report. |

Note. The data selection for batch type should be different for the AR and AP Monthly VAT Report.

- | | |
|------------------------|---|
| 3. Reverse Sign | Specify whether to reverse the sign of the transaction amounts on the report. Values are: |
|------------------------|---|

Blank: Do not reverse.

/: Reverse.

Select

These processing options let you specify the dates that the system uses to select transactions for the report as well as the tax rate for intracommunity VAT.

- 1. From GL Date** Specify a beginning GL date for the system to use when it selects records for the report.
- 2. Through GL Date** Specify an ending GL date for the system to use when it selects records for the report. If you leave this processing option blank, the system uses the system date.
- 3. Tax Rate for Intra-community VAT** Specify the tax rate for intracommunity VAT that you want to print on the report. This depends on whether you are running the AR version (Input VAT - minus sign) or the AP version (Output VAT - plus sign). Values are:
Blank: Print the tax rate on line 1 of Tax Rate/Area Revision.
/: Print the tax rate on line 2 of Tax Rate/Area Revision.

Print

These processing options let you specify how various elements print on the report.

- 1. Sequential Numbers and Dates** Specify whether you want the system to skip lines on the report when document numbers or GL dates are not sequential. Values are:
Blank: Do not skip.
/: Skip lines. If you select this processing option, the system skips two lines.
- 2. Document Description** Specify how you want the system to print the document type description. Values are:
Blank: Print the document type description from the invoice remark.
/: Print the document type description from the user-defined codes.
- 3. Suppress Header** Specify whether you want the system to suppress the printing of print headings and page numbers. Values are:
Blank: Print.
/: Suppress.
- 4. Enter the Year that should be printed with the page numbers of the report** Specify whether you want the system to print the year along with the page numbers on the report. Enter the last two digits of the fiscal year that you want to print on the report. If you leave this processing option blank and the report heading is not suppressed, the system prints runtime page numbers.
- 5. Enter the Number to be used as the first page number of the report** Specify the number from which you want to start the page numbering for the report. If you leave this processing option blank and the report heading is not suppressed, the system prints runtime page numbers.

Currency

These processing options let you set up as-if currency processing.

- | | |
|---|---|
| 1. Enter the Currency Code for As-If currency reporting. | Specify the currency code for as-if currency reporting. This option enables you to print amounts in a currency other than the currency in which they are stored. Either enter a currency code or leave this option blank to print amounts in the currency in which they are stored. |
| 2. Enter the As-Of date for processing the exchange rate for the as-if currency. | Specify the as-of date for processing the exchange rate for the as-if currency. If you leave this option blank, the system uses the exchange rate that is valid for the system date. |

R09404 - (ITA) G/L Registration Report

Businesses in Italy are required to print a general journal report that lists all of the general ledger transactions for each month in chronological and sequential order. To do this task, you can print the G/L Registration Report-Italy.

You can print the G/L Registration Report-Italy in proof or final mode. You can reprint the G/L Registration Report in proof mode to review transactions for which registration numbers are already assigned. When you select final mode, the system assigns a chronological and sequential registration number to each general ledger transaction in the F0911 table. The system stores the registration number for each transaction in a dedicated field (REG#). You can use a processing option to control whether the system assigns registration numbers to journal entries or to each individual journal entry line.

To ensure that the registration number for each transaction is sequential by date, run the G/L Registration Report program in final mode only after you perform these tasks:

- Enter all of the transactions for the month.
- Review the G/L Registration report generated in proof mode.

Note. If your company implements JD Edwards EnterpriseOne software in the middle of a fiscal year, you need to indicate the continuing registration number from your previous numbering system (manual or automated). To do this task, access the Revise G/L Registration File form.

You can also print the G/L Registration report for multicompartment environments where general ledger transactions are entered for different document companies that belong to the same legal entity. To do this task, set the processing options so that you can enter the legal company that you want to print on the header of the report. Then use data selection to identify the document companies that belong to the legal company.

To number the pages of the report progressively by calendar year, specify the year and number for the first page in the processing options. The pages are numbered on the report by using the year and beginning with the number that you specify. For example, if you print two 1000-page reports during the year 2007, the pages should be numbered as follows:

- First report of 1000 pages - First page number 2007/1 and last page number 2007/1000
- Second report of 1000 pages - First page number 2007/1001 and last page number 2007/2000

In this example, you would specify a year of 07 and a first page number of 1 when you print the first report, and a year of 07 and a first page number of 1001 when you print the second report.

Registration Numbers for Adjusting Journal Entries

After the year end, you might need to enter general ledger transactions to record adjustments for the previous fiscal year. You can enter these adjusting journal entries with a special document type (##) and the general ledger date for the end of the fiscal year, such as January 31, 2007.

Italian law requires that the date on which you actually enter the adjustment also be included in the journal entry record. To satisfy this requirement, the system records both the general ledger date that you specify for the end of the fiscal year and the actual date when you enter the adjusting entry. You can use a processing option to control the actual date of the adjustment entry that prints on the G/L Registration report. In addition, adjusting entries must include a chronological and sequential registration number, as would any other general ledger transaction.

Print the G/L Registration Report to assign registration numbers to adjusting journal entries for the previous fiscal year. You can specify registration numbers for adjusting journal entries, based on these numbering patterns:

- Start with the next available number for the previous fiscal year.
- Start with the next available number for the current fiscal year.

Important! The practice of numbering adjustments by using the next available number for the previous fiscal year can be disputed by the Italian fiscal authority. The option of using the next available number for the current fiscal year is legally acceptable and should be adopted by all Italian customers. To select a numbering pattern, use the corresponding processing option on the Adjustments tab for the G/L Registration Report.

When you print the G/L Registration Report for the adjusting entries in final mode, the system:

- Updates the Adjustments Registration Date with the date that you specify in the processing option for adjusting entries
- Assigns chronological and sequential registration numbers to each transaction

See Also

Chapter 84, “(ITA) Working With Functionality for Italy,” Closing a Fiscal Year in Italy, page 1476

Processing Options for G/L Registration Report (R09404)

Processing options enable you to specify the default processing for reports.

Default

- | | |
|--|--|
| 1. Processing Mode | Specify the mode in which you want to run the report. Values are: Blank: Run the report in proof mode. 1: Run the report in final mode without headings and titles. 2: Run the report in final mode with headings and titles. |
| 2. Registration Number | Specify how the system assigns registration numbers. Values are: Blank: Assign a registration number to each document. 1: Assign a registration number to each individual journal entry line. |
| 3. Adjustment Registration Date | Specify the adjustment registration date. Enter any specific registration date. If you leave this processing option blank, the system assigns the general ledger date of the adjustment. |
| 4. Next Available Registration Number for Adjustments | Specify how the system assigns the next available registration number for adjustments entered in the prior year. Values are: Blank: Use the next available registration number from the current fiscal year. |

I: Use the next available registration number from the fiscal year of the adjustment general ledger date, which would be for the previous fiscal year. This option is not recommended.

Select

1. From Date and 2. Thru Date

Specify the beginning date and ending date for the system to use when selecting records for the report.

3. Enter the company number to be used to store and retrieve G/L balance values

Specify the company number for which the report is printed. If you leave this processing option blank, the system prints the report for company 00000.

Print

1. Enter the Year that should be printed with the page numbers of the report

Enter the year that you want to print on the page numbers of the report. If you leave this processing blank, runtime page numbers are printed in proof mode and no page numbers are printed in final mode.

2. Enter the Number to be used as the first page number of the report

Specify the number from which you want to start the page numbering for the report. If you leave this processing option blank, runtime page numbers are generated in proof mode and no page numbers are generated in final mode.

3. Enter the Account Number to print on the report

Specify whether the system includes account numbers from the alternate chart of accounts on the report. Enter the category code that contains the alternate chart of accounts. Values are:

Blank: Do not include account numbers from the alternate chart of accounts. Use the regular account number (BU.Obj.Sub).

21: Include account numbers from the chart of accounts in category code 21.

22: Include account numbers from the chart of accounts in category code 22.

23: Include account numbers from the chart of accounts in category code 23.

Currency

1. Enter the Currency Code for as-if currency reporting.

Specify the currency for *as if* currency reporting. This processing option allows amounts to print in a currency other than the currency in which they were originally entered. Enter a currency code from F0013 table. If you leave this processing option blank, the system prints amounts in the currency in which they were originally entered.

2. Enter the As-Of date for processing the exchange rate for the as-if currency.

Specify the effective date for processing the exchange rate for the *as if* currency. If you leave this processing option blank, the system uses the exchange rate associated with the system date.

Processing Options for R7404430 (ITA) Print W/T Payment Proposal

Processing options enable you to set default values for processing.

Date

From Due Date Enter the beginning of the date range for which you print the report.

Through Due Date Enter the end of the date range for which you print the report.

Print

Print Enter 1 to print the supplier address on the report.

R74079 - (ITA) Invoice List Control Report

You can print a list of suspended VAT invoices that still need to be paid by printing the Invoice List Control report (R74079). When you print the report, the system verifies that the invoice has not been paid on the as of date that you specify for the report. The system then calculates the open amount.

For each invoice, the report lists this information:

- Identifying data (date, number, and pay item).
- VAT rate.
- Original credit amounts (taxable, tax, and total).
- Advance receipts amounts and credit notes to be debited (taxable, tax, and total).

Processing Options for Invoice List Control Report (R74079)

Processing options enable you to specify the default processing for programs and reports.

As Of Date

As of Date Enter the As of Date. If left blank, the System Date will be used.

Currency

- 1. Currency Code** 1. Enter the Currency Code for as-if currency reporting. This option allows for amounts to print in a currency other than the currency they are stored in. Amounts will be translated and print in this as-if currency. If left blank, amounts will print in their database currency.
- 2. Date** 2. Enter the As-Of date for processing the current rate for the as-if currency. If left blank, the system date will be used.

R74093 - (ITA) Print VAT Summary Reports

To review the total amount of VAT that is due to the Italian government, print the summary VAT report. The report prints VAT totals by:

- Register type
- Register class
- Previous balance

To number the pages of the report progressively by calendar year, specify the year and number for the first page in the processing options. The pages are numbered on the report by using the year and beginning with the number that you specify. For example, if you print two 1000-page reports during the year 2005, the pages should be numbered as:

- First report of 1000 pages - First page number 2005/1, last page number 2005/1000.
- Second report of 1000 pages - First page number 2005/1001, last page number 2005/2000.

In this example, you would specify a year of 05 and a first page number of 1 when you print the first report, and a year of 05 and a first page number of 1001 when you print the second report.

When you print the summary VAT report, the system:

- Creates a temporary workfile for Printing IVA Summary - Italy (F74093) that is based on the links that you establish for document type, register class, and register; and for the information in the F0018 table.
- Prints an error report that lists records from the Taxes table that do not include register type or register class information.
- Prints the summary VAT report.

Date Ranges

The beginning date of the date range that is specified in the processing options for the Print VAT summary Reports (R74093) must be one day later than the most recent record in the F74093 table. If you are running the summary VAT report for the first time, the beginning date must be one day later than the date of the initial VAT balance.

Intra-Community VAT Summary Report

You must print the information for sales and purchases that are subject to intracommunity VAT on separate sections of the Print VAT Summary Reports. To separate intracommunity VAT on the report, you must set up a register type and class for the intracommunity VAT tax rate/area and document type.

To report the offset intracommunity VAT, you need to indicate which rate from the Intra-Community VAT tax rate/area includes the negative tax rate.

Processing Options for Print VAT Summary Reports (R74093)

Processing options enable you to specify the default processing for programs and reports.

Default

This processing option let you specify whether to generate the report in proof or final mode.

- | | |
|---------------------------|--|
| 1. Processing Mode | Specify whether to run the report in proof or final mode. Values are: Blank: Proof mode. / Final mode. |
|---------------------------|--|

Select

These processing options let you specify information that the system uses to select transactions for the report as well as information about intracommunity VAT.

- | | |
|--------------------------------------|---|
| 1. From date and 2. Thru date | Specify the beginning date or the ending date for the system to use when it selects records for the report. |
|--------------------------------------|---|

- | | |
|--|---|
| 3. Company | Specify the company for the system to include on the report. |
| 4. Tax Rate for Payable Intra-Community Offset VAT. | Specify the tax rate for payable intracommunity offset VAT that you want to print on the report. Values are: Blank: Print tax rate 1 on the report. / : Print tax rate 2 on the report. |
| 5. VAT Register Class for Payable Intra-Community Offset VAT. | Specify the VAT register class for payable intracommunity offset VAT. Select a valid VAT register class from UDC table 74/01. |
| 6. VAT Register Type for Payable Intra-Community Offset VAT. | Specify the VAT register type for payable intracommunity offset VAT. Select a valid register type from UDC table 74/02. |

Print

These processing options let you specify how various elements print on the report.

- | | |
|--|---|
| 1. Print Header Option | Specify whether the system should print the standard JD Edwards EnterpriseOne report header or the through date header. Values are: Blank: Print the standard report header. / : Print the through date report header. If you select this processing option, the system prints the words, Payment Vat Report thru and then prints the date that you entered in the Thru date processing option. |
| 2. Enter the Year that should be printed with page numbers of the report. | Specify whether you want the system to print the year along with the page numbers on the report. Enter the last two digits of the fiscal year that you want to print on the report. If you leave this processing option blank, the system prints runtime page numbers. |
| 3. Enter the Number to be used as the first page number of the report. | Specify the number from which you want to start the page numbering of the report. If you leave this option blank, the system prints runtime page numbers. |
| 4. Suppress negative sign | Specify whether to suppress the printing of the negative sign. Values are: Blank: Do not suppress. / : Suppress. |

Currency

These processing options let you set up as-if currency processing.

- | | |
|---|---|
| 1. Enter the Currency Code for as-if currency reporting. | Specify the currency code for as-if currency reporting. This option enables you to print amounts in a currency other than the currency in which they are stored. Enter a valid currency code from the Designate Currency Codes program (P0013). The system converts and prints the amounts in this as-if currency. If you leave this processing option blank, the system prints amounts in the currency in which they are stored. |
| 2. Enter the As-of date for processing the exchange rate for the as-if currency. | Specify the as-of date for processing the exchange rate for the as-if currency. If you leave this processing option blank, the system uses the exchange rate that is valid for the system date. |

(JPN) Reports for Japan

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Japan.

| Report ID and Report Name | Description | Navigation |
|-------------------------------------|--|---|
| R7503420 Draft Receivable Report | Prints a list of processed drafts, including the bank-assigned draft number. No processing options exist for this report. | Japanese Localization (G75J), Draft Receivable Report |
| R75402 A/P Draft Payable List | Use this report to list all of the outstanding draft payables, including the bank name and value date. No processing options exist for this report. | Japanese Localization (G75J), A/P Draft Payable List |

(POL) Reports for Poland

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Poland.

Additional reports for value-added taxes exist.

See *JD Edwards EnterpriseOne Tax Processing 8.12 Implementation Guide*, “(RUS and POL) Setting Up the System for Russian and Polish Taxes,” (POL) Working with Tax Processing for Poland.

| Report ID and Report Name | Description | Navigation |
|--|--|--|
| R74P03B61 AR Trial Balance Report | Lists all accounts receivable transactions by currency, company, account, and supplier. | General Ledger (G74P09), AR Trial Balance |
| R74P0450 AP Trial Balance | This report lists all accounts payable transactions by currency, company, account, and supplier or customer. You use this report to verify data in offset and vendor accounts. You can print the report in summary or detail mode. | General Ledger (G74P09), A/P Trail Balance. |
| R74P9010 GL Trial Balance by Object | Lists information about transaction posted to the general ledger. | General Ledger (G74P09), GL Trial Balance by Obj |

| Report ID and Report Name | Description | Navigation |
|---|---|--|
| R74P9015 GL Trial Balance by Category Code | Prints the same information as the General Ledger by Object report, but it presents information by category code instead of object account. For example, the General Ledger by Category Code report has three level breaks (one for each category code) instead of one level break like the General Ledger by Object report. The system prints the information for account category codes 21, 22, and 23, as applicable. | General Accounting (G74P09), GL Trial Balance by Category Code |
| R74P9020 Transaction Journal | Lists all journal entries and assigns a register number to them by company and fiscal year. | General Ledger (G74P09), GL Transaction Journal |
| R74P9030 Bank Register | Lists bank transactions. | General Ledger (G74P09), Bank Register |

R74P03B61 - AR Trial Balance Report

The AR Trial Balance report (R74P03B61) lists all accounts receivable transactions by currency, company, account, and supplier. You use this report to verify data in offset and vendor accounts. You can print the report in summary or detail mode.

When you run the AR Trial Balance report, the system writes data from the F03B11 and F03B14 tables to the F74P03BW table, and then prints the formatted data on the report.

Summary Mode

When you run the report in summary mode, the system prints this information in the report header:

- Reporting period
- Company number
- Company description
- Currency code

The system prints this information in the report detail section:

- Vendor's address book number.
- Vendor name.
- Opening balance for the report period (debit or credit).
- Opening balance for the year (debit or credit).
- Account turnover.
- Year to date debit or credit.
- Cumulative balance (debit or credit).

Detail Mode

When you run the report in detail mode, the system prints this information in the report header:

- Reporting period
- Company number
- Company description
- Currency code

For each detail line, the system prints this information in the report detail section:

- Document type
- Document number
- Document date
- Transaction amount
- Transaction description

Additionally, the detailed report lists a subheading that precedes the list of transactions for an account. The subheading shows the supplier's address book number and name. The report also has a summary line for each account that lists the year opening balance, the net change in the account for the month, the year to date balance and the accumulated balance.

Note. Before you run this report, post accounts receivable transactions.

Processing Options for AR Trial Balance (R74P03B61)

Processing options enable you to specify the default processing for programs and reports.

Select

| | |
|---------------------------|---|
| Fiscal Year | Specify the fiscal year for which the system selects records to process. |
| Fiscal Period From | Specify the first period in a range of periods that the system uses to select records to process. |
| Fiscal Period Thru | Specify the end period in a range of periods that the system uses to select records to process. |
| Company Number | Specify the company number for which the system selects records to process. |
| Date From | Specify the first date in a range of dates that the system uses to select records to process. The system uses this processing option if you leave the Fiscal Period From and the Fiscal Period Thru processing options blank. |
| Date Thru | Specify the last date in a range of dates that the system uses to select records to process. The system uses this processing option if you leave the Fiscal Period From and the Fiscal Period Thru processing options blank. |

Process

| | |
|--------------------------|---|
| Report Appearance | Enter 1 to print all detail lines for the accounts. Leave this processing option blank to print account totals. |
|--------------------------|---|

Rebuild Work Table Enter *1* to clear the table before writing new records to the table. Leave this processing option blank to append new records to the table.

Print

Account Print Format Specify the format in which the system prints account numbers on the report. Values are:

- 1*: Account number
- 2*: Short Account ID
- 3*: Unstructured account

Account Suppress Mode Enter *1* to suppress printing accounts which have no transactions since the beginning of the current year. Enter *2* to suppress printing accounts which have no transactions in the current period. Leave this processing option blank to print information for all accounts.

R74P0450 - (POL) AP Trial Balance

The AP Trial Balance report lists all accounts payable transactions by currency, company, account, and supplier or customer. You use this report to verify data in offset and vendor accounts. You can print the report in summary or detail mode.

When you run the AP Trial Balance report, the system writes data from the F0411 table and the F0414 table to the F74P04W table and then prints the formatted data on the report.

You must post your transactions before running the AP Trial Balance report.

Summary Mode

When you run the report in summary mode, the system prints the following information in the report header:

- Reporting period
- Company number
- Company description
- Currency code

The system prints the following information in the report detail section:

- Vendor's address book number.
- Vendor name.
- Opening balance for the report period (debit or credit).
- Opening balance for the year (debit or credit).
- Account turnover.
- Year to date debit or credit.
- Cumulative balance (debit or credit).

Detail Mode

When you run the report in detail mode, the system prints the following information in the report header:

- Reporting period
- Company number
- Company description
- Currency code

For each detail line, the system prints the following information in the report detail section:

- Document type
- Document number
- Document date
- Transaction amount
- Transaction description

Additionally, the detailed report lists a subheading that precedes the list of transactions for an account. The subheading shows the vendor's address book number and name. The report also has a summary line for each account that lists the year opening balance, the net change in the account for the month, the year to date balance and the accumulated balance.

(POL) Processing Options for AP Trial Balance (R74P0450)

Processing options enable you to specify the default processing for programs and reports.

Select

| | |
|---------------------------|---|
| Fiscal Year | Specify the fiscal year for which the system selects records to process. |
| Fiscal Period From | Specify the first period in a range of periods that the system uses to select records to process. |
| Fiscal Date Thru | Specify the end period in a range of periods that the system uses to select records to process. |
| Company Number | Specify the company number for which the system selects records to process. |
| Date From | Specify the first date in a range of dates that the system uses to select records to process. The system uses this processing option if you leave the Fiscal Period From and the Fiscal Period Thru processing options blank. |
| Date Thru | Specify the last date in a range of dates that the system uses to select records to process. The system uses this processing option if you leave the Fiscal Period From and the Fiscal Period Thru processing options blank. |

Process

| | |
|---------------------------|---|
| Report Appearance | Leave this processing option blank to print account totals. Enter <i>1</i> to print all detail lines for the accounts. |
| Rebuild Work Table | Leave this processing option blank to append new records to the table. Enter <i>1</i> to clear the table before writing new records to the table. |

Print

Account Print Format

Specify the format in which the system prints account numbers on the report. Values are:

- 1: Account number
- 2: Short Account ID
- 3: Unstructured account

Account Suppress Mode

Enter 1 to suppress printing accounts which have no transactions since the beginning of the current year. Enter 2 to suppress printing accounts which have no transactions in the current period. Leave this processing option blank to print information for all accounts.

R74P9010 - (POL) Trial Balance by Object

The GL Trial Balance by Object report (R74P9010) lists information about transaction posted to the general ledger. This report reads the F0901 table, the F0911 table, and the F0006 table, and prints the transactions for the specified reporting period by object account.

The GL Trial Balance by Object report contains:

- Account transactions (detail).
- Account balances (summary).
- Account numbers and names.
- Columns for open balances, period and year-to-date turnover, and period closing balance.
- Totals for each open balance, period and year-to-date turnover, and period closing balance.

Processing Options for GL Trial Balance by Obj (R74P9010)

Processing options enable you to specify the default processing for reports.

Select

1. From Period

Specify how the system determines the balances included in the report.

Enter 0 or leave this option blank to use the first period of the current fiscal year as the beginning period for balances. The system prints all current year transactions for all accounts plus debit and credit totals by period for the current fiscal year. The balance forward totals for balance sheet accounts are from inception through the end of the previous fiscal year.

Enter 1 to use the current period as the beginning period. The system prints a balance forward total of the previous activity for the current fiscal year and transactions for the current period only for each account. The report does not print all account activity for the year. The balance forward total reflects the year-to-date amounts through the end of the previous period for profit-and-loss accounts. For balance sheet accounts, the report reflects the inception-to-date amounts through the end of the previous period.

2. From Date

Specify the beginning date in a range of dates that the system uses to select records to process. If you leave this processing option blank, the system uses the date of the period specified in the From Period processing option.

- 3. Thru Fiscal Year** Specify the ending fiscal year in a range of years. The system uses the range to select records for the report. Enter the last two digits of the fiscal year, for example, enter 07 for the year 2007.
- If you enter 0 for the From Period processing option, the year that you enter for this processing option must be the same as the year specified for the Beginning of Fiscal Year field in the Company Names & Numbers program (P0010). If the year you specify is not the same, the report does not include a line item for balance forward amounts.
- 4. Period Number** Specify the period number that the system uses to select records to process.
- 5. Thru Date** Specify the end date in a range of dates that the system uses to select records to process. If you leave this processing option blank, the system uses the date of the period specified in the From Period processing option.
- 6. Subledger** Specify the subledger for which the system processes records. Enter a specific subledger, or enter * to processes records for all subledgers. Leave this processing option blank to process records that do not have subledgers.
- 7. Subledger Type** Specify the subledger type that the system uses when selecting records to process. The value that you enter must exist in UDC table 00/ST. You must complete this processing option if you entered a specific subledger in the Subledger processing option.
- 8. Ledger Type** Specify the ledger type that the system uses to select records to process. The value that you enter must exist in UDC table 09/LT. If you leave this processing option blank, the system selects records with a ledger type of AA.

Print

- 1. Account Number Format** Specify the format in which the system prints account numbers on the report. Values are:
- 1: Account number.
 - 2: Short account ID.
 - 3: Unstructured account.
- 2. Accounts with Zero Balances** Leave this processing option blank to print information for all accounts. Enter 1 to omit accounts with a zero balance.

Currency

- 1. Currency Code** Specify the currency code of the records that the system selects for processing. Enter a specific currency codes to select only records with the specified currency code. Leave this processing option blank to select records for all currency codes.
- 2. Currency Code From** Specify an *as if* currency code. The currency code must exist in the F0013 table. The system prints amounts on the report in the currency you specify, instead of the currency in which the records are stored.
- Leave this processing option blank to print amounts in the currency in which they are stored.

3. As-of Date

Specify the date that the system uses when processing records in an as-if currency. If you leave this processing option blank, the system uses the date in the Thru Date processing option.

Localization**1. Report Title**

Enter a title that the system prints on the report. You can enter as many as 60 characters. If you leave this processing option blank, the system does not print a title.

2. Report Title Continuation

Enter additional text for the title of the report. You can enter as many as 60 characters.

3. Company Number

Specify a company number to print the company name and number on the report.

4. Accounts Detail

Leave this processing option blank to print all detail lines for the account. Enter 1 to print a summary with a total for the account.

Processing Options for GL Trial Balance by Category Code (R74P9015)

The processing options for the GL Trial Balance by Category Code report are the same as those for GL Trial Balance by Object Report, with one additional processing option.

See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” Processing Options for GL Trial Balance by Obj (R74P9010), page 1877.

Localization**5. Category Code for Trial Balance**

Specify the category code that the system uses to select records to process. Values are 21, 22, or 23.

R74P9020 - (POL) Transaction Journal

The Transaction Journal lists all journal entries and assigns a register number to them by company and fiscal year. It consolidates all of the information for a company. The report includes:

- Report name.
- Company name.
- Code and name of the transaction ledger.
- Name of the program producing the report.
- Reporting period.
- Date and time report was printed.
- User who printed the report.

Processing Options for Transaction Journal (R74P9020)

Processing options enable you to specify the default processing for reports.

Default

| | |
|--|--|
| Processing Mode | Leave this processing option blank to run the report in proof mode. Enter 1 to run the report in final mode without titles and headers. Enter 2 to run the report in final mode and print titles and headers. |
| Registration Number | Enter 1 to have the system assign a registration number to each individual line entry. Leave this processing option blank to have the system assign a registration number to each document. |
| Adjustment Registration Date | Specify the adjustment registration date. If you leave this processing option blank, the system assigns the GL date of the adjustment. |
| Next Available Registration Number | Specify how the system assigns the next available registration number for adjustments entered in the prior year. Enter 1 to use the next available registration number from the fiscal year of the general ledger adjustment date, which is the next available registration number from the previous year. |
| <hr/> Note. You should not use this processing option. Instead, leave this processing option blank to use the next available registration number from the current year. | |

Select

| | |
|-----------------------|--|
| From Date | Specify the first date of a range of dates that the system uses to select records for the report. |
| Thru Date | Specify the end date for a range of dates that the system uses to select records for the report. |
| Company Number | Specify the company for which the system retrieves general ledger records. If you leave this processing option blank, the system uses company 00000. |

Print

| | |
|-----------------------|--|
| Account Number | Specify whether the system includes account numbers from an alternate chart of accounts on the report. Values are: Blank: Use account numbers from the standard chart of accounts and prints them in the BU.OBJ.SUB format. 21: Use account numbers from the chart of accounts set up in category code 21. 22: Use account numbers from the chart of accounts set up in category code 22. 23: Use account numbers from the chart of accounts set up in category code 23. |
|-----------------------|--|

Currency

| | |
|----------------------|--|
| Currency Code | Specify a currency code for <i>as if</i> processing. Enter a valid currency code from the F0013 table. The system processes all records in the currency you specify instead of in the currency in which the records are stored. If you leave this processing option blank, the system uses the currency code in which the records are stored. |
|----------------------|--|

As-of Date Specify the date that the system uses to retrieve the exchange rate for *as if* processing. If you leave this processing option blank, the system uses the date in the Thru Date processing option.

Localization

Report Title Enter the title that you want the system to print on the report. The maximum number of characters you can enter is 60. If you need additional characters, complete the Report Title (continuation) processing option.

Report Title (continuation) Enter additional text for the report title. You can enter as many as 60 characters.

Ledger Type Specify a ledger type that the system uses to select records. Enter a valid code from UDC table 09/LT. If you leave this processing option blank, the system uses the AA ledger type.

Processing Options for Bank Register (R74P9030)

Processing options enable you to specify the default processing for reports.

Select

1. **From Period** Specify the balances that the system includes in the report.

0: Use the first period of the current fiscal year as the beginning period. This is the default value. The report prints all current year transactions for all accounts plus debit and credit totals by period for the current fiscal year. The balance forward totals for balance sheet accounts are from inception through the end of the previous fiscal year.

1: Use the current period as the beginning period. The report prints a balance forward total of the previous activity for the current fiscal year and transactions for the current period only for each account. The report does not print all account activity for the year. The balance forward total reflects the year-to-date amounts through the end of the previous period for profit and loss accounts. For balance sheet accounts, the report reflects the inception-to-date amounts through the end of the previous period.

2: Use the first period of the first fiscal year (when General Accounting processing began) as the beginning period. If you enter 2, the report prints transaction information from the date when General Accounting processing began through the current period.
2. **From Date** Specify a beginning date in a range of dates for the system to use when selecting records to print on this report. If you leave this processing option blank, the system uses the value specified in the From Period processing option.
3. **Thru Fiscal Year** Specify the ending fiscal year in a range of years that the system uses to select records for this report. Enter the last two digits of the fiscal year. For example, enter 07 for the year 2007.

If you enter 0 (for year-to-date balances) for the From Period processing option and you enter a year for this processing option, the year must be the same as the year specified in the Beginning of Fiscal Year field in the Company Names & Numbers program (P0010). Otherwise, the report does not include a line item for balance forward amounts.

- 4. Period Number** Specify a period number for the system to use to select records for this report.
- 5. Thru Date** Specify an ending date in a range of dates for the system to use to select records to print on this report. If you leave this processing option blank, the system uses the value specified in the From Period processing option.
- 6. Subledger and 7. Subledger Type** Specify the subledger for which the system processes records. Enter a specific subledger or enter * to process records for all subledgers, including blank subledgers. Leave this processing option blank to process records that do not have subledgers.
- Specify a subledger type from UDC table 00/ST. If you specify a value in the Subledger processing option, you must enter a subledger type for this processing option.
- 8. Ledger Type** Specify a ledger type from UDC table 09/LT. If you leave this processing option blank, the system uses ledger type AA.
- 9. Document Type** Complete this processing option in conjunction with the Ledger Type processing option to specify a document type from UDC table 00/DT. If you leave this processing option blank, the system selects all document types.
- If you do not specify a ledger type for the Ledger Type processing option, the system ignores the value in this processing option.

Print

- 1. Account Number Format** Specify the format in which the system prints the account number. Values are:
- 1: Print the account number in business unit.object.subsidiary format.
 - 2: Print the short account ID.
 - 3: Print the third (unstructured) account number.
- 2. Accounts with zero balance** Leave this processing option blank to print information for all accounts. Enter 1 to suppress printing for accounts with a zero balance.
- 3. Posted Transactions** Leave this processing option blank to print posted transactions only. Enter 1 to print both posted and unposted transactions.

Currency

- 1. Currency Code** Specify the currency code of the records that the system selects for processing. Enter a specific currency codes to select only records with the specified currency code. Leave this processing option blank to select records for all currency codes.
- 2. Currency Code From** Specify an *as if* currency code. The system prints amounts on the report in the currency you specify, instead of the currency in which the records are stored. Leave this processing option blank to print amounts in the currency in which they are stored.
- 3. As-of date** Specify the date that the system uses when processing records in an *as if* currency. If you leave this processing option blank, the system uses the date in the Thru Date processing option.

Localization Options

- 1. Report Title** Enter a title that the system prints on the report. You can enter as many as 60 characters. If you leave this processing option blank, the system does not print a title.
- 2. Report Title (continuation)** Enter additional text for the title of the report. You can enter as many as 60 characters.
- 3. Bank Register Number** Specify the bank register number that the system prints in the header area of the report. If you leave this processing option blank, the system does not print a register number.

(RUS) Reports for Russia

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Russia.

| Report ID and Report Name | Description | Navigation |
|---------------------------------------|---|--|
| R74R41003 Print Transfer Item Note | Use this program when you transfer inventory between two business units within the same company. | Select Inventory (G74R41), Print Transfer Item Note |
| R74R5003 Cash Issue Note Print | Print the Petty Cash Issue report for each transaction that decreases petty cash. | Cash Transactions (G74RCASH), Cash Issue Note Print |
| R74R5005 Cash Note Receipt | Prints a cash receipt note for each transaction that increases petty cash. | Cash Desk Transactions (G74RCASH), Cash Note Receipt |
| R74R5120 Fixed Asset Card | <p>The Fixed Asset Card is a report for each asset that includes the initial cost, depreciation, maintenance, and location of the asset, as well as any changes to the cost, depreciation, and location. You must produce the report upon request of the tax authorities.</p> <p>Before you run this report, you must verify that the Documents for Change (74R/CH) UDC table and the Documents for Maintenance (74R/MN) UDC table are set up.</p> <p>When you run the Fixed Asset Card program (R74R5120), the system reads the data stored in the F74R5110 table and the F1201 table.</p> | Fixed Assets (G74R12), Fixed Asset Card |

| Report ID and Report Name | Description | Navigation |
|--|--|--|
| R74R5130 Fixed Assets Transfer Note | Generate the document that is required to transfer fixed assets. The system produces three copies of the report. You must produce the Fixed Asset Transfer Note report when you transfer a fixed asset to another location. The report includes information about the item and information about the location change. | Fixed Assets (G74R12), Fixed Assets Transfer Note |
| R74R6000 Print Stock Balance Report | Use this program to confirm stock balances and transactions for a specified period. | Select Inventory (G74R41), Print Stock Balance Report. |

Generating the Print Transfer Item Note Report (R74R41003)

The Print Transfer Item Note report when you transfer inventory between two business units within the same company. The report is based on the F4111 table. When you run the Print Transfer Item Note program, you must print two copies of the report. One copy of report is kept in the issuing location, and the another one is sent to the new location of the inventory. The system summarizes all lines with the same item number into one line if the unit of measure for the items is the same, and prints the taxes on the items.

Setting Processing Options for Print Transfer Item Note (R74R41003)

Processing options enable you to specify the default processing for programs and reports.

General

- 1. Language Preference** Specify the language in which the system prints the report. The value that you enter must exist in the Language (01/LP) UDC table.
- 2. Document Date From** Specify the beginning of the date range that the system uses to select records.
- 3. Document Date Thru** Specify the end of the date range that the system uses to select records.
- 4. Report Name** Enter the text that the system prints as the name of the report.
- 5. Delivered Signature Role** Specify the role of the person delivering the report.
- 6. Received Signature Role** Specify the role of the person who receives the report.

R74R5003 - (RUS) Cash Issue Note Print

You print the Cash Issue Note document for each transaction that decreases petty cash. The Cash Issue Note documents are printed with sequential numbering, starting from 1, within each financial year for each cash account.

Before you print a cash receipt note, you use the Petty Cash Transactions program (P74R0101) to add petty cash information to the records that the system uses for the Cash Issue Note Print report, the Petty Cash Receipts report and the Cash Desk Transaction report.

Processing Options for Cash Issue Note Print (R74R5003)

Processing options enable you to specify the default processing for programs and reports.

Printing

- | | |
|---|--|
| 1. Business Unit | Enter <i>Y</i> to print the business unit associated with the user's ID on the document. Enter <i>N</i> to print the business unit of the Payee on the document. |
| 2. Suppress Printing | Leave this processing option blank or enter <i>N</i> to print the document number, batch number, and batch type on the document. Enter <i>Y</i> to suppress printing. |
| 3. Reference to Original Document | Enter <i>Y</i> to print the original document number on the attachments line. Leave this processing option blank or enter <i>N</i> to suppress the printing of the document number. |
| 4. CEO Address Number | Specify the address book number of the CEO. The system uses this number to determine the mailing name in the F74R101T table. The system prints the mailing name on the Petty Cash Issue document. |
| 5. CEO Position | Enter the title that prints with the name that is associated with the code that you entered in the CEO Address Number processing option. |
| 6. Chief Accountant Address Number | Specify the address book number of the chief accountant. The system uses this number to determine the mailing name in the F74R101T table. The system prints the mailing name on the Petty Cash Issue document. |

Settings

- | | |
|------------------------------|---|
| 1. Currency | Enter <i>Y</i> to print the document in the domestic currency. Leave the processing option blank or enter <i>N</i> to print the document using the original currency. |
| 2. Format of Accounts | Specify the format in which the system prints the account number. The value that you enter must exist in the Account Type (74R/AT) UDC table. |
| 3. Language | Specify the language in which the system prints the document. The value that you enter must exist in the Language (00/LP) UDC table. |
| 4. Mode | Enter <i>Y</i> to print in final mode. When you print in final mode, the system assigns the legal number to the document and updates the F74R0100 table. Leave this processing option blank or enter <i>N</i> to print in proof mode. |

R74R5005 - (RUS) Cash Note Receipt

Many transactions in Russia, including payroll and reimbursement for expenses, are paid in cash. Because of the transitory nature of cash, the Russian government requires additional steps to assure accurate accounting of cash transactions.

You print a cash receipt note for each transaction that increases petty cash. The system prints cash receipt notes with sequential numbering, starting from 1, within each financial year for each cash account.

Before you print a cash receipt note, you use the Petty Cash Transactions program (P74R0101) to add petty cash information to the records that the system uses for the Petty Cash Issue report, the Petty Cash Receipts report, and the Cash Desk Transaction report.

See Chapter 94, "(POL and RUS) Setting Up Functionality for Russia and Poland," (RUS) Setting Up Petty Cash Processing for Russia, page 1593.

Processing Options for Cash Note Receipt (R74R5005)

Processing options enable you to specify the default processing for programs and reports.

Printing

These processing options specify how the system processes records.

- | | |
|--|--|
| 1. Business Unit | Enter <i>Y</i> to print the business unit of the person completing the cash receipt note on the cash receipt note. Leave this processing option blank to print the business unit of the company being credited with the receipt. |
| 2. Suppress Printing | Leave this option blank or enter <i>N</i> to print the document number, batch number, and batch type. Enter <i>Y</i> to suppress printing. |
| 3. Reference to Original Document | Enter <i>Y</i> to print the original document number on the attachments line. Leave this option blank or enter <i>N</i> to suppress the printing of the document number. |
| 4. CEO Address Number (chief executive officer address number) | Specify the address book number of the CEO. The system uses this number to determine the mailing name in F74R101T table. The system prints the mailing name on the petty cash issue document. |
| 5. CEO Position | Enter the title that prints with the name that is associated with the code that you entered in the CEO Address Number processing option. |
| 6. Chief Accountant Address Number | Specify the address book number of the chief accountant. The system uses this number to determine the mailing name in the F74R101T table. The system prints the mailing name on the petty cash issue document. |

Settings

These processing options specify how the system processes records.

- | | |
|------------------------------|---|
| 1. Currency | Enter <i>Y</i> to print the document in the domestic currency. Leave the processing option blank or enter <i>N</i> to print the document using the original currency. |
| 2. Format of Accounts | Specify the format in which the system prints the account number. The value that you enter must exist in the Account Type (74R/AT) UDC table. |
| 3. Language | Specify the language in which the system prints the document. The value that you enter must exist in the Language (00/LP) UDC table. |
| 4. Mode | Enter <i>Y</i> to print in final mode. Leave the option blank or enter <i>N</i> to print in proof mode. |

Processing Options for the Fixed Asset Card (R74R5120) Report

Set these processing options before you run the fixed asset card report.

General

Use these processing options to specify the ledger type and account number category code that print on the report.

- | | |
|-----------------------|---|
| 1. Ledger Type | Specify the ledger type that identifies the original cost of the assets. The value that you enter must exist in the Ledger Type (09/LT) UDC table. If you leave this processing option blank, the system uses ledger type AA. |
|-----------------------|---|

**2. Account Number
Category Code**

Specify the account number category code that the system prints on the report. Values are 21, 22, and 23. If you leave this processing option blank, the system prints the account number on the report.

Revaluation

Use these processing options to specify the ledger type for revaluation.

1. Revaluation

Specify the ledger type that the system uses to retrieve the revaluation. The value that you specify must exist in the Ledger Type (09/LT) UDC table.

Processing Options for Fixed Asset Transfer Note (R74R5130)

Set these processing options before you run the fixed asset transfer note.

General

Use these processing options to specify the ledger type and the chief accountant name and address number to print on the report.

1. Ledger Type

Specify the ledger type that the system uses to select records to process. The value that you enter must exist in the Ledger Type (09/LT) UDC table.

**2. Use Name from Address
Book**

Specify whether the system retrieves the name of the Chief Account from the F0101 table. Enter 1 to retrieve the name from the F0101 table. Leave this processing option blank to use the name that you specify in the Chief Accountant Name processing option.

3. Chief Accountant Name

Specify the name of the chief accountant.

**4. Address Number of
Chief Accountant**

Specify the address book number of the chief accountant.

Generating the Stock Balance Report (R74R6000)

You produce the Stock Balance to confirm stock balances and transactions for a specified period. The period for which you produce the report is determined by the company's accounting policy.

The report separates records by warehouse and by person responsible, and does not include records with zero balances. The system reads the F41112 table and the F4111 table to calculate the beginning balance. The system calculates the received product amounts minus issued product amounts for the period. The system also calculates a final sum for the balance.

When you run the Stock Balance program, the system calls the Create Missing As Of Record (R74R6097) program to actualize the product amounts when there were no transactions for the product during the accounting period.

Setting Processing Options for Print Stock Balance Report (R74R6000)

Processing options enable you to specify the default processing for programs and reports.

General

1. Company

Specify the company for which you run the report.

- | | |
|-------------------------------------|---|
| 2. Business Unit | Specify the business unit for which you run the report. |
| 3. Document Date | Specify the date that the system prints on the Stock Balance report. If you leave this processing option blank, the system prints the system date. |
| 4. Document Type | Specify the document type that the system uses to determine the next numbering scheme to use. The value that you enter must exist in the Document Type (00/DT) UDC table. |
| 5. Language | Specify the language in which the system prints the report. The value that you enter must exist in the Language (01/LP) UDC table. |
| 6. Header Signature Role | Enter the role of the person who will sign the document in the header area. The value that you enter must exist in the Signature Role (74R/RL) UDC table. |
| 7. Footer Signature Role | Enter the role of the person who will sign the document in the footer area. The value that you enter must exist in the Signature Role (74R/RL) UDC table. |
| 8. Accountant Signature Role | Enter the role of the accountant who will sign the document. The value that you enter must exist in the Signature Role (74R/RL) UDC table. |

Process

- | | |
|---|---|
| 1. GL Date - Beginning Effective | Specify the beginning of a range of dates that the system uses to select records to include on the report. |
| 2. GL Date - Ending Effective | Specify the end of a range of dates that the system uses to select records to include on the report. |
| 3. Document Description Format | Specify the description for the document that the system prints on the report. Enter <i>1</i> to print the Transaction description. Leave this processing option blank to print the Document/ Order Accountant description. |

(ESP) Reports for Spain

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Spain.

| Report ID and Report Name | Description | Navigation |

| Report ID and Report Name | Description | Navigation |
|--|--|---|
| R74S540 (ESP) Stamp Fees Report | Prints a list of the total amount and the fee amount for each draft. | Print the Stamp Fee report as part of draft remittance by entering the program and version numbers of the report on the Custom Report processing option of the Draft Remittance program (R03B672) |
| R74S560 (ESP) G/L by Obj. Account - Spain | Prints detailed information about account transactions. You can use the report to: <ul style="list-style-type: none"> • Review transactions within individual accounts. • Research accounts that are out of balance. • Verify account accuracy. | G/L Reports - Spain (G74S09), G/L by Obj. Account - Spain |
| R74S570 (ESP) T/B by Obj. Account | Prints total debit and credit amounts for each account in any given ledger. | Spanish Reports (G74S09), T/B by Obj. Account |
| R74S71 (ESP) 347 - Dec. Companies Report | Use this program produces a report that lists each company with a unique tax identification number that is included in the tax declaration. | Process 347 - Spain menu (G74S8011), 347 - Dec. Companies Report. |
| R74S72 (ESP) 347 - Operations Report | Use this program to review the total operations amount by operation type for each customer or supplier. | Process 347 - Spain (G74S8011), 347 - Operations Report. |
| R74S91 (ESP) 349 - Dec. Companies Report | This reports lists each company with a unique tax identification number that is included in the tax declaration. | Process 349 - Spain (G74S8022), 349 - Dec. Companies Report. |
| R74S92 (ESP) 349 - Operations Report | This report lists the total operations amount by operation type for each customer or supplier. | Process 349 - Spain (G74S8022), 349 - Operations Report. |

R74S440 - (ESP) Print Invoice Company

A company invoice (*autofactura*) is a legal document that displays the exempted VAT for Intra-Community VAT transactions. You should keep this report on file for the tax authority in the event of an audit.

You must print a company invoice for each voucher that you create.

You use the processing option to indicate which rate from the Intra-Community VAT tax rate/area contains the positive tax rate.

Processing Options for Print Invoice Company (R74S440)

Processing options enable you to specify the default processing for programs and reports.

Print Options

- 1. Tax Rate** Select the Tax Rate for Intra-Community VAT:
- Blank - Tax Rate 2
 - / - Tax Rate 3

R74S450 - (ESP) VAT Report by Tax Rate/Area

In Spain, businesses are required to document all Accounts Payable and Accounts Receivable transactions that are subject to VAT. The VAT Report by Tax Area/Rate report lists all VAT-eligible transactions as well as total amounts of accounts receivable (input) and accounts payable (output) VAT.

You use the processing options on the monthly VAT reports to create both an accounts payable and an accounts receivable version of the report. You should run both reports monthly.

You use the processing options to indicate which rate from the Intra-Community VAT tax rate/area setup should be included on the report. On the accounts payable version, include the positive tax rate. On the accounts receivable version, include the negative tax rate. The exempt VAT (0 percent) prints on the Accounts Payable version.

Processing Options for VAT Report by Tax Rate/Areas (R74S450)

Processing options enable you to specify the default processing for programs and reports.

Print Options

- 1. Update Records** Select */* if you want to update as printed the selected records. If blank the records won't be marked.
- 2. Beginning Number** Select the beginning number for the printed records. If left blank, the system will begin with one.
- 3. Totals** Print report total by:
- Blank - Tax Rate
 - / - Tax Area
 - 2 - Tax Area and Tax Rate
- 4. Detail or Summary** Print Detail or summarized report
- Blank - Detail
 - / - Summarized
- 5. Zero Balance Lines** Select */* whether summarizing by documents the report doesn't have to print zero balance lines. Otherwise the zero balance lines will be printed.
- 6. Report Type** Select the type of report:
- Blank - Account Receivable
 - / - Account Payable
- 7. Tax Rate** Select the Tax Rate Line Number for Intra-Community VAT depending on the information to be printing on the report AR or AP.

- Blank - Tax Rate Line 2
- / - Tax Rate Line 3

Date Selection

- 1. Select the from date and the to date to establish the range of selection.** From Date or Through Date

Currency

Currency Code Enter the currency code for As If currency display. This option allows for amounts to display in a currency other than the currency they are stored in. Domestic amounts will be translated and displayed in this as-if currency. If left blank, the stored currency will be used.

- 2. Date** Enter the As Of date for processing the current exchange rate for the as-if currency. If left blank, the current date will be used.

Note. A valid exchange rate must exist in the exchange rate table between the two currencies base on the As Of date.

R74S490 - (ESP) G/J by Cat. Code - Spain

Businesses in Spain must submit a general journal of all transactions to the Mercantile Registration at the close of each fiscal year. The transactions must be marked with a register number and must be reported chronologically. Businesses can report individual transactions or transactions summarized by account for each month. The summarized report includes credit and debit totals for each object and subledger account and period. The detail report includes credit and debit amounts for each transaction.

You can run the G/J by Cat. Code by object and subsidiary, or by category code, depending on whether accounts are defined in the object and subsidiary or in category code 21, 22, or 23.

This information is included on the general journal report:

- Register number.
- General ledger date.
- Object account and subsidiary.
- Account description.
- Transaction description.
- Credit and debit totals for each period.
- At the end of each page, debit and credit totals for the page.
- At the beginning of each page except the first page, debit and credit totals from the preceding pages.

For the G/J by Cat. Code report, these features apply:

- You can use processing options to specify which general ledger date the system uses.

If the processing option is set to print summarized transactions, the general ledger date is the end date of the period. If the processing option is set to print detail transactions, the general ledger date is the general ledger date of the transaction.

- Accounts with the same object account and subsidiary, but with different business units, appear as the same account.
- You can display information for multiple accounting periods.
- Every record on the general journal is numbered sequentially.

You use the processing options to enter a specific starting number.

The sequence of information on the general journal report depends on whether the report is run in detail or summary mode, and whether the report is run by object account or by category code. To meet statutory requirements, information on the general journal is sequenced as follows:

| General Journal | Report Sequence |
|---------------------------------|--|
| Detail mode, by object account | Report sequence: <ul style="list-style-type: none"> • Company • Period • G/L date • Object and subsidiary |
| Detail mode, by category code | Report sequence: <ul style="list-style-type: none"> • Company • Period • General ledger date • Category code value |
| Summary mode, by object account | Report sequence: <ul style="list-style-type: none"> • Company • Period • Object and subsidiary |
| Summary mode, by category code | Report sequence: <ul style="list-style-type: none"> • Company • Period • Category code value |

Processing Options for G/J by Obj. Account or Cat. Code - Spain (R74S490)

Processing options enable you to specify the default processing for reports.

Report Detail

1. From Number

Enter the from number to begin numbering the lines of the report. If you leave this processing option blank, the numbering will begin with 1.

- 2. From and To Fiscal Period/Year** Specify the *from* period and fiscal year and the *to* period and fiscal year in which to show account balances in detail.
- 3. Summarized Transactions** Specify whether to print summarized transaction. Values are:
 Blank: Print detail transactions.
 1: Print summarized transactions.

Category Code

- 1. Category Code** Specify the category code that contains the alternate chart of accounts. The report prints the corresponding accounts. Valid category codes are 21–23. If you leave this processing option blank, the accounts that print on the report are based on the object.account.subsidiary values.

Currency

- 1. As-If Currency** Specify an *as if* currency code in which to print amounts for this report. This processing option allows you to review amounts in a currency other than the currency in which they are stored. Only amounts associated with the AA ledger type are converted to the *as if* currency. If you enter an *as if* currency code, the decimal point for the journal entry currency must be the same as the decimal point for the *as if* currency.
- If you leave this processing option blank, use the data selection to select only ledger types that use the same currency. Amounts do not print in an *as if* currency and the As If Currency column does not appear on the report.
- 2. As-Of Date** Specify the date on which to retrieve the exchange rate for the *as if* currency from the F0015 table. If you enter a value for the As If Currency Code processing option and leave this processing option blank, the system uses the current date.

R74S540 - (ESP) Stamp Fees Report

Spanish law enables you to collect payment on multiple invoices by combining invoices on a draft. The government charges a fee for processing drafts. The amount of the fee depends upon the total amount of the draft. Spanish businesses can print drafts on special paper that is stamped with the correct fee amount. Alternatively, Spanish businesses can pay an additional fee to the bank to have the bank print the drafts.

The Stamp Fees Report (R74S540) lists the total amount and the fee amount for each draft. You can use this report to verify that the bank is charging the correct fee for each draft. The report includes only the fee that is charged by the government, not any additional fees that the bank might charge for the service.

You print the Stamp Fee report as part of draft remittance by entering the program and version numbers of the report on the Custom Report processing option of the Draft Remittance program (R03B672).

Processing Options for Stamp Fees Report (R74S540)

Processing options enable you to specify the default processing for programs and reports.

Total

1. Total by Register Number

Specify whether to total draft amounts by register number. Values are:

Blank: Total by register number.

/: Do not total by register number.

R74S560 - G/L by Obj. Account - Spain

The G/L by Obj. Account - Spain report includes detailed information about account transactions. You can use the report to:

- Review transactions within individual accounts.
- Research accounts that are out of balance.
- Verify account accuracy.

You also use this report to open and audit accounts with the same control totals as the journal report. The accounts and the totals are the basis of the trial balance.

In Spain, businesses use the G/L by Obj. Account - Spain report as a basis for:

- Internal auditing, as a control of account accuracy.
- External auditing by a third-party, such as a fiscal authority or auditing firm.

The report includes this information:

- Beginning and ending balances for each account.
- Transactions that are based on a period selection or a date range selection.
- Prior year-end balance or previous-period balance, depending on the transaction types that you select.
- Balance forward amount printed at the bottom of the page when a page break occurs within an account.
- Previous balance amount printed after a page break within an account.
- Option to omit account with zero balances.
- Option to print posted and unposted transactions.
- Detail information by subsidiary or by object account only.
- Totals by period and by account.

Accounts with the same object account but different business units are recognized as the same account for the report.

Businesses print the G/L by Obj. Account - Spain report at least once a year for all accounts, typically, at the end of the fiscal year. The total debits and credits that print on the report should equal the total debits and credits of the Trial Balance and G/L Registration reports.

Processing Options for G/L by Obj. Account - Spain (R74S560)

Processing options enable you to specify the default processing for reports.

Report Detail

- 1. From Period or Date** Specify a from period or enter a from date to show account balances. For the from period, values are:
- Blank: Year to date
1: Current period
2: Inception to date.

- 2. Thru Period Number/Fiscal Year or Date** Specify a through period and fiscal year or enter or a through date.

Print

- 3. Units** Enter 1 to print units or leave this processing option blank to print amounts only.
- 4. Balances** Enter 1 to omit accounts without balances or leave this processing option blank to include accounts with balances.
- 5. Detail Information** Enter 1 to show detail information by subsidiary or leave this processing option blank to show detail information by object account only.
- 6. Totals** Enter 1 to create totals by company or leave this processing option to not create totals by company.
- 7. Model Business Unit** Enter the model business unit to use for descriptions of the accounts. If you leave this processing option blank, the system uses the descriptions of the first account found.

Document

- 8. Ledger Type** Enter a ledger type code or leave this processing option blank to specify ledger type AA (actual amounts).
- 9. Document Type** Enter a document type to use if you entered a specific ledger type code or leave this processing option blank to include all document types.
- 10. Transactions** Enter 1 to print posted and unposted transactions or leave this processing option blank to print only posted transactions.

Subledger

- 11. Subledger** Enter a specific subledger or enter * to include all subledgers.
- 12. Subledger Type** Enter a subledger type if you entered a specific subledger in the Subledger processing option.

Currency

- 13. Currency Code** Enter a specific currency code or enter * for all currency codes.
- Alternatively, specify an *as if* currency code in which to print amounts for this report. This processing option allows you to review amounts in a currency

other than the currency in which they are stored. Only amounts associated with the AA ledger type are converted to the *as if* currency. Specify the date on which to retrieve the exchange rate for the *as if* currency from the F0015 table. If you enter a value for the As If Currency Code processing option and leave this processing option blank, the system uses the current date.

R74S570 - (ESP) T/B by Obj. Account

Businesses in Spain are required to submit a trial balance to the Spanish tax authority. The statutory trial balance must be organized and summarized by object account. Businesses often print the T/B by Obj. Account report to facilitate:

- Internal audits and verify one or more accounts.
- External audits as required by a fiscal authority or auditing firm.

You can print the T/B by Obj. Account report to review the total debit and credit amounts for each account in any given ledger. You can also find errors that cause the general ledger to be out of balance. Possible errors might include incorrect entries or missing transactions.

The T/B by Obj. Account report for Spain includes these features:

- Recognition of accounts with the same object account but different business units as the same account in the report.
- Information selection by a specific period and fiscal year, and for a specific level of detail.
- Ledger type selection.
- Selection of a specific business unit to retrieve the account descriptions.
- Optional totals by company.
- Option to include accounts with zero balances.

Processing Options for T/B by Obj. Account (R74S570)

Processing options enable you to specify the default processing for reports.

Report Period

1. Accounting Period and Fiscal Year

Enter the accounting period and the fiscal year. If you leave these processing options blank, the system uses the period and fiscal year of the financial reporting date of the company.

Ledger Type

1. Ledger Type

Enter up to three ledger types. If you leave all three processing options blank, the system uses ledger type AA.

Business Unit

1. Model Business Unit

Enter the model business unit to be use for the account descriptions. If you leave this processing option blank, the transaction descriptions are used.

Zero Balance

- 1. Zero Balance** Enter *1* to print accounts with zero balances or leave this processing option to not print them.

Totaling Level

- Totaling Level** Enter the 1–4 character totaling level for the account. For example, Totaling Level 2 = Class Total (1) and Sub-class Total (10).
If you leave this processing option blank, the system uses totaling level 2.

Mode

- 1. Report Mode** Enter *1* to run the report in final mode or leave this processing option to run it in proof mode.

Note. You can run this report in final mode only once for the selected period and fiscal year. If you run the report again in final mode, the transactions will not appear.

Summarization

- 1. Summarization** Enter *1* to summarize all subsidiary accounts into one object account. If you leave this processing option blank, subsidiary accounts are not summarized.

Currency

- 1. As-If Currency** Specify an *as if* currency code in which to print amounts for this report. This processing option allows you to review amounts in a currency other than the currency in which they are stored.
If you leave this processing option blank, the company or transaction currency is used.
- 2. As-Of Date** Specify the date on which to retrieve the exchange rate for the *as if* currency from the F0015 table. If you enter a value for the As If Currency Code processing option and leave this processing option blank, the system uses the current date.

R74S71 - 347 - Dec. Companies Report

The 347 - Declaring Companies report lists each company with a unique tax identification number that is included in the tax declaration. Information for companies that share a tax identification number is combined.

The report is for the review only. You should not submit this report to the tax authority. Instead, you should submit the 347 Tax Declaration tape file.

For each reporting company, the report lists the number of records of each type and the total amount of transactions for each record type. The report lists these record types:

| Record Type | Transaction Total |
|---------------|---|
| Record Type A | Acquisitions over 3.005,06 euros |
| Record Type B | Sales over 3.005,06 euros |
| Record Type C | Payments over 300,51 euros to a third-party payee |
| Record Type D | Acquisitions over 3.005,06 euros by government companies that are not related to regular company activity |
| Record Type E | Government subsidies over 3.005,06 euros |

The 347 - Declaring Companies report includes information from the F74S71 table.

R74S72 - 347 - Operations Report

The 347 - Operations report lists the total operations amount by operation type for each customer or supplier. Customer and supplier records are grouped by the declaring company. The report also lists the tax identification number for each customer and supplier.

The 347 - Operations report is for the review only. You should not submit this report to the tax authority. Instead, you should submit the 347 Tax Declaration tape file.

The 347 - Operations report includes information from the F74S72 table.

Processing Options for 347 - Operations Report (R74S72)

Processing options enable you to specify the default processing for programs and reports.

Print Option

- 1. Selection** Select *1* if you want to include the Leasing Operations in the report.

R74S91 - 349 - Dec. Companies Report

The 349 - Declaring Companies report lists each company with a unique tax identification number that is included in the tax declaration. Information for companies that share a tax identification number is combined.

The report is for the review only. Do not submit this report to the Tax Authority. Instead, submit the 349 Tax Declaration tape file.

For each reporting company, the report lists the number of records of each operation type, as well as the total amount of transactions for each operation type. The report lists these operation types:

| Operation Type | Description |
|----------------|--|
| A | Acquisitions |
| E | Exempted Sales |
| T | Sales in Other European Member Countries |

Note. The report does not distinguish between regular and rectification records because rectification information is included in the regular records.

The 349 - Declaring Companies report includes information from the F74S91 table.

R74S92 - (ESP) 349 - Operations Report

The 349 - Operations report lists the total operations amount by operation type for each customer or supplier. Customer and supplier records are grouped by declaring company. The report also lists the country code and tax identification number for each customer and supplier.

The 349 - Operations report is for the review only. Do not submit this report to the tax authority. Instead, submit the 349 Tax Declaration tape file.

The 349 - Operations report includes information from the F74S92 table.

(CHE) Reports for Switzerland

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Switzerland.

| Report ID and Report Name | Description | Navigation |
|---|---|--|
| R740380 Account Receivable VAT Report | Use this program to a list of the accounts receivable transactions that include VAT in a format that complies with the standards set by the Swiss government. | Swiss Localization menu (G74C), Account Receivable VAT Report. |
| R740480 Accounts Payable VAT Detail Report | Use this program to a list of the accounts payable transactions that include VAT in a format that complies with the standards set by the Swiss government. | Swiss Localization menu (G74C), Accounts Payable VAT Detail Report. |

R740380 - (CHE) Account Receivable VAT Report

You print the Account Receivable VAT Report to create a list of transactions that include VAT in a format that complies with the standards set by the Swiss government.

A running total must be printed after every 100 lines or every page, whichever comes first. You can specify page totaling in the processing options.

You can use the processing options to:

- Limit the transactions included in the reports by specifying a from and through date.
- Select reporting based on the invoice date or the GL date.

Processing Options for Account Receivable VAT Report (R740380)

Processing options enable you to specify the default processing for programs and reports.

Date Selection

Date Enter 1 to select record by invoice date, 2 to select by Service tax date, and leave blank to select by GL date.

Date Range

Enter the date range for selection Enter Date From or Date Through

Summarize Repo

Tax Rate Code Enter 1 to summarize report by Tax Rate Code, leave blank for detail.

Document Number Enter 1 to print report summarized by document number.

Total Enter 1 to print a total line at the end of each page.

R740480 - (CHE) Accounts Payable VAT Detail Report

You print the Accounts Payable VAT Detail Report to create a list of transactions that include VAT in a format that complies with the standards set by the Swiss government.

A running total must be printed after every 100 lines or every page, whichever comes first. You can specify page totaling in the processing options.

You can use the processing options to:

- Limit the transactions included in the reports by specifying a from and through date.
- Select reporting based on the invoice date or the GL date.

Processing Options for Accounts Payable VAT Detail Report (R740480)

Processing options enable you to specify the default processing for programs and reports.

Date Range

Beginning Date and Through Date Enter Beginning Date or Through Date for Data Selection.

Date Type

Date Enter 1 to use the Invoice Date. Leave blank to use the GL date.

Document Number Enter 1 to print detail report summarize by document number

Total Line

Total Enter 1 to print a total line at the bottom of each page of the report.

Tax Rate Area Enter 1 to print summarized by Tax Rate Area.

(VEN) Reports for Venezuela

In addition to the reports specified as part of a process in other sections of this implementation guide, these reports exist for Venezuela.

| Report ID and Report Name | Description | Navigation |
|--|--|--|
| R76VCRVP AR-CV Withholding Certificate | Run the AR-CV Withholding Certificate program to generate a report that lists the suppliers for which withholdings are calculated. The report also lists the amounts of the withholding and the percentage. | Monthly Reports (G76V07), AR-CV Withholding Certificate |
| R76VDJRM IM Withholding Affidavit | Run the IM Withholding Affidavit program to print a report that list the withholdings for municipal taxes. The reports group the amounts withheld by withholding type. | Monthly Reports (G76V07), IM Withholding Affidavit |
| R76VDJRN ISLR Withholding Affidavit | Run the ISLR Withholding Affidavit program to print a report that lists the withholdings for income taxes for a specified period. | Monthly Reports (G76V07), ISLR Withholding Affidavit |
| R76VIR01B Withholding Integrity - Erases Historical | Run the Withholding Integrity - Erases Historical program to maintain data consistency between the F0411 table and the Withholding Historical File - VEN (F76V4581) table. | Withholding Integrity Reports (G76V049), Withholding Integrity - Erases Historical |
| R76VIR02C Withholding Integrity - Create Historical | Run the Withholding Integrity - Create Historical program to maintain data consistency between the F0411 table and the F76V4581 table. | Withholding Integrity Reports (G76V049), Withholding Integrity - Create Historical |
| R76VPART Annual Withholding Affidavit - Diskette | Run the Annual Withholding Affidavit - Diskette program to write flat file data to the Text Processor Header (F007101) and Text Processor Detail (F007111) tables. You then use the Text File Processor program (P00710) to work with the data and generate a flat file that includes the withholdings for a specified period. | Annual Reports (G76V048), Annual Withholding Affidavit (Diskette) |

Processing Options for AR-CV Withholding Certificate (R76VCRVP)

Processing options enable you to specify the default processing for programs and reports.

AR-CV Withholding

| | |
|----------------------------------|---|
| Date From | Enter the first date in a range of dates that the system uses to select records to process. |
| Date To | Enter the last date in a range of dates that the system uses to select records to process. |
| Company | Enter the company number of the company for which you generate the report. |
| Withholding Document Type | Enter the document type that the system uses to select records to process. |

Processing Options for ISLR Withholding Affidavit (R76VDJRN)

Processing options enable you to specify the default processing for programs and reports.

ISLR Declaration

| | |
|------------------------------|--|
| Summarize by Supplier | Enter <i>1</i> to summarize the report by supplier. Leave this processing option blank to print in detail. |
| Date From | Enter the first date in a range of dates that the system uses to select records to process. |
| Date To | Enter the last date in a range of dates that the system uses to select records to process. |

Processing Options for IM Withholding Affidavit (R76VDJRM)

Processing options enable you to specify the default processing for programs and reports.

IM Withholding Affidavit

| | |
|------------------------------|--|
| Summarize by Supplier | Enter <i>1</i> to summarize the report by supplier. Leave this processing option blank to print in detail. |
| Date From | Enter the first date in a range of dates that the system uses to select records to process. |
| Date To | Enter the last date in a range of dates that the system uses to select records to process. |

R76VIR01B - (VEN) Withholding Integrity - Erases Historical and R76VIR02C - (VEN) Withholding Integrity - Create Historical

You run the Withholding Integrity - Create Historical (R76VIR02C) and the Withholding Integrity - Erases Historical (R76VIR01B) programs to maintain data consistency between the F0411 table and the Withholding Historical File - VEN (F76V4581) table.

When you run Withholding Integrity - Erase Historical program, the system deletes records from the F76V4581 table when no record exists in the F0411 table for a transaction which includes:

- A document type of PV (paid voucher).
- A document type of PW (paid national withholding).

The Withholding Integrity- Erase Historical program produces a report that lists the records deleted from the F76V4581 table.

You run the Withholding Integrity - Create Historical program to update table F76V4581 with data about the municipal taxes withheld.

Processing Options for Withholding Integrity - Erase Historical (R76VIR01B)

Processing options enable you to specify the default processing for programs and reports.

Delete

Delete Enter *Y* to delete historical records.

Processing Options for Withholding Integrity - Create Historical (R76VIR02C)

Processing options enable you to specify the default processing for programs and reports.

Document

I.S.R.L. Document Type Enter the document type from UDC 00/DT that identifies ISRL records.

I.M Document Type Enter the document type from UDC 00/DT that identifies records with municipal taxes.

Company Enter the company for which you process records.

Processing Options for Annual Withholding Affidavit-Diskette (R76VPART)

Processing options enable you to specify the default processing for programs and reports.

Withholding

Document Type of Withholding (Country) Enter the document type from UDC 00/DT that identifies vouchers for national withholding.

Document Type of Withholding (City) Enter the document type from UDC 00/DT that identifies vouchers for municipal withholding.

Company

Withholding Agent Name Enter the name of the company which processed the withholding.

Address Number Enter the address book number of the person in charge of processing withholding.

Fiscal Year

Fiscal Year Enter the fiscal year for which you process records.

(USA) Reports for the United States

In addition to the reports specified as part of a process in other sections of this implementation guide, the Debit/Credit T/B by Object report (R09473) is available for the United States and other countries.

See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” R09473 - (FRA, ITA, USA) Debit/Credit T/B by Object, page 1838.

See Appendix C, “JD Edwards EnterpriseOne Country-Specific Reports,” Processing Options for Debit/Credit T/B by Object (R09473), page 1838.

Glossary of JD Edwards EnterpriseOne Terms

| | |
|---------------------------------------|---|
| activity | A scheduling entity in JD Edwards EnterpriseOne tools that represents a designated amount of time on a calendar. |
| activity rule | The criteria by which an object progresses from one given point to the next in a flow. |
| add mode | A condition of a form that enables users to input data. |
| Advanced Planning Agent (APAg) | A JD Edwards EnterpriseOne tool that can be used to extract, transform, and load enterprise data. APAg supports access to data sources in the form of relational databases, flat file format, and other data or message encoding, such as XML. |
| application server | A server in a local area network that contains applications shared by network clients. |
| as if processing | A process that enables you to view currency amounts as if they were entered in a currency different from the domestic and foreign currency of the transaction. |
| alternate currency | <p>A currency that is different from the domestic currency (when dealing with a domestic-only transaction) or the domestic and foreign currency of a transaction.</p> <p>In JD Edwards EnterpriseOne Financial Management, alternate currency processing enables you to enter receipts and payments in a currency other than the one in which they were issued.</p> |
| as of processing | A process that is run as of a specific point in time to summarize transactions up to that date. For example, you can run various JD Edwards EnterpriseOne reports as of a specific date to determine balances and amounts of accounts, units, and so on as of that date. |
| back-to-back process | A process in JD Edwards EnterpriseOne Supply Management that contains the same keys that are used in another process. |
| batch processing | <p>A process of transferring records from a third-party system to JD Edwards EnterpriseOne.</p> <p>In JD Edwards EnterpriseOne Financial Management, batch processing enables you to transfer invoices and vouchers that are entered in a system other than JD Edwards EnterpriseOne to JD Edwards EnterpriseOne Accounts Receivable and JD Edwards EnterpriseOne Accounts Payable, respectively. In addition, you can transfer address book information, including customer and supplier records, to JD Edwards EnterpriseOne.</p> |
| batch server | A server that is designated for running batch processing requests. A batch server typically does not contain a database nor does it run interactive applications. |
| batch-of-one immediate | <p>A transaction method that enables a client application to perform work on a client workstation, then submit the work all at once to a server application for further processing. As a batch process is running on the server, the client application can continue performing other tasks.</p> <p>See also direct connect and store-and-forward.</p> |
| business function | A named set of user-created, reusable business rules and logs that can be called through event rules. Business functions can run a transaction or a subset of a transaction (check inventory, issue work orders, and so on). Business functions also contain the application programming interfaces (APIs) that enable them to be called from a form, a database trigger, or a non-JD Edwards EnterpriseOne application. Business functions can be combined with other business functions, forms, event rules, |

and other components to make up an application. Business functions can be created through event rules or third-generation languages, such as C. Examples of business functions include Credit Check and Item Availability.

| | |
|-------------------------------------|---|
| business function event rule | See named event rule (NER). |
| business view | A means for selecting specific columns from one or more JD Edwards EnterpriseOne application tables whose data is used in an application or report. A business view does not select specific rows, nor does it contain any actual data. It is strictly a view through which you can manipulate data. |
| central objects merge | A process that blends a customer's modifications to the objects in a current release with objects in a new release. |
| central server | A server that has been designated to contain the originally installed version of the software (central objects) for deployment to client computers. In a typical JD Edwards EnterpriseOne installation, the software is loaded on to one machine—the central server. Then, copies of the software are pushed out or downloaded to various workstations attached to it. That way, if the software is altered or corrupted through its use on workstations, an original set of objects (central objects) is always available on the central server. |
| charts | Tables of information in JD Edwards EnterpriseOne that appear on forms in the software. |
| connector | Component-based interoperability model that enables third-party applications and JD Edwards EnterpriseOne to share logic and data. The JD Edwards EnterpriseOne connector architecture includes Java and COM connectors. |
| contra/clearing account | A general ledger account in JD Edwards EnterpriseOne Financial Management that is used by the system to offset (balance) journal entries. For example, you can use a contra/clearing account to balance the entries created by allocations in JD Edwards EnterpriseOne Financial Management. |
| Control Table Workbench | An application that, during the Installation Workbench processing, runs the batch applications for the planned merges that update the data dictionary, user-defined codes, menus, and user override tables. |
| control tables merge | A process that blends a customer's modifications to the control tables with the data that accompanies a new release. |
| cost assignment | The process in JD Edwards EnterpriseOne Advanced Cost Accounting of tracing or allocating resources to activities or cost objects. |
| cost component | In JD Edwards EnterpriseOne Manufacturing, an element of an item's cost (for example, material, labor, or overhead). |
| cross segment edit | A logic statement that establishes the relationship between configured item segments. Cross segment edits are used to prevent ordering of configurations that cannot be produced. |
| currency restatement | The process of converting amounts from one currency into another currency, generally for reporting purposes. You can use the currency restatement process, for example, when many currencies must be restated into a single currency for consolidated reporting. |
| database server | A server in a local area network that maintains a database and performs searches for client computers. |
| Data Source Workbench | An application that, during the Installation Workbench process, copies all data sources that are defined in the installation plan from the Data Source Master and Table and Data Source Sizing tables in the Planner data source to the system-release number data source. It also updates the Data Source Plan detail record to reflect completion. |

| | |
|--|---|
| date pattern | A calendar that represents the beginning date for the fiscal year and the ending date for each period in that year in standard and 52-period accounting. |
| denominated-in currency | The company currency in which financial reports are based. |
| deployment server | A server that is used to install, maintain, and distribute software to one or more enterprise servers and client workstations. |
| detail information | Information that relates to individual lines in JD Edwards EnterpriseOne transactions (for example, voucher pay items and sales order detail lines). |
| direct connect | A transaction method in which a client application communicates interactively and directly with a server application. See also batch-of-one immediate and store-and-forward. |
| Do Not Translate (DNT) | A type of data source that must exist on the iSeries because of BLOB restrictions. |
| dual pricing | The process of providing prices for goods and services in two currencies. |
| edit code | A code that indicates how a specific value for a report or a form should appear or be formatted. The default edit codes that pertain to reporting require particular attention because they account for a substantial amount of information. |
| edit mode | A condition of a form that enables users to change data. |
| edit rule | A method used for formatting and validating user entries against a predefined rule or set of rules. |
| Electronic Data Interchange (EDI) | An interoperability model that enables paperless computer-to-computer exchange of business transactions between JD Edwards EnterpriseOne and third-party systems. Companies that use EDI must have translator software to convert data from the EDI standard format to the formats of their computer systems. |
| embedded event rule | An event rule that is specific to a particular table or application. Examples include form-to-form calls, hiding a field based on a processing option value, and calling a business function. Contrast with the business function event rule. |
| Employee Work Center | A central location for sending and receiving all JD Edwards EnterpriseOne messages (system and user generated), regardless of the originating application or user. Each user has a mailbox that contains workflow and other messages, including Active Messages. |
| enterprise server | A server that contains the database and the logic for JD Edwards EnterpriseOne. |
| EnterpriseOne object | A reusable piece of code that is used to build applications. Object types include tables, forms, business functions, data dictionary items, batch processes, business views, event rules, versions, data structures, and media objects. |
| EnterpriseOne process | A software process that enables JD Edwards EnterpriseOne clients and servers to handle processing requests and run transactions. A client runs one process, and servers can have multiple instances of a process. JD Edwards EnterpriseOne processes can also be dedicated to specific tasks (for example, workflow messages and data replication) to ensure that critical processes don't have to wait if the server is particularly busy. |
| Environment Workbench | An application that, during the Installation Workbench process, copies the environment information and Object Configuration Manager tables for each environment from the Planner data source to the system-release number data source. It also updates the Environment Plan detail record to reflect completion. |
| escalation monitor | A batch process that monitors pending requests or activities and restarts or forwards them to the next step or user after they have been inactive for a specified amount of time. |

| | |
|------------------------------------|--|
| event rule | A logic statement that instructs the system to perform one or more operations based on an activity that can occur in a specific application, such as entering a form or exiting a field. |
| facility | An entity within a business for which you want to track costs. For example, a facility might be a warehouse location, job, project, work center, or branch/plant. A facility is sometimes referred to as a “business unit.” |
| fast path | A command prompt that enables the user to move quickly among menus and applications by using specific commands. |
| file server | A server that stores files to be accessed by other computers on the network. Unlike a disk server, which appears to the user as a remote disk drive, a file server is a sophisticated device that not only stores files, but also manages them and maintains order as network users request files and make changes to these files. |
| final mode | The report processing mode of a processing mode of a program that updates or creates data records. |
| FTP server | A server that responds to requests for files via file transfer protocol. |
| header information | Information at the beginning of a table or form. Header information is used to identify or provide control information for the group of records that follows. |
| interface table | See Z table. |
| integration server | A server that facilitates interaction between diverse operating systems and applications across internal and external networked computer systems. |
| integrity test | A process used to supplement a company’s internal balancing procedures by locating and reporting balancing problems and data inconsistencies. |
| interoperability model | A method for third-party systems to connect to or access JD Edwards EnterpriseOne. |
| in-your-face-error | In JD Edwards EnterpriseOne, a form-level property which, when enabled, causes the text of application errors to appear on the form. |
| IServer service | This internet server service resides on the web server and is used to speed up delivery of the Java class files from the database to the client. |
| jargon | An alternative data dictionary item description that JD Edwards EnterpriseOne appears based on the product code of the current object. |
| Java application server | A component-based server that resides in the middle-tier of a server-centric architecture. This server provides middleware services for security and state maintenance, along with data access and persistence. |
| JDBNET | A database driver that enables heterogeneous servers to access each other’s data. |
| JDEBASE Database Middleware | A JD Edwards EnterpriseOne proprietary database middleware package that provides platform-independent APIs, along with client-to-server access. |
| JDECallObject | An API used by business functions to invoke other business functions. |
| jde.ini | A JD Edwards EnterpriseOne file (or member for iSeries) that provides the runtime settings required for JD Edwards EnterpriseOne initialization. Specific versions of the file or member must reside on every machine running JD Edwards EnterpriseOne. This includes workstations and servers. |
| JDEIPC | Communications programming tools used by server code to regulate access to the same data in multiprocess environments, communicate and coordinate between processes, and create new processes. |

| | |
|---------------------------------------|---|
| jde.log | The main diagnostic log file of JD Edwards EnterpriseOne. This file is always located in the root directory on the primary drive and contains status and error messages from the startup and operation of JD Edwards EnterpriseOne. |
| JDENET | A JD Edwards EnterpriseOne proprietary communications middleware package. This package is a peer-to-peer, message-based, socket-based, multiprocess communications middleware solution. It handles client-to-server and server-to-server communications for all JD Edwards EnterpriseOne supported platforms. |
| Location Workbench | An application that, during the Installation Workbench process, copies all locations that are defined in the installation plan from the Location Master table in the Planner data source to the system data source. |
| logic server | A server in a distributed network that provides the business logic for an application program. In a typical configuration, pristine objects are replicated on to the logic server from the central server. The logic server, in conjunction with workstations, actually performs the processing required when JD Edwards EnterpriseOne software runs. |
| MailMerge Workbench | An application that merges Microsoft Word 6.0 (or higher) word-processing documents with JD Edwards EnterpriseOne records to automatically print business documents. You can use MailMerge Workbench to print documents, such as form letters about verification of employment. |
| master business function (MBF) | An interactive master file that serves as a central location for adding, changing, and updating information in a database. Master business functions pass information between data entry forms and the appropriate tables. These master functions provide a common set of functions that contain all of the necessary default and editing rules for related programs. MBFs contain logic that ensures the integrity of adding, updating, and deleting information from databases. |
| master table | See published table. |
| matching document | A document associated with an original document to complete or change a transaction. For example, in JD Edwards EnterpriseOne Financial Management, a receipt is the matching document of an invoice, and a payment is the matching document of a voucher. |
| media storage object | Files that use one of the following naming conventions that are not organized into table format: Gxxx, xxxGT, or GTxxx. |
| message center | A central location for sending and receiving all JD Edwards EnterpriseOne messages (system and user generated), regardless of the originating application or user. |
| messaging adapter | An interoperability model that enables third-party systems to connect to JD Edwards EnterpriseOne to exchange information through the use of messaging queues. |
| messaging server | A server that handles messages that are sent for use by other programs using a messaging API. Messaging servers typically employ a middleware program to perform their functions. |
| named event rule (NER) | Encapsulated, reusable business logic created using event rules, rather than C programming. NERs are also called business function event rules. NERs can be reused in multiple places by multiple programs. This modularity lends itself to streamlining, reusability of code, and less work. |
| <i>nota fiscal</i> | In Brazil, a legal document that must accompany all commercial transactions for tax purposes and that must contain information required by tax regulations. |
| <i>nota fiscal factura</i> | In Brazil, a <i>nota fiscal</i> with invoice information. See also <i>nota fiscal</i> . |

| | |
|---|--|
| Object Configuration Manager (OCM) | In JD Edwards EnterpriseOne, the object request broker and control center for the runtime environment. OCM keeps track of the runtime locations for business functions, data, and batch applications. When one of these objects is called, OCM directs access to it using defaults and overrides for a given environment and user. |
| Object Librarian | A repository of all versions, applications, and business functions reusable in building applications. Object Librarian provides check-out and check-in capabilities for developers, and it controls the creation, modification, and use of JD Edwards EnterpriseOne objects. Object Librarian supports multiple environments (such as production and development) and enables objects to be easily moved from one environment to another. |
| Object Librarian merge | A process that blends any modifications to the Object Librarian in a previous release into the Object Librarian in a new release. |
| Open Data Access (ODA) | An interoperability model that enables you to use SQL statements to extract JD Edwards EnterpriseOne data for summarization and report generation. |
| Output Stream Access (OSA) | An interoperability model that enables you to set up an interface for JD Edwards EnterpriseOne to pass data to another software package, such as Microsoft Excel, for processing. |
| package | JD Edwards EnterpriseOne objects are installed to workstations in packages from the deployment server. A package can be compared to a bill of material or kit that indicates the necessary objects for that workstation and where on the deployment server the installation program can find them. It is point-in-time snapshot of the central objects on the deployment server. |
| package build | <p>A software application that facilitates the deployment of software changes and new applications to existing users. Additionally, in JD Edwards EnterpriseOne, a package build can be a compiled version of the software. When you upgrade your version of the ERP software, for example, you are said to take a package build.</p> <p>Consider the following context: “Also, do not transfer business functions into the production path code until you are ready to deploy, because a global build of business functions done during a package build will automatically include the new functions.” The process of creating a package build is often referred to, as it is in this example, simply as “a package build.”</p> |
| package location | The directory structure location for the package and its set of replicated objects. This is usually \\deployment server\release\path_code\package\package name. The subdirectories under this path are where the replicated objects for the package are placed. This is also referred to as where the package is built or stored. |
| Package Workbench | An application that, during the Installation Workbench process, transfers the package information tables from the Planner data source to the system-release number data source. It also updates the Package Plan detail record to reflect completion. |
| planning family | A means of grouping end items whose similarity of design and manufacture facilitates being planned in aggregate. |
| preference profile | The ability to define default values for specified fields for a user-defined hierarchy of items, item groups, customers, and customer groups. |
| print server | The interface between a printer and a network that enables network clients to connect to the printer and send their print jobs to it. A print server can be a computer, separate hardware device, or even hardware that resides inside of the printer itself. |
| pristine environment | A JD Edwards EnterpriseOne environment used to test unaltered objects with JD Edwards EnterpriseOne demonstration data or for training classes. You must have this environment so that you can compare pristine objects that you modify. |

| | |
|-------------------------------------|---|
| processing option | A data structure that enables users to supply parameters that regulate the running of a batch program or report. For example, you can use processing options to specify default values for certain fields, to determine how information appears or is printed, to specify date ranges, to supply runtime values that regulate program execution, and so on. |
| production environment | A JD Edwards EnterpriseOne environment in which users operate EnterpriseOne software. |
| production-grade file server | A file server that has been quality assurance tested and commercialized and that is usually provided in conjunction with user support services. |
| program temporary fix (PTF) | A representation of changes to JD Edwards EnterpriseOne software that your organization receives on magnetic tapes or disks. |
| project | In JD Edwards EnterpriseOne, a virtual container for objects being developed in Object Management Workbench. |
| promotion path | <p>The designated path for advancing objects or projects in a workflow. The following is the normal promotion cycle (path):</p> <p>11>21>26>28>38>01</p> <p>In this path, 11 equals new project pending review, 21 equals programming, 26 equals QA test/review, 28 equals QA test/review complete, 38 equals in production, 01 equals complete. During the normal project promotion cycle, developers check objects out of and into the development path code and then promote them to the prototype path code. The objects are then moved to the productions path code before declaring them complete.</p> |
| proxy server | A server that acts as a barrier between a workstation and the internet so that the enterprise can ensure security, administrative control, and caching service. |
| published table | Also called a master table, this is the central copy to be replicated to other machines. Residing on the publisher machine, the F98DRPUB table identifies all of the published tables and their associated publishers in the enterprise. |
| publisher | The server that is responsible for the published table. The F98DRPUB table identifies all of the published tables and their associated publishers in the enterprise. |
| pull replication | One of the JD Edwards EnterpriseOne methods for replicating data to individual workstations. Such machines are set up as pull subscribers using JD Edwards EnterpriseOne data replication tools. The only time that pull subscribers are notified of changes, updates, and deletions is when they request such information. The request is in the form of a message that is sent, usually at startup, from the pull subscriber to the server machine that stores the F98DRPCN table. |
| QBE | An abbreviation for query by example. In JD Edwards EnterpriseOne, the QBE line is the top line on a detail area that is used for filtering data. |
| real-time event | A service that uses system calls to capture JD Edwards EnterpriseOne transactions as they occur and to provide notification to third-party software, end users, and other JD Edwards EnterpriseOne systems that have requested notification when certain transactions occur. |
| refresh | A function used to modify JD Edwards EnterpriseOne software, or subset of it, such as a table or business data, so that it functions at a new release or cumulative update level, such as B73.2 or B73.2.1. |
| replication server | A server that is responsible for replicating central objects to client machines. |
| quote order | In JD Edwards Procurement and Subcontract Management, a request from a supplier for item and price information from which you can create a purchase order. |

| | |
|--|--|
| | In JD Edwards Sales Order Management, item and price information for a customer who has not yet committed to a sales order. |
| selection | Found on JD Edwards EnterpriseOne menus, a selection represents functions that you can access from a menu. To make a selection, type the associated number in the Selection field and press Enter. |
| Server Workbench | An application that, during the Installation Workbench process, copies the server configuration files from the Planner data source to the system-release number data source. It also updates the Server Plan detail record to reflect completion. |
| spot rate | An exchange rate entered at the transaction level. This rate overrides the exchange rate that is set up between two currencies. |
| Specification merge | A merge that comprises three merges: Object Librarian merge, Versions List merge, and Central Objects merge. The merges blend customer modifications with data that accompanies a new release. |
| specification | A complete description of a JD Edwards EnterpriseOne object. Each object has its own specification, or name, which is used to build applications. |
| Specification Table Merge Workbench | An application that, during the Installation Workbench process, runs the batch applications that update the specification tables. |
| store-and-forward | The mode of processing that enables users who are disconnected from a server to enter transactions and then later connect to the server to upload those transactions. |
| subscriber table | Table F98DRSUB, which is stored on the publisher server with the F98DRPUB table and identifies all of the subscriber machines for each published table. |
| supplemental data | <p>Any type of information that is not maintained in a master file. Supplemental data is usually additional information about employees, applicants, requisitions, and jobs (such as an employee's job skills, degrees, or foreign languages spoken). You can track virtually any type of information that your organization needs.</p> <p>For example, in addition to the data in the standard master tables (the Address Book Master, Customer Master, and Supplier Master tables), you can maintain other kinds of data in separate, generic databases. These generic databases enable a standard approach to entering and maintaining supplemental data across JD Edwards EnterpriseOne systems.</p> |
| table access management (TAM) | The JD Edwards EnterpriseOne component that handles the storage and retrieval of use-defined data. TAM stores information, such as data dictionary definitions; application and report specifications; event rules; table definitions; business function input parameters and library information; and data structure definitions for running applications, reports, and business functions. |
| Table Conversion Workbench | An interoperability model that enables the exchange of information between JD Edwards EnterpriseOne and third-party systems using non-JD Edwards EnterpriseOne tables. |
| table conversion | An interoperability model that enables the exchange of information between JD Edwards EnterpriseOne and third-party systems using non-JD Edwards EnterpriseOne tables. |
| table event rules | Logic that is attached to database triggers that runs whenever the action specified by the trigger occurs against the table. Although JD Edwards EnterpriseOne enables event rules to be attached to application events, this functionality is application specific. Table event rules provide embedded logic at the table level. |
| terminal server | A server that enables terminals, microcomputers, and other devices to connect to a network or host computer or to devices attached to that particular computer. |

| | |
|--|--|
| three-tier processing | The task of entering, reviewing and approving, and posting batches of transactions in JD Edwards EnterpriseOne. |
| three-way voucher match | In JD Edwards Procurement and Subcontract Management, the process of comparing receipt information to supplier's invoices to create vouchers. In a three-way match, you use the receipt records to create vouchers. |
| transaction processing (TP) monitor | A monitor that controls data transfer between local and remote terminals and the applications that originated them. TP monitors also protect data integrity in the distributed environment and may include programs that validate data and format terminal screens. |
| transaction set | An electronic business transaction (electronic data interchange standard document) made up of segments. |
| trigger | One of several events specific to data dictionary items. You can attach logic to a data dictionary item that the system processes automatically when the event occurs. |
| triggering event | A specific workflow event that requires special action or has defined consequences or resulting actions. |
| two-way voucher match | In JD Edwards Procurement and Subcontract Management, the process of comparing purchase order detail lines to the suppliers' invoices to create vouchers. You do not record receipt information. |
| User Overrides merge | Adds new user override records into a customer's user override table. |
| variance | <p>In JD Edwards Capital Asset Management, the difference between revenue generated by a piece of equipment and costs incurred by the equipment.</p> <p>In JD Edwards EnterpriseOne Project Costing and JD Edwards EnterpriseOne Manufacturing, the difference between two methods of costing the same item (for example, the difference between the frozen standard cost and the current cost is an engineering variance). Frozen standard costs come from the Cost Components table, and the current costs are calculated using the current bill of material, routing, and overhead rates.</p> |
| Version List merge | The Versions List merge preserves any non-XJDE and non-ZJDE version specifications for objects that are valid in the new release, as well as their processing options data. |
| visual assist | Forms that can be invoked from a control via a trigger to assist the user in determining what data belongs in the control. |
| vocabulary override | An alternate description for a data dictionary item that appears on a specific JD Edwards EnterpriseOne form or report. |
| wchar_t | An internal type of a wide character. It is used for writing portable programs for international markets. |
| web application server | A web server that enables web applications to exchange data with the back-end systems and databases used in eBusiness transactions. |
| web server | A server that sends information as requested by a browser, using the TCP/IP set of protocols. A web server can do more than just coordination of requests from browsers; it can do anything a normal server can do, such as house applications or data. Any computer can be turned into a web server by installing server software and connecting the machine to the internet. |
| Windows terminal server | A multiuser server that enables terminals and minimally configured computers to display Windows applications even if they are not capable of running Windows software themselves. All client processing is performed centrally at the Windows |

terminal server and only display, keystroke, and mouse commands are transmitted over the network to the client terminal device.

| | |
|--------------------------------------|---|
| workbench | A program that enables users to access a group of related programs from a single entry point. Typically, the programs that you access from a workbench are used to complete a large business process. For example, you use the JD Edwards EnterpriseOne Payroll Cycle Workbench (P07210) to access all of the programs that the system uses to process payroll, print payments, create payroll reports, create journal entries, and update payroll history. Examples of JD Edwards EnterpriseOne workbenches include Service Management Workbench (P90CD020), Line Scheduling Workbench (P3153), Planning Workbench (P13700), Auditor's Workbench (P09E115), and Payroll Cycle Workbench. |
| work day calendar | In JD Edwards EnterpriseOne Manufacturing, a calendar that is used in planning functions that consecutively lists only working days so that component and work order scheduling can be done based on the actual number of work days available. A work day calendar is sometimes referred to as planning calendar, manufacturing calendar, or shop floor calendar. |
| workflow | The automation of a business process, in whole or in part, during which documents, information, or tasks are passed from one participant to another for action, according to a set of procedural rules. |
| workgroup server | A server that usually contains subsets of data replicated from a master network server. A workgroup server does not perform application or batch processing. |
| XAPI events | A service that uses system calls to capture JD Edwards EnterpriseOne transactions as they occur and then calls third-party software, end users, and other JD Edwards EnterpriseOne systems that have requested notification when the specified transactions occur to return a response. |
| XML CallObject | An interoperability capability that enables you to call business functions. |
| XML Dispatch | An interoperability capability that provides a single point of entry for all XML documents coming into JD Edwards EnterpriseOne for responses. |
| XML List | An interoperability capability that enables you to request and receive JD Edwards EnterpriseOne database information in chunks. |
| XML Service | An interoperability capability that enables you to request events from one JD Edwards EnterpriseOne system and receive a response from another JD Edwards EnterpriseOne system. |
| XML Transaction | An interoperability capability that enables you to use a predefined transaction type to send information to or request information from JD Edwards EnterpriseOne. XML transaction uses interface table functionality. |
| XML Transaction Service (XTS) | Transforms an XML document that is not in the JD Edwards EnterpriseOne format into an XML document that can be processed by JD Edwards EnterpriseOne. XTS then transforms the response back to the request originator XML format. |
| Z event | A service that uses interface table functionality to capture JD Edwards EnterpriseOne transactions and provide notification to third-party software, end users, and other JD Edwards EnterpriseOne systems that have requested to be notified when certain transactions occur. |
| Z table | A working table where non-JD Edwards EnterpriseOne information can be stored and then processed into JD Edwards EnterpriseOne. Z tables also can be used to retrieve JD Edwards EnterpriseOne data. Z tables are also known as interface tables. |
| Z transaction | Third-party data that is properly formatted in interface tables for updating to the JD Edwards EnterpriseOne database. |
