

Oracle® Identity Manager

Installation Guide for Oracle Containers for J2EE

Release 9.0

B32148-02

January 2007

The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software--Restricted Rights (June 1987). Oracle USA, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

Oracle, JD Edwards, PeopleSoft, and Siebel are registered trademarks of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

Preface

Note: This is a transitional release following Oracle's acquisition of Thor Technologies. Some parts of the product and documentation still refer to the original Thor company name and Xellerate product name and will be rebranded in future releases.

Oracle Identity Manager has formerly been known as both Oracle Xellerate Identity Provisioning and Thor Xellerate Identity Manager. The Oracle Identity Manager Audit and Compliance module, formerly known as Oracle Xellerate Audit and Compliance Manager, is a new, optional module that installs on top of Oracle Identity Manager and facilitates user profile auditing.

This document explains how to install Oracle Identity Manager Release 9.0 on an Oracle Containers for J2EE (OC4J) application server.

Note: The information in this guide applies generally to all Oracle Identity Manager 9.0.x versions.

Audience

The *Oracle Identity Manager Installation Guide for Oracle Containers for J2EE* is intended for system administrators who plan to install Oracle Identity Manager Release 9.0 on an OC4J application server.

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at

<http://www.oracle.com/accessibility/>

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

TTY Access to Oracle Support Services

Oracle provides dedicated Text Telephone (TTY) access to Oracle Support Services within the United States of America 24 hours a day, seven days a week. For TTY support, call 800.446.2398.

Related Documents

Documentation Updates

Oracle is committed to delivering the best and most recent information available. For information about updates to the Oracle Identity Manager documentation set, visit Oracle Technology Network at:

<http://www.oracle.com/technology/documentation>

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.

Convention	Meaning
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
monospace	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.
<*_HOME>	The directory where an application is installed. The directory where you install Oracle Identity Manager server is referred to as <XL_HOME>. Each Oracle Identity Manager component includes an abbreviation: <XL_DC_HOME> for the Design Console and <XL_RM_HOME> for the Remote Manager.
OC4J	Oracle Containers for J2EE

Introduction

This chapter provides a brief introduction to the Oracle Identity Manager product and its architecture, and contains the following sections:

- [Product Overview](#)
- [Oracle Identity Manager Components](#)
- [Product Architecture](#)
- [Installation Overview](#)

Product Overview

Oracle Identity Manager is an advanced, secure enterprise provisioning system that helps streamline the creation of user accounts, management of those accounts, and revocation of user access rights and privileges. Oracle Identity Manager automates access rights management, security, and provisioning of IT resources.

Oracle Identity Manager instantly connects users to the resources they need to be productive. It also prevents unauthorized access to protected, sensitive corporate information.

Access rights management is the process that grants and revokes permissions to access enterprise resources.

Provisioning is the process that grants employees, customers, suppliers, and business partners appropriate access rights to enterprise systems and applications. The provisioning process involves setting up user accounts, groups, and attributes for each user, so that they can access the information they need to work within your company. The Oracle Identity Manager provisioning solution automates these time-consuming manual tasks and secures the correct approvals so that users are connected quickly and securely.

Reconciliation is the process by which any action to create, modify, or delete a target system identity initiated in the target system (using traditional means) is communicated back to the provisioning system and recorded.

De-provisioning is the process of revoking access rights and privileges.

Oracle Identity Manager Components

Oracle Identity Manager includes the following components:

- Oracle Identity Manager Server
- Oracle Identity Manager Remote Manager

- Oracle Identity Manager Design Console (for Windows only)

All components use a single database schema and include documentation. These components can be deployed on one or more host machines that meet the supported requirements. Refer to "[Hardware and Software Requirements](#)" on page 2-1 for more information.

Product Architecture

Oracle Identity Manager uses a three-tier architecture: the presentation tier, the server tier, and the data and enterprise integration tier.

The presentation tier contains the following components:

- Design Console
- Administrative and User Console
- Any installed custom client applications

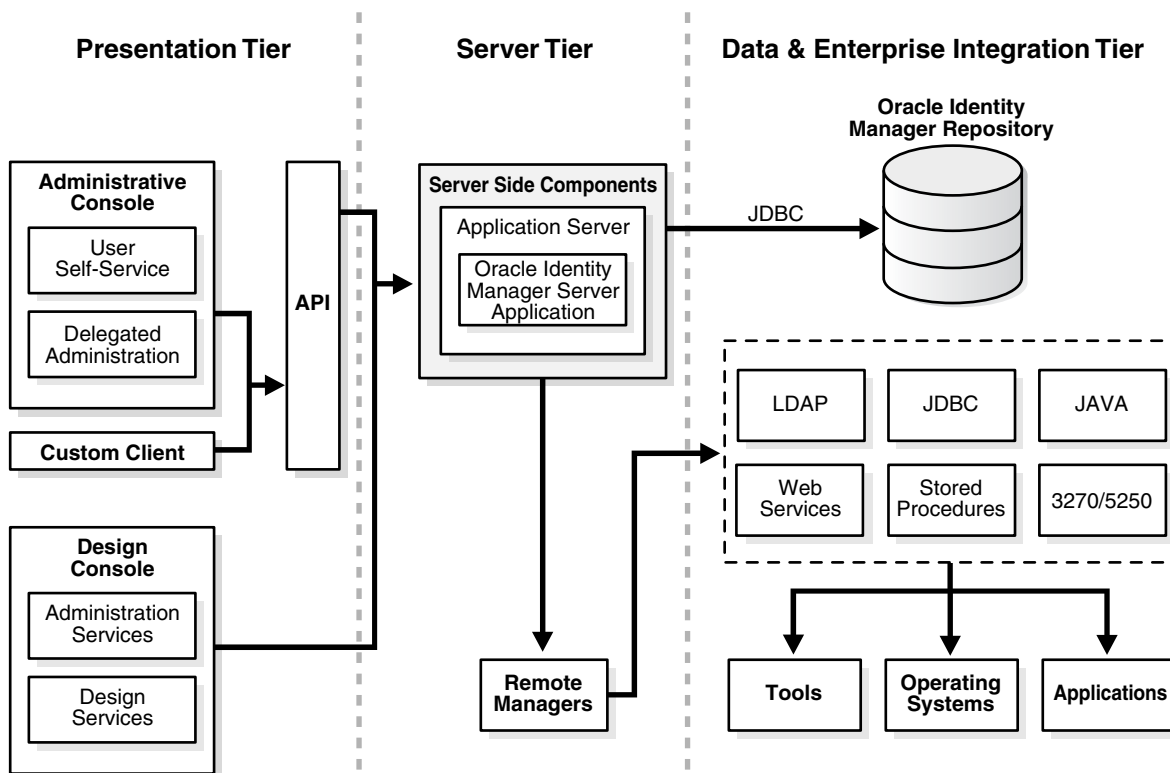

The server tier contains the Oracle Identity Manager Server component, which serves as a bridge between the presentation tier and the data and enterprise integration tier. All requests between the clients and the database are processed through the server tier.

The data and enterprise integration tier contains the database server, which holds the Oracle Identity Manager data structure.

Note: Throughout this document, the Oracle Identity Manager Server is referred to as “the server.” The OC4J application server that hosts the Oracle Identity Manager Server is referred to as “the application server.”

[Figure 1–1](#) illustrates the Oracle Identity Manager architecture:

Figure 1–1 Oracle Identity Manager Architecture

Installation Overview

The following steps explain how to use this guide for installing Oracle Identity Manager on OC4J:

1. Use [Chapter 2, "Planning the Installation"](#) on page 2-1 to prepare for the installation.
2. Use [Chapter 3, "Installing and Configuring OC4J for Oracle Identity Manager"](#) on page 3-1 to set up OC4J for Oracle Identity Manager.
3. Use [Chapter 4, "Installing and Configuring a Database for Oracle Identity Manager"](#) on page 4-1 to set up a database for Oracle Identity Manager.
4. Use one of the following chapters, specific to your operating system, to install a single Oracle Identity Manager instance:
 - [Chapter 5, "Installing Oracle Identity Manager Server on Windows"](#) on page 5-1
 - [Chapter 6, "Installing Oracle Identity Manager Server on UNIX or Linux"](#) on page 6-1
5. Use [Chapter 7, "Post-Install Configuration for Oracle Identity Manager Server and OC4J"](#) on page 7-1 to perform basic Oracle Identity Manager Server and OC4J configuration tasks related to the installation setup.
6. Use [Chapter 8, "Starting the Oracle Identity Manager Server"](#) on page 8-1 to start the Oracle Identity Manager server and access the Administrative and User Console.

7. Use [Chapter 9, "Installing and Configuring the Oracle Identity Manager Design Console"](#) on page 9-1 to install, configure, and start the Oracle Identity Manager Design Console.
8. Use [Chapter 10, "Installing and Configuring the Oracle Identity Manager Remote Manager"](#) on page 10-1 to install, configure, and start the Oracle Identity Manager Remote Manager.

Planning the Installation

Oracle strongly recommends that you familiarize yourself with the components required for your deployment before starting to install Oracle Identity Manager. Oracle also recommends that you install and use the included Diagnostic Dashboard to ensure that your system is ready for installation. See ["Using the Diagnostic Dashboard"](#) on page 2-6 for more information.

The following sections describe the hardware and software needed for a basic Oracle Identity Manager installation, which consists of the following:

- A database server
- An application server
- An Oracle Identity Manager server (running in the application server)
- A Design Console
- An Administrative and User Console (running in a web-browser)

This chapter contains the following topics:

- [Release 9.0.2 for Initial Deployments Only](#)
- [Hardware and Software Requirements](#)
- [Planning for Non-English Oracle Identity Manager Environments](#)
- [Before You Start](#)
- [Using the Diagnostic Dashboard](#)

Release 9.0.2 for Initial Deployments Only

Oracle Identity Manager Release 9.0.2 is intended only for customers performing initial deployments of the Oracle Identity Manager product. Do not install Release 9.0.2 over existing legacy Oracle Identity Manager installations. Contact your Oracle Support representative if you want to upgrade to Release 9.0.2 from previous releases.

Hardware and Software Requirements

Important: The information in this guide applies generally to all Oracle Identity Manager 9.0.x versions. Always check the Oracle Identity Manager Release Notes for the hardware and software requirements and supported configurations specific to each version of the Oracle Identity Manager product.

The following sections list the supported host computer, application server, and databases required for installing Oracle Identity Manager Release 9.0 and its components.

Note: You must obtain the enterprise versions of the application server and database software, complete with valid licenses. Oracle Identity Manager does not include this software.

Caution: There is a possibility that the Oracle Identity Manager installation program may conflict with previously installed applications, utilities, or drivers. Therefore, try to remove all non-essential software and drivers from the installation machine before loading Oracle Identity Manager. The same practice should be followed to ensure that the database host can create the database schema.

Supported OC4J Application Servers

Oracle Identity Manager Release 9.0 is supported on the OC4J 10.1.3.1 Enterprise edition application server delivered in the Oracle SOA Suite 10g Release 3 (10.1.3.1.0). The OC4J Standalone edition application server is not certified in Release 9.0.

Important: Oracle Identity Manager for OC4J requires that you use the JDK included with the OC4J application server. Remove any older JDK versions from your system to ensure the installer works properly.

Supported Operating Systems

Oracle Identity Manager Release 9.0 for the OC4J 10.1.3.1 Enterprise Edition application server is supported on the following operating systems:

- Microsoft Windows Server 2003 Enterprise Edition with SP1
- Microsoft Windows Server 2003 R2 Enterprise Edition
- RedHat Linux AS 4.1

Supported Databases

Select one database for your Oracle Identity Manager installation. Oracle Identity Manager supports the following databases:

- Oracle9i Enterprise Edition Release 9.2.0.7
- Oracle 10g Enterprise Edition Release 10.2.0.1.0

Host System Requirements for Oracle Identity Manager Components

The tables in this section list the minimum host system requirements for the various components in an Oracle Identity Manager environment.

Oracle Identity Manager Server Host Requirements

Table 2–1 lists the minimum host requirements for Oracle Identity Manager Server and are guidelines for a basic deployment. Increase each measurement if more size is needed for your deployment.

Table 2–1 Oracle Identity Manager Server Host Requirements

Server Platform	Item
Windows and Linux	<ul style="list-style-type: none"> ■ Processor Type: Intel Xeon or Pentium IV ■ Processor Speed: 2.4 GHz or higher, 400 MHz FSB or higher ■ Number of Processors: 1 ■ Memory: 2 GB for each Oracle Identity Manager Server instance ■ Hard Disk Space: 20 GB (initial size) ■ Operating System: Microsoft Windows Server 2003 Enterprise Edition with SP1 and R2 Enterprise Edition, or RedHat Linux AS 4.1

Database Server Host Requirements

Table 2–2 provides sample database host requirements for selective supported operating systems and should be considered only as guidelines. Increase each measurement if more size is needed for your deployment. Consult your database vendor's documentation for the specific database host requirements.

Table 2–2 Sample Database Server Host Requirement

Database Server Platform	Item
Windows and Linux	<ul style="list-style-type: none"> ■ Processor Type: Intel Xeon ■ Processor Speed: 2.4 GHz or higher, 400 MHz FSB or higher ■ Number of Processors: 2 ■ Memory: 4 GB total or 2 GB for each CPU ■ Hard Disk Space: 40 GB (initial size) for Windows, 20 GB (initial size) for Linux ■ Operating System: Microsoft Windows 2000 (Server, Advanced Server, Professional), Windows 2003 Server SP1 and Windows XP, or RedHat Linux AS 4.1

Design Console Host Requirements

Table 2–3 lists the minimum host requirements for the Oracle Identity Manager Design Console. Increase each measurement if more size is needed for your deployment.

Table 2–3 Design Console Host Requirements

Design Console Platform	Item
Windows	<ul style="list-style-type: none"> Processor Type: Intel Pentium IV Processor Speed: 1.4 GHz or higher Number of Processors: 1 Memory: 512 MB Hard Disk Space: 1 GB Operating System: Windows 2003 (all versions) and Windows XP (all versions)

Remote Manager Host Requirements

Table 2–4 lists the minimum host requirements for the Oracle Identity Manager Remote Manager. Increase each measurement if more size is needed for your deployment.

Table 2–4 Remote Manager Host Requirements

Remote Manager	
Platform	Item
Windows and Linux	<ul style="list-style-type: none"> Processor Type: Intel Pentium IV Processor Speed: 1.4 GHz or higher Number of Processors: 1 Memory: 512 MB Hard Disk Space: 1 GB Operating System: Microsoft Windows Server 2003 Enterprise Edition with SP1 and R2 Enterprise Edition, or RedHat Linux AS 4.1

Supported Versions Details

Table 2–5 lists version details for third-party components compatible with Oracle Identity Manager Release 9.0:

Table 2–5 Support Details for Third-Party Components

Item	Version Details
OC4J Application Server	OC4J 10.1.3.1 Enterprise edition application server delivered in the Oracle SOA Suite 10g Release 3 (10.1.3.1.0)
Oracle9i Database	9.2.0.7
Oracle 10g Release 2 Database	10.2.0.1.0
Microsoft Windows Server	2003 Enterprise Edition with SP1 and 2003 R2 Enterprise Edition
RedHat Linux	AS 4.1
JDK	JDK included with the OC4J application server
Microsoft Internet Explorer	6.x

Planning for Non-English Oracle Identity Manager Environments

If you are deploying Oracle Identity Manager Release 9.0.2 components in non-English environments, be sure to review the following guidelines and requirements:

- Before installing any of the Oracle Identity Manager Release 9.0.2 components, ensure the regional and language settings (locale) on the target system meet the following requirements:
 - An appropriate language version of the operating system is installed
 - Specific language settings are properly configured.
- Refer to the *Oracle Identity Manager Globalization Guide* for information about configuring localized deployments and to ensure you meet the character restrictions for various components and attributes.
- For Oracle database globalization support, you must configure the database for Unicode. Refer to ["Creating an Oracle Database"](#) on page 4-1 for more information.

Before You Start

Before installing Oracle Identity Manager, you should read ["Hardware and Software Requirements"](#) on page 2-1 and ["Installation Worksheet"](#) on page 2-5 to help plan your installation.

Since the Database Administrator (DBA), System Administrator, and IT Developer typically handle tasks specific to their specific areas of expertise, you should share Oracle Identity Manager installation information among your team members.

[Table 2–6](#) indicates the document sections each installation team member should read.

Table 2–6 Installation Roles and Documentation

Installation Role	Sections to Read
Database Administrator	<ul style="list-style-type: none"> ■ Planning Your Installation (this section) ■ Database Setup
System Administrator	<ul style="list-style-type: none"> ■ Planning Your Installation (this section) ■ Pre-Installation ■ Oracle Identity Manager Installation ■ Post-Installation ■ Advance Configuration
IT Developer	<ul style="list-style-type: none"> ■ Planning Your Installation (this section) ■ Oracle Identity Manager Installation ■ Installing the Design Console

Installation Worksheet

The Installation Worksheet table enables you to identify configuration attributes you need before starting the Oracle Identity Manager installation. Print this worksheet and use it to take notes as you go through your installation. Use the *User Selection* column to fill-in information specific to your installation:

Table 2–7 Installation Worksheet

Item	Default	User Selection
The base directory for installing Oracle Identity Manager.	Windows: C:\oracle UNIX or Linux: /opt/oracle	
The name or IP address of the machine where the Oracle Identity Manager database is installed.	N/A ¹	
The TCP port number on which the database listens for connections.	1521 for Oracle	
The name of the database for your installation.	N/A	
The name and password of the database account Oracle Identity Manager uses to access the database.	N/A	
The JDK install directory	Windows: <OC4J_HOME>\jdk UNIX or Linux: <OC4J_HOME>/jdk	
The OC4J install directory	Windows: C:\product\10.1.3.1\OracleAS_1 UNIX or Linux: /opt/product/10.1.3.1/OracleAS_1	

¹ N/A = Not Applicable for a default. However you must enter a value for this item when you install Oracle Identity Manager.

Using the Diagnostic Dashboard

The Diagnostic Dashboard is a web application that runs in your application server. It checks your pre- and post-installation environments for components required by Oracle Identity Manager. Oracle highly recommends that you install the Diagnostic Dashboard before installing Oracle Identity Manager.

Installing the Diagnostic Dashboard

The Diagnostic Dashboard tool is distributed on the Oracle Identity Manager Installer CD media. It is located in the DiagnosticDashboard directory.

You must deploy the Diagnostic Dashboard web application on your application server. For more information, refer to the *Oracle Identity Manager Administrative and User Console Guide*.

Verifying Your Pre-installation Environment

The Diagnostic Dashboard verifies the presence of the following components required to install Oracle Identity Manager:

- A supported Application Server
- A supported Java Virtual Machine (JVM)
- A supported Database

Installing and Configuring OC4J for Oracle Identity Manager

This chapter explains how to set up OC4J before installing Oracle Identity Manager and contains the following topics: You must perform the following tasks:

- [Verifying the Java JDK Version](#)
- [Setting Environment Variables](#)
- [Installing OC4J](#)
- [Installing OC4J JDBC Drivers](#)

Verifying the Java JDK Version

Oracle Identity Manager Release 9.0 for the OC4J application server requires that you use the JDK included with OC4J, which is version 1.5.0_06. Remove any older JDK versions from your system.

The following procedure explains how to verify that the correct version of the Java JDK will be used by Oracle Identity Manager. To verify on a Windows system:

1. Open a console window.
2. Enter `java -version`

For example, the information that appears should look like the following:

```
C:\>java -version
java version "1.5.0_06"
Java(TM) 2 Runtime Environment, Standard Edition (build 1.5.0_06-b05)
Java HotSpot(TM) Client VM (build 1.5.0_06-b05, mixed mode)
```

Setting Environment Variables

After you have verified that Oracle Identity Manager is using the JDK included with the OC4J application server (refer to "[Verifying the Java JDK Version](#)" for more information), complete the following steps to set your environment variables:

Note: The following instructions are for Windows. For UNIX or Linux, use the equivalent shell variable commands and settings.

1. From the Windows **Start Menu**, select **Settings**, select **Control Panel**, select **System**, select **Advanced**, then select **Environment Variables**. In the scroll box labelled **System Variables**, select **Path**, then click **Edit**.

In the text box labelled **Variable Value**, add the location of your JDK to the beginning of the existing path. For example, if your existing path is the following:

```
%SystemRoot%\system32;%SystemRoot%;C:\Program Files;
```

Change it to the following:

```
<OC4J_HOME>\jdk\bin;%SystemRoot%\system32;%SystemRoot%;C:\Program Files
```

Click **OK** to commit your change.

2. In the scroll box labelled **System Variables**, search for **JAVA_HOME**. If it does not exist, complete Step a. If **JAVA_HOME** does exist, complete Step b.
 - a. Click **New**. In the text box labelled **Variable Name**, enter **JAVA_HOME**. In the text box labelled **Variable Value**, enter the path to your JDK. Click **OK** to commit your entry, then click **OK** twice more to close the **Environment Variables** and **System Properties** dialogs, respectively.
 - b. Click **Edit**. Verify that the path to your JDK exists in the text box labelled **Variable Value**. If it does not exist, set **Variable Value** to the path for your JDK. Click **OK** to commit your entry, then click **OK** twice more to close the **Environment Variables** and **System Properties** dialogs, respectively.

Note: A message may appear displaying a message asking if you want to update the JDK. Close this window without updating the JDK, as Oracle Identity Manager Release 9.0 for OC4J requires that you use the JDK included with OC4J.

Installing OC4J

Perform the following steps to install OC4J for Oracle Identity Manager:

1. Install OC4J on the computer where you are going to install Oracle Identity Manager by using the OC4J application server documentation. After OC4J installs on the system, it will start automatically.
2. Stop OC4J.
3. Set the **ORACLE_HOME** system variable to the following:

```
c:\product\10.1.3.1\OracleAS_n
```

Note: *n* is a variable that changes after each OC4J installation on the system. For example, if you have installed OC4J twice on the system, *n* will be 2.

4. Start the OC4J application server.

Installing OC4J JDBC Drivers

You must install the latest OC4J JDBC drivers before installing Oracle Identity Manager on OC4J. The following is a list of the OC4J JDBC drivers required for Oracle Identity Manager on OC4J:

- ojdbc14.jar
- ojdbc14_g.jar
- ojdbc14dms.jar
- ojdbc14dms_g.jar
- orail8n.jar

Use the following steps to acquire and apply the latest OC4J JDBC drivers:

1. Log in to Oracle Technology Network at the following URL:
<http://www.oracle.com/technology/index.html>
2. Select **Downloads** from the horizontal menu at the top of the page.
3. In the Drivers section, select **JDBC**.
4. Select the **Oracle Database 10g Release 2 (10.2.0.1.0) drivers** option and accept the terms and conditions to download the drivers.
5. Use the following steps to install the OC4J JDBC drivers:
 - a. Log in to the Oracle Enterprise Manager 10g Application Server Control
 - b. Select **Home** from the **Members** section.
 - c. Select **Administration** from the horizontal navigation at the top.
 - d. Select the **Shared Libraries: Manage the shared libraries of this OC4J instance** option in the **Administration Tasks** section.
 - e. Click **Create** on the Shared Libraries page.
 - f. Enter `oracle.jdbc` as the name for the shared library and `10.2.0.1.0` (or higher) as the shared library version. Click **Next**.
 - g. Click **Add** on the **Create Shared Library: Add Archives** page and browse to the location of the OC4J JDBC files. Select one of the OC4J JDBC files.
 - h. Click **Continue** and repeat Step g until you add all OC4J JDBC files.
 - i. Click **Finish** on the **Create Shared Library: Add Archives** page to install all the OC4J JDBC drivers.

After installing the OC4J JDBC drivers, the following is added to the `<OC4J_HOME>/j2ee/home/config/server.xml` file on UNIX or Linux, or to the `<OC4J_HOME>\j2ee\home\config` file on Windows:

```
<shared-library name="oracle.jdbc" version="10.2.0.1.0">
  <code-source path="ojdbc14.jar"/>
  <code-source path="ojdbc14_g.jar"/>
  <code-source path="ojdbc14dms.jar"/>
  <code-source path="ojdbc14dms_g.jar"/>
  <code-source path="orail8n.jar"/>
</shared-library>
```

Installing and Configuring a Database for Oracle Identity Manager

Oracle Identity Manager requires a database. You must install and configure your database before you begin the Oracle Identity Manager installation. This chapter contains the following topics:

- [Using an Oracle Database for Oracle Identity Manager](#)

Using an Oracle Database for Oracle Identity Manager

To use Oracle for your database, you must:

1. Install Oracle—see ["Installing Oracle"](#) on page 4-1 for more information.
2. Create your Oracle database—see ["Creating an Oracle Database"](#) on page 4-1 for more information.
3. Prepare the Oracle database—see ["Preparing the Oracle Database"](#) on page 4-2 for more information.

Installing Oracle

Install the Oracle9i or 10g Release 2 database by referring to the documentation delivered with the Oracle database. See ["Supported Databases"](#) on page 2-2 for the specific supported versions. Oracle recommends using the Basic installation.

Note: If you choose the Custom installation, you must include the JVM option, which is required for XA transaction support.

Creating an Oracle Database

You need to create a new Oracle database instance for Oracle Identity Manager. When creating the database, make sure to configure the Oracle JVM feature and enable query rewrite.

You can use the Database Configuration Assistant (DBCA) tool to create the database. To configure the Oracle JVM feature, select the Oracle JVM feature on the Standard Database Features page of the DBCA.

To enable the database for query rewrite, set the init.ora parameters `QUERY_REWRITE_ENABLED` to `TRUE` and `QUERY_REWRITE_INTEGRITY` to `TRUSTED` in the **All Initialization Parameters** field of the DBCA.

Consult your Oracle database documentation for detailed instructions on creating a database instance.

Configuring the Database for Globalization Support

For globalization support for Oracle Identity Manager Release 9.0.2, Oracle recommends configuring the database for Unicode. To configure the database for Unicode, perform the following steps:

1. Set the database character to AL32UTF8, which supports the latest version of the Unicode standard, by selecting AL32UTF8 in the **Character Sets** tab of the DBCA.
2. Set the `NLS_LENGTH_SEMANTICS` init.ora parameter to CHAR in the **All Initialization Parameters** field of the DBCA.

See Also: *Oracle Identity Manager Globalization Guide*

Preparing the Oracle Database

Once you have installed Oracle and created a database instance, you must prepare it for Oracle Identity Manager by completing the following tasks:

- Verify that query rewrites is enabled
- Enable XA transactions support

Note: The Java JVM is required to enable XA transaction support. If you did not install the JVM during your Oracle installation, you must install it now. Consult Oracle documentation for specific instructions.

- Create at least one tablespace for storing Oracle Identity Manager data
- Create a database user account for Oracle Identity Manager

You can perform the preceding tasks to prepare your Oracle database for Oracle Identity Manager by running one of the following scripts:

- `prepare_xl_db.sh` (for UNIX or Linux)
- `prepare_xl_db.bat` (for Windows)

Both of these scripts ship with the Oracle Identity Manager installer and reside in the directory `\installServer\Xellerate\db\oracle\`.

You must observe the following prerequisites when using these scripts:

- The script must be run by the user holding dba privilege (For example, the oracle user on UNIX or Linux typically holds these privileges).
- The script must be run on the machine where the database resides.

To prepare your Oracle database for Oracle Identity Manager, complete the steps associated with the operating system on the machine hosting your Oracle database:

UNIX or Linux:

1. Copy the scripts `prepare_xl_db.sh` and `xell_db_prepare.sql` from the distribution CD to a directory on the machine hosting your database where you (as the account user performing this task) have write permission.
2. Run the following command to enable execute permission for the script:

```
chmod 755 prepare_xl_db.sh
```

3. Run the script `prepare_xl_db.sh` by entering the following command:

```
./prepare_xl_db.sh
```
4. Provide information appropriate for your database and host machine when the script prompts you for the following items:
 - a. The location of your Oracle home (`ORACLE_HOME`)
 - b. The name of your database (`ORACLE_SID`)
 - c. The name of the Oracle Identity Manager database user to be created
 - d. The password for the Oracle Identity Manager database user
 - e. The name of the tablespace to be created for storing Oracle Identity Manager data
 - f. The directory in which to store the data file for the Oracle Identity Manager tablespace
 - g. The name of the data file (you do not need to append the `.dbf` extension)
 - h. The name of the temporary tablespace.
5. Check the `prepare_xell_db.lst` log file located in the directory where you ran the `xell_db_prepare` script from to see execution status and additional information.

Windows:

1. Copy the scripts `prepare_xl_db.bat` and `xell_db_prepare.sql` from the distribution CD to a directory on the machine hosting your database where you (as the account user performing this task) have write permission.
2. Open a command window, navigate to the directory where you just copied the scripts, then run `prepare_xl_db.bat` with the following arguments:

```
prepare_xl_db.bat <ORACLE_SID> <ORACLE_HOME>
<XELL_USER> <XELL_USER_PWD> <TABLESPACE_NAME>
<DATAFILE_DIRECTORY> <DATAFILE_NAME>
<XELL_USER_TEMP_TABLESPACE> <SYS_USER_PASSWORD>
```

For example, the string you enter on the command line might look something like the following:

```
prepare_xl_db.bat XELL C:\oracle\ora92 xladm xladm
xeltbs C:\oracle\oradata xeltbs_01 TEMP manager
```

[Table 4–1](#) lists the options used in the preceding example of `prepare_xl_db.bat`:

Table 4–1 Options for the `prepare_xl_db.bat` Script

Argument	Description
XELL	Name of the database
C:\oracle\ora92	Directory where the Oracle database is installed
xladm	Name of the Oracle Identity Manager user to be created
xladm	Password for the Oracle Identity Manager user
xeltbs	Name of the tablespace to be created
C:\oracle\oradata	Directory where the datafiles will be placed

Table 4–1 (Cont.) Options for the prepare_xl_db.bat Script

Argument	Description
xeltbs_01	Name of the datafile (you do not need to give .dbf extension)
TEMP	Name of the temporary tablespace that already exists in your database
manager	Password for the SYS user

3. Check the prepare_xell_db.lst log file located in the directory where you ran the xell_db_prepare script from to see execution status and additional information.

If the script returns a message indicating successful execution, you can continue to the next task, which is Oracle Identity Manager installation.

If the script does not succeed, you must manually fix all fatal errors so that the database is prepared successfully.

You can ignore non-fatal errors. For example, when the script tries to drop a non-existent view, it will return the error "ORA-00942: table or view does not exist". This can be ignored without adverse consequences.

Make sure to scan all the errors in the log file and ignore or resolve them on an individual basis. Remember that you must successfully prepare the database for Oracle Identity Manager before you can install Oracle Identity Manager.

Installing Oracle Identity Manager Server on Windows

This chapter explains how to install Oracle Identity Manager on Windows. You must install the Oracle Identity Manager server on systems running the application server. Oracle Identity Manager components such as the Remote Manager and Design Console can be installed on separate systems. Each component has its own installer.

Caution: *DO NOT* use a remote client tool such as PCAnywhere to install Oracle Identity Manager products.

This chapter contains the following topics:

- [Installing the Database Schema](#)
- [Installing Documentation](#)
- [Installing the Oracle Identity Manager Server on Windows](#)

Installing the Database Schema

As part of the installation, the Oracle Identity Manager installer loads a schema into your database. You only install the database schema once. It is installed the first time you run the Oracle Identity Manager installer. Each subsequent time you run the installer to deploy other Oracle Identity Manager components you enter information about the database connection to configure the component for the same schema. Contact your database administrator (DBA) for details on your database.

Note: During the schema installation, a corresponding log file is created under the <XL_HOME>\logs\ directory.

Installing Documentation

The Oracle Identity Manager documentation is installed automatically under the <XL_HOME> directory. No special input is required. A full documentation set is installed with each Oracle Identity Manager component.

Installing the Oracle Identity Manager Server on Windows

This section describes how to install the Oracle Identity Manager server on a computer running Microsoft Windows.

Note: During the installation process, an unused log file named log.conf is created in the <XL_HOME>\xellerate\config\ directory. You can safely ignore this file.

To install the Oracle Identity Manager server on a Windows host:

1. Insert the Oracle Identity Manager Installation CD into your CD-ROM drive.
2. From Windows Explorer, access the installServer directory on the installation CD and double-click the setup_server.exe file.
3. Select a language on the Installer screen and click **OK**. The Welcome screen appears.
4. On the Welcome screen, click **Next**.
5. On the Oracle Identity Manager Application Options screen, select to install one of the following applications, and then click **Next**:
 - Oracle Identity Manager
 - Oracle Identity Manager with Audit and Compliance Module

Important: Do not install Oracle Identity Manager on top of an existing Oracle Identity Manager installation. For each new installation, use a different home directory. If you want to reuse the same name of an existing Oracle Identity Manager home directory, then backup your original Oracle Identity Manager home by renaming that directory.

Remember at all times that all Oracle Identity Manager components must be installed in different home directories. For example, you cannot install the Remote Manager in the same directory as the Oracle Identity Manager server.

6. After the Target directory screen appears, complete one of the following bulleted actions:
 - The default directory for the Oracle Identity Manager server is C:\oracle. To install the Oracle Identity Manager server into this directory, click **Next**.
 - To install the Oracle Identity Manager server into another directory, enter the path in the **Directory** field, then click **Next**.

or

Click **Browse**, navigate to the desired location, then click **Next**.

Note: If the directory path does not exist, the Base Directory settings text box appears. Click **OK**. Oracle Identity Manager creates this directory for the Oracle Identity Manager server. If you do not have write permission to create the default directory for the Oracle Identity Manager server, a message appears informing you that the installer could not create the directory. Click **OK** to dismiss the message, then contact your System Administrator to obtain the appropriate permissions.

7. On the Database Server Selection page, specify **Oracle** as the database you are using with Oracle Identity Manager and click **Next**.
8. On the Database Information page, provide all database connectivity information required to install the database schema. You install this schema just once, as part of your initial Oracle Identity Manager installation. Thereafter, you configure all the other Oracle Identity Manager components to point to this common schema.

Note: To install against an existing database, verify that the version of Oracle Identity Manager you are installing is certified with your existing database version. Refer to the *Oracle Identity Manager Release Notes* to confirm the certified configurations.

When Oracle Identity Manager is installed against an existing database, the .xldatabasekey file from the earlier Oracle Identity Manager installation must be copied to the new <XL_HOME>\xellerate\config directory. You should create the \config directory in the new <XL_HOME>\xellerate\ path if it does not already exist.

Enter the following database information:

- In the **host** field, enter the host name or the IP address of the computer on which the database resides.
- In the **PORT** field, enter the port number on which the database listens for connections. The default port is 1521 for Oracle.
- In **Database SID** field, enter the name of the database instance.
- In the **User Name** field, enter the user name of the database account you created for Oracle Identity Manager.
- In the **Password** field, enter the Oracle Identity Manager database user password.
- Click **Next** to commit these settings.

Note: When setting the preceding items, refer to the configuration settings specified in ["Using an Oracle Database for Oracle Identity Manager"](#) on page 4-1 to be sure you set consistent information.

The installer checks for database connectivity and if a database schema exists. If the check passes, the installer proceeds to the next step in the process. If the check fails, an error message appears.

- Select the appropriate database options:
 - If a database exists, and the connectivity is good, proceed to step 9.
 - If no connectivity is detected, you are prompted to enter new information or to fix the connection. Click **Next** after entering new information or fixing the connection.
9. On the Authentication Information page, select the **Oracle Identity Manager Default Authentication** option and click **Next**.

Note: Single Sign-On is not currently supported and you should not select the **SSO** (Single Sign-On) **Authentication** option.

10. On the Application Server Selection page, select **Oracle Application Server**, then click **Next**.
11. On the Application Server Information page, enter the information pertaining to your application server and Java installation:
 - a. Enter the path to your application server installation
or
Click Browse and navigate to your application server installation
 - b. Enter the path to the OC4J JDK directory
or
Click Browse and navigate to your JDK directory

Note: If you enter an invalid directory, an error message appears.

- c. Click **Next**.
 - d. Enter the OC4J administrator user name, `oc4jadmin`, in the **User Name** field.
 - e. Enter the password for the OC4J administrator in the **Password** field.
 - f. Enter 12401 in the **RMI Port No** field.
 - g. Enter 6003 in the **Oracle Process Manager and Notification (OPMN) Port No** field.
 - h. Enter the Oracle Process Manager and Notification Server Instance Name in the **Oracle Application Server Instance Name** field.
 - i. Click **Next**.
12. Backup your application server when the Application Server Configuration Backup screen appears, then click **Next** to initiate server installation.
13. If the installer detects an existing database, you can choose to use that database. Select **Yes**, then click **Next**. If the existing database is not encrypted, you are prompted to encrypt it. Select **Yes**, then click **Next**.
14. The Summary screen appears. Click **Install** to install the application.
15. The Completed screen appears. Click **Finish** to exit the installer.

After installing the Oracle Identity Manager server, perform the steps in [Chapter 7, "Post-Install Configuration for Oracle Identity Manager Server and OC4J"](#) on page 7-1 to continue the installation process.

Removing the Oracle Identity Manager Server Installation

To remove the Oracle Identity Manager server installation, perform the following steps:

1. Stop the Oracle Identity Manager server if it is running and stop all Oracle Identity Manager processes.

2. Delete the `<XL_HOME>` directory where you installed the Oracle Identity Manager server.

Installing Oracle Identity Manager Server on UNIX or Linux

This chapter explains how to install Oracle Identity Manager on UNIX or Linux. Refer to [Supported Operating Systems](#) on page 2-2 for more information on the supported UNIX or Linux platforms. You must install the Oracle Identity Manager server on systems running the application server. Oracle Identity Manager components such as the Remote Manager can be installed on separate systems. Each component has its own installer.

Note: The default logging package included by the base RedHat UNIX or Linux installation causes installation problems and exceptions for Oracle Identity Manager. Before installing Oracle Identity Manager on RedHat Linux, delete the commons-logging-1.0.2 library from the base operating system installation. The commons-logging-1.0.2 library is typically installed with any standard RedHat installation. Also, be sure to delete the symbolic links in the /usr/share/java/ directory. Deleting these symbolic links will force Oracle Identity Manager to use its own internal logger jar files during installation.

This chapter contains the following topics:

- [Installing the Database Schema](#)
- [Installing Documentation](#)
- [Installing the Oracle Identity Manager Server on UNIX or Linux](#)

Installing the Database Schema

As part of the installation, the Oracle Identity Manager installer loads a schema into your database. You only install the database schema once. It is installed the first time you run the Oracle Identity Manager installer. Each subsequent time you run the installer to deploy other Oracle Identity Manager components you enter information about the database connection to configure the component for the same schema. Contact your database administrator (DBA) for details on the particulars of your database.

Note: During the schema installation, a corresponding log file is created under the <XL_HOME>/logs/ directory.

Installing Documentation

The Oracle Identity Manager documentation is installed automatically under the `<XL_HOME>` directory. No special input is required. A full documentation set is installed with each Oracle Identity Manager component

Installing the Oracle Identity Manager Server on UNIX or Linux

To install Oracle Identity Manager on the OC4J application server running on UNIX or Linux, you must install as the same non-root user that installed the OC4J application server. Do not attempt to install Oracle Identity Manager on the OC4J application server running on UNIX or Linux as the root user.

Oracle Identity Manager for UNIX or Linux is installed through a console mode installer, which supports the following two input methods:

- Choose from among list of options
Each option is numbered and accompanied by square brackets ([]). To select an option, enter its number. Once selected, the associated square brackets display an X ([X]).
- Enter information at a prompt
To enter information at the prompt, enter the information and press the Enter key. To accept a default value—default values are enclosed in brackets after a prompt—simply press the **Enter** key to accept them.

The installer contains logical sections (panels).

- When you have selected an item from a list of options, enter the number zero (0) to indicate that the desired item has been selected.
- To move to the next installation panel, enter the number one (1).
- To go back to the previous panel, enter the number two (2).
- To cancel the installation, enter the number three (3).
- To redisplay the current panel, enter the number five (5).

Note: Before installing Oracle Identity Manager you must set the `JAVA_HOME` variable to the JDK included with the OC4J application server.

To install Oracle Identity Manager server on UNIX or Linux:

Note: During the installation process, an unused log file named `log.conf` is created in the `<XL_HOME>/xellerate/config/` directory. You can safely ignore this file.

1. Insert the Oracle Identity Manager Installation CD into your CD-ROM drive.
2. From the console, change directory (`cd`) to the `installServer` directory on the installation CD and run the `install_server.sh` file using the following command:

```
sh install_server.sh
```

The installer starts in console mode.

Note: If you are not installing Oracle Identity Manager from distributed media (CD), you must set the execute bit of all shell scripts under in the installServer directory. To set the execute bit for all shell scripts recursively, cd to the installServer directory and run the following command:

```
# chmod -R u+x *.sh
```

3. Choose a language by entering a number from the list of languages. Enter 0 to apply the language selection. The product Welcome Message panel appears.
4. Enter 1 on the Welcome Message panel to display the next panel. The Oracle Identity Manager Application Options panel appears.
5. Enter 1 on the Oracle Identity Manager Application Options panel to display the next panel. The Select the Oracle Identity Manager application to install panel appears.
6. Select the application to install:
 - Enter 1 for Oracle Identity Manager.
 - Enter 2 for the Oracle Identity Manager with Audit and Compliance Module.Enter 0 when you are finished to apply the application selection. The Target directory panel appears.
7. On the Target directory panel, enter the path to the directory where you want to install Oracle Identity Manager. For example, enter /opt/oracle/. Enter 1 to move to the next panel.

Important: Do not install Oracle Identity Manager on top of an existing Oracle Identity Manager installation. Use a different Oracle Identity Manager home directory. If you want to reuse the same directory name for the Oracle Identity Manager home directory backup your previous Oracle Identity Manager home by renaming the original directory.

All Oracle Identity Manager components must be installed in different home directories. For example, you cannot install the Remote Manager in the same directory where the Oracle Identity Manager server is installed.

If the directory does not exist, you are asked to create it. Enter y for yes.
The Database Server Selection panel appears.

Note: To install against an existing database, verify that the version of Oracle Identity Manager you are installing is certified with your existing database version. Refer to the *Oracle Identity Manager Release Notes* to confirm the certified configurations.

When Oracle Identity Manager is installed against an existing database, the .xldatabasekey file from the earlier Oracle Identity Manager installation must be copied to the new <XL_HOME>/xellerate/config directory. You should create the /config directory in the new <XL_HOME>/xellerate/ path if it does not already exist.

8. On the Database Server Selection panel, specify the type of database you are using.
 - Enter 1 for Oracle.
 - Enter 0 when you are finished.
 - Enter 1 to move to the next panel.
9. Enter your database information:
 - a. Enter the database host name or IP address.
 - b. Enter (or accept the default) port number.
 - c. Enter the SID for the database name.
 - d. Enter the database user name for the account that Oracle Identity Manager uses to connect to the database.
 - e. Enter the password for the database account that Oracle Identity Manager uses to connect to the database.
 - f. Enter 1 to move to the next panel.

The Authentication Information panel appears.

10. Select the authentication mode for the Oracle Identity Manager web application:

Note: Single Sign-On is not currently supported and you should not select the **SSO** (Single Sign-On) **Authentication** option.

- Enter 1 for Oracle Identity Manager Default Authentication.
- Enter 0 when you are finished.
- Enter 1 to move to the next panel.

The Application Server Selection panel appears.

11. Specify your application server type.
 - Enter 1 for Oracle Application Server.
 - Enter 0 when you are finished.
 - Enter 1 to move to the next panel.

The Application Server Information panel appears.

12. In the Application Server Information panel:
 - Enter the path to where the application server is installed

- Enter the path to where the OC4J JDK is installed
- Enter 1 to move to the next section.

The Oracle Application Server Information panel appears.

13. On the Oracle Application Server Information panel:
 - Enter the user name for the OC4J administrator
 - Enter the password for the OC4J administrator
 - Enter the RMI Port Number
 - Enter the Oracle Process Manager and Notification (OPMN) Port Number
 - Enter the Oracle Application Server Instance Name
 - Type 1 to move to the next panel.
14. When you receive a message about backing up the application server installation, enter 1 to move to the next section. The Summary panel appears.
15. On the Summary panel, enter 1 to begin installation.
16. After the installation finishes, the Completed panel appears. Enter 3 to finish and exit.

After installing the Oracle Identity Manager server, perform the steps in [Chapter 7, "Post-Install Configuration for Oracle Identity Manager Server and OC4J"](#) on page 7-1 to continue the installation process.

Removing the Oracle Identity Manager Server Installation

To remove the Oracle Identity Manager server installation, perform the following steps:

1. Stop the Oracle Identity Manager server if it is running and stop all Oracle Identity Manager processes.
2. Delete the <XL_HOME> directory where you installed the Oracle Identity Manager server.

Post-Install Configuration for Oracle Identity Manager Server and OC4J

After you have installed Oracle Identity Manager, you must complete some post-installation tasks before you can use the application. Additionally, there are several optional post-installation tasks you may choose to complete, depending on your deployment, before using the application. The following is a list of the sections in this chapter:

- [Required Post-Installation Tasks for OC4J](#)
- [Optional Post-installation Tasks](#)

Required Post-Installation Tasks for OC4J

After you install Oracle Identity Manager on OC4J you *must* perform the tasks in this section for Oracle Identity Manager to operate properly.

Increasing the OC4J Heap Size

After installing Oracle Identity Manager on OC4J you must increase the OC4J heap size before using Oracle Identity Manager. Perform the following steps to increase the OC4J heap size:

1. Open the `<OC4J_HOME>\opmn\conf\opmn.xml` file in a text editor.
2. Search for the following string:

```
-XX:MaxPermSize=128M
```

Change this string to the following:

```
-XX:MaxPermSize=512M
```

3. Save and close the `<OC4J_HOME>\opmn\conf\opmn.xml` file.
4. Restart the OC4J application server after increasing the heap size.

Increasing the Number of MDB Listener Threads

After installing Oracle Identity Manager on OC4J you must increase the number of MDB listener threads before using Oracle Identity Manager. By default, the number of listener threads is set to 1 and you must increase that setting to 15. Perform the following steps to increase the number of MDB listener threads:

1. Open the `<XL_HOME>\xellerate\DDTemplates\BO\orion-ejb-jar.xml` file in a text editor.

2. Add a listener thread attribute by inserting the following text:

```
<message-driven-deployment name="MessageHandlerMDB"
connection-factory-location="jms/XAQueueConnectionFactory"
destination-location="queue/xlQueue"
listener-threads="15"
>
```

3. Save and close the orion-ejb-jar.xml file.
4. Run the `<XL_HOME>\setup\patch_oc4j` command.
5. Restart the OC4J application server.

Configuring JMS File-based Persistence

After installing Oracle Identity Manager on OC4J you must configure JMS file-based persistence to ensure messages in the JMS queue can continue to be processed after the server restarts. Perform the following steps to configure JMS file-based persistence:

1. Stop the OC4J application server if it is running.
2. Open the `<OC4J_HOME>\j2ee\home\config\jms.xml` file in a text editor.
3. Add a persistence file attribute for `xlQueue` by inserting the following text:

```
<queue
name="xlQueue"
location="queue/xlQueue"
persistence-file="xlQueueJMSStore"
>
```

4. Add a persistence file attribute for `xlErrorQueue` by inserting the following text:

```
<queue
name="xlErrorQueue"
location="queue/xlErrorQueue"
persistence-file="xlErrorQueueJMSStore"
>
```

5. Save and close the `jms.xml` file.
6. Start the OC4J application server.

Optional Post-installation Tasks

After installing Oracle Identity Manager, you should considering performing the *optional* post-installation tasks documented in this section before using the application. Depending on your Oracle Identity Manager deployment, you may choose not to perform some of these tasks.

Changing Keystore Passwords

Oracle Identity Manager has two keystores: one for the Oracle Identity Manager server and one for the database. During installation, the passwords for both are set to *xellerate*. Oracle recommends changing the keystore passwords for all production installations. You can use the `keytool` to change the keystore password for either keystore.

To change the keystore password:

1. Open a command prompt on the Oracle Identity Manager host computer.

2. Navigate to the `<XL_HOME>\xellerate\config` directory.

3. Run the keytool with the following options:

```
<JAVA_HOME>\jre\bin\keytool -storepasswd -new <new_password>
-storepass xellerate -keystore .xlkeystore -storetype JKS
```

Table 7-1 lists the options used in the preceding example of keytool usage:

Table 7-1 Command Options for keytool

Option	Description
<code><JAVA_HOME></code>	Location of the Java directory associated with the application server
<code><new_password></code>	New password for the keystore
<code>-keystore <option></code>	Keystore whose password you are changing (.xlkeystore for the Oracle Identity Manager server or .xldatabasekey for the database)
<code>-storetype <option></code>	JKS for .xlkeystore and JCEKS for .xldatabasekey

4. Launch a plain-text editor, then open the `<XL_HOME>\xellerate\config\xlconfig.xml` file.

5. Edit the `<xl-configuration>.<Security>.<XLPKIPProvider>.<KeyStore>` section to specify the keystore password.

Note: Change the `<XLSymmetricProvider>.<KeyStore>` section of the configuration file to update the password for the database keystore (.xldatabasekey).

- Change the password tag to `encrypted="false"`.
- Enter the password (in the clear). For example, change the following block:

```
<Security>
<XLPKIPProvider>
<KeyStore>
<Location>.xlkeystore</Location>
<Password encrypted="true">xYr5V2FfkRYHxKXHeT9dDg==</Password>
<Type>JKS</Type>
<Provider>sun.security.provider.Sun</Provider>
</KeyStore>
```

to the following:

```
<Security>
<XLPKIPProvider>
<KeyStore>
<Location>.xlkeystore</Location>
<Password encrypted="false">newpassword</Password>
<Type>JKS</Type>
<Provider>sun.security.provider.Sun</Provider>
</KeyStore>
```

6. Restart your application server.

When you stop and start the application server, a backup of the configuration file is created. The configuration file (with the new password) is read in, and the password is encrypted in the file.

7. If all of the preceding steps have succeeded, you can delete the backup file.

Setting Log Levels

Oracle Identity Manager uses log4j for logging. Logging levels are configured in the logging properties file, `<XL_HOME>/xellerate/config/log.properties`. By default, Oracle Identity Manager is configured to output at the Warning level. You can change the log level universally for all components or for an individual component.

Oracle Identity Manager components are listed in the `<XL_HOME>\xellerate\config\log.properties` file in the XELLERATE section, for example:

```
log4j.logger.XELLERATE=WARN
log4j.logger.XELLERATE.DDM=DEBUG
log4j.logger.XELLERATE.ACCOUNTMANAGEMENT=DEBUG
log4j.logger.XELLERATE.SERVER=DEBUG
log4j.logger.XELLERATE.RESOURCEMANAGEMENT=DEBUG
log4j.logger.XELLERATE.REQUESTS=DEBUG
log4j.logger.XELLERATE.WORKFLOW=DEBUG
log4j.logger.XELLERATE.WEBAPP=DEBUG
log4j.logger.XELLERATE.SCHEDULER=DEBUG
log4j.logger.XELLERATE.SCHEDULER.Task=DEBUG
log4j.logger.XELLERATE.ADAPTERS=DEBUG
log4j.logger.XELLERATE.JAVACLIENT=DEBUG
log4j.logger.XELLERATE.POLICIES=DEBUG
log4j.logger.XELLERATE.RULES=DEBUG
log4j.logger.XELLERATE.DATABASE=DEBUG
log4j.logger.XELLERATE.APIS=DEBUG
log4j.logger.XELLERATE.OBJECTMANAGEMENT=DEBUG
log4j.logger.XELLERATE.JMS=DEBUG
log4j.logger.XELLERATE.REMOTEMANAGER=DEBUG
log4j.logger.XELLERATE.CACHEMANAGEMENT=DEBUG
log4j.logger.XELLERATE.ATTESTATION=DEBUG
log4j.logger.XELLERATE.AUDITOR=DEBUG
```

To set Oracle Identity Manager log levels, edit the logging properties in the `<XL_HOME>\xellerate\config\log.properties` file as follows:

1. Open the `<XL_HOME>\xellerate\config\log.properties` file in a text editor. This file contains a general setting for Oracle Identity Manager and specific settings for the components and modules that comprise Oracle Identity Manager.

By default, Oracle Identity Manager is configured to output at the Warning level:

```
log4j.logger.XELLERATE=WARN
```

This is the general value for Oracle Identity Manager. Individual components and modules are listed following the general value in the properties file. You can set individual components and modules to different log levels. The log level for a specific component overrides the general setting.

2. Set the general value to the desired log level. The following is a list of the supported log levels, appearing in descending order of information logged (DEBUG logs the most information and FATAL logs the least information):
 - DEBUG
 - INFO
 - WARN
 - ERROR

- FATAL

3. Set other component log levels as desired. Individual components or modules can have different log levels. For example, the following values set the log level for the Account Management module to INFO, while the server is at DEBUG and the rest of Oracle Identity Manager is at the WARN level.

```
log4j.logger.XELLERATE=WARN
```

```
log4j.logger.XELLERATE.ACCOUNTMANAGEMENT=INFO
```

```
log4j.logger.XELLERATE.SERVER=DEBUG
```

4. Save your changes.
5. Restart your application server so that the changes take effect.

Starting the Oracle Identity Manager Server

This chapter explains how to start and stop the Oracle Identity Manager server, and how to access the Administrative and User Console. This chapter contains the following topics:

- [Removing Backup xlconfig.xml Files After Starting or Restarting](#)
- [Starting the Oracle Identity Manager Server](#)
- [Stopping the Oracle Identity Manager Server](#)
- [Accessing the Administrative and User Console](#)
- [Using Diagnostic Dashboard to Verify Installation](#)

Important: You must complete all post-installation steps in [Chapter 7, "Post-Install Configuration for Oracle Identity Manager Server and OC4J"](#) on page 7-1 before starting the Oracle Identity Manager Server.

Removing Backup xlconfig.xml Files After Starting or Restarting

After starting any Oracle Identity Manager component either the first time, or after changing any passwords in xlconfig.xml, passwords are encrypted and saved. However, Oracle Identity Manager also keeps a backup copy of xlconfig.xml (named xlconfig.xml.<x>) before saving. This backup xlconfig.xml.<x> file contains the passwords in plain text.

Important: Be sure to remove these files after starting any Oracle Identity Manager component either the first time, or after restarting after changing any passwords in xlconfig.xml once you have established that the new password is working properly. The backup file is named xlconfig.xml.<x>, where x is the latest available number, for example xlconfig.xml.0, xlconfig.xml.1, and so on.

Starting the Oracle Identity Manager Server

This section describes how to start the Oracle Identity Manager server on Windows, UNIX, or Linux. To start the Oracle Identity Manager server you start the OC4J application server. Use the following steps to start the OC4J application server and Oracle Identity Manager:

1. Verify that your database is up and running

2. Start the OC4J application server as follows:

Windows

From the **Start** menu, select **Oracle <OC4J Instance Name>**, then select **Oracle Process Manager**, then select **Start Oracle Process Manager**.

UNIX or Linux

- a. Go to the <OC4J_HOME>/opmn/bin directory
- b. Run the following command:

```
./opmnctl startall
```

Stopping the Oracle Identity Manager Server

This section describes how to stop the Oracle Identity Manager server gracefully on Windows, UNIX, or Linux. To stop the Oracle Identity Manager server gracefully, you stop the OC4J application server using the following steps:

Windows

From the **Start** menu, select **Oracle <OC4J Instance Name>**, then select **Oracle Process Manager**, then select **Stop Oracle Process Manager**.

UNIX or Linux

1. Go to the <OC4J_HOME>/opmn/bin/ directory.
2. Run the following command:

```
./opmnctl stopall
```

Accessing the Administrative and User Console

After starting the OC4J application server and the Oracle Identity Manager server you can access the Administrative and User Console. Perform the following steps to access the Administrative and User Console:

1. Launch your web browser, then point it to the following URL:

```
http://<hostname>:<port>/xlWebApp
```

<hostname> represents the name of the machine hosting the application server and <port> refers to the port on which the OC4J application server is listening. The default port number for OC4J is 7777. To learn which port OC4J is listening on, open <OC4J_HOME>/install/readme.txt on UNIX or Linux, and <OC4J_HOME>\install\readme.txt on Windows.

For example:

```
http://localhost:7777/xlWebApp
```

Notes: Be aware of the following when accessing the Administrative and User Console:

- Do not use the IP address of the machine hosting the application server in the URL to connect to the Administrative and User Console. Use the fully-qualified domain name as shown in the example.
 - The application name, xIWebApp, is case-sensitive.
-

2. After the Oracle Identity Manager login screen appears, login with your user name and password.

Note: The default administrator user name and password are xelsysadm.

Using Diagnostic Dashboard to Verify Installation

The Diagnostic Dashboard verifies each component in your post-installation environment by testing for:

- A trusted store
- Messaging capability
- A task scheduler
- A Remote Manager

The Diagnostic Dashboard also checks for all supported versions of components along with their packaging.

Note: See ["Using the Diagnostic Dashboard"](#) on page 2-6 for more information.

Installing and Configuring the Oracle Identity Manager Design Console

This section explains how to install the Oracle Identity Manager Design Console Java client. You have the option to install the Design Console on the same computer as your Oracle Identity Manager server or on a separate computer.

This chapter contains the following topics:

- [Requirements](#)
- [Installing the Design Console](#)
- [Post-Installation Requirements for the Design Console](#)
- [Starting the Design Console](#)

Requirements

Verify that your environment meets the following requirements for Design Console installation:

- You must have an Oracle Identity Manager server installed and running.
- If you are installing on a computer other than the host for the application server, you need to know the host name and port number of the computer hosting that application server.
- The Design Console host must be able to ping the application server host using both IP and hostname.

Note: If you cannot resolve the hostname of the application server, then try adding the hostname and IP address in the hosts file in the directory C:\WINDOWS\system32\drivers\etc\.

Installing the Design Console

To install the Design Console on a Windows host:

1. Insert the Oracle Identity Manager Installation CD into your CD-ROM drive.
2. Launch Windows Explorer, then navigate to the installServer directory on the installation CD.
3. Double-click the setup_client.exe file.

4. Choose a language from the list on the Installer screen. The Welcome page appears.
5. On the Welcome page, click **Next**.
6. On the Target directory screen, complete one of the following sub-steps:

Important: All Oracle Identity Manager components must be installed in different home directories. If you are installing the Design Console on a machine that is hosting another Oracle Identity Manager component, such as the Oracle Identity Manager server or the Remote Manager, you must specify a different install directory for the Design Console.

- a. The default directory for the Design Console is C:\oracle. To install the Design Console into this directory, click **Next**.
- b. To install the Design Console into another directory, enter the path in the **Directory** field, then click **Next**.

or

Click **Browse**, navigate to the desired location, then click **Next**.

Note: If the directory path that you does not exist, the Base Directory settings text box appears: Click **OK**. Oracle Identity Manager creates this directory for the Oracle Identity Manager server. If you do not have write permission to create the default directory for the Oracle Identity Manager server, a message appears informing you that the installer could not create the directory, Click **OK** to dismiss the message, then contact your System Administrator to obtain the appropriate permissions.

7. On the Application Server page, select **Oracle**, then click **Next**. The next screen prompts you to specify the JRE to use with Design Console.
8. Select either the JRE that is installed with Oracle Identity manager or specify an existing JRE. Click **Next**. The Application Server configuration screen appears.
9. On the Application Server Host Information page, enter the information appropriate for the application server hosting your Oracle Identity Manager server:
 - a. Enter the host name or IP address in the upper text box.
 - b. Use the default, pre-filled value of 12401 for the OC4J naming port.

Note: The host name is case-sensitive.

- c. Click **Next**.
10. On the Graphical Workflow Rendering Information page, enter the Application server configuration information:
 - a. Enter the Oracle Identity Manager server host IP address.

- b. Enter the port number the OC4J application server is listening on—the default port is 7777. To learn which port OC4J is listening on, open `<OC4J_HOME>/install/readme.txt` on UNIX or Linux, and `<OC4J_HOME>\install\readme.txt` on Windows.
 - c. Select **No** to specify whether the Design Console should use SSL.
 - d. Click **Next**.
- 11. On the Shortcut page, select (or deselect) the check boxes for the shortcut options according to your preferences:
 - a. Choose to create a shortcut to the Design Console on the Start Menu.
 - b. Choose to create a shortcut to the Design Console on the desktop.
 - c. Click **Next** when you are satisfied with the check box settings.
- 12. On the Summary page, click **Install** to initiate Design Console installation.
- 13. The final installation page displays a reminder to copy certain application server-specific files to your Oracle Identity Manager server installation. Follow these instructions and then click OK.
- 14. Click **Finish** to complete the installation process.

Removing the Design Console Installation

To remove the Design Console installation, perform the following steps:

1. Stop the Oracle Identity Manager server and the Design Console if they are running.
2. Stop all Oracle Identity Manager processes.
3. Delete the `<XL_DC_HOME>` directory where you installed the Design Console.

Post-Installation Requirements for the Design Console

After installing the Design Console, you must perform the following required steps before using it for Oracle Identity Manager on OC4J:

1. Copy the `<OC4J_HOME>\j2ee\home\lib\ejb.jar` file on the OC4J system to the `<XL_DC_HOME>\xlclient\ext` directory on the Design Console system.
2. Copy the `<OC4J_HOME>\j2ee\home\oc4jclient.jar` file on the OC4J system to the `<XL_DC_HOME>\xlclient\ext` directory on the Design Console system.

Starting the Design Console

Double-click `<XL_DC_HOME>\xlclient\xlclient.cmd` or select Design Console from the Windows Start menu or desktop.

Installing and Configuring the Oracle Identity Manager Remote Manager

This chapter explains how to install Oracle Identity Manager Remote Manager. It contains the following sections:

- [Installing the Remote Manager on Windows](#)
- [Installing the Remote Manager on UNIX or Linux](#)
- [Configuring the Remote Manager](#)
- [Starting Remote Manager](#)
- [Removing the Remote Manager Installation](#)

Installing the Remote Manager on Windows

Complete the following steps to install the Remote Manager on a Windows host:

1. Insert the Oracle Identity Manager Installation CD into your CD-ROM drive.
2. Launch Windows Explorer, then navigate to the installServer directory on the installation CD.
3. Double-click the setup_rm.exe file.
4. Choose a language from the list on the Installer screen. The Welcome page appears.
5. On the Welcome page, click **Next**.
6. On the Target directory page, complete one of the following sub-steps:

Important: All Oracle Identity Manager components must be installed in different home directories. If you are installing the Remote Manager on a machine that is hosting another Oracle Identity Manager component (the server or the Design Console), specify an install directory that hasn't been used yet.

- a. The default directory for Oracle Identity Manager products is C:\oracle. To install Remote Manager into this directory, click **Next**.
- b. To install Remote Manager into another directory, enter the path in the **Directory name** field, and click **Next**.

or

Navigate to the desired location, then click **Next**.

Note: If the directory path that you specified does not exist, the Base Directory settings text box appears: Click **OK**. Oracle Identity Manager creates this directory for the Oracle Identity Manager server. If you do not have write permission to create the default directory for the Oracle Identity Manager server, a message appears informing you that the installer could not create the directory. Click **OK** to dismiss the message, then contact your System Administrator to obtain the appropriate permissions.

7. Select either the JRE that is installed with Oracle Identity Manager or specify an existing JRE. Click **Next**. The Remote Manager Configuration screen appears.
8. On the Remote Manager Configuration page, enter the appropriate information for the Remote Manager:
 - a. Enter the Service Name.
 - b. Use the default, pre-filled value of 12346 as the binding port.
 - c. Use the default, pre-filled value of 12345 as the Remote Manager SSL port.
 - d. Click **Next**.
9. On the Shortcut page, select (or deselect) the check boxes for the shortcut options according to your preferences:
 - a. Choose to create a shortcut for the Remote Manager on the desktop.
 - b. Choose to create a shortcut for the Remote Manager on the Start Menu.
 - c. Click **Next** when you are satisfied with the check box settings.
10. On the Summary page, review the configuration details, and then click **Install** to initiate installation.
11. After the installation has completed, click **Finish** on the Completed page to exit.

Installing the Remote Manager on UNIX or Linux

To install the Remote Manager on UNIX or Linux:

Note: Before installing the Remote Manager you must set the JAVA_Home variable to the JRE included with the Remote Manager installer.

1. Insert the Oracle Identity Manager Installation CD into your CD-ROM drive.
2. From the File Manager, access the installServer directory on the installation CD.
3. Run the install_rm.sh file. The command-line installer starts.
4. Choose a language from the list by entering a number and then entering 0 to apply the language. The Welcome panel appears.
5. On the Welcome panel, enter 1 to move to the next panel. The Target directory panel appears.

6. On the Target directory panel, enter the path to the directory where you want to install the Oracle Identity manager Remote Manager. The default directory is /opt/oracle.
 - Enter 1 to move to the next panel.
 - If the directory does not exist, you are asked to create it. Enter y for yes.

Important: All Oracle Identity Manager components must be installed in different home directories. If you are installing the Remote Manager on a machine that is hosting an Oracle Identity Manager server, you must specify a unique install directory.

7. Specify the JRE to use with Remote Manager:
 - Enter 1 to install the JRE included with Oracle Identity Manager.
 - Enter 2 to use an existing JRE at a specified location.
 - Enter 0 to accept your selections
 - Enter 1 to move to the next panel.

The Remote Manager Configuration panel appears.
8. On the Remote Manager Configuration panel, enter the Remote Manager configuration information:
 - a. Enter the Service Name, or press the Enter key to accept the default.
 - b. Enter 12346 as the Remote Manager binding port.
 - c. Enter 12345 as the Remote Manager SSL port.
 - d. Enter 1 to move to the next panel.

The Remote Manager installation summary panel appears.

9. Check the information.
 - Enter 2 to go back and make changes.
 - Enter 1 to start the installation.

Oracle Remote Manager installs and the Post Install Summary panel appears.

10. Enter 3 to finish the Remote Manager installation.

Configuring the Remote Manager

The Remote Manager and Oracle Identity Manager server communicate using SSL. If you are using Remote Manager, you must enable a trust relationship between your Oracle Identity Manager server and the Remote Manager. (The server must trust the Remote Manager certificate).

Optionally, you can enable client-side authentication (where the Remote Manager checks the server's certificate). Import the Remote Manager's certificate into your Oracle Identity Manager server's keystore and make it trusted. For client-side authentication, import the certificate for your Oracle Identity Manager server into the keystore for your Remote Manager, then make that certificate trusted. You must also manually edit the configuration file associated with the server, and depending on the

options you selected during Remote Manager installation, the Remote Manager configuration file as well.

Trusting the Remote Manager Certificate

To configure the Remote Manager:

1. Copy the Remote Manager certificate to the server computer. On the Remote Manager computer, locate the file `<XL_RM_HOME>\xlremote\config\xlserver.cert` and copy it to the server computer.

Note: The server certificate in `<XL_HOME>\config` is also named `xlserver.cert`, so make sure you do not overwrite that certificate.

2. Open a command prompt on the server computer.
3. To import the certificate using the keytool, use the following command:

```
<JAVA_HOME>\jre\bin\keytool -import -alias rm_trusted_cert -file <RM_cert_location>\xlserver.cert -trustcacerts -keystore <XL_HOME>\xellerate\config\xlkeystore -storepass xellerate
```

`<JAVA_HOME>` is the location of the Java directory for your application server, the value of *alias* is an arbitrary name for the certificate in the store, and `<RM_cert_location>` is the location where you copied the certificate.

Note: If you changed the keystore password, substitute that for `xellerate` for the value of the `storepass` variable.

4. Enter Y at the prompt to trust the certificate.
5. Launch a plain-text editor, then open the `<XL_HOME>\xellerate\config\xlconfig.xml` file.
6. Locate the `<RMIOverSSL>` property and set it to `true`, for example:

```
<RMIOverSSL>true</RMIOverSSL>
```
7. Locate the `<KeyManagerFactory>` property and set the value to `SUNX509`. For example:

```
<KeyManagerFactory>SUNX509</KeyManagerFactory>
```
8. Save the file.
9. Restart your application server.

Using Your Own Certificate

Complete the following steps if you want to use your own certificate:

On the Remote Manager Server System:

1. Import your custom key in a new keystore (`new_keystore_name`) other than `.xlkeystore`. Be sure to remember the password (`new_keystore_pwd`) you used for the new keystore.
2. Copy this new keystore to the `<XL_RM_HOME>\xlremote\config\` directory.
3. Open `<XL_RM_HOME>\xlremote\config\xlconfig.xml` using a text editor.

4. Locate the <RMSecurity> tag and change the value in the <Location> and <Password> tags as follows:

```
<KeyStore>
  <Location>new_keystore_name</Location>
  <Password encrypted="false">new_keystore_pwd</Password>
  <Type>JKS</Type>
  <Provider>sun.security.provider.Sun</Provider>
</KeyStore>
```

5. Restart the Remote Manager Server and open xlconfig.xml to make sure the password for the new keystore was encrypted.

On the Oracle Identity Manager Server System:

1. Import the same certificate key used in the Remote Manager system to a new keystore (new_svrkeystore_name) other than .xlkeystore. Be sure to remember the password (new_svrkeystore_pwd) you used for the new keystore.
2. Copy this new keystore to the <XL_HOME>\xellerate\config directory.
3. Open <XL_HOME>\xellerate\config\xlconfig.xml using a text editor.
4. Locate the <RMSecurity> tag and change the value in the <Location> and <Password> tags as follows:

```
<TrustStore>
  <Location>new_svrkeystore_name</Location>
  <Password encrypted="false">new_svrkeystore_pwd</Password>
  <Type>JKS</Type>
  <Provider>sun.security.provider.Sun</Provider>
</TrustStore>
```

5. Restart the Oracle Identity Manager Server and open xlconfig.xml to make sure the password for the new keystore was encrypted.

Enabling Client-side Authentication for Remote Manager

To enable client-side authentication:

1. On the machine hosting the Remote Manager, launch a plain-text editor and open <XL_RM_HOME>\xlremote\config\xlconfig.xml
2. Set the <ClientAuth> property to true, for example:

```
<ClientAuth>true</ClientAuth>
```

3. Ensure the <RMIOverSSL> property is set to true, for example:

```
<RMIOverSSL>true</RMIOverSSL>
```

4. Locate the <KeyManagerFactory> property and set the value to SUNX509. For example:

```
<KeyManagerFactory>SUNX509</KeyManagerFactory>
```

5. Save the file.
6. Copy the server certificate to the Remote Manager computer. On the server computer, locate the file <XL_HOME>\xellerate\config\xlserver.cert and copy it to the Remote Manager computer.

Note: The Remote Manager certificate is also named `xlserver.cert`, so make sure you do not overwrite that certificate.

7. Open a command prompt on the Remote Manager computer.
8. Import the certificate using the `keytool`, use the following command:

```
<JAVA_HOME>\jre\bin\keytool -import -alias trusted_server_cert -file <server_
cert_location>\xlserver.cert -trustcacerts -keystore <XL_RM_
HOME>\xlremote\config\xlkeystore -storepass xellerate
```

`<JAVA_HOME>` is the location of the Java directory for your Remote Manager, the value of *alias* is an arbitrary name for the certificate in the store, `<XL_RM_HOME>` is the home directory for the Remote Manager, and `<server_cert_location>` is the location to which you copied the server certificate.

Note: If you changed the keystore password, substitute that value for `xellerate`, which is the default value of the `storepass` variable.

9. Enter `Y` at the prompt to trust the certificate.
10. Restart the Remote Manager.

Starting Remote Manager

Use the following to start the Remote Manager:

- **Windows:** execute the `<XL_RM_HOME>\xlremote\remotemanager.bat` script.
- **UNIX or Linux:** execute the `<XL_RM_HOME>/xlremote/remotemanager.sh` script.

Removing the Remote Manager Installation

To remove the Remote Manager installation, perform the following steps:

1. Stop the Oracle Identity Manager server and the Remote Manager if they are running.
2. Stop all Oracle Identity Manager processes.
3. Delete the `<XL_RM_HOME>` directory where you installed the Remote Manager.
