

# **Siebel Web Services On Demand Guide**

Version 3.1 (CRM On Demand  
Release 15) Rev. B  
October 2008

Copyright © 2005, 2008, Oracle. All rights reserved.

The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

**PRODUCT MODULES AND OPTIONS.** This guide contains descriptions of modules that are optional and for which you may not have purchased a license. Siebel's Sample Database also includes data related to these optional modules. As a result, your software implementation may differ from descriptions in this guide. To find out more about the modules your organization has purchased, see your corporate purchasing agent or your Oracle sales representative.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

**U.S. GOVERNMENT RIGHTS.** Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software--Restricted Rights (June 1987). Oracle USA, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

## What's New in This Release

### What's New in Siebel Web Services On Demand Guide, Version 3.1 (CRM On Demand Release 15) Rev. B

Table 1 lists changes described in this version of the documentation to support Version 3.1 (CRM On Demand Release 15) Rev. B of the software.

Table 1. What's New in Siebel Web Services On Demand Guide, Version 3.1 (CRM On Demand Release 15) Rev. B

Topic	Description
<a href="#">"Account" on page 34</a>	A new CustomObject3 child object is exposed for the Account object.
<a href="#">"Contact" on page 62</a>	A new CustomObject3 child object is exposed for the Contact object.
<a href="#">"CustomObject2" on page 85</a>	A new CustomObject3 child object is exposed for the CustomObject2 object.
<a href="#">"CustomObject3" on page 93</a>	A new CustomObject3 parent object is exposed.
<a href="#">"Performance of the Update and Insert Methods Versus the InsertOrUpdate Method" on page 29</a>	A new topic has been added about the performance of the InsertOrUpdate method compared to the Update and Insert methods.

Table 2 lists the new features in this version of the documentation to support Version 3.1 (CRM On Demand Release 15) Rev. A of the software.

Table 2. New Product Features in Siebel Web Services On Demand Guide, Version 3.1 (CRM On Demand Release 15) Rev. A

Topic	Description
<a href="#">"Field Types Supported by CRM On Demand" on page 13</a>	Information about the query syntax for Date/Time and Date fields has been added.
<a href="#">"Validation of Email Fields" on page 16</a>	Information about the validation rules for email address fields has been added.
<a href="#">Chapter 4, "Best Practices for Designing Client Applications,"</a>	A chapter about best practices for designing client applications has been added.

Table 2. New Product Features in Siebel Web Services On Demand Guide, Version 3.1 (CRM On Demand Release 15) Rev. A

Topic	Description
<a href="#">"DeleteChild" on page 161</a>	Information about the possibility of deleting parent objects using the DeleteChild method has been added.
<a href="#">"Update" on page 172</a>	Information has been added about the updating of records for which required fields have been added.
<a href="#">"Downloading the Integration Event WSDL File" on page 181</a>	Information about the XSD Schema files in the integrationevent.zip file has been added.
<a href="#">"GetPicklistValues" on page 183</a>	The information for the GetPicklistValues method has been updated with a list of record types for which the method is supported.
<a href="#">"Query by Children Example 4" on page 214</a>	A new sample has been added for the Query by Children query type for the QueryPage method. The sample illustrates how to use the UseChildAnd parameter to retrieve a list of modified child objects.

# 2

## Overview of Web Services On Demand

This chapter provides an overview of Oracle's Siebel CRM On Demand's support for Web services. It contains the following topics:

- "About Web Services"
- "Web Services and the CRM On Demand Objects" on page 12
- "Field Types Supported by CRM On Demand" on page 13
- "Web Services Utilization" on page 17

### About Web Services

The term *Web services* describes a standardized way of integrating Web-based applications over the Web. Web services allow businesses to communicate with each other and with other clients, without intimate knowledge of each other's IT systems. Web services share business logic, data, and processes through a Web services application programming interface (API). Application developers can then add the Web services to a software application (such as a Web page or executable program) to offer specific functionality to users.

### Web Services Core Technologies

The Web services core technologies are a set of standards-based technologies that include:

- **Extensible Markup Language (XML)**. The standard markup language that allows the definition of message structures and facilitates the passing of data between software applications.
- **Web Services Description Language (WSDL)**. The XML-formatted language that is used to describe a Web service. A WSDL file defines the available methods, message structures, and network addresses required for using a specific Web service.
- **Simple Object Access Protocol (SOAP)**. The XML-based protocol that is used to send Web services messages. Web services messages are sent between the customer implementation of Web services and the SOAP handler on the Siebel Web Server.

For more information on Web services technologies, see:

<http://www.w3.org/2002/ws>.

## Siebel CRM On Demand Web Services Toolkit

The Web Services Toolkit provides access to an application programming interface (API) that companies can use to build programs to integrate with CRM On Demand. The Toolkit includes a set of WSDL files that describes the interface to the CRM On Demand objects. This provides a programmatic interface for accessing your company's CRM On Demand information. A customer application can use the WSDL files through standard Web services development tools, such as those provided by the Oracle SOA Suite.

The API for this release of CRM On Demand is backward-compatible with previous releases.

Figure 1 shows how the Web Services Toolkit interacts with the CRM On Demand database. The customer uses the Web Services Toolkit (WSDL fields) to define the objects and methods that are contained in the CRM On Demand Hosted Service. The customer application communicates with CRM On Demand over the Internet using the secure HTTPS protocol. It invokes the Web services implementation contained in the CRM On Demand Hosted Service.

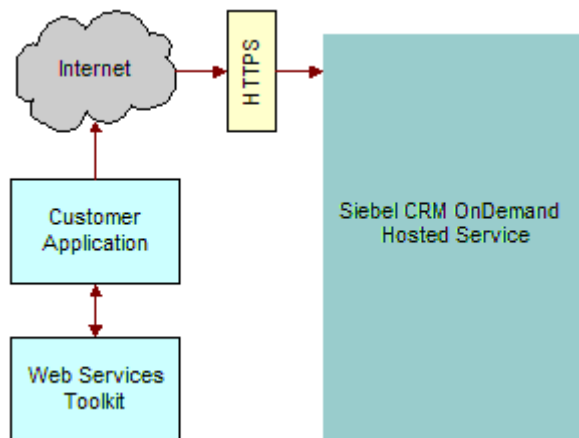

Figure 1. How Web Services Communicate with CRM On Demand

Web Services On Demand is designed to be backward-compatible with previous releases. Therefore WSDL files from previous releases will continue to work with newer releases of Web Services On Demand, and there is no need for customers to modify their code when upgrading to a new release of CRM On Demand.

## CRM On Demand Web Services and Integration with CRM On Demand

The Web Services On Demand API allows companies to build programs to integrate with CRM On Demand. Some common examples of client integrations include the following:

- **Integrations of CRM and back-office applications.** You can retrieve real-time sales, marketing, and service information from CRM On Demand and use it in financial and other back-office applications. For example, you can retrieve information about recently closed opportunities through the Web services interface and insert this information into an order entry system that has a Web services user interface. In addition, you can store information from back-office applications in CRM On Demand for instant access by users, visible in custom fields on any CRM On Demand page.
- **Web-based portal applications.** You can create customized Web-based applications using Active Server Pages (ASPs), Java Server Pages (JSPs), or similar Web technology that accesses CRM On Demand through the Web services interface. For example, a CRM On Demand customer can deploy a customized Web form on its corporate Web site, allowing visitors to enter requests for more information. The application creates new lead records in CRM On Demand for these requests through the Web services interface. Another Web page can allow visitors to browse through solutions to common problems stored in CRM On Demand and retrieved in real time through the Web services interface.
- **Custom add-on modules.** Customers can also extend CRM On Demand functionality. For example, a company can create a custom add-on module to streamline its unique quote creation process, or a company can create additional utilities to perform mass data cleanup operations. These modules access data in CRM On Demand directly through the Web services interface. CRM On Demand administrators and users can run these modules while concurrently accessing the CRM On Demand user interface.

## Web Services Security

The CRM On Demand Web Services Integration framework includes the following security features:

- All communications are encrypted with Secure Sockets Layer (SSL) for security (minimum 128-bit).
- Access is session-based, requiring authorization with a valid CRM On Demand user name and password.
- Inactive sessions are closed automatically after a period of inactivity.
- The same data visibility and access capabilities that apply to users in the CRM On Demand hosted service are applied to users connected through the Web services interface. Data visibility and access are restricted by the role that your company assigns. Permissions are checked for every data access.
- A full audit trail of Web services activity is available through CRM On Demand's Administration pages. These pages display both current and historical usage statistics.
- A number of other proprietary solutions protect CRM On Demand against malicious use of the Web services interface. These solutions are constantly reviewed and improved as new technologies and techniques become available.

A session with a standard HTTPS request is created to establish a connection with CRM On Demand through the Web services interface. A client can create a new session with the login operation and close it with the logoff operation. When a session is created, an encrypted session identifier is provided to the client. Security is maintained by the client by including the session identifier with each request during that session. For more information, see [“Establishing and Managing the Web Services Session” on page 19](#).

Support is provided for part of the UserNameToken profile of the WS-I Basic Security Profile 1.0. The complete profile is not supported, rather only the UserName and Password part of the UserNameToken standards. This allows a username and password to be passed with a SOAP request, which removes the necessity for a separate login operation. For more information, see [“Logging In and Making an Integration Request” on page 23](#).

## Web Services Reliability

All server components of CRM On Demand, including those responsible for the Web services interface, incorporate load balancing and other high-availability mechanisms. These mechanisms prevent the service from being interrupted by server or network infrastructure failure.

# Web Services and the CRM On Demand Objects

The CRM On Demand Web services allow applications to integrate with CRM On Demand. They provide the ability to find and invoke the core Siebel On Demand Web Services across the Web from any client application language. This ability makes the process of using CRM On Demand services easy for those who want to use them.

The CRM On Demand services provide a basis for customers to perform integration with CRM On Demand based on SOAP technology.

All major CRM On Demand business objects are exposed in the Web services, with the names of the Web services matching the default names of the business objects. [Chapter 5, “CRM On Demand Objects Exposed Through Web Services”](#) details the CRM On Demand parent and child objects that are exposed through CRM On Demand Web Services.

## About Parent-Child Relationships

Many of the CRM On Demand objects interact with each other through parent-child relationships. A parent object refers to the main or base object of interest and the child object refers to objects that are related to the parent in some way—for example, if the child is contained in the parent, or if the child has records that refer to the parent.

These parent-child relationships can be one-to-many or many-to-many. For example, a lead can be associated with a particular account, but an account can have many leads associated with it. In this case, you can think of the relationship between the account and its leads as a one-to-many parent-child relationship.

Other relationships can be many-to-many, meaning that many children are associated with many parents. For example, a contact can be associated with several opportunities, or an opportunity can have several contacts associated with it. In this case, you can think of the relationship between contacts and their opportunities as a many-to-many parent-child relationship. The parent-child relationship between contacts and opportunities can be treated with either the opportunity as the parent with contacts as children, or with the contact as the parent and the opportunities as children.

## Web Services On Demand and Custom Fields

CRM On Demand allows company administrators to create custom fields that capture information specific to the company's needs. Web Services On Demand allows customers to interact with the data stored in these custom fields. Each custom field has an associated integration tag that is used by Web services and Web links to reference data in custom fields. This feature allows administrators to change the display name of a field without making modifications to the existing Web services integration.

### *To view or modify integration tag information for a record type*

- 1 Navigate to the Field Setup Administration screen for the required record type.

For example: Admin > Application Customization > Account > Account Field Setup > Rename Fields.

- 2 Click Advanced.

The integration tag information is displayed for you to view or modify.

You can download custom WSDL files in which the XML tags for the custom fields are based on the integration tags.

### *To download a WSDL file that is specific to your company's customization*

- 1 Navigate to the Web Services Administration screen.
- 2 Select the required record type, and click Download Custom WSDL.

A record type's WSDL that is specific to your company's customization is downloaded.

For more information about downloading WSDL files, refer to the online help for CRM On Demand.

## Field Types Supported by CRM On Demand

All fields in Web services On Demand are transmitted and received as strings. It is the client's responsibility to cast these to and from the required data type in any application. The proper type can usually be determined from the name, purpose, or application of the field. There is no dynamic method for determining field types. You can derive clues about a field's type from its name as follows:

- A name ending in the suffix Id is usually a key field, such as a primary key, foreign key, or user key Id. It can usually be treated as a unique text string.
- Fields with names containing Date or Time, such as LastUpdated, DueDate, StartTime, or EndTime might be date fields.
- Telephone number fields can be treated as numeric phone numbers or as plain text. When performing queries on phone number type fields the following formats should be used in Query operations:
  - U.S. Format: +1 872 9269923
  - France: +33 01 40359564
  - Japan: +81 3 54579623
- Other numeric fields, such as currency, size, revenue, or probability can be treated as integer, floating point, or text fields depending on the application.
- Boolean fields have the value Y for true or N for false.
- Most other fields can be treated as ordinary text.

If you attempt to query a field of type Date with syntax like <CloseDate>&gt;'01/01/2004 00:00:00'</CloseDate> you get an error, because the time parameter 00:00:00 is only valid for fields of type Date/Time and not for fields of type Date.

## Special Search Fields

Some field names are prefixed with CI\_ to denote that they are special fields that provide better search functionality. These fields do not exist for all objects but are easily identified in the WSDL files as shown in the following excerpt from the Account WSDL file:

```
<xsd:element name="CI_AccountName" maxOccurs="1" minOccurs="0" type="xsd:string"></xsd:element>
```

```
<xsd:element name="CI_Location" maxOccurs="1" minOccurs="0" type="xsd:string"></xsd:element>
```

## Support for Multi-Select Picklists

A multi-select picklist is a picklist from which the user can select multiple values. In Web Services On Demand, all standard and custom multi-select picklist fields are exposed, however, multi-select picklists are only supported for the following record types:

- Account
- Activity
- Contact
- Custom Object 1
- Custom Object 2

- Lead
- Opportunity,
- Service Request

No child record types are supported.

You can add, remove, or replace selections in multi-select picklist fields, and you can query selections in all parent-level multi-select picklist fields.

Input and output values are language-independent code (LIC) delimited, but the multi-select picklist delimiter is always a semicolon regardless of locale for input and output: <LIC1>;<LIC2>.

The following is a sample request to insert a multi-select picklist field.

```
<?xml version="1.0" encoding="UTF-8" standalone="no"?>

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"

        </Opportunity>

      </ListOfOpportunity>

    </OpportunityWS_OpportunityInsertOrUpdate_Input>

  </soap:Body></soap:Envelope>
```

## Locale-Dependent Access to CRM On Demand

Siebel On Demand Web Services does not provide any specialized localization interfaces. CRM On Demand supports full localization, so that the data created through Web services is localized for users. The localized fields in the Web services interfaces follow the formats outlined in the following topics.

### Date and Time Fields

Date and time fields in CRM On Demand are in the following format:

MM/DD/YYYY hh:mm:ss

### Number and Currency Fields

Number and currency fields in CRM On Demand are in raw number format. In other words, number and currency fields hold only digits with no currency symbols, decimal separators, or other numeric separators (different locales use different symbols as the decimal point).

## Validation of Email Fields

When CRM On Demand validates fields containing email addresses, it identifies the following as invalid:

- Empty string
- String too long
- No characters before the at sign (@) character, for example: @rightequip.com
- No at sign (@) character, for example: isamplerightequip.com
- No period (.) character, for example: isample@rightequipcom
- No domain, for example: isample@
- No domain suffix such as com, for example: isample@rightequip
- Multiple at signs (@), for example: isample@@rightequip.com
- Consecutive period (.) characters, for example: isample@rightequip..com
- Spaces in the string, for example: isa mple@rightequip
- Characters other than the following in the local part of an email address:
  - Uppercase and lowercase letters (case insensitive)
  - The digits 0 through 9
  - The characters:
    - Exclamation point (!)
    - Hash symbol (#)

- ❑ Dollar sign (\$)
- ❑ Percent (%)
- ❑ Ampersand (&)
- ❑ Single quotation sign (')
- ❑ Asterisk (\*)
- ❑ Plus sign (+)
- ❑ Minus sign (-)
- ❑ Slash (/)
- ❑ Equal sign (=)
- ❑ Question mark (?)
- ❑ Caret (^)
- ❑ Underscore (\_)
- ❑ Back single quotation mark (`)
- ❑ Left curly brace ({)
- ❑ Vertical bar (|)
- ❑ Right curly brace (})
- ❑ Tilde (~)

- Any special characters in the domain name of an email address. These special characters are the same as those allowed in the local part of the email address, and also the left and right parentheses ().

## Web Services Utilization

The Web Services Utilization page provides useful information on Web services usage, both current and historical, for a company.

In the Web Services utilization page, the source of Web services calls is logged to determine whether the calls originated, for example, from a PDA application, or from a generic custom application.

See the CRM On Demand online help for more information on using the Web Services Utilization page.

# 3

## Getting Started with Web Services

This chapter provides an overview of how to get started with Siebel CRM On Demand Web Services. It contains the following topics:

- [“Setting Up Web Services On Demand” on page 19](#)
- [“Establishing and Managing the Web Services Session” on page 19](#)

### Setting Up Web Services On Demand

A customer who wants to access data in CRM On Demand from a Web services-enabled client must perform the following tasks:

- 1 Request Web Services Integration.** For security reasons, this capability is not automatically enabled for CRM On Demand customers. On request, a Siebel CRM On Demand Customer Care representative enables the Web Services On Demand Integration capability for your company.
- 2 Download WSDL files.** The customer's designated CRM On Demand Administrator accesses the Web Services Administration page in CRM On Demand. The Administrator downloads Web Service Description Language (WSDL) files that have been published for the desired CRM On Demand objects (record types).
- 3 Incorporate WSDL files.** The company incorporates the WSDL files into its Web services development environment—for example, by generating Java or C# (C Sharp) proxy classes.
- 4 Establishing and Managing the Web Services Session.** A Web services-enabled client, including a client application written in any language that interacts with the Web services framework, establishes a secure session with CRM On Demand. Throughout this session, the client interacts with the published CRM On Demand Web Services to perform data retrieval, modification, creation, and deletion operations. CRM On Demand and the client format requests and resulting data as standard XML/SOAP messages. For more information, see [“Establishing and Managing the Web Services Session” on page 19](#).

### Establishing and Managing the Web Services Session

The Web Service API for CRM On Demand integration is session-based. It has the following features:

- Clients must make login and logoff calls in their code to manage the session.
- The login step returns an HTTP cookie that contains the session identifier that must be used for making additional requests.
- A session remains active until the user explicitly logs out or until the session times out.

Web services session management is HTTP-based. Session management in CRM On Demand is based on a session ID, JSESSIONID, contained in HTTP Session Cookies. The session ID is critical to successful session generation and maintenance of a SOAP transaction. CRM On Demand Web Services enable session management by first creating a session using the login call, which is then referenced in any subsequent SOAP operations.

In a Siebel SOAP session, after a session ID has been created in a login request, it can be referenced in one of these ways:

- The session ID can be attached as a parameter to the URL request line. When a session ID is present in the URL line, it is identified by the string `jsessionId` in lowercase, followed by the exact session ID, which is coded using URL syntax.

**NOTE:** This is the recommended approach to referencing the session ID.

- The session ID can be part of the cookie header line. When a session ID is referenced as a cookie, a cookie header line must appear in the SOAP request with the name `JSESSIONID=`. In this case, the session ID appears in uppercase, and the value of the cookie is exactly the same as the session ID received from the login request.

SOAP operations do not work if a Siebel Session ID is not referenced in one of these ways.

When a login request is made, the session ID is returned as a cookie in the response to the request. The client is responsible for extracting this session ID and using it throughout the session. If the session times out for any reason, the error returned reports that the session is not valid and the client must then request a new session. In this case, no explicit logoff operation is required.

The logoff operation is considered as one of the operations for a session, so the session ID must be present in the logoff request. However, only the cookie version is accepted in the logoff request.

The CRM On Demand Web Service interface supports the following three types of function:

- [“Logging In to the Web Services Session”](#)
- [“Integration Requests for the Web Services Session” on page 22](#)
- [“Logging Out of the Web Services Session” on page 24](#)

All requests must use Secure Sockets Layer (SSL) over HTTP (HTTPS).

## Logging In to the Web Services Session

The login request is an HTTPS request to instantiate a session and obtain a session ID. A client invokes login by sending an HTTP GET request to a URL like the following:

```
https://secure.crmondemand.com/Services/Integration?command=login
```

**NOTE:** The login parameter value is case sensitive.

- **Login input.** The input to login is provided in the URL parameters and the HTTP headers, as follows:
  - The only URL parameter to be set is `command`. This parameter value is `login`.

- Two HTTP headers, `UserName` and `Password`, must be set with the appropriate values for your system. For example:
  - `UserName: johndoe@email.com`
  - `Password: mypass`
- **Login output.** The login command returns the following items:
  - A session cookie, `jsessionid`. The client must use this cookie when submitting subsequent requests, including logoff requests.
  - A status code of 200, if the session does not encounter any errors. This indicates that the request succeeded.

For code samples for logging in, see [“Code Samples for Logging In and Logging Out” on page 189](#).

It is also possible to log in at the same time as making an integration request; for more information, see [“Logging In and Making an Integration Request” on page 23](#).

## Logging in Using Single Sign-On

The Single Sign-On (SSO) feature of CRM On Demand allows companies to integrate the hosted CRM On Demand service with other systems that have the ability to manage user credentials and authentication.

If your company has been set up to use SSO for CRM On Demand, the following steps are used to log in and retrieve the session ID.

- 1 The Web service client makes a request with the following command specifying the SSO Company Identifier.

```
https://server/Services/Integration?command=ssotsurl&ssoid=company-ssoid
```

- 2 The server returns the SSO ITS URL in the "X-SsoItsUrl" HTTP header of the response
- 3 The Web service makes a request with the ITS URL and retrieves a session ID.

For detailed information about Single Sign-On, refer to the White Paper available from Customer Care.

For code samples for single sign-on see [“Code Samples for Logging In Using Single Sign-On” on page 198](#).

## Outbound SSO

The outbound SSO feature allows users who have signed into CRM On Demand using SSO to pass the SSO credentials from CRM On Demand to third-party sites such as corporate Web pages or intranets. This allows users to embed or access third-party sites from within CRM On Demand.

Outbound SSO in CRM On Demand uses a proprietary method to generate a hashed message authentication code (HMAC) token that is passed to the third-party site. This third-party site makes a request back to CRM On Demand with the token. CRM On Demand then validates the token and provides a username back to the third-party site, or authenticates the token and provides a session ID to the user.

Two methods are available as part of outbound SSO:

- 1 SSO Token Validation.** The following steps are used to validate an SSO token:
  - a** The third-party application makes a request with the following command specifying the SSO token:  
`https://server/Services/SSOTokenValidate?odSsoToken = "ssotoken value"`
  - b** The server returns the username in the response.
- 2 Login using SSO Token.** The following steps are used to obtain a session ID using the SSO token:
  - a** The third party application makes a request with the following command specifying the SSO token:  
`https://server/Services/Integration?command=ssologin&odSsoToken="ssotoken value"`
  - b** The server returns the session ID in the response, which is used for access to data within CRM On Demand.

For detailed information about outbound SSO, refer to the Customer Care Portal - Web services resource library.

## Integration Requests for the Web Services Session

An integration request is an HTTPS request to invoke a Web service to perform data creation, retrieval, update, and deletion operations. An integration request is made by an HTTP POST command to a URL like the following:

`https://secure.crmondemand.com/Services/Integration/object`

where *object* is the name of the relevant CRM On Demand object (record type). This CRM On Demand object is determined from the contents of the SOAP request.

**Integration request input.** The *jsessionid* returned to the client during login must be included with the request. The request must contain the *jsessionid* either as a cookie or as a URL parameter, as follows:

`https://secure.crmondemand.com/Services/Integration/object;  
jsessionid=xyZ12489w3482413`

The Web service input is provided as a SOAP command in the body of the HTTP POST request.

**Integration request output.** The properties returned by the HTTP server populate the response headers and the response body. The following table shows the top-level properties that specify key properties of the HTTP response.

Table 4. Properties of the HTTP Response

Property	Comments
HttpStatus	Status code returned in the response. If no value is provided, the response is given the value 200 (indicating success).
Content-Type	Content type returned in the response. If no value is provided, the response is given the value text/xml.

## Logging In and Making an Integration Request

It is possible to log into a Web services session without making an explicit log in request. When the first integration request is being sent, you can provide login credentials in the security header along with the request. This is due to support for the UsernameToken profile of the WS-I Basic Security Profile 1.0. In this case, the SOAP header contains a <wsse:UsernameToken> element, which has child elements containing a username and password. The response includes the cookie with a JSESSIONID.

A sample SOAP request is as follows:

```
<?xml version="1.0" encoding="utf-8"?>

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:wsse="http://
  schemas.xmlsoap.org/ws/2002/xx/secext" xmlns:xsd="http://www.w3.org/2001/
 /XMLSchema">

  <soap:Header>

    <wsse:Security>

      <wsse:UsernameToken >

        <wsse:Username>user@emod.com</wsse:Username>

        <wsse:Password>user1285</wsse:Password>

      </wsse:UsernameToken>

    </wsse:Security>

  </soap:Header>

  <soap:Body>

    <AccountWS_AccountQueryPage_Input xmlns="urn:crmondemand/ws/account/">

      <PageSize>10</PageSize>

      <ListOfAccount xmlns="urn:/crmondemand/xml/account">

        <Account>

          <AccountId></AccountId>

```

```

        <Location></Location>

        <AccountName>LIKE '*'</AccountName>

    </Account>

</ListOfAccount>

<StartRowNum>0</StartRowNum>

</AccountWS_AccountQueryPage_Input>

</soap:Body>

</soap:Envelope>

```

## Logging Out of the Web Services Session

A client logs out by sending an HTTP POST or HTTP GET request to a URL. For example:

```
https://secure.crmondemand.com/Services/Integration?command=logoff;
```

**NOTE:** The parameter value `logoff` is case sensitive.

**Logoff input.** The `jsessionId` returned to the client during login must be included with the request as a cookie with the same name. There are no other URL parameters or HTTP headers, and there is no HTTP body. The `jsessionId` returned to the client during login must be included with the request. The request must contain the `JSESSIONID` as a cookie.

**Logoff output.** There is no output. If the session does not encounter any errors, the status code of the response is 200. This response indicates that the request succeeded.

For code samples for logging out, see [“Code Samples for Logging In and Logging Out” on page 189](#).

### Additional Logoff

The `jsessionId` can be included in the URL instead of a cookie if the user wants. The following URL is what the user would use, where `XXXX` is the `jsessionId`.

```
https://secure.crmondemand.com/Services/Integration;jsessionId=XXXX?command=logoff
```

## Limits for the Web Services Session

The CRM On Demand's Web Services interface resources can be shared by multiple organizations. CRM On Demand provides a limiting infrastructure to make sure that some users do not consume a disproportionate share of those resources. These limiters constrain customer organizations' use of server-side resources to equitably share available resources among users and to minimize the possibility of denial-of-service incidents.

The limiters are summarized in the following topics; for more information, contact Customer Care.

## Request Rate

All integration requests (data exchange requests) in a session are subject to rate limiting. Rate limiting is implemented for the following reasons:

- A user can perform long-running operations on the server that result in complex and long-running queries on the database.
- A user can perform constant operations on the server that constantly use resources.

Rate limiting can alleviate the previous problems to some extent. CRM On Demand applies a restriction to each session to limit the number of requests for each second that clients can make. The rate limit is set to twenty requests for each second. This is measured as a minimum of 1/20th second wait time between requests.

If the rate limit is exceeded, the following error message is provided to subsequent SOAP requests:

The maximum rate of requests was exceeded. Please try again in <waitTime> ms.

## Request Size Limit

The upper limit on the size of any incoming HTTP request is 5 MB. If the request size is exceeded, the following error message is provided to subsequent SOAP requests:

Request exceeded the size limit of 5 MB.

## Session Time-outs

Web services sessions time out after 10 minutes if there is no activity during the session.

## Maximum Records Returned

For return messages the maximum number of records returned for each query is limited to 100. If the requested records exceed this limit, an error of the following type is returned:

PageSize method argument cannot be greater than 100, specified by the server parameter 'MaximumPageSize'.

A response never returns more than the specified number of records for a parent object in a request.

## Maximum Objects in a Web Services Request

The maximum number of objects that can be sent in a single SOAP request is 20.

# 4

## Best Practices for Designing Client Applications

This chapter provides best practice recommendations that allow you to design client applications that interface optimally with CRM On Demand using Web Services On Demand. It contains the following topics:

- [“Batch Processing” on page 27](#)
- [“Session Management and Pooling” on page 28](#)
- [“API Calls” on page 28](#)
- [“Error Handling and Logging” on page 29](#)
- [“Handling Outages” on page 29](#)

### Batch Processing

With Web Services On Demand, you can perform batch operations that optimize performance by combining multiple requests into one.

CRM On Demand batch processing has a limit of 20 top-level records for each request and is supported for the following operations:

- Insert
- Delete
- Update
- InsertOrUpdate
- QueryPage

Because batch calls take longer to process than single operations they should only be used in instances where longer response time would not impact the user experience. However, for such interactive applications, if the application needs to process multiple records of the same type, batch operations increase the performance.

If a single record in a batch causes an error, the entire batch is not processed. For example, a batch of 20 Account inserts where one record contains an error will require all records to be re-inserted.

A batch error could result from a data error or other error (for example, network outage, session expiry, and so on). If the error is not data-related, it is recommended that the user logs in again and tries the Web service call again. If the error is data-related, the batch can be split into smaller batches so that the records that do not cause errors can be processed.

## Session Management and Pooling

Web Services On Demand uses a session-based security mechanism for which each operation is synchronous.

It is recommended that a user:

- Always closes sessions if the application process is not likely to be used multiple times within the session idle time-out period (10 minutes by default).
- Always keeps sessions open and reuses them when the application process is likely to be used multiple times within the session idle time-out period. It is important to reuse sessions that are not in use, as frequent logins add overhead to your process and slow it down.

Client applications should not reuse sessions that are in use, in other words, they should not submit several simultaneous requests using the same session.

The client time-out on a single Web service call should be set to at least 10 minutes, so that the client does not time out when a request is still pending.

For information about Web services sessions, see [“Establishing and Managing the Web Services Session” on page 19](#).

## Session Pooling

Session pooling is another option for increasing the performance of your application further. Session pooling involves maintaining a list of active sessions on the client application. The client application must ensure that each session is active and valid (it must have a valid session ID) before using it in a request. The application might determine whether the session is active based on the success of the login operation and the time that has passed since the session was used. If all active sessions are in use for pending Web service requests, add a new session to the pool.

You can use session pooling to improve performance in both a single-threaded or multi-threaded application. In a single-threaded application, session pooling can avoid the unnecessary overhead of re-logging into the application for each request. In a multi-threaded application session, you can use session pooling to run multiple requests at the same time.

## API Calls

Whenever possible, it is recommended that queries be as specific as possible to reduce the number of records in the result set. You should restrict the fields returned by queries to only the fields that are required by your process.

Queries that involve related child objects (that is child objects that are top-level objects), or complex queries that involve criteria from both parent and related child objects, may perform better if they are separated into multiple requests.

The following are also recommended:

- Use the child methods [DeleteChild](#), [InsertChild](#), and [UpdateChild](#) for child delete, insert, and update operations.

- Whenever possible, store your company's unique identifiers in the external system ID field on objects.
- Use the [Insert](#) method and [Update](#) method whenever possible as they perform better than the [InsertOrUpdate](#) method.

## Performance of the Update and Insert Methods Versus the InsertOrUpdate Method

Designing your application to use the Insert and Update methods may result in an increase in throughput compared to using the InsertOrUpdate method. This is due to the additional business logic and SQL statements executed during the InsertOrUpdate operation to determine whether the submitted records match any existing records in the CRM On Demand database. The performance and throughput improvement may not be apparent at lower volumes, but high volume applications could benefit from the direct update and insert operation, which does not require the additional business logic to determine whether the records already exist.

## Error Handling and Logging

Error handling and logging are essential when developing a client application. The client application should provide for:

- Logging of detailed information about the error observed.
- Logging of the body and header information of all SOAP requests and responses. For the resolution of some errors, the actual SOAP request can be extremely useful in identifying the root cause of a problem.
- A call stack, which can be extremely important when analyzing problems and can provide useful hints that may reveal contributing factors to the problem.
- Entry points wrapped in log messages. The ability to identify entry and exit of Web service calls is important when analyzing issues.
- If a Web service request returns an error, the ability to analyze the result, stop immediately, or continue depending on the severity of the issue reported.
- End points that are not hard-coded.
- Dynamic server name and protocol configuration.

## Handling Outages

This topic describes best practices for handling outages due to:

- **Scheduled Maintenance Downtime.** From time to time, CRM On Demand will have scheduled downtime when the application is shut down to perform regular maintenance and upgrades. It is important for your client applications to be able to identify and respond correctly to this scenario.

- **Application Failures.** If there is a failure within CRM On Demand, it is important for the client application to respond appropriately. Performing proper error handling and logging is extremely important because it will not only help you resolve issues on your own but, if necessary, help you engage with CRM On Demand customer support and provide them with critical information. For more information, see ["Error Handling and Logging" on page 29](#).

## Handling Outages and Failures

The client application should contain a mechanism to recognize when the CRM On Demand application is not available, and be able to persist in a dormant state. This mechanism can either be achieved manually or programmatically; for example:

- A process can become dormant if it receives a HTTP 404 error message and retry after several minutes.
- A process can alert an administrator and shut down after  $x$  failed attempts.

A situation may arise where it is unknown if an operation has succeeded or not. In this situation, if the client application can detect duplicate errors, you can retry an insert operation with CRM On Demand user keys allowing you to uniquely identify records. You can identify lost updates by examining modification dates on records.

# 5

## CRM On Demand Objects Exposed Through Web Services

This chapter contains reference information about the objects exposed through the Web Services On Demand API. These objects correspond to record types and enable access to data stored within an instance of CRM On Demand.

This chapter contains the following topics:

- [“Reference Information About the Parent Objects” on page 31](#)
- [“Parent Objects” on page 33](#)
- [“Child Objects” on page 149](#)

### Reference Information About the Parent Objects

The reference information about the parent objects includes:

- A description of each object, as well as information on usage of the object.
- Information about the relationships between objects; for each object, the associated parent and child objects are listed.
- The methods that can be invoked to insert, update, delete, and find data. For more information on these methods, see [Chapter 6, “Web Services On Demand API Calls.”](#)
- The fields that are exposed for the objects:
  - The required and read-only fields
  - The user keys, see [“CRM On Demand User Keys” on page 31](#)
  - The audit fields, see [“Audit Fields” on page 32](#)
  - The status key, see [“CRM On Demand Status Keys” on page 33](#)
  - The pick map fields, see [“CRM On Demand Pick Maps” on page 33](#)
  - The filterable fields, see [“Filterable Fields” on page 33](#)
  - The picklist fields

### CRM On Demand User Keys

A *user key* is a field or group of fields that uniquely identifies a record. Generally, a subset of the record's fields are used as a user key. However, one field on its own can act as a user key, depending on whether the field can identify the record as unique. Each user key can be used independently to identify a record.

The most basic user key is the single field *ObjectId*; for example, for the user object the *UserId* field is a user key. Every record in the database has at least the following independent user keys:

- *ObjectId*
- *ExternalSystemId*.

In addition, there are various field combinations for different objects that can also be used to define uniqueness.

It is possible only to query for or update a particular record in a table if the values of all the fields in any user key are known. In some instances, the *ObjectId* or *ExternalSystemId* of a record might not be known, but the values for some other user key might be known, in which case the record can be successfully queried or updated using that user key. For example, for a Note child object, the *Subject* and *Description* fields form a user key, because they can be used in conjunction with each other to determine whether the record is unique or not. Such a combination is not guaranteed to provide complete uniqueness, but it can be used to query for uniqueness.

The user keys for each object are detailed for each object in [“Parent Objects” on page 33](#).

## Audit Fields

The audit fields for an object provide information about who created an instance of the object, when it was created, who has last updated an instance of the object, and when it was last updated. All objects, both parent and child level, exposed by the Web services API contain the read-only audit fields contained in [Table 5](#).

Table 5. Audit Fields for the CRM On Demand Objects

Field Name	Description
CreatedBy	This field is a combination of the full name of the person who created this instance of the object, and the date on which the instance was created. This information is contained within the field in the following format:  <i>"Creator Full Name, CreatedDate"</i>
CreatedById	The Row ID of the user who created the record.
CreatedDate	The DateTime stamp of when the record was created.
ModifiedBy	This field is a combination of the full name of the person who modified this instance of the object, and the date on which the instance was modified. This information is contained within the field in the following format:  <i>"Modified By Full Name, ModifiedDate"</i>
ModifiedById	The Row ID of the user who last modified the record.
ModifiedDate	The DateTime stamp of when the record was last modified.

## CRM On Demand Status Keys

A CRM On Demand *status key* is a field or a number of fields that is returned following an operation on a CRM On Demand object.

The status key of objects contained through the Web services API contains all user key and audit fields in addition to some other fields that are identified as status keys for the object. The status keys for the CRM On Demand objects are outlined in [“Parent Objects” on page 33](#).

## CRM On Demand Pick Maps

A CRM On Demand *pick map* allows you to set a foreign key for an object using a different field from the foreign key field.

For example, when updating an account, you might want to set the owner of the account to a specific user. If the UserId of the user is known it can be set in the OwnerId field, which is the foreign key. However, if the UserId is not known, and only the alias of the user is known, that alias can be entered in the Owner field, which is a pick map field. When CRM On Demand recognizes that the Owner field has been set, it automatically sets the OwnerId field to the UserId for the user.

Pick maps can be used by a number of CRM On Demand objects to update foreign key references in this way. For each object, a list of pick map fields, and the foreign key fields that they map to, are detailed in [“Parent Objects” on page 33](#).

## Filterable Fields

A filterable field is a field in which you can apply a search query. All fields in parent objects are filterable. Some fields on child objects are filterable; these fields are shown in the tables of filterable fields for each object in this chapter.

## Parent Objects

The following CRM On Demand objects are detailed in this topic:

- [“Account” on page 34](#)
- [“Activity” on page 46](#)
- [“Asset” on page 55](#)
- [“Campaign” on page 57](#)
- [“Contact” on page 62](#)
- [“Current User” on page 75](#)
- [“CustomObject1” on page 77](#)
- [“CustomObject2” on page 85](#)
- [“CustomObject3” on page 93](#)

- "Dealer" on page 98
- "Household" on page 100
- "Lead" on page 105
- "MedEd" on page 109
- "Note" on page 112
- "Opportunity" on page 114
- "Portfolio" on page 123
- "Product" on page 128
- "Product Category" on page 130
- "Service Request" on page 132
- "Solution" on page 136
- "Territory" on page 139
- "User" on page 140
- "User Group" on page 143
- "Vehicle" on page 146

## Account

The account object stores information about the companies that you do business with and is also used to track partners and competitors. The methods called on the account object require a list (array) of account objects as an input argument. This list of accounts identifies the records on which the operation is to be carried out.

## Usage

It is important to understand the purpose of the following interfaces in the Account Web Service for accessing contact data related to accounts:

- **ListofAccountContact.** Use this interface if you need to access or update a unique account-contact relationship, where there is only one record for each related {Account, Contact} pair.
- **ListOfContactRole.** Use this interface if you need to access or update a unique account-contact-role relationship, where there is only one record for each {Account, Contact, Role} triple. There can be multiple rows for each {Account, Contact} pair (one for each role).
- **ListofContact.** Use this interface for regular account-contact relationships.

## Child Components

Activity, Address, Asset, Competitor, Contact, CustomObject3, Lead, Opportunity, Multiple Contact Roles, Note, Partner, Related Account, Revenue, Service Request, and Team

## Methods Called

Table 6 details the methods called by the Account service.

Table 6. Methods Called by Account Service

Method	Name as Defined in Service
<a href="#">"Delete" on page 158</a>	AccountDelete
<a href="#">"DeleteChild" on page 161</a>	AccountDeleteChild
<a href="#">"Insert" on page 162</a>	AccountInsert
<a href="#">"InsertChild" on page 163</a>	AccountInsertChild
<a href="#">"InsertOrUpdate" on page 164</a>	AccountInsertOrUpdate
<a href="#">"QueryPage" on page 167</a>	AccountQueryPage
<a href="#">"Update" on page 172</a>	AccountUpdate
<a href="#">"UpdateChild" on page 173</a>	AccountUpdateChild

## Fields

Table 7 details the required and read-only fields for the account object.

Table 7. Required and Read-Only Fields for the Account Object

Child Component	Field Name	Type
Account	AccountName	Required
	AccountConcatField	Read-only
	<a href="#">Audit Fields</a>	Read-only
CustomObject3	AccountCustomObject3CreatedBy	Read-only
	AccountCustomObject3CreatedDate	Read-only
	AccountCustomObject3ModifiedBy	Read-only
	AccountCustomObject3ModifiedDate	Read-only
	CustomObject3Id	Read-only
Multiple Contact Roles	ContactRole	Required
	ContactId	Required
	<a href="#">Audit Fields</a>	Read-only
RelatedAccount	AccountRelationshipId	Read-only
	RelatedAccountId	Read-only

Table 7. Required and Read-Only Fields for the Account Object

Child Component	Field Name	Type
Revenue	RevenueId	Required
	PartNumber	Required
	Revenue	Required
	ContactFullName	Required
	<a href="#">Audit Fields</a>	Read-only

[Table 8](#) details the status key for the account object, and the child component on which this key resides.

Table 8. Status Key for the Account Object

Child Component	Field Name
Account	<a href="#">Audit Fields</a>
	ExternalSystemId
	AccountId
	IntegrationId
	LastUpdated
AccountNote	<a href="#">Audit Fields</a>
	ExternalSystemId

For more information on the fields exposed through the Account Web service, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the account object.

## Related Topic

[Contact](#)

## Activity

The activity object stores information on an activity that a user must carry out, for example, a call-back activity for an account. When an activity is created, the user must set the Activity field explicitly to Task or Appointment.

## Usage

Siebel On Demand Web Services uses activities to organize, track, and resolve a variety of tasks, from finding and pursuing opportunities to closing service requests. If a task requires multiple steps that one or more people can carry out, activities greatly simplify the job. Activities can help to:

- Define and assign the task
- Provide information to complete the task
- Track the progress of the task
- Track costs and bill for the task

For the Attachment child object, FileExtension is not a required field for URL attachments. The URL in the FileNameOrURL field must begin with HTTP, HTTPS, WWW, or FTP.

## Parent Objects

[Account](#), [Campaign](#), [Contact](#), [Lead](#), [Opportunity](#) and [Service Request](#)

## Child Components

[Attachment](#), [Contact](#), [ProductsDetailed](#), [SampleDropped](#), [Solution](#), and [User](#).

## Methods Called

## Asset

The asset object stores information on the assets held by your accounts, for example, the products that an account has purchased. The asset object has no child components.

## Usage

Siebel On Demand Web Services uses assets to manage products through their life cycle. It is also used by your accounts to register products, receive product news and literature, track warranty agreements, and receive recommendations on scheduled services.

## Parent Objects

[Account](#) and [Contact](#).

## Methods Called

[Table 18](#) details the methods called by the Asset service.

Table 18. Methods Called by Asset Service

Method	Name as Defined in Service
<a href="#">"Delete" on page 158</a>	AssetDelete
<a href="#">"Insert" on page 162</a>	AssetInsert
<a href="#">"InsertOrUpdate" on page 164</a>	AssetInsertOrUpdate
<a href="#">"QueryPage" on page 167</a>	AssetQueryPage
<a href="#">"Update" on page 172</a>	AssetUpdate

## Fields

For more information on the fields exposed through the Asset Web service, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the asset object.

## Campaign

The campaign object provides a mechanism for marketing products and services to customers and prospects. The campaign object is the primary way in which new products and services are marketed to customers and prospects.

### Parent Object

Lead

### Child Components

Activity, Contact/Recipient, Lead, Opportunity and Note

### Methods Called

## Related Topic

[Current User](#) and [Opportunity](#)

## Contact

The contact object stores information on individuals with whom your organization has a relationship. It allows the user to store information on individuals who are external to your company, but who are associated with the business process. Contacts stored in the CRM On Demand database can also be associated with an account.

### Parent Objects

[Account](#), [Activity](#), [Campaign](#), [Household](#), [Opportunity](#), [Portfolio](#), and [Vehicle](#)

## Dealer

The dealer object stores information about dealerships in the automotive industry, for example, the name of the dealership, the identity of the parent dealership, the site on which the dealership is based, and so on. The dealer object does not have any parent objects or child components.

**NOTE:** To download the Dealer WSDL file, you must be given access to the Dealer object. If you do not have access to the Dealer object, it is not available to download from the Web Services Administration screen or available to use the vertical Web service calls. For assistance in gaining access to the Dealer object, contact your Siebel CRM On Demand service provider.

## Methods Called

Table 57 details the methods called by the Dealer service.

Table 57. Methods Called by Dealer Service

Method	Name as Defined in Service
<a href="#">"Delete" on page 158</a>	DealerDelete
<a href="#">"Insert" on page 162</a>	DealerInsert

For more information on the fields exposed through the Dealer Web service, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the dealer object.

## Household

The household object allows you to define and record financial details about a group of contacts that live in the same household, for example, parents, brothers, sisters, spouses, and so on. These details include the assets of the household, the liabilities of the household, the net income of the household, and so on.

**NOTE:** To download the Household WSDL, you must be given access to the Household object. If you do not have access to the Household object, it is not available to download from the Web Services Administration screen or available to use the vertical Web service calls. For assistance in gaining access to the Household object, contact your Siebel CRM On Demand service provider.

For more information on the fields exposed through the Lead Web service, go to the Web Services Administration screen within the CRM On Demand application and generate the WSDL file for the lead object.

## MedEd

The MedEd object allows you to plan and track medical education events. A medical education event can be as simple as a lunch-and-learn session in a physician's office or as complex as a seminar series or national sales meeting.

**NOTE:** To download the MedEd WSDL file, you must be given access to the MedEd object. If you do not have access to the MedEd object, it is not available to download from the Web Services Administration screen or available to use the vertical Web service calls. For assistance in gaining access to the MedEd object, contact your Siebel CRM On Demand service provider.

## Related Topic

[Invitee](#)

## Note

The note object stores information about the notes available in the Message Center in the CRM On Demand application. The notes can be sent from users or can store extra information (as a note) on a parent object. This allows employees who are working on a particular record to add extra information as they see fit. For example, when talking to a contact, an employee might notice that the contact is not happy with a service provided. The employee can record this information in a note so that any other employees who talk to the contact are aware of the contact's dissatisfaction.

The note object has no child components.

## Parent Objects

[Account](#), [Campaign](#), [Contact](#), [Opportunity](#), and [Service Request](#)

## Methods Called

[Table 80](#) details the methods called by the Note service.

Table 80. Methods Called by Note Service

## Territory

The territory object allows you to store information about the sales territory that is assigned to a user. This information includes the territory name, a description, the currency code, and the sales quota for the territory. The territory object does not have any associated child objects or parent objects.

### Methods Called

[Table 118](#) details the methods called by the Territory service.

Table 118. Methods Called by Territory Service

Method	Name as Defined in Service
<a href="#">"Delete" on page 158</a>	TerritoryDelete
<a href="#">"Insert" on page 162</a>	TerritoryInsert

For more information on the fields exposed through the Territory Web service, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the territory object.

## User

The user object allows you to define and record details of all users in the application, for example, name, position, contact details, manager, and so on. It is different from the [Current User](#) object in that it is not restricted only to the currently logged in user. It enables queries to be run on all users, and enables an administrator to insert and update a user's profile. The user object does not have any child components.

## Usage

The UserLoginId and UserSignInId fields must be used as follows:

- **UserLoginId.** Used for creating user records through the User Web service.
- **UserSignInId.** Used as the user name for logging in and authenticating using Web services. Also, used for queries, as using UserLoginId is not allowed for queries.

## Parent Object

User Group

## Methods Called

For more information on the fields exposed through the User group Web service, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the user group object.

## Vehicle

The vehicle object allows you to create and store information about a vehicle, for example, a car, a truck, a van, and so on, that your company would like to sell to a contact or account. This information includes the vehicle's current mileage, the invoice price, the dealership, the make, and so on.

**NOTE:** To download the Vehicle WSDL file, you must be given access to the Vehicle object. If you do not have access to the Vehicle object, it is not available to download from the Web Services Administration screen or available to use the vertical Web service calls. For assistance in gaining access to the Vehicle object, contact your Siebel CRM On Demand service provider.

## Child Component

## Child Objects

The following is a list of child objects that are used in Siebel On Demand Web Services. These are objects that are child objects only and are not themselves parent objects.

- ["Address" on page 150](#)
- ["Attachment" on page 150](#)
- ["Audit Trail" on page 150](#)
- ["Competitor" on page 151](#)
- ["HouseholdTeam" on page 151](#)
- ["Interests" on page 151](#)

- "Invitee" on page 152
- "Login History" on page 152
- "Multiple Contact Roles" on page 152
- "OpportunityTeam" on page 152
- "Partner" on page 153
- "PortfolioTeam" on page 153
- "ProductsDetailed" on page 153
- "Recipient" on page 154
- "Revenue" on page 154
- "Related Account" on page 154
- "Related Contact" on page 154
- "SampleDropped" on page 155
- "Team" on page 155

## Address

The address object stores information on the different addresses that are associated with accounts and contacts. It is used to store billing and shipping addresses for accounts. It is also used to store the personal addresses for contacts.

### Parent Object

[Account](#), [Contact](#)

## Attachment

The attachment object stores information about a URL that is attached to a record in the application. File attachments are not supported for Web Services On Demand.

### Parent Object

[Activity](#)

## Audit Trail

The audit trail object stores information about how a service request object is modified from the moment that it is created until a solution for the service request has been found. The audit trail object stores information, such as the created and modified dates for the service request, and also the users who created and updated the service request.

## Parent Object

[Service Request](#)

## Competitor

The competitor object stores the information on competitors for your accounts.

### Fields

[Table 139](#) details the list of value fields available for the competitor object.

Table 139. Picklists Available for the Competitor Object

Field Name
RelationshipRole
ReverseRelationshipRole

For more information on the competitor fields exposed, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the account object.

## Parent Object

[Account](#), [Opportunity](#)

## HouseholdTeam

The HouseholdTeam object stores the information on a team that shares household records.

For more information on the household team fields exposed, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the household object.

## Parent Object

[Household](#)

## Interests

The Interests object stores information about things in which a contact is interested, such as products, services, or hobbies.

## Parent Object

[Contact](#)

## Invitee

The Invitee object stores information about invitees to medical education events, including feedback about the invitation.

## Parent Object

[MedEd](#)

## Login History

The login history object stores information about the currently logged in user, such as the amount of times that the user has logged in, and the dates and times at which the current user logged in.

## Parent Object

[Current User](#)

## Multiple Contact Roles

The multiple contact roles object stores information on the different roles that a contact can hold within an account. It stores information on the different types of jobs that one contact can hold within your organization. For example, the customer relations manager can also have a role within the sales team to provide valuable feedback to the sales representatives.

## Parent Objects

[Account](#)

## OpportunityTeam

The OpportunityTeam object stores information about a team that shares opportunity records.

For more information on the opportunity team fields exposed, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the opportunity object.

## Parent Object

[Opportunity](#)

## Partner

The partner object stores information on partners for your accounts.

### Fields

Table 140 details the list of value fields available for the partner object.

Table 140. Picklists Available for the Partner Object

Field Name
RelationshipRole
ReverseRelationshipRole

For more information on the partner fields exposed, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the account object

### Parent Object

[Account](#), [Opportunity](#)

## PortfolioTeam

The PortfolioTeam object stores information about a team that shares portfolio records

For more information on the portfolio team fields exposed, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the portfolio object.

### Parent Object

[Portfolio](#)

## ProductsDetailed

The ProductsDetailed object stores the information on product details for an activity. This is used, for example, to record information about products discussed on sales calls to customers.

For more information on the product detail fields exposed, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the activity object.

### Parent Object

[Activity](#)

## Quota

The quota object stores information about the sales targets of and sales made by the current user.

### Parent Object

[Current User](#)

## Recipient

The recipient object stores information about a recipient associated with a campaign.

### Parent Object

[Campaign](#)

## Related Account

The related account object stores information on an account that has a relationship with the parent account in question. The details of the related account child object are inherited from a particular account parent object.

### Parent Object

[Account](#)

## Related Contact

The related contact object stores information about a contact that has a relationship with the parent contact in question. The details of the related contact child object are inherited from a particular contact parent object.

### Parent Object

[Contact](#)

## Revenue

The revenue object stores monetary information about accounts, contacts, and their associated opportunities. This includes information on the revenue available, expected revenue, and also information about the products associated with the accounts, contacts, opportunities, and so on.

## Parent Object

[Account](#), [Contact](#) and [Opportunity](#)

## SampleDropped

The SampleDropped object stores the information on samples for an activity. This is used, for example, to record information about samples left with the customer on sales calls to customers.

For more information on the SampleDropped fields exposed, go to the Web Services Administration screen within the CRM On Demand application, and generate the WSDL file for the activity object.

## Parent Object

[Activity](#)

## Team

The team object stores information on the team that is assigned to a particular account or contact. In this way, a team of employees can be dedicated to an account or contact, ensuring that the activities, service requests, leads, and opportunities surrounding that account or contact are always kept up-to-date and are attended to regularly.

## Parent Object

[Account](#) and [Contact](#)

## Web Services On Demand API Calls

This chapter describes the methods that the CRM On Demand Web services can call:

- The core methods that are called on CRM On Demand objects, for example, to insert, update, delete, and find data within a specified CRM On Demand instance.
- The service methods that, for example, enable external applications to establish an interface with the CRM On Demand GUI.

For each of these methods, the description, usage, arguments taken, and return values are detailed. This chapter contains the following topics:

- ["API Calls"](#)
- ["Service API Calls" on page 174](#)

### API Calls

The CRM On Demand Web Services core methods are listed in [Table 141](#). The core methods are those methods that can be called on the CRM On Demand objects (record types), for example, Account, Contact, Opportunity, and so on.

**NOTE:** The actual method names consist of the object name prefix and Delete, Insert, and so on, for example, AccountDelete and AccountInsert are methods of the Account service.

Table 141. Web Services On Demand Core Methods

Method	Comments
<a href="#">Delete</a>	<p>Finds records in the Siebel CRM On Demand database that match specified field values, and then deletes them (in other words, puts them into the Deleted Items area).</p> <p><b>NOTE:</b> To conform with CRM On Demand's business logic, be careful about the order in which objects are deleted. You cannot delete some objects unless some action is performed on its child objects. For example, you cannot delete an account unless you re-associate all its service requests with a different account. For information about the behavior of the Delete method on child objects, see <a href="#">Table 142</a>.</p>
<a href="#">DeleteChild</a>	Deletes a child record from the CRM On Demand database, or removes the association between the child and the parent object.
<a href="#">Insert</a>	Inserts a new record into the CRM On Demand database.
<a href="#">InsertChild</a>	Inserts a new child record into the CRM On Demand database.

Table 141. Web Services On Demand Core Methods

Method	Comments
<a href="#">InsertOrUpdate</a>	Updates an existing record or inserts a new record if one did not exist.
<a href="#">MergeRecords</a>	Merges records.
<a href="#">QueryPage</a>	Executes a query against a specified list of records, and returns a subset of the records that match the search criteria set by the method arguments.
<a href="#">Update</a>	Updates the selected record with the new value.
<a href="#">UpdateChild</a>	Updates the selected child record with the new value.

For each object, the methods are defined in the WSDL file for that object. Many of the methods described in this chapter can be called on all of the objects.

CRM On Demand Web services using the methods Insert, Update, InsertAndUpdate, Delete, InsertChild, UpdateChild, and DeleteChild can specify an Echo input argument. The Echo string is used only for Integration events and is not required. Echo is case-sensitive and controls whether data sent to CRM On Demand through integration Web services are recorded as transactions. The default value is On. When the Echo value is On or missing, the transaction is recorded. When the Echo value is Off, the transaction is not recorded.

**NOTE:** For Java users, the Echo string is required for all input methods. The echo string can be set to Off.

Depending on whether an object is a parent or child object, Web services methods can act in different ways on the object in question. These differences are described in the following topics.

## Delete

Removes records of a specified record type from the CRM On Demand database.

### Usage

You use the delete method to remove one or more records of a particular object from a CRM On Demand instance.

Table 142 illustrates the behavior of the delete method on child objects that are related to the parent object being deleted. For more information about deleting records, see the Online Help for CRM On Demand.

**NOTE:** If you update an object, and the child is not in the input, that child is deleted from CRM On Demand. For more information, see Table 153.

Table 142. Behavior of Delete Method on Child Objects

Parent Object	Child	Action When Parent Is Deleted
Account	Activity	Delete
	Asset	Delete
	Competitor	None
	Contact	None
	Lead	Delete
	Note	Delete
	Opportunity	Delete
	Partner	None
	ServiceRequest	None
	Team	Delete
Activity	Attachment	Delete
Campaign	Activity	Delete

Solution	ServiceRequest	None

## Arguments

Table 143 describes the arguments taken by the delete method.

Table 143. Arguments Taken by the Delete Method

Name	Description	Required	Default	I/O
ListOf( <i>Object</i> ). For example, ListOfAccount	The list of object instances to be deleted.	Yes	Not applicable	Input/Output
Echo	Controls whether data sent to CRM On Demand through integration Web services are recorded as transactions.	No	On	Input

## Return Value of the Call

The status key for each of the deleted objects.

## Related Topic

[Update.](#)

## DeleteChild

Removes child records from the CRM On Demand database.

### Usage

You use the DeleteChild method to remove one or more child records of a particular object from a CRM On Demand instance, or remove the association between the child and parent object.

The deletion of child records or removal of association follows the same pattern as for deletion in the UI of the CRM On Demand application. For example, if you use AccountDeleteChild on a Contact child record, the association is removed, but the Contact is not deleted. On the other hand, if you use AccountDeleteChild on a Team child record, that record is deleted. However, the integration events generated in the UI and from Web services requests differ for child objects of Account, Contact, and Opportunity. For more information about these differences in integration events and about deleting records, see the information about workflow rules in the Online Help for CRM On Demand.

The objects (both child and parent level) provided in the input argument must provide data in at least one of the user keys for the given object. You use the user key information to uniquely identify records. If no user key values are provided, or if there is a conflict with the user keys of an existing record, the DeleteChild method fails, and a SOAP error is thrown by the API.

**CAUTION:** The parent object may be deleted by the DeleteChild method in some cases when a child object is not specified when executing the different DeleteChild methods. Nodes with at least one child are called internal nodes and nodes without children are called leaf nodes. DeleteChild operates on leaf nodes, so that if the request specifies a parent that has no children, the parent is deleted. You can avoid this situation by calling the Update method on the parent with an empty container for the children.

See [“DeleteChild Sample” on page 215](#) for an example of XML code.

## Arguments

Table 144 describes the arguments taken by the DeleteChild method.

Table 144. Arguments Taken by the DeleteChild Method

Name	Description	Required	Default	I/O
ListOf( <i>Object</i> ). For example, ListOfAccount	The list of child object instances to be deleted. Each child object has an associated parent object.	Yes	Not applicable	Input/Output
Echo	Controls whether data sent to CRM On Demand through integration Web services are recorded as transactions.	No	On	Input

## Return Value of the Call

The status key for each of the deleted child records.

## Insert

Inserts a new record in the CRM On Demand database.

## Usage

You use the insert method to create one or more records of a particular object in a CRM On Demand instance. Each of the objects (both child and parent level) provided in the input argument must provide data in at least one of the user keys for the given object. The user key information is used to uniquely identify records. If no user key values are provided, or if there is a conflict with the user keys of an existing record, the insert method fails, and a SOAP error is thrown by the API.

When inserting a batch of records, the batch is treated as a single transaction. If one record fails to insert during a batch insertion, the entire operation is rolled back and no records are inserted.

Table 145 outlines how the Insert method acts on parent and child objects to create or update an object instance.

Table 145. Effect of Insert on Parent and Child Objects

Method	New Parent	New Child	Existing Parent	Child Exists in CRM On Demand and in Input	Child Exists in CRM On Demand but Not in Input
Insert	New parent instance	New child instance	Error	Use child instance	Not applicable

## Arguments

Table 146 describes the arguments taken by the Insert method.

Table 146. Arguments Taken by the Insert Method

Name	Description	Required	Default	I/O
ListOf( <i>Object</i> ). For example, ListOfAccount	The list of object instances to be inserted.	Yes	Not applicable	Input/Output
Echo	Controls whether data sent to CRM On Demand through integration Web services are recorded as transactions.	No	On	Input

## Return Value of the Call

The status key for each of the CRM On Demand objects.

## Related Topic

[Update](#).

## InsertChild

Inserts a new child record in the CRM On Demand database.

## Usage

You use the InsertChild method to create one or more child records of a particular object in a CRM On Demand instance.

The objects (both child and parent level) provided in the input argument must provide data in at least one of the user keys for the given object. You use the user key information to uniquely identify records.

See [“InsertChild Sample” on page 216](#) for an example of XML code.

If no user key values are provided, or if there is a conflict with the user keys of an existing record, the InsertChild method fails, and a SOAP error is thrown by the API.

## Arguments

Table 147 describes the arguments taken by the InsertChild method.

Table 147. Arguments Taken by the InsertChild Method

Name	Description	Required	Default	I/O
ListOf( <i>Object</i> ). For example, ListOfAccount	The list of child object instances to be inserted. Each child object has an associated parent object	Yes	Not applicable	Input/Output
Echo	Controls whether data sent to CRM On Demand through integration Web services are recorded as transactions.	No	On	Input

## Return Value of the Call

The status key for each of the inserted child records.

## InsertOrUpdate

Updates an existing record or inserts a new record if one did not exist for this instance of the object.

### Usage

You use the InsertOrUpdate method to update one or more records of a particular object in a CRM On Demand instance. Each of the objects (both child and parent level) provided in the input argument must provide data in at least one of the user keys for the given object. Use the user key information to uniquely identify records. If no user key values are provided or if there is a conflict with the user keys of an existing record, the insert method fails, and a SOAP error is thrown by the API.

Use the user key specified for the parent level objects in the input argument to determine whether to insert each of the parent records, or to update an existing parent record.

Table 148 outlines how the InsertOrUpdate method acts on parent and child objects to create or update an object instance.

Table 148. Effect of InsetOrUpdate on Parent and Child Objects

Method	New Parent	New Child	Existing Parent	Child Exists in CRM On Demand and in Input	Child Exists in CRM On Demand but Not in Input
InsertOrUpdate	New parent	New child	Update parent	Update child	Child is unchanged

## Arguments

Table 149 describes the arguments taken by the InsertOrUpdate method.

Table 149. Arguments Taken by the InsertOrUpdate Method

Name	Description	Required	Default	I/O
ListOf( <i>Object</i> ). For example, ListOfAccount	The object instances to be inserted or updated.	Yes	Not available	Input/Output
Echo	Controls whether data sent to CRM On Demand through integration Web services are recorded as transactions.	No	On	Input

## Return Value of the Call

The status key for each of the inserted or updated objects.

## Related Topic

[Update, Insert](#)

## MergeRecords

Merges records for certain record types.

## Usage

This method is used to merge records. When you merge two records, you specify the record that you want to keep, which is called the *primary record*, and the record that is to be deleted, which is called the *duplicate record*. The following rules apply to merging records:

- Fields in the primary parent record that contain data are retained.
- Fields in the primary record that are blank get the value from the duplicate record, if it has a value and if the MergeWhenPrimaryBlank argument is set to true.
- Fields in the primary parent record that are blank remain blank, if the MergeWhenPrimaryBlank argument is not set, or is set to a value other than true.

The Merge Web service has the same security restrictions as in the CRM On Demand UI regarding privilege and record permissions.

MergeRecords is only supported for the Account, Contact, and Lead record types. If an invalid record type is provided, an error message is displayed.

Table 150 describes the arguments taken by MergeRecords.

Table 150. Arguments taken by MergeRecords

Field Name		Required	Default	I/O
PrimaryId	The ID of the primary record.	Yes	Not applicable	Input
PrimaryExternalSystemId	The externalsystemID of the primary record.	Yes	Not applicable	Input
DuplicateId	The ID of the duplicate record.	No	Not applicable	Input
DuplicateExternalSystemId	The externalsystemID of the duplicate record.	No	Not applicable	Input
MergeWhenPrimaryBlank	Determines how records are merged when fields in the primary record are blank.  True values are set as Y, Yes, True, or 1.  False values are any other values including blanks.	No	False	Input
RecordType	The record type; this is case sensitive.	Yes	Not applicable	Input

## Return Value of the Call

The following four values are returned:

- **MergedRecordId.** The ID of the merged record, that is, the primary record.
- **MergedRecordExternalId.** The externalsystemID of the merged record.
- **DeletedRecordId.** The ID of the deleted record, that is, the duplicate record.

- **DeletedRecordExternalId.** The externalSystemID of the merged record.

## QueryPage

Executes a query against a specified list of records, and returns a subset of the records that match the search criteria set by the method arguments. You can use the QueryPage method in a number of different ways to return records, which means that there are a number of functions that can be performed using this method:

- **Query by Example (QBE).** A query in which only the fields you are querying on are returned as part of the result.
- **Query by Template.** A query in which only components and fields that are present in the input parameter are present in the output parameter.
- **Query by Children.** A query that is based on a parent-child relationship; for example, you can query for all the parents of a child object, or all children of a child object.

For more information, see [“Querying CRM On Demand Data Using Web Services” on page 169](#) and [Appendix A, “CRM On Demand Code Samples.”](#)

## Usage

This method is useful when the search specification retrieves a large number of records at the root component. To avoid returning one large set of results, you can specify the number of records to be returned using the PageSize argument. You can also use the StartRowNum argument to dictate which records are to be returned.

Even though the QueryPage method returns a limited number of records, it keeps the data in the cache, which you can then retrieve by calling the QueryPage method again with a new value for the StartRowNum argument.

For all CRM On Demand object methods, it is possible to query, update, or insert using one operation within a parent-child relationship. This type of query is called Query By Children. The query can be assembled using parent attributes as well as child attributes. You can query for all children of a particular parent or set of parents, all parents of a particular child or set of children, or for both parents and children of a particular set. The Query By Children approach uses the same expression notation as QBE, where the expression can appear in either the parent, the child, or both. These queries are described in [Appendix A, “CRM On Demand Code Samples.”](#)

**NOTE:** If you want to include a field to be returned in a query’s results, you must include a blank tag in the QueryPage input. Effectively, this means that you must set the field’s value to “”; that is, an empty string.

## About CRM On Demand Query Syntax

Only fields that have nonempty values are interpreted as part of the search specification. [Table 151](#) illustrates how the field values follow the syntax shown. Nonterminal symbols are in italics.

Table 151. Query by Example Syntax

Syntax Type	Syntax
conjuncti on	OR
<i>conjunction</i>	AND
expressi on	I S NULL
expressi on	operator value
expressi on	( <i>expression</i> ) <i>conjunction</i> ( <i>expression</i> )
<i>literal</i>	l i t e r a l Char l i t e r a l
l i t e r a l Char	' '
l i t e r a l Char	{0x00 ... 0xFF} \ '
l i t e r a l Char l i t e r a l	⌈
operator	=
operator	~=
operator	<
operator	<=
operator	>
operator	>=
operator	<>
operator	L I K E
operator	~L I K E
val ue	' <i>literal</i> '

## CRM On Demand Query Syntax Rules

Syntax rules are as follows:

- Literal data is always enclosed in single quotes.
- If you want to use a single quote within a literal, you must place another single quote immediately beside the quote that you want to specify as a literal. In this way, the query recognizes the quote as a literal and not as an operator. For example, the string ab' c is presented as ab' ' c.

- To use the wildcard characters asterisk (\*), question mark (?), and backslash (\) in queries, they must be preceded by the backslash (\) character. For example, if you want to use the ? wildcard operator in a query, you must precede it with the backslash character as follows:  
`\?`
- Every expression must start with an operator to avoid ambiguity. There is no default operator.
- Wildcard characters are treated as such only in the context of the operator LIKE.
- To find a match for a value that has no value, the IS NULL expression must be specified as the QueryByExample field's value.
- The tilde (~) and equal (=) ~ = operator denote a case-insensitive exact search (no wildcards used), while the ~LIKE operator denotes a case-insensitive wildcard search.
- A conjugated expression must be enclosed in parentheses to avoid ambiguity. However, nonconjugated expressions must not be enclosed in parentheses.

## Querying CRM On Demand Data Using Web Services

The QueryPage functions require a list of object instances as input to perform a query. This input argument is called ListOf(*Object*). For example, the ContactQueryPage method requires the ListOfContact argument. Each ListOf(*Object*) argument requires at least one instance of the Object to specify a valid query.

To query an object by a certain field, specify the QBE expression that corresponds to the desired result. For information about QBE expression samples, see [Table 166](#).

### Querying Multiple Fields

If you want to query multiple fields, QBE expressions must be present in each of the fields. When multiple fields in an object instance have QBE expressions, the QueryPage method result is the intersection of all the QBE expressions, or in other words, all of the QBE expressions are combined using the AND operator. This is outlined in ["Example 1: Combining Expressions Using the AND Operator."](#)

### Example 1: Combining Expressions Using the AND Operator

The Web service client requires the first name, last name, and job title of all the contacts in CRM On Demand that have a job title equal to CEO and a last name equal to Doe. The XML representation of the ListOfContact object that must be sent in the ContactQueryPage call is as follows:

```
<ListOfContact>
  <Contact>
    <JobTitle>= 'CEO' </JobTitle>
    <ContactLastName>= 'Doe' </ContactLastName>
    <ContactFirstName />
  </Contact>
</ListOfContact>
```

```
</ListOfContact>
```

### Multiple Query by Example Expressions on a Single Field

If you want to apply multiple QBE expressions to a single field, you can combine each QBE expression using either the AND or the OR operator. The result is either the intersection or the union of the object instances respectively.

**NOTE:** For multiple QBE expressions on a single field, each QBE expression must be enclosed in brackets.

### Example 2: Combining Multiple Expressions Using the AND Operator

The Web service client requires the first name, last name, and job title of all the contacts that have been updated between July 28, 2004 6:30am and July 28, 2004 6:45 am.

Send the following XML representation of the ListOfContact object in the ContactQueryPage call:

```
<ListOfContact>
  <Contact>
    <JobTitle />
    <ContactLastName />
    <ContactFirstName />
    <LastUpdated> (>=' 07/28/2004 06: 30: 00' ) AND (<=' 07/28/2004 06: 45: 00' )</
    LastUpdated >
  </Contact>
</ListOfContact>
```

### Example 3: Combining Multiple Expressions Using the OR Operator

The Web service client requires the first name, last name, and job title of all the contacts in CRM On Demand that have a last name equal to Doe or Brown.

Send the following XML representation of the ListOfContact object in the ContactQueryPage call:

```
<ListOfContact>
  <Contact>
    <JobTitle />
    <ContactLastName>(' Doe' ) OR (' Brown' )</ContactLastName>
    <ContactFirstName />
  </Contact>
</ListOfContact>
```

## Arguments

Table 152 describes the arguments taken by the QueryPage method.

Table 152. Arguments Taken by the QueryPage Method

Name	Description	Required	Default	I/O
ListOf( <i>Object</i> ). For example, ListOfAccount	The list of object instances queried (input), and after query execution, the list of object instances returned (output).	Yes	Not applicable	Input/Output
PageSize	The maximum number of records displayed on a page following a query.	No	10	Input
StartRowNum	Indicates the row from which the QueryPage method starts to return records. Use the StartRowNum argument to return a set of records for any given method.  For example, if you want to return records 1-100, you set StartRowNum to 0. Then, if you want to return records 101-200, you set StartRowNum to 100, and run the query again. You continue doing this until the last page is returned. In this way, you can return all records for a particular query.	No	0	Input
UseChildAnd	If this argument is set to true, the query result set returns the set of records that satisfy both parent and child search criteria. (That is, the query set returned is the AND combination of parent and child queries.)  If this argument is set to false (or not set at all), the query result set returns the set of records that satisfy either the parent or the child search criteria. (That is, the query set returned is the OR combination of parent and child queries.)	No	False	Input

## Return Value of the Call

An object or list of objects of the type on which the method was called.

LastPage: A Boolean value that indicates whether or not the last value in the query set has been returned.

## Update

Updates the selected record with the new value.

### Usage

You use the update method to update one or more records of a particular object in a CRM On Demand instance. Each of the objects (both child and parent level) provided in the input argument must provide data in at least one of the user keys for the given object. You use the user key information to uniquely identify records. If no user key values are provided, or if there is a conflict with the user keys of an existing record, the insert method fails, and a SOAP error is thrown by the API.

**NOTE:** If the administrator customizes a record type to add a required field, CRM On Demand does not check for the required field when existing records are updated. When you update the record without the required field through a Web services request, or merge it with a record that does not have the required field, the record is updated or merged without error. This is the intended behavior; when a field is made required, it is the responsibility of the administrator to update all existing records to populate the required field. On inserting new records however, CRM On Demand checks for the required field.

Table 153 outlines how the update method acts on parent and child objects to update an object instance.

Table 153. Effect of Update on Parent and Child Objects

Method	New Parent	New Child	Existing Parent	Child Exists in CRM On Demand and in Input	Child Exists in CRM On Demand but Not in Input
Update	Error	New child	Update parent	Update child	Child is removed

### Arguments

Table 154 describes the arguments taken by the update method.

Table 154. Arguments Taken by the Update Method

Name	Description	Required	Default	I/O
ListOf( <i>Object</i> ). For example, ListOfAccount	The object instance to be updated.	Yes	Not applicable	Input/Output
Echo	Controls whether data sent to CRM On Demand through integration Web services are recorded as transactions.	No	On	Input

## Return Value of the Call

The updated object.

## UpdateChild

Updates a selected child record with a given value in the CRM On Demand database.

## Usage

You use the UpdateChild method to update one or more child records of a particular object in a CRM On Demand instance.

The objects (both child and parent level) provided in the input argument must provide data in at least one of the user keys for the given object. You use the user key information to uniquely identify records. If no user key values are provided, or if there is a conflict with the user keys of an existing record, the UpdateChild method fails, and a SOAP error is thrown by the API.

See [“UpdateChild Sample” on page 217](#) for an example of XML code.

## Arguments

[Table 155](#) describes the arguments taken by the UpdateChild method.

Table 155. Arguments Taken by the UpdateChild Method

Name	Description	Required	Default	I/O
ListOf( <i>Object</i> ). For example, ListOfAccount	The list of child object instances to be updated. Each child object has an associated parent object.	Yes	Not applicable	Input/Output
Echo	Controls whether data sent to CRM On Demand through integration Web services are recorded as transactions.	No	On	Input

## Return Value of the Call

The status key for each of the updated child records.

## Service API Calls

The CRM On Demand Web Services service methods are listed in [Table 156](#). The service methods are those methods that are not called on CRM On Demand record types. Instead they are used, for example, to carry out functions that enable external applications to establish an interface with the CRM On Demand GUI. The table also shows the Web service for each of the methods. You can download the WSDL file for each service from the Web Services Administration page in the CRM On Demand application.

Table 156. Web Services On Demand Service Methods

Method Name	Web Service	Comments
<a href="#">"DeletedItemQueryPage" on page 174</a>	Deleted Item	Gets information about deleted items.
<a href="#">"DeleteEvents" on page 178</a>	Integration Event	Deletes events from the integration event queue.
<a href="#">"GetEvents" on page 179</a>	Integration Event	Gets events from the integration event queue.
<a href="#">"GetPicklistValues" on page 183</a>	Picklist	Gets lists of picklist values.
<a href="#">"GetMapping" on page 182</a>	Mapping Service	Gets a list of the display names of fields for a particular record type and their associated XML tags.
<a href="#">"GetServerTime" on page 185</a>	Time	Gets the server time.
<a href="#">"SetPasswordAPI" on page 185</a>	Password	Sets the passwords of users who use the application.
<a href="#">"SetSessionTimeZone" on page 186</a>	Time	Sets the time zone for a session.

## DeletedItemQueryPage

Returns details of deleted items.

### Usage

Executes a query against the list of deleted records, and returns a subset of the records that match the search criteria set by the method arguments.

The Type of the DeletedItems object returned by the DeletedItemQueryPage method is not always the same as that used in the UI of the CRM On Demand application, as shown in [Table 157](#).

**NOTE:** In [Table 157](#), the \* characters are asterisk characters, and do not represent wildcard characters.

You must use the types shown in the table in queries for deleted item records. (The type is language independent.)

Table 157. Deleted Item Types Returned by DeletedItemQueryPage Method

UI Record Type	Deleted Item Type
Account	Account
Contact	Contact
Opportunity	Opportunity

Dealer Attachment	Dealer Attachment
Patient	VONDMED Patient
Patient Note	VONDMED Patient Note

## Arguments

Table 158 describes the arguments taken by the DeletedItemQueryPage method.

Table 158. Arguments Taken by the DeletedItemQueryPage Method

Name	Description	Required	Default	I/O
ListOfDeletedItem	The list of object instances queried (input), and after query execution, the list of object instances returned (output).	Yes	Not applicable	Input/Output
PageSize	The maximum number of records displayed on a page following a query.	No	10	Input
StartRowNum	Indicates the row from which the DeletedItemQueryPage method starts to return records. Use the StartRowNum argument to return a set of records for any given method.  For example, if you want to return records 1-100, you set StartRowNum to 0. Then, if you want to return records 101-200, you set StartRowNum to 100, and run the query again. You continue doing this until the last page is returned. In this way, you can return all records for a particular query.	No	0	Input
LastPage	A value that indicates whether or not the last value in the query set has been returned.	Not applicable	Not applicable	Output

## Return Value of the Call

The following information is returned for deleted items:

- **DeletedItemId.** The ID of the deleted item.

- **DeletedById**. The user ID of the user who deleted the item.
- **DeletedBy**. The name of the user who deleted the item.
- **DeletedDate**. The date on which the item was deleted.
- **Name**. The name of the deleted record.
- **ObjectId**. The object ID of the deleted record.
- **Type**. The type of the deleted record.
- **ExternalSystemId**. The external system ID of the item.

## DeleteEvents

Deletes events from the integration event queue.

### Usage

You use the DeleteEvents method of the Integration Event Web service to delete events from the integration event queue. Integration events are actions that are triggered based on meeting certain workflow criteria. The integration event stores information about data that has changed:

- User key information about the changed record, for example: objectId, externalsystemID
- Audit information, for example, created date, createdby, modified date, modified by

Integration events are stored in a company queue on the hosted environment. The maximum number of events in the queue is set by Customer Care. Contact Customer Care to request support for the Integration Event Web Service and to specify the size of the integration queue you require.

For more information about integration events and setting up workflow criteria, refer to the CRM On Demand online help.

The DeleteEvents method deletes events from the queue. If the DateTime argument is supplied, all events older than the specified date and time are deleted. If the LastEventId argument is supplied, all events older than the specified event are deleted. If DateTime and LastEventId are not specified, all events are deleted.

You can delete events for all record types, or a subset of record types, depending on how you prepare the WSDL files associated with the Integration Event service, see ["Downloading the Integration Event WSDL File" on page 181](#).

## Arguments

Table 159 describes the arguments taken by the DeleteEvents method.

Table 159. Arguments Taken by the DeleteEvents Method

Name	Description	Required	Default	I/O
DateTime	A date and time.	No	Not applicable	Input
LastEventId	An event ID	No	Not applicable	Input/Output

## Return Value of the Call

The ID of the last event deleted.

## GetEvents

Returns events from the integration event queue.

### Usage

You use the GetEvents method of the Integration Event Web service to return events from the integration event queue. Integration events are actions that are triggered based on meeting certain workflow criteria. The integration event stores information about data that has changed:

- User key information about the changed record, for example: objectID, externalsystemID
- Audit information, for example, created date, created by, modified date, modified by

Integration events are stored in a company queue on the hosted environment. The maximum number of events in the queue is set by Customer Care. Contact Customer Care to request support for the Integration Event Web Service and to specify the size of the integration queue you require.

For more information about integration events and setting up workflow criteria, refer to the CRM On Demand online help.

If the EventCount argument is not supplied, all events are returned.

You can return events for all record types, or a subset of record types, depending on how you prepare the WSDL files associated with the Integration Event service, see [“Downloading the Integration Event WSDL File” on page 181](#).

In some cases the names of objects in the list of events returned differ from the name of the object used in the UI of the CRM On Demand application, as shown in [Table 160](#).

Table 160. Object Names Returned by GetEvents Method

UI Name	GetEvents Name (object attribute)
Account Competitor	AccountCompetitor
Account Relationship	AccountRelationship
Address	CUT Address
Call Product Detail	Call ProdDetail
Call Sample Dropped	Call SampDrop
Campaign Recipient	ContactCampaign
Contact Interests	ContactInterest
Contact Relationship	ContactRelationship
Custom Object 1 Team	CustObj1 Team
Custom Object 2 Team	CustObj2 Team
Dealer	Channel Partner
Household Team	HouseholdTeam
MedEd Event	MedEdEvent
MedEd Invitee	MedEdInvitee
Opportunity Competitor	OpportunityCompetitor
Opportunity Partner	OpportunityPartner
Portfolio Team	PortfolioTeam
Portfolio Owner	PortfolioOwners
Vehicle Financial Information	Vehicle FinInfo
Vehicle Sales History	Vehicle SalesHist
Vehicle Service History	Vehicle ServHist

## Arguments

Table 161 describes the arguments taken by the GetEvents method.

Table 161. Arguments Taken by the GetEvents Method

Name	Description	Required	Default	I/O
EventCount	The maximum number of events to be returned.	No	Not applicable	Input
ListOfEvent	A list of events	Not applicable	Not applicable	Output
LastEventID	An event ID	Not applicable	Not applicable	Output

## Return Value of the Call

A list of the events returned from the integration event queue. Also, the ID of the last event returned.

For each event in the list of events, there are the following attributes:

- **name.** The name of the associated Workflow.
- **object.** The record type.
- **operation.** The operation performed. The attribute values can be:
  - insert - for items inserted
  - update - for items updated
  - purge - for items that have been purged from the Deleted Items area
  - delete - for items that have been deleted and are still in the Deleted Items area
  - associate - for child items that have been associated with a parent record type
  - dissociate - for child items that have been dissociated from a parent record type

**NOTE:** Only the Account, Contact, and Opportunity objects support the associate and dissociate operations. The integration events generated for these objects vary depending on whether the request is made through a Web service request or the UI. For more information, about these differences in integration events, see the information about workflow rules in the Online Help for CRM On Demand.

## Downloading the Integration Event WSDL File

You can use the methods of the Integration Events service to track changes for particular record types or for all record types, depending on how you prepare the WSDL.

### *To prepare the WSDL:*

- 1 Go to the Web Services Administration page in the CRM On Demand application.

**2** Download the Integration Events WSDL.

The file downloaded is the `integrationevent.zip` file. This zip file contains the integration event WSDL file and the XSD schema files of all supported record types such as account, contact, and so on. The integration event WSDL file imports the XSD files for each record type.

**3** Unzip the `integrationevent.zip` file to the required location.

You must extract the integration event WSDL file and the XSD schema files to the same folder.

**4** Add the integration event WSDL to your development environment.**Downloading Schema Files for Record Types Containing Custom Fields**

If you have record types that have custom or renamed fields, you cannot use the XSD files contained in the `integrationevent.zip` file for tracking these fields. Instead you must download an XSD file using the Download Custom Schema button in the Web Services Administration page in the application. For more information, refer to online help for CRM On Demand.

## GetMapping

Returns the display names and XML tags of the fields of a record type or one of its child components.

### Usage

This method is used to return the display names of all the fields in a particular record type. It also returns the XML tags for each field. It therefore displays the mappings between the display names of fields and their XML tags.

This method can be used on all record types and on all of their child components.

### Arguments

Table 162 describes the arguments taken by the `GetMapping` method.

Table 162. Arguments Taken by the `GetMapping` Method

Name	Description	Required	Default	I/O
ObjectName	The name of the record type for which you wish to return a list of mappings.	Yes	Not applicable	Input/Output

### Return Value of the Call

A list of the display names for fields and their associated XML mappings.

- **LastUpdated.** The date the field was last updated.
- **DisplayName.** The display name of the field.
- **ElementName.** The XML element name for the field.

- **DataType.** The field type of the field, for example, Check box, Picklist, and so on.

## GetPicklistValues

Gets picklist values from CRM On Demand.

GetPicklistValues is supported for the following record types:

- Account
- Activity
- Asset
- Campaign
- Category (Product Category)
- Contact
- Custom Object 1
- Custom Object 2
- Dealer
- Household
- Lead
- MedEdEvent
- Opportunity
- Portfolio
- Product
- RevenueAsset (Opportunity Product)
- Service Request
- Solution
- User
- Vehicle

## Usage

This method is used to enable external applications to present lists of values to users, typically in a language-dependent manner. The method can get lists of possible values for both cascading and regular picklist fields.

Because On Demand Web Services is language-independent, it is the client application's responsibility to convert code from the language-independent code (LIC) used by CRM On Demand to language-dependent values (LDVs) typically used by the external presentation layer.

The returned list of values corresponds to the organization to which the current user belongs (that is, the user whose credentials have been passed during the log-in call).

Cascading picklists restrict the values of one picklist, the related picklist, based on the value selected in another picklist, the parent picklist. For example, a parent picklist might present a list of IT areas and drive the value of a related picklist called SubAreas. When the user selects, for example, the value Installation for Area, the SubAreas picklist is dynamically constrained to show only the picklist values that are associated with the Installation area, for example, Server Crash and No Admin Login. This is illustrated in [“Sample of GetPicklistValues for a Cascading Picklist” on page 221](#).

If the provided picklist has a parent, only the values that have a parent are returned. When a picklist has a parent, the result set includes the parent and the child values and at the end includes an empty set that contains all values available for the requested picklist. For an illustration of this, see [“Sample of GetPicklistValues for a Cascading Picklist” on page 221](#).

If a picklist is not cascading, the following elements are returned empty:

- ParentFieldName
- ParentDisplayValue
- ParentCode

For an illustration of this, see [“Sample of GetPicklistValues for a Regular Picklist” on page 223](#).

If a “10/2004” namespace is used, the FieldName and ParentFieldName elements respectively accept and return the integration tag value for custom fields, otherwise, they accept and return the generic custom field tag names (that is, CustomPicklist1 and so on).

## Arguments

[Table 163](#) describes the arguments taken by the GetPicklistValues method.

Table 163. Arguments Taken by the GetPicklistValues Method

Name	Description	Required	Default	I/O
RecordType	The record type; this is case insensitive	Yes	Not applicable	Input
FieldName	The name of the picklist field.	Yes	Not applicable	Input
LanguageCode	The code of the language in which language-dependent values are to be returned, for example, ENU, DEU, FRA, ESN, and so on. If the code is not specified, the default language for the current session's user is used.	No	<i>User's Default Language</i>	Input
ListOfParentPicklistValue	A sequence of ParentPicklistValue elements.	Yes	Not applicable	Output

## Return Value of the Call

A list of picklist values. For a cascading picklist, this includes the values for the related picklist that apply for particular values of the parent picklist. For a regular picklist, values for parent picklist are not included.

The ParentPicklistValue element contains the following child elements:

- **Language.** The language.
- **ParentFieldName.** The parent picklist field name as an integration tag.
- **ParentDisplayValue.** A display value translated into the specified language.
- **ParentCode.** A parent Language Independent Code (LIC).
- **ListOfPickListValue.** A sequence of PicklistValue elements containing the related picklist values that correspond to the parent picklist value.

The PicklistValue element contains the following child elements:

- **DisplayValue.** The display value translated into the specified language).
- **Code.** The Language Independent Code (LIC).

## GetServerTime

Returns the time from a server.

### Usage

This method gets the time at the server involved in a Web services API session. The time returned is converted to the time for the locale of the user ID making the request.

## Return Value of the Call

The current server time.

## SetPasswordAPI

Allows the system administrator to set the passwords of users who use the application.

### Usage

This method is used to enable external applications to synchronize user passwords. For security reasons the password API is not available by default. If customers want to use SetPasswordAPI, they can call Customer Care to have the functionality enabled.

The API allows for the setting of passwords for one or more users at the same time. For each password that is updated, a corresponding user Audit Trail record is created. A user with the ability to set passwords does not have the ability to update the password of another user who has the ability to set passwords.

## Arguments

Table 164 describes the arguments taken by SetPasswordAPI.

Allows the system administrator to set the passwords of users who use the application.

Table 164. Arguments Taken by SetPasswordAPI

Field Name	Description	Required	Default	I/O
UserId	The user ID	Yes	Not applicable	Input/Output
EmailAddr	The user's email address	No	Not applicable	Input/Output
UserIntegrationID	The integration Id for the user.	No	Not applicable	Input/Output
IntegrationId	The integration Id	No	Not applicable	Input/Output
Password	The password for the user.	Yes	Not applicable	Input/Output

## SetSessionTimeZone

Sets the time zone for a Web Services API session.

## Usage

This method sets the time zone for a Web services API session. The time zone is set according to the locale of the user making the request.

## Arguments

Table 165 describes the arguments taken by the SetSessionTimeZone method.

Table 165. Arguments Taken by the SetSessionTimeZone Method

Name	Description	Required	Default	I/O
TimeZone	The time zone of the user.	Yes	Not applicable	Input
CurrentServerTime	The current server time converted to the specified time zone.	Not applicable	Not applicable	Output

## Return Value of the Call

The current server time.

# A

## CRM On Demand Code Samples

This appendix contains samples of code for logging in and out of a Web services session and XML code for using the methods of the Web services API. It contains the following topics:

- ["Code Samples for Logging In and Logging Out" on page 189](#)
- ["Code Samples for Logging In Using Single Sign-On" on page 198](#)
- ["XML Code Samples for API Calls" on page 205](#)

## Code Samples for Logging In and Logging Out

The following code samples illustrate how to log in and log out using Visual Basic (VB), Java, and C#.NET code. These samples are specific to Oracle's Siebel CRM On Demand Web Services. For clarity and simplicity, the following samples do not include error detection and handling. The code samples are detailed in the following topics:

- ["Visual Basic Code Sample" on page 189](#)
- ["Java Code Sample" on page 192](#)
- ["C# Code Sample" on page 195](#)

## Visual Basic Code Sample

The following sample is compatible with Visual Studio, Visual Basic 6.0.

' Declarations used to perform http internet communications from Visual Basic.

```
Declare Function InternetOpen Lib "WININET.DLL" Alias "InternetOpenA" ( _
```

```
    ByVal lpszAgent As String, _
```

```
    ByVal dwAccessType As Long, _
```

```
    ByVal lpszProxyName As String, _
```

```
    ByVal lpszProxyBypass As String, _
```

```
    ByVal dwFlags As Long) As Long
```

```
Declare Function InternetConnect Lib "WININET.DLL" Alias "InternetConnectA" ( _
```

```
    ByVal hInternetSession As Long, _
```

```
    ByVal lpszServerName As String, _
```

```

    ByVal nServerPort As Integer, _
    ByVal lpszUserName As String, _
    ByVal lpszPassword As String, _
    ByVal dwService As Long, _
    ByVal dwFlags As Long, _
    ByVal dwContext As Long) As Long

Declare Function HttpSendRequest Lib "WININET.DLL" Alias "HttpSendRequestA" ( _
    ByVal hHttpRequest As Long, _
    ByVal lpszHeaders As String, _
    ByVal dwHeadersLength As Long, _
    ByVal lpOptional As String, _
    ByVal dwOptionalLength As Long) As Integer

Declare Function InternetReadFile Lib "WININET.DLL" ( _
    ByVal hFile As Long, _
    ByRef lpBuffer As Any, _
    ByVal dwNumberOfBytesToRead As Long, _
    ByRef lpNumberOfBytesRead As Long) As Integer

Declare Function InternetCloseHandle Lib "WININET.DLL" ( _
    ByVal hInternet As Long) As Boolean

' Adds one or more HTTP request headers to the HTTP request handle.

Declare Function HttpAddRequestHeaders Lib "WININET.DLL" Alias "pAddRequestHeadersA" ( _
    ByVal hHttpRequest As Long, _
    ByVal sHeaders As String, _
    ByVal lHeadersLength As Long, _
    ByVal lModifiers As Long) As Integer

Declare Function HttpQueryInfo Lib "WININET.DLL" Alias "HttpQueryInfoA" ( _
    ByVal hHttpRequest As Long, _

    ByRef sBuffer As Any, _
    ByRef lBufferLength As Long, _

```

```

ByRef IIndex As Long) As Integer

' Define a function or sub to contain the login steps as defined here.

    Dim netHeaders As String * 1024

    Dim headerSize as Long

' Open the internet connection.

    m_hInternet = InternetOpen("ApplicationName", 0, vbNullString, vbNullString, 0)

    m_hConnect = InternetConnect(m_hInternet, server, 443, sProxyUser, sProxyPwd, 3, 0,
    0)

    m_hRequest = HttpOpenRequest(m_hConnect, "GET", "/Services/
    Integration?command=login", "HTTP/1.1", vbNullString, vbNullString, &H84A83000, 0)

    sHeaders = "Accept-Language: en" & vbCrLf & _
        "Connection: Keep-Alive" & vbCrLf & _
        "UserName: email@address.com" & vbCrLf & _
        "Password: userpassword"

    result = HttpAddRequestHeaders(m_hRequest, sHeaders, Len(sHeaders), &HA0000000) '
    Add headers

    result = HttpSendRequest(m_hRequest, vbNullString, 0, vbNullString, 0)

    headerSize = Len(netHeaders)

    result = HttpQueryInfo(m_hRequest, &H16, ByVal netHeaders, headerSize, 0)

' Now parse netHeaders for header named JSESSIONID.

' This will be the value to use for the rest of the session.

' Then to Logoff, do the following:

    m_hRequest = HttpOpenRequest(m_hConnect, "GET", "/Services/
    Integration?command=logoff", "HTTP/1.1", vbNullString, vbNullString, &H84A83000, 0)

    sHeaders = "Accept-Language: en" & vbCrLf & _
        "Connection: Keep-Alive" & vbCrLf & _
        "Cookie: JSESSIONID=abc123: -1"

    result = HttpAddRequestHeaders(m_hRequest, sHeaders, Len(sHeaders), &HA0000000) '
    Add headers

    result = HttpSendRequest(m_hRequest, vbNullString, 0, vbNullString, 0)

```

## Java Code Sample

The following is a code sample for logging in and logging out using Java:

```
/*
 * log on to a web services session at the passed in service provider location using
 * the passed in credentials. return a session id string that can be used in later
 * communication with the service provider in the event of a successful logon
 * @param wsLocation - the location of the web services provider
 * @param userName - On Demand user name (email address) of the user we are logging
 * in as
 * @param password - password that corresponds to the userName parameter
 * @return FAIL if the logon failed, session id string otherwise
 */
private static String logon(String wsLocation, String userName, String password)
{
    String sessionString = FAIL;
    try
    {
        // create an HTTPS connection to the On Demand webservices
        URL wsURL = new URL(wsLocation + "?command=logon");
        HttpURLConnection wsConnection = (HttpURLConnection)wsURL.openConnection();

        // we don't want any caching to occur
        wsConnection.setUseCaches(false);

        // we want to send data to the server
        // wsConnection.setDoOutput(true);

        // set some http headers to indicate the username and password we are using to
        // logon
        wsConnection.setRequestProperty("UserName", userName);
    }
}
```

```

wsConnecti on.setRequestProperty("Password", password);
wsConnecti on.setRequestMethod("GET");

// see if we got a successful response
if (wsConnecti on.getResponseCode() == HttpURLConnection.HTTP_OK)
{
    // get the session id from the cookie setting
    sessi onStri ng = getCooki eFromHeaders(wsConnecti on);
    setSessi onIdFromCooki e(sessi onStri ng);
}
}
catch (Excepti on e)
{
    System.out.println("Logon Excepti on generated :: " + e);
}
return sessi onStri ng;
}

/*
 * Log off an existi ng web servi ces session, using the sessi onCooki e informati on
 * to indicate to the server which sessi on we are logging off of
 * @param wsLocati on - locati on of web servi ces provi der
 * @param sessCooki e - cooki e string that indicates our sessi onId wi th the WS provi der
 *
 */
private static void logoff(String wsLocati on, String sessi onCooki e)
{
    try
    {
        // create an HTTPS connecti on to the On Demand webservi ces

```

```

        URL wsURL = new URL(wsLocation + "?command=logoff");
        HttpURLConnection wsConnection = (HttpURLConnection)wsURL.openConnection();

        // we don't want any caching to occur
        wsConnection.setUseCaches(false);

        // let it know which session we're logging off of
        wsConnection.setRequestProperty("Cookie", sessionCookie);
        wsConnection.setRequestMethod("GET");

        // see if we got a successful response
        if (wsConnection.getResponseCode() == HttpURLConnection.HTTP_OK)
        {
            // if you care that a logoff was successful, do that code here
            // showResponseHttpHeaders(wsConnection);
        }
    }
    catch (Exception e)
    {
        System.out.println("Logoff Exception generated :: " + e);
    }
}

/*
 * given a successful logon response, extract the session cookie information
 * from the response HTTP headers
 *
 * @param wsConnection successfully connected connection to On Demand web services
 * @return the session cookie string from the On Demand WS session or FAIL if not
 * found*
 */

```

```

private static String getCookieFromHeaders(HttpURLConnection wsConnection)
{
    // debug code - display all the returned headers
    String headerName;
    String headerValue = FAIL;
    for (int i=0; ; i++)
    {
        headerName = wsConnection.getHeaderFieldKey(i);
        if (headerName != null && headerName.equals("Set-Cookie"))
        {
            // found the Set-Cookie header (code assumes only one cookie is being set)
            headerValue = wsConnection.getHeaderField(i);
            break;
        }
    }
    // return the header value (FAIL string for not found)
    return headerValue;
}

```

## C# Code Sample

The following is a code sample for logging in and logging out using C# (C Sharp):

```

using System;
using System.Net;
using System.IO;

namespace WebServiceHandler
{

    public class ManageSession

```

```

{

public static string SessionID = "";

public static String Login(String loginUrlString, String userName, String password,
StringBuilder output)
{
    try
    {
        // create a http request and set the headers for authentication
        HttpRequest myRequest = (HttpRequest)WebRequest.Create(loginUrlString);
        HttpResponse myResponse;

        myRequest.Method = "GET";
        myRequest.Headers["UserName"] = userName;
        myRequest.Headers["Password"] = password;

        // Return the response.
        myResponse = (HttpResponse)myRequest.GetResponse();
        Stream sr = myResponse.GetResponseStream();

        // retrieve session id
        char[] sep = { ';' };

        String[] headers = myResponse.Headers["Set-Cookie"].Split(sep);
        for (int i=0; i <= headers.Length-1; i++)
        {
            if (headers[i].StartsWith("JSESSIONID"))
            {
                sep[0] = '=';
            }
        }
    }
}

```

```

        SessionID = headers[i].Split(sep)[1];
        break;
    }
}
sr.Close();
myResponse.Close();
}
catch (WebException webException)
{
}
catch (Exception e)
{
}
return SessionID;
}

public static void Logoff()
{
    String logoffUrlString = serverName + "/Services/Integration?command=logoff";
    HttpRequest req = (HttpRequest) WebRequest.Create(logoffUrlString);
    req.Headers["Cookie: JSESSIONID"] = SessionID;

    // make the HTTP call
    HttpResponse resp = (HttpResponse) req.GetResponse();
    if (resp.StatusCode != System.Net.HttpStatusCode.OK)
    {
    }
}
}
}
}

```

# Code Samples for Logging In Using Single Sign-On

The following code samples illustrate how to log in using single sign-on using Java, and C# .NET code. These samples are specific to Siebel CRM On Demand Web Services. The code samples are detailed in the following topics:

- ["Java Code Sample" on page 198](#)
- ["C# Code Sample" on page 203](#)

## Java Code Sample

The following is a code sample for single sign-on using Java:

```
//Declare variables for sessionId and servername
private static String mstrSessionId="";
private static String mstrServer="";

public static String logonSSO(String ssoid)
{
    String sessionString = "FAIL";
    String pftokenCookie = "";
    String sessionCookie = "";
    String strSSOITSURL="";
    String newLocation="";
    boolean blnGotSession = false;

    try
    {

        // Retrieve the ITS url from OnDemand
        //If you want to use a different ITS url, this step can be skipped
        // create an HTTPS connection to OnDemand
```

```

URL wsURL = new URL(mstrServer + "/Services/Integration?command=ssoitsurl &ssoid="
+ ssoid);

URLConnection wsConnection = (URLConnection) wsURL.openConnection();

//Turn off caching
wsConnection.setUseCaches(false);
wsConnection.setDoOutput(true);
wsConnection.setRequestMethod("GET");

// If response is successful retrieve ssoitsurl
if (wsConnection.getResponseCode() == HttpURLConnection.HTTP_OK)
{

    //retrieve ssoitsurl string from response
    strSSOITSURL = wsConnection.getHeaderField("X-SsoitsUrl");

    //Open a connection to the ITS URL
    wsURL = new URL(strSSOITSURL);
    wsConnection = (URLConnection) wsURL.openConnection();

    //Turn off caching
    wsConnection.setUseCaches(false);

    //The ITS URL will redirect and pass a PTFToken
    //Turn off redirects and redirect manually so that
    //the token can be passed along to the url which will return the sessionId
    wsConnection.setInstanceFollowRedirects(false);
    wsConnection.setRequestMethod("GET");

    while(!blnGotSession)

```

```

{
    //Call CookieFromHeaders function to return cookie
    //Retrieve the PFTOKEN20 cookie so we can pass it in the redirect
    pftokenCookie = getCookieFromHeaders(wsConnection, "PFTOKEN20");

    //check to see if we have a jsession cookie so we can stop redirecting
    sessionCookie = getCookieFromHeaders(wsConnection, "JSESSIONID");

    //Check to see if we have the sessionid and stop redirecting
    if(sessionCookie != "FAIL")
    {
        blnGotSession = true;
    }
    else
    {
        //Get the URL for the next Redirect
        String newurl = wsConnection.getHeaderField("Location");
        wsURL = new URL(newurl);
        wsConnection = (HttpURLConnection) wsURL.openConnection();
        wsConnection.setInstanceFollowRedirects(false);
        wsConnection.setUseCaches(false);

        if(pftokenCookie != "FAIL")
        {
            wsConnection.setRequestProperty("Cookie", pftokenCookie);
        }

        wsConnection.setRequestMethod("GET");
    }
}

```

```

        if (blnGotSession)
        {
            // Retrieve the session id from the cookie setting
            setSessionIdFromCookie(sessionCookie);
            return mstrSessionId;
        }
    }
    catch (Exception e)
    {
        System.out.println("Logon Exception generated :: " + e);
    }
    return mstrSessionId;
}

//Function which returns cookie from headers
//If no cookie is returned, return FAIL
private static String getCookieFromHeaders(HttpURLConnection wsConnection, String
pstrCookieName)
{
    String headerName;
    String headerValue = "FAIL";
    Map m = wsConnection.getHeaderFields();

    for (Iterator it = m.keySet().iterator(); it.hasNext();)
    {
        String headerFieldKey = (String)it.next();

```

```

        Object headerFieldValue = (Object) m.get(headerFieldKey);
    }

    for (int i = 0; i <= m.size() ; i++)
    {

        headerName = wsConnecton.getHeaderFieldKey(i);

        if (headerName != null && headerName.equals("Set-Cookie") &&
            wsConnecton.getHeaderField(i).indexOf(pstrCookieName)>=0 )
        {
            headerValue = wsConnecton.getHeaderField(i);
            break;
        }
    }

    // return the header value (FAIL string for not found)
    return headerValue;
}

//Strip JSESSIONID from cookie
private static void setSessionIdFromCookie(String sessionString)
{
    int jsessionidx=0;

    jsessionidx = sessionString.indexOf("JSESSIONID=");
    if (jsessionidx >=0)
    {
        //remove anything before the JSESSIONID=
        sessionString = sessionString.substring(jsessionidx);
    }
}

```

```

        // 11 is the length of JSESSIONID=
        setSessionId(sessionString.substring(11, sessionString.indexOf(";")));
    }
}

//Set SessionId
public static void setSessionId(String sessionId)
{
    mstrSessionId = sessionId;
}

```

## C# Code Sample

The following is a code sample for single sign-on using C# (C Sharp):

```

public void SSOEstablish(string server, string ssoid)
{
    DateTime dtStart = DateTime.Now;
    string strSSOITSURL="";
    string Servername = server;
    string SSOID = ssoid;

    try
    {
        //check for existing session
        if(sessionId != null)
        {
            this.Destroy();
        }
    }
}

```

```

// create a container for an HTTP request
HttpRequest req = (HttpRequest) WebRequest.Create(Servername + "/Services/
Integration?command=ssoitsurl&ssoid=" + SSOID);

// make the HTTP call
HttpWebResponse resp=null;
try
{
    resp = (HttpWebResponse) req.GetResponse();
}
catch(Exception excep)
{
    throw(excep);
}
//if call is succesful, retrieve the SSOITSURL
if (resp.StatusCode == System.Net.HttpStatusCode.OK)
{
    strSSOITSURL= resp.Headers["X-SsoitsUrl"];
}
//make a call to ssoitsurl
req = (HttpRequest) WebRequest.Create(strSSOITSURL);

// cookie container is added to the request
// retrieve the cookie from the response.
req.CookieContainer = new CookieContainer();
try
{
    resp = (HttpWebResponse) req.GetResponse();
}
catch(Exception excep)

```

```

    {
        throw(excep);
    }
    if (resp.StatusCode == System.Net.HttpStatusCode.OK)
    {
        //store cookie
        cookie = resp.Cookies["JSESSIONID"];
        if (cookie == null)
        {
            throw new Exception("No JSESSIONID cookie found in log-in response!");
        }
        //obtain sessionId
        sessionId = cookie.Value;
    }
}
catch(Exception excep)
{
    throw(excep);
}
}

```

## XML Code Samples for API Calls

This appendix contains samples of XML code entered in and returned from some of the CRM On Demand Web services methods.

- ["QueryPage Method: Query by Example Expression Samples" on page 206](#)
- ["QueryPage Method: Query by Template Samples" on page 208](#)
- ["QueryPage Method: Query by Children Samples" on page 210](#)
- ["Child Node Method Samples" on page 215](#)
- ["MergeRecords Method Sample" on page 218](#)
- ["DeleteEvents Method Sample" on page 219](#)

- [“GetEvents Method Sample” on page 219](#)
- [“GetPicklistValues Method Samples” on page 221](#)

## QueryPage Method: Query by Example Expression Samples

This topic contains samples of XML code relevant to the QueryPage method when using the QBE type of query. For more information about the QueryPage method, see [“QueryPage” on page 167](#).

The examples in this topic cover the corner cases of quote and wildcard escaping. Assume that a table in the CRM On Demand database contains the following values for a particular column that is being queried by example:

```
?abc
abcd
' abc'
= ' abc'
abc?d
abc*d
aBc*D
abcd
abc*d
abc\d
abc\*d
abc\\*d
abc\d
abc\* ' d
abc\?"d
abc\*"d
abc\*' "d
(NULL val ue)
```

Table 166 specifies the returned record sets for various values of each QBE field value that maps to the preceding list.

Table 166. Returned Record Sets

QBE Field Value	Returned Record Set	Comments
abc	Not appl i cabl e	An unquoted value without an explicit operator is invalid input.
' abc'	Not appl i cabl e	A quoted value without an explicit operator is invalid input.
= ' ' ' abc	' ' ' ' abc'	None
= " ' abc' "	Not appl i cabl e	Double quotes are not allowed by the CRM On Demand Query Validator. Consequently, this example returns an error message.

Table 166. Returned Record Sets

QBE Field Value	Returned Record Set	Comments
= ' abc	' abc	None
= ' = ' ' abc	' ' ' = ' abc'	None
= ' = ' ' abc' '	Not appl i cabl e	The caller is responsible for correctly formatting quotes in Query* methods. This example does not have correctly formatted quotes, so it results in an error.
= ' abc?d	' abc?d	None
= ' abc\?d	' abc?d	None
LI KE ' abc\?d	' abc?d	None
LI KE ' abc?d	' abc?d abc*d abc\d	None
~LI KE ' abc?d	' abc?d aBc*D abc*d abc\d	None
= ' abc*d'	abc*d	Any wildcard character that has not been formatted with quotes is treated as if it were formatted with quotes.
= ' abc\*d	' abc*d	None
= ' abc\\*d	' abc\*d	None
LI KE ' abc\\*d	' abc\d abc\*d abc\\*d abc\d abc\*' d abc\?"d abc\*"d abc\*' "d	None
= ' abc\\\*"d	' abc\*"d	None
= ' abc\\?"d	' abc\?"d	None
= ' abc\\\?"d	' abc\*"d	None
LI KE ' abc\\?"d	' abc\?"d abc\*"d	None
LI KE ' abc\\\?"d	' abc\?"d	None
LI KE ' abc\\*"d	' abc\?"d abc\*"d abc\*' "d	None

Table 166. Returned Record Sets

QBE Field Value	Returned Record Set	Comments
LIKE 'abc\\*\"d	'abc\\*\"d	None
= 'abc\\*\" d	'abc\\*\" d	None
~ LIKE 'abc*d	'aBc*D abc*d abcd abc*d	None
LIKE 'abc*d	'abc*d abcd abc*d	None
(empty field)	Not applicable	An empty field value does not influence the search specification in Query by Template.
IS NULL	(empty field) (( > 'abc*' ) AND ( < 'abcd' ))	None
OR (~= 'abc*d' )	abc*d aBc*D abc*d	None
NOT LIKE 'abc?d'	Not applicable	The CRM On Demand Query Validator does not support the NOT operator, so this query returns an error.
> 'abc' BUT < 'abcd'	Not applicable	BUT is not a valid conjunction. Consequently, this query returns an error.

## QueryPage Method: Query by Template Samples

This topic contains samples of XML code that is relevant to the QueryPage method when using the Query by Template type of query. For more information about the QueryPage method, see [“QueryPage” on page 167](#).

The CRM On Demand Export API has *Query by Template* semantics. This means that only components and fields that are present in the input parameter are present in the output parameter.

### Query by Template Example 1

The following is an example of an input integration object instance:

```
<ListOfAccount>
  <Account>
    <LastUpdated>&gt;= '10/13/2003 03:25:32' </LastUpdated>
    <Name />
```

```

    <Locati on>I S NULL</Locati on>
  </Account>
</Li stOfAccount>

```

The search specification applied to the Account BusComp is as follows:

```
[LastUpdated] >= '10/13/2003 03: 25: 32' AND [Locati on] I S NULL.
```

The following shows an example of the XML returned:

```

<Li stOfAccount>
  <Account>
    <LastUpdated>10/14/2003 04: 25: 32</LastUpdated>
    <Name>I BM</Name>
    <Locati on></Locati on>
  </Account>
  <Account>
    <LastUpdated>10/13/2003 03: 25: 36 PM</LastUpdated>
    <Name>Si ebel </Name>
    <Locati on></Locati on>
  </Account>
</Li stOfAccount>

```

## Query by Template Example 2

The following is an example of an input integration object instance:

```

<Li stOfAccount>
  <Account>
    <LastUpdated/>
    <Name>LI KE ' Si e*' <Name/>
    <Locati on>= ' San Mateo' </Locati on>
  </Account>
</Li stOfAccount>

```

The application applies the search specification as follows:

```
[Name] LI KE ' Si e*' AND [Locati on] = ' San Mateo'
```

The following is an example of the XML returned:

```
<ListOfAccount>
  <Account>
    <LastUpdated>10/19/2003 09: 22: 33 AM</LastUpdated>
    <Name>Siebel Systems, Inc. </Name>
    <Location>San Mateo</Location>
  </Account>
  <Account>
    <LastUpdated>8/22/2003 03: 25: 36 PM</LastUpdated>
    <Name>Siemens</Name>
    <Location>San Mateo</Location>
  </Account>
</ListOfAccount>
```

## QueryPage Method: Query by Children Samples

This topic contains samples of XML code that is relevant to the QueryPage method when using the Query by Children type of query. For more information about the QueryPage method, see ["QueryPage" on page 167](#).

The examples in this topic illustrate the semantics of queries that include search specifications on child components.

### Query by Children Example 1

This example illustrates data synchronization through periodic exports, based on the time of the last update:

```
<ListOfAccount>
  <Account>
    <Name></Name>
    <Location></Location>
    <LastUpdated>(&gt; ' 05/12/02 10: 00: 03 PM' ) AND (&lt;= ' 05/18/02 10: 02: 22 PM' )</LastUpdated>
  </Account>
</ListOfAccount>
```

```

    <Contact>
      <FirstName><FirstName>
      <LastName></Lastname>
      <LastUpdated>(&gt; ' 05/12/02 10: 00: 03 PM' ) AND (&l t; = ' 05/18/02 10: 02: 22
PM' )</LastUpdated>
    </Contact>
  </Li stOfContact>
  <Li stOfBusi nessAddress>
    <Busi nessAddress>
      <Address/>
      <Ci ty/><State/>
      <Zi pCode/>
      <LastUpdated>(&gt; ' 05/12/02 10: 00: 03 PM' ) AND (&l t; = ' 05/18/02 10: 02: 22
PM' )</LastUpdated>
    <Busi nessAddress>
  </Li stOfBusi nessAddress>
</Account>
</Li stOfAccount>

```

Using a formal search specification language, the application interprets this query as follows:

```

([Account_LastUpdated] > ' 05/12/02 10: 00: 03 PM' )
AND
([Account_LastUpdated] <= ' 05/18/02 10: 02: 22 PM' )
)
OR
EXISTS
(
  ([Contact_LastUpdated] >= ' 05/12/02 10: 00: 03 PM' )
  AND
  ([Contact_LastUpdated] <= ' 05/18/02 10: 02: 22 PM' )
)
OR

```

```

EXISTS
(
  ([BusinessAddress_LastUpdated] > '05/12/02 10:00:03 PM')
  AND
  ([BusinessAddress_LastUpdated] <= '05/18/02 10:02:22 PM')
)

```

This specifies to find all accounts that have met one of the following conditions between 05/12/02 10:00:03 PM and 05/18/02 10:02:22 PM in the current user's time zone that have:

- Been updated
- Been associated with at least one new contact
- Changed or added at least one business address

## Query by Children Example 2

This example shows how to query to find all child opportunities associated with a contact:

```

<ListOfOpportunity>
  <Opportunity>
    <Description/>
    <Revenue></Revenue>
    <ListOfContact>
      <Contact>
        <Id>(= '12-12345') OR (= '12-54321')</Id>
        <FirstName></FirstName>
        <LastName></Lastname>
      </Contact>
    </ListOfContact>
  </Opportunity>
</ListOfOpportunity>

```

Using a formal search specification language, the application interprets this query as follows:

```
EXISTS( [Contact_Id]='12-12345' OR [Contact_Id]='12-54321' )
```

This example specifies to find all opportunities that are associated either with a contact whose Id is 12-12345, or with a contact whose Id is 12-54321.

### Query by Children Example 3

This example illustrates the interpretation of peer inter-component and intra-component expressions, and the fact that the default operator for text fields is LIKE:

```
<ListOfAccount>
  <Account>
    <Name></Name>
    <Location></Location>
    <LastUpdated>&gt; 05/12/02 10:00:03 PM</LastUpdated>
    <ListOfContact>
      <Contact>
        <FirstName>= 'Sanj i n' </FirstName>
        <LastName>= 'Tul ac' </Lastname>
        <MiddleName />
      </Contact>
      <Contact>
        <FirstName>LIKE 'Al ex*' </FirstName>
        <LastName>LIKE 'Warsha*' </Lastname>
      </Contact>
    </ListOfContact>
    <ListOfOpportunity>
      <Opportunity>
        <Description/>
        <Revenue>&gt; = '10000' </Revenue>
      </Opportunity>
    </ListOfOpportunity>
  </Account>
</ListOfAccount>
```

The application interprets this input to the QueryPage method as the following search specification:

```
[Account_LastUpdated] >= '05/12/02 10:00:03 PM'
```

OR

```

EXISTS
(
  (
    ([Contact_FirstName]=' Sanjin') AND ([Contact_LastName]=' Tulac')
  )
  OR
  (
    ([Contact_FirstName]LIKE ' Alex*') AND [Contact_LastName]LIKE ' Warsha*')
  )
)
OR
EXISTS
(
  [Opportunity_Revenue] >= ' 10000'
)

```

This example specifies to find all accounts that:

- Have been updated since 05/12/02 10:00:03 PM in current user's time zone
- Are associated with a contact whose first name is Sanjin and whose last name is Tulac
- Are associated with a contact whose first name starts with Alex and whose last name starts with Warsha
- Have an associated opportunity whose revenue is estimated at more than 10000 units of currency

## Query by Children Example 4

This example illustrates the use of the UseChildAnd parameter to retrieve a list of modified activities for a user:

```

<UseChildAnd>true</UseChildAnd>

<ListOfActivity>
  <Activity>
    <Subject/>
    <Description/>
    <Location/>
  
```

```

<ModifiedDate>> ' 05/12/02 10: 00: 03 PM' </ModifiedDate>

<ListOfUser>

  <User>

    <UserId>=' 12-12345' </UserId>

  </User>

</ListOfUser>

</Activity>

</ListOfActivity>

```

Using a formal search specification language, the application interprets this query as follows:

```

([Activity_ModifiedDate] > ' 05/12/02 10: 00: 03 PM' )

AND

EXISTS

([User_Id]=' 12-12345' )

```

This example tells the application to find all activities that have met all of the following conditions after 05/12/02 10:00:03 PM in the current user's time zone that:

- Have been updated
- Are associated with a user whose Id is 12-12345

## Child Node Method Samples

This topic contains samples for the child-node methods InsertChild, UpdateChild, and DeleteChild.

### DeleteChild Sample

This sample shows a request to delete a contact child record of an account. The parent account is identified by the AccountId field with the value 1-DOLTV, and contact child record is identified using the ContactId field with the value 1-EA7P7.

```

<?xml version="1.0" encoding="utf-8"?>

<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
www.w3.org/2001/XMLSchema">

  <soap:Body>

    <AccountWS_AccountDeleteChild_Input xmlns="urn:crmondemand/ws/account/10/2004">

      <ListOfAccount xmlns="urn:/crmondemand/xml/account">

```

```

    <Account>
      <AccountId>1-D0LTV</AccountId>
      <ListOfContact>
        <Contact>
          <ContactId>1-EA7P7</ContactId>
        </Contact>
      </ListOfContact>
    </Account>
  </ListOfAccount>
</AccountWS_AccountDeleteChildInput>
</soap: Body>
</soap: Envelope>

```

## InsertChild Sample

This sample shows a request to insert a contact child record of an account. The parent account is identified by the AccountId field with the value 1-D0LTV, and the contact child record is identified using the ContactId field with the value 1-EA7P7. Values for the ContactFirstName, ContactLastName, and ContactRole fields are provided.

```

<?xml version="1.0" encoding="utf-8"?>

<soap: Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
  www.w3.org/2001/XMLSchema">

  <soap: Body>

    <AccountWS_AccountInsertChildInput xmlns="urn:crmondemand/ws/account/10/2004">

      <ListOfAccount xmlns="urn:/crmondemand/xml/account">

        <Account>

          <AccountId>1-D0LTV</AccountId>

          <ListOfContact>

            <Contact>

              <ContactId>1-EA7P7</ContactId>

              <ContactFirstName>Freddy15</ContactFirstName>

```

```

        <ContactLastName>Qui mby15</ContactLastName>
        <ContactRole>User</ContactRole>
    </Contact>
</ListOfContact>
</Account>
</ListOfAccount>
</AccountWS_AccountInsertChildInput>
</soap: Body>
</soap: Envelope>

```

## UpdateChild Sample

This sample shows a request to update a contact child record of an account. The parent account is identified by the AccountId field with the value 1-D0LTV, and the contact child record is identified using the ContactId field with the value 1-EA7P7. Values for updating the ContactFirstName, ContactLastName, and ContactRole fields are provided.

```

<?xml version="1.0" encoding="utf-8"?>

<soap: Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
www.w3.org/2001/XMLSchema">

    <soap: Body>

        <AccountWS_AccountUpdateChildInput xmlns="urn:crmondemand/ws/account/10/2004">

            <ListOfAccount xmlns="urn:/crmondemand/xml/account">

                <Account>

                    <AccountId>1-D0LTV</AccountId>

                    <ListOfContact>

                        <Contact>

                            <ContactId>1-EA7P7</ContactId>

                            <ContactFirstName>Freddy22_updt</ContactFirstName>

                            <ContactLastName>Qui mby22_updt</ContactLastName>

                            <ContactRole>User</ContactRole>

                        </Contact>

                    </ListOfContact>

```

```

        </Account>
    </ListOfAccount>
</AccountWS_AccountUpdateChildInput>
</soap: Body>
</soap: Envelope>

```

## MergeRecords Method Sample

This topic contains a sample SOAP request and SOAP response for the MergeRecords method.

The following is the SOAP request:

```

<?xml version="1.0" encoding="UTF-8" standalone="no" ?>

<soap: Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
www.w3.org/2001/XMLSchema">

    <soap: Body>

        <MergeRecordsWS_MergeRecords_Input xmlns="urn:crmondemand/ws/mergerecords/">

            <PrimaryId>1-E5C55</PrimaryId>

            <DuplicateId>1-E5C4Z</DuplicateId>

            <PrimaryExternalSystemId />

            <DuplicateExternalSystemId />

            <RecordType>Contact</RecordType>

        </MergeRecordsWS_MergeRecords_Input>

    </soap: Body>

</soap: Envelope>

```

The following is the SOAP response:

```

<?xml version="1.0" encoding="UTF-8" ?>

<SOAP-ENV: Envelope xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
www.w3.org/2001/XMLSchema">

    <SOAP-ENV: Body>

        <ns: MergeRecordsWS_MergeRecords_Output xmlns:ns="urn:crmondemand/ws/
mergerecords/">

            <ns: DeletedRecordExternalSystemId />

```

```

    <ns: DeletedRecordId>1-E5C4Z</ns: DeletedRecordId>

    <ns: MergedRecordExternalSystemId />

    <ns: MergedRecordId>1-E5C55</ns: MergedRecordId>

  </ns: MergeRecordsWS_MergeRecords_Output>

</SOAP-ENV: Body>

</SOAP-ENV: Envelope>

```

## DeleteEvents Method Sample

This topic contains a sample SOAP request for the DeleteEvents method.

```

<?xml version="1.0" encoding="UTF-8" standalone="no"?>

  <soap: Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
    www.w3.org/2001/XMLSchema">

    <soap: Body>

      <IntegrationEventWS_DeleteEvents_Input xmlns="urn:crmondemand/ws/
      integrationevent/">

        <LastEventId>20061128121620_Account_Account_1-FLSDF_0_i.xml</LastEventId>

      </IntegrationEventWS_DeleteEvents_Input>

    </soap: Body>

  </soap: Envelope>

```

## GetEvents Method Sample

This topic contains a sample SOAP request and SOAP response for the GetEvents method.

The following is the SOAP request:

```

<?xml version="1.0" encoding="UTF-8" standalone="no" ?>

  <soap: Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
    www.w3.org/2001/XMLSchema">

    <soap: Body>

      <IntegrationEventWS_GetEvents_Input xmlns="urn:crmondemand/ws/integrationevent/">

        <EventCount/>

      </IntegrationEventWS_GetEvents_Input>

    </soap: Body>

  </soap: Envelope>

```

```
</soap: Body>
```

```
</soap: Envelope>
```

The following is the SOAP response:

```
<?xml version="1.0" encoding="UTF-8" ?>

<SOAP-ENV: Envelope xmlns: SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
www.w3.org/2001/XMLSchema">

  <SOAP-ENV: Body>

    <ns: IntegrationEventWS_GetEvents_Output xmlns:ns="urn:crmondemand/ws/
integrationevent/">

      <ListOfEvent xmlns="urn:/crmondemand/xml/integrationevent">

        <Event name="TerritoryNew">

          <Siebel Message>

            <ListOfTerritory xmlns="urn:/crmondemand/xml/territory">

## GetPicklistValues Method Samples

This topic contains samples for both regular and cascading picklists.

### Sample of GetPicklistValues for a Cascading Picklist

This sample shows the output for a SubArea picklist that has a parent picklist of Area. The sample shows the related picklist values that correspond to parent picklist values of Installation (Server Crash and No Admin Login) and Maintenance (Need Upgrade and Need Patch).

**NOTE:** The last topic of the ParentPicklistValue element contains all the available values for the SubArea picklist.

```

<Input>

<Object>Account</Object>

<FieldName>SubArea</FieldName>

</Input>

<Output>

  <ListOfParentPicklistValue>

    <ParentPicklistValue>

      <Language>ENU</Language>

      <ParentFieldName>Area</ParentFieldName>

      <ParentDisplayValue>Installation</ParentDisplayValue>

      <ParentCode>Installation</ParentCode>

    <ListOfPicklistValue>

      <PicklistValue>

        <DisplayValue>Server Crash</DisplayValue>

        <Code>Crash</Code>

      </PicklistValue>

```

```

    <PickListValue>
      <DisplayValue>No Admin LogIn</DisplayValue>
      <Code>NoLogIn</Code>
    </PickListValue>
  </ListOfPickListValue>
</ParentPickListValue>
<ParentPickListValue>
  <Language>ENU</Language>
  <ParentFieldName>Area</ParentFieldName>
  <ParentDisplayValue>Maintenance</ParentDisplayValue>
  <ParentCode> Maintenance </ParentCode>
  <ListOfPickListValue>
    <PickListValue>
      <DisplayValue>Need Upgrade</DisplayValue>
      <Code>Crash</Code>
    </PickListValue>
    <PickListValue>
      <DisplayValue>Need Patch</DisplayValue>
      <Code>NoLogIn</Code>
    </PickListValue>
  </ListOfPickListValue>
</ParentPickListValue>
<ParentPickListValue>
  <Language>ENU</Language>
  <ParentFieldName></ParentFieldName>
  <ParentDisplayValue></ParentDisplayValue>
  <ParentCode></ParentCode>
  <ListOfPickListValue>
    <PickListValue>
      <DisplayValue>Need Upgrade</DisplayValue>

```

```

        <Code>Crash</Code>
      </PicklistValue>
    <PicklistValue>
      <DisplayValue>Need Patch</DisplayValue>
      <Code>NoLogin</Code>
    </PicklistValue>
    <PicklistValue>
      <DisplayValue>Server Crash</DisplayValue>
      <Code>Crash</Code>
    </PicklistValue>
    <PicklistValue>
      <DisplayValue>No Admin Login</DisplayValue>
      <Code>NoLogin</Code>
    </PicklistValue>
  </ListOfPicklistValue>
</ParentPicklistValue>
</ListOfParentPicklistValue>
</Output>

```

### Sample of GetPicklistValues for a Regular Picklist

This sample shows the output for a Priority picklist that has possible values of High, Medium, and Low.

```

<Input>
  <Object>Account</Object>
  <FieldName>Priority</FieldName>
</Input>
<Output>
  <ListOfParentPicklistValue>
    <ParentPicklistValue>
      <Language>ENU</Language>
      <ParentFieldName></ParentFieldName>
    </ParentPicklistValue>
  </ListOfParentPicklistValue>

```

```

<ParentDi spl ayVal ue></ ParentDi spl ayVal ue>

- about 139
- fields 139
- methods 139
- picklists 140
- read-only fields 139
- required fields 139
- status key 140

**time and date fields** 16

## U

### **Update method**

- arguments 172
- call return value 173
- parent and child objects, effect of 172
- usage 172

### **UpdateChild method**

- arguments 173
- usage 173

### **user group object**

- about 143
- child components 143
- fields 144, 147
- filterable fields 145
- methods 143
- pick map field 145
- read-only fields 144
- required fields 144
- status key 144

### **user keys**

- about 31

- product category object 132
- product object 129
- user object 143

### **user object**

- about 140
- fields 141
- methods 141
- pick map field 140, 142
- read-only fields 142
- required fields 142
- status key 142
- user keys 143

**UserNameToken profile** 12

## V

**VB code sample** 189

### **vehicle object**

- about 146
- child components 146
- filterable fields 148
- methods 146
- pick map field 148
- picklists 149
- read-only fields 147
- required fields 147
- status key 147

## W

### **Web services**

- core technologies 9
- custom fields 13
- integration tag 13
- reliability 12
- security 11

### **Web services samples**

- DeleteChild sample 215
- DeleteEvents sample 219
- GetEvents sample 219
- GetPickListValues sample 221
- InsertChild sample 216
- MergeRecords sample 218
- query by children samples 210
- query by example expression samples 206
- query by template samples 208
- UpdateChild sample 217

### **Web services session**

- establishing and managing 19
- integration requests 22
- logging in 20
- logging in with integration request 23
- logging off 24
- maximum objects in Web Services request 25

maximum records returned 25  
request rate limit 25  
request size limit 25  
session time-outs 25
