# About This Document

This document describes the Java sample applications that are provided with the BEA WebLogic Enterprise™ software and is intended to be used with the following documents:

- ◆ *Getting Started*
- ◆ *Creating Client Applications*
- ◆ *Creating Java Server Applications*

This document covers the following topics:

- ◆ Chapter 1, “Introduction,” provides an overview of the sample applications.
- ◆ Chapter 2, “The Java Simpapp Sample Application,” describes how to build and use the Java Simpapp sample application.
- ◆ Chapter 3, “The JDBC Bankapp Sample Application,” describes how to build and use the JDBC Bankapp sample application.
- ◆ Chapter 4, “The XA Bankapp Sample Application,” describes how to build and use the XA Bankapp sample application.

## What You Need to Know

This document is intended for application designers and client and server programmers who would find a set of progressive examples useful in understanding the WebLogic Enterprise software.

---

# e-docs Web Site

The BEA WebLogic Enterprise product documentation is available on the BEA Systems, Inc. corporate Web site. From the BEA Home page, click the Product Documentation button or go directly to the “e-docs” Product Documentation page at <http://e-docs.bea.com>.

## How to Print the Document

You can print a copy of this document from a Web browser, one file at a time, by using the File—>Print option on your Web browser.

A PDF version of this document is available on the WebLogic Enterprise documentation Home page on the e-docs Web site (and also on the documentation CD). You can open the PDF in Adobe Acrobat Reader and print the entire document (or a portion of it) in book format. To access the PDFs, open the WebLogic Enterprise documentation Home page, click the PDF Files button, and select the document you want to print.

If you do not have Adobe Acrobat Reader installed, you can download it for free from the Adobe Web site at <http://www.adobe.com/>.

## Related Information

For more information about CORBA, Java 2 Enterprise Edition (J2EE), BEA Tuxedo™, distributed object computing, transaction processing, C++ programming, and Java programming, see the *WebLogic Enterprise Bibliography* in the WebLogic Enterprise online documentation.

# Contact Us!

Your feedback on the BEA WebLogic Enterprise documentation is important to us. Send us e-mail at **docsupport@bea.com** if you have questions or comments. Your comments will be reviewed directly by the BEA professionals who create and update the WebLogic Enterprise documentation.

In your e-mail message, please indicate that you are using the documentation for the BEA WebLogic Enterprise 5.1 release.

If you have any questions about this version of BEA WebLogic Enterprise, or if you have problems installing and running BEA WebLogic Enterprise, contact BEA Customer Support through BEA WebSUPPORT at [www.bea.com](http://www.bea.com). You can also contact Customer Support by using the contact information provided on the Customer Support Card, which is included in the product package.

When contacting Customer Support, be prepared to provide the following information:

- Your name, e-mail address, phone number, and fax number
- Your company name and company address
- Your machine type and authorization codes
- The name and version of the product you are using
- A description of the problem and the content of pertinent error messages

# Documentation Conventions

The following documentation conventions are used throughout this document.

Convention	Item
<b>boldface text</b>	Indicates terms defined in the glossary.
Ctrl+Tab	Indicates that you must press two or more keys simultaneously.

Convention	Item
<i>italics</i>	Indicates emphasis or book titles.
monospace text	Indicates code samples, commands and their options, data structures and their members, data types, directories, and filenames and their extensions. Monospace text also indicates text that you must enter from the keyboard. <i>Examples:</i> #include <iostream.h> void main ( ) the pointer psz chmod u+w * \tux\data\ap .doc tux.doc BITMAP float
<b>monospace boldface text</b>	Identifies significant words in code. <i>Example:</i> void <b>commit</b> ( )
<i>monospace italic text</i>	Identifies variables in code. <i>Example:</i> String <i>expr</i>
UPPERCASE TEXT	Indicates device names, environment variables, and logical operators. <i>Examples:</i> LPT1 SIGNON OR
{ }	Indicates a set of choices in a syntax line. The braces themselves should never be typed.
[ ]	Indicates optional items in a syntax line. The brackets themselves should never be typed. <i>Example:</i> buildobjclient [-v] [-o name ] [-f <i>file-list</i> ]... [-l <i>file-list</i> ]...

---

Convention	Item
	Separates mutually exclusive choices in a syntax line. The symbol itself should never be typed.
...	<p>Indicates one of the following in a command line:</p> <ul style="list-style-type: none"><li>n That an argument can be repeated several times in a command line</li><li>n That the statement omits additional optional arguments</li><li>n That you can enter additional parameters, values, or other information</li></ul> <p>The ellipsis itself should never be typed.</p> <p><i>Example:</i></p> <pre>buildobjclient [-v] [-o name ] [-f file-list]... [-l file-list]...</pre>
.	Indicates the omission of items from a code example or from a syntax line.
.	The vertical ellipsis itself should never be typed.
.	

---

# 1 Introduction

This chapter provides an overview of the Java sample applications

## Overview of the Sample Applications

The sample applications provide client and server programmers with the basic concepts of developing Java server applications for the Weblogic Enterprise software.

The following sample applications are provided:

- **Java Simpapp**—provides a Java client application and a Java server application. The Java server application contains two operations that manipulate strings received from the Java client application.
- **JDBC Bankapp**—implements an automatic teller machine (ATM) interface and uses Java Database Connectivity (JDBC) to access a database that stores account and customer information.
- **XA Bankapp**—implements the same ATM interface as JDBC Bankapp; however, XA Bankapp uses a database XA library to demonstrate using the Transaction Manager to coordinate transactions.

The chapters in this manual describe how to build and run the sample applications.

For a description of the development process used to create the sample applications, see [Getting Started](#).

# 2 The Java Simpapp Sample Application

This topic includes the following sections:

- How the Java Simpapp sample application works
- Software prerequisites
- The Object Management Group (OMG) Interface Definition Language (IDL) for the Java Simpapp sample application
- Building and running the Java Simpapp sample application
- Using the Java Simpapp sample application
- Using the C++ client application with the Java Simpapp sample application
- Stopping the Java Simpapp Sample Application

Refer to `Readme.txt` in the `\WLEdir\samples\corba\simpapp_java` directory for troubleshooting information and the latest information about using the Java Simpapp sample application.

# How the Java Simpapp Sample Application Works

The Java Simpapp sample application consists of a Java client application that sends requests to a Java server application. The Java server application provides an implementation of a CORBA object that has the following two methods:

- The `upper` method accepts a string from the Java client application and converts the string to uppercase letters.
- The `lower` method accepts a string from the Java client application and converts the string to lowercase letters.

Figure 2-1 illustrates how the Java Simpapp sample application works.

**Figure 2-1 The Java Simpapp Sample Application**

# Software Prerequisites

To run the `idltojava` compiler used by the Java Simpapp sample application, you need to install Visual C++.

## The OMG IDL Code for the Java Simpapp Sample Application

The Java Simpapp sample application implements the CORBA interfaces listed in Table 2-1:

**Table 2-1 CORBA Interfaces for the Java Simpapp Sample Application**

Interface	Description	Operation
SimpleFactory	Creates object references to the Simple object	<code>find_simple()</code>
Simple	Converts the case of a string	<code>to_upper()</code> <code>to_lower()</code>

Listing 2-1 shows the `simple.idl` file that defines the CORBA interfaces in the Java Simpapp sample application. This is the same OMG IDL file used by the Simpapp sample application. The `runme` command automatically copies it from the `\corba\simpapp_java` directory.

### Listing 2-1 OMG IDL Code for the Java Simpapp Sample Application

---

```
#pragma prefix "beasys.com"

interface Simple
{
    //Convert a string to lower case (return a new string)
    string to_lower(in      string val);

    //Convert a string to upper case (in place)
    void to_upper(inout string val);
};

interface SimpleFactory
{
    Simple find_simple();
};
```

## Building and Running the Java Simpapp Sample Application

To build and run the Java Simpapp sample application, complete the following steps:

1. Copy the files for the Java Simpapp sample application into a work directory.
2. Change the protection attribute on the files for the Java Simpapp sample application.
3. Verify the environment variables.
4. Execute the `runme` command.

The following sections describe these steps.

## Copying the Files for the Java Simpapp Sample Application into a Work Directory

You need to copy the files for the Java Simpapp sample application into a work directory on your local machine. The files for the Java Simpapp sample application are located in the following directories:

### Windows NT

`drive:\WLEdir\samples\corba\simpapp_java`

### UNIX

`/usr/local/WLEdir/samples/corba/simapp_java`

You will use the files listed in Table 2-2 to build and run the Java Simpapp sample application.

**Table 2-2 Files Included in the Java Simpapp Sample Application**

File	Description
<code>Simple.idl</code>	The OMG IDL code that declares the <code>Simple</code> and <code>SimpleFactory</code> interfaces. This file is copied from the WebLogic Enterprise <code>simpapp_java</code> directory by the <code>runme</code> command file.
<code>ServerImpl.java</code>	The Java source code that overrides the <code>Server.initialize</code> and <code>Server.release</code> methods.
<code>SimpleClient.java</code>	The Java source code for the client application in the Java Simpapp sample application.
<code>SimpleFactoryImpl.java</code>	The Java source code that implements the <code>SimpleFactory</code> methods.
<code>SimpleImpl.java</code>	The Java source code that implements the <code>Simple</code> methods.

**Table 2-2 Files Included in the Java Simpapp Sample Application**

File	Description
<code>Simple.xml</code>	The Server Description File used to associate activation and transaction policy values with CORBA interfaces. For the Java Simpapp sample application, the <code>Simple</code> and <code>SimpleFactory</code> interfaces have an activation policy of <code>method</code> and a transaction policy of <code>optional</code> .
<code>Readme.txt</code>	Provides the latest information about building and running the Java Simpapp sample application.
<code>runme.cmd</code>	The Windows NT batch file that builds and runs the Java Simpapp sample application.
<code>runme.ksh</code>	The UNIX Korn shell script that builds and executes the Java Simpapp sample application.
<code>makefile.mk</code>	The make file for the Java Simpapp sample application on the UNIX operating system. This file is used to manually build the Java Simpapp sample application. Refer to the <code>Readme.txt</code> file for information about manually building the Java Simpapp sample application. The UNIX make command needs to be in the path of your machine.
<code>makefiles.nt</code>	The make file for the Java Simpapp sample application on the Windows NT operating system. This make file can be used directly by the Visual C++ <code>nmake</code> command. This file is used to manually build the Java Simpapp sample application. Refer to the <code>Readme.txt</code> file for information about manually building the Java Simpapp sample application. The Windows NT <code>nmake</code> command needs to be in the path of your machine.
<code>smakefile.nt</code>	The make file for the Java Simpapp sample application that is used with Visual Cafe <code>smake</code> command.  <b>Note:</b> <code>makefile.nt</code> is included by <code>smakefile.nt</code> .

## Changing the Protection Attribute on the Files for the Java Simpapp Sample Application

During the installation of the WebLogic Enterprise software, the sample application files are marked read-only. Before you can edit or build the files in the Java Simpapp sample application, you need to change the protection attribute of the files you copied into your work directory, as follows:

### Windows NT

```
prompt>attrib -r drive:\workdirectory\*.*
```

### UNIX

```
prompt>/bin/ksh
```

```
ksh prompt>chmod u+w /workdirectory/*.*
```

On the UNIX operating system platform, you also need to change the permission of `runme.ksh` to give execute permission to the file, as follows:

```
ksh prompt>chmod +x runme.ksh
```

## Verifying the Settings of the Environment Variables

Before building and running the Java Simpapp sample application, you need to ensure that certain environment variables are set on your system. In most cases, these environment variables are set as part of the installation procedure. However, you need to check the environment variables to ensure they reflect correct information.

## 2 The Java Simpapp Sample Application

---

Table 2-3 lists the environment variables required to run the Java Simpapp sample application.

**Table 2-3 Required Environment Variables for the Java Simpapp Sample Application**

Environment Variable	Description
TUXDIR	The directory path where you installed the WebLogic Enterprise software. For example: <b>Windows NT</b> TUXDIR=c:\WLEdir <b>UNIX</b> TUXDIR=/usr/local/WLEdir
JAVA_HOME	The directory path where you installed the JDK software. For example: <b>Windows NT</b> JAVA_HOME=c:\JDK1.2 <b>UNIX</b> JAVA_HOME=/usr/local/JDK1.2

To verify that the information for the environment variables defined during installation is correct, complete the following steps:

### **Windows NT**

1. From the Start menu, select Settings.
2. From the Settings menu, select the Control Panel.  
The Control Panel appears.
3. Click the System icon.  
The System Properties window appears.
4. Click the Environment tab.  
The Environment page appears.
5. Check the settings for TUXDIR and JAVA\_HOME.

### **UNIX**

```
ksh prompt>printenv TUXDIR
```

```
ksh prompt>printenv JAVA_HOME
```

To change the settings, perform the following steps:

### Windows NT

1. On the Environment page in the System Properties window, click the environment variable you want to change or enter the name of the environment variable in the Variable field.
2. Enter the correct information for the environment variable in the Value field.
3. Click OK to save the changes.

### UNIX

```
ksh prompt>export TUXDIR=directorypath
```

```
ksh prompt>export JAVA_HOME=directorypath
```

## Executing the runme Command

The `runme` command automates the following steps:

1. Sets the system environment variables.
2. Loads the `UBBCONFIG` file.
3. Compiles the code for the client application.
4. Compiles the code for the server application.
5. Starts the server application using the `tmboot` command.
6. Starts the client application.
7. Stops the server application using the `tmshutdown` command.

**Note:** You can also run the Java Simpapp sample application manually. The steps for manually running the Java Simpapp sample application are described in the `Readme.txt` file.

To build and run the Java Simpapp sample application, enter the `runme` command, as follows:

### Windows NT

```
prompt>cd workdirectory
```

```
prompt>runme
```

### UNIX

```
ksh prompt>cd workdirectory
```

```
ksh prompt>./runme.ksh
```

The Java Simpapp sample application runs and prints the following messages:

```
Testing simpapp
  cleaned up
  prepared
  built
  loaded ubb
  booted
  ran
  shutdown
  saved results
PASSED
```

**Note:** After executing the `runme` command, you may get a message indicating the `Host`, `Port`, and `IPCKEY` parameters in the `UBBCONFIG` file conflict with an existing `UBBCONFIG` file. If this occurs, you need to set these parameters to different values to get the Java Simpapp sample application running on your machine. See the `Readme.txt` file for information about how to set these parameters.

The `runme` command starts the following application processes:

#### ■ TMSYSEVT

The BEA Tuxedo system event broker.

#### ■ TMFFNAME

The following three `TMFFNAME` server processes are started:

- The `TMFFNAME` server process started with the `-N` and `-M` options is the master `NameManager` service. The `NameManager` service maintains a mapping of the application-supplied names to object references.

- The `TMFFNAME` server process started with only the `-N` option is the slave NameManager service.
  - The `TMFFNAME` server process started with the `-F` option contains the FactoryFinder object.
- **JavaServer**
- The Java Simpapp sample application server process. The JavaServer process has one option, `simple`, which is the Java ARchive (JAR) file that was created for the application.
- **ISL**
- The IIOP Listener process.

**Note:** The JavaServer will not start on Microsoft Windows NT if JDK bin is in the path after the network drive. Make sure the JDK bin directories (that is, `jre/bin` and `jre/bin/classic`) are set in the `PATH` before any network driver path elements via the Control Panel before booting the JavaServer.

Table 2-4 lists the files in the work directory generated by the `runme` command.

**Table 2-4 Files Generated by the `runme` Command**

File	Description
<code>SimpleFactory.java</code>	Generated by the <code>m3idltojava</code> command for the <code>SimpleFactory</code> interface. The <code>SimpleFactory</code> interface contains the Java version of the OMG IDL interface. It extends <code>org.omg.CORBA.Object</code> .
<code>SimpleFactoryHolder.java</code>	Generated by the <code>m3idltojava</code> command for the <code>SimpleFactory</code> interface. This class holds a public instance member of type <code>SimpleFactory</code> . The class provides operations for <code>out</code> and <code>inout</code> arguments that are included in CORBA, but that do not map exactly to Java.
<code>SimpleFactoryHelper.java</code>	Generated by the <code>m3idltojava</code> command for the <code>SimpleFactory</code> interface. This class provides auxiliary functionality, notably the <code>narrow</code> method.

**Table 2-4 Files Generated by the runme Command**

File	Description
<code>_SimpleFactoryStub.java</code>	Generated by the <code>m3idltojava</code> command for the <code>SimpleFactory</code> interface. This class is the client stub that implements the <code>SimpleFactory.java</code> interface.
<code>_SimpleFactoryImplBase.java</code>	Generated by the <code>m3idltojava</code> command for the <code>SimpleFactory</code> interface. This abstract class is the server skeleton. It implements the <code>SimpleFactory.java</code> interface. The user-written server class <code>SimpleFactoryImpl</code> extends <code>_SimpleFactoryImplBase</code> .
<code>Simple.java</code>	Generated by the <code>m3idltojava</code> command for the <code>Simple</code> interface. The <code>Simple</code> interface contains the Java version of the OMG IDL interface. It extends <code>org.omg.CORBA.Object</code> .
<code>SimpleHolder.java</code>	Generated by the <code>m3idltojava</code> command for the <code>Simple</code> interface. This class holds a public instance member of type <code>Simple</code> . The class provides operations for out and inout arguments that CORBA has but that do not match exactly to Java.
<code>SimpleHelper.java</code>	Generated by the <code>m3idltojava</code> command for the <code>Simple</code> interface. This class provides auxiliary functionality, notably the <code>narrow</code> method.
<code>_SimpleStub.java</code>	Generated by the <code>m3idltojava</code> command for the <code>Simple</code> interface. This class is the client stub that implements the <code>Simple.java</code> interface.
<code>_SimpleImplBase.java</code>	Generated by the <code>m3idltojava</code> command for the <code>Simple</code> interface. This abstract class is the server skeleton. It implements the <code>Simple.java</code> interface. The user-written server class <code>SimpleImpl</code> extends <code>_SimpleImplBase</code> .
<code>Simple.ser</code>	The Server Descriptor File generated by the <code>buildjobjsrserver</code> command in the <code>runme</code> command.

**Table 2-4 Files Generated by the `runme` Command**

File	Description
<code>Simple.jar</code>	The server Java Archive file generated by the <code>buildjavaserver</code> command in the <code>runme</code> command.
<code>SimpleClient.jar</code>	The Java Archive file for the client application. It can be used to verify. This file is used during the installation of the WebLogic Enterprise software to insure the client application is installed properly. For information about verifying the installation of the WebLogic Enterprise software, see <a href="#">BEA WebLogic Enterprise Installation Guide</a> .
<code>.adm/.keybd</code>	A file that contains the security encryption key database. The subdirectory is created by the <code>tmloadcf</code> command in the <code>runme</code> command.
<code>results</code>	A directory generated by the <code>runme</code> command.

Table 2-5 lists files in the `results` directory generated by the `runme` command.

**Table 2-5 Files in the `results` Directory Generated by the `runme` Command**

File	Description
<code>input</code>	Contains the input that the <code>runme</code> command provides to the Java client application.
<code>output</code>	Contains the output produced when the <code>runme</code> command executes the Java client application.
<code>expected_output</code>	Contains the output that is expected when the Java client application is executed by the <code>runme</code> command. The data in the <code>output</code> file is compared to the data in the <code>expected_output</code> file to determine whether or not the test passed or failed.

**Table 2-5 Files in the results Directory Generated by the runme Command**

File	Description
log	Contains the output generated by the <code>runme</code> command. If the <code>runme</code> command fails, check this file for errors.
setenv.cmd	Contains the commands to set the environment variables needed to build and run the Java Simpapp sample application on the Windows NT operating system platform.
setenv.ksh	Contains the commands to set the environment variables needed to build and run the Java Simpapp sample application on the UNIX operating system platform.
stderr	Generated by the <code>tmboot</code> command, which is executed by the <code>runme</code> command. If the <code>-noredirect JavaServer</code> option is specified in the <code>UBBCONFIG</code> file, the <code>System.err.println</code> method sends the output to the <code>stderr</code> file instead of to the <code>ULOG</code> file.
stdout	Generated by the <code>tmboot</code> command, which is executed by the <code>runme</code> command. If the <code>-noredirect JavaServer</code> option is specified in the <code>UBBCONFIG</code> file, the <code>System.out.println</code> method sends the output to the <code>stdout</code> file instead of to the <code>ULOG</code> file.
tmsysevt.dat	Contains filtering and notification rules used by the TMSYSEVT (system event reporting) process. This file is generated by the <code>tmboot</code> command in the <code>runme</code> command.
tuxconfig	A binary version of the <code>UBBCONFIG</code> file.
ubb	The <code>UBBCONFIG</code> file for the Java Simpapp sample application.
ULOG.<date>	A log file that contains messages generated by the <code>tmboot</code> command.

# Using the Java Simpapp Sample Application

This section describes how to use the Java Simpapp sample application after the `runme` command is executed.

Run the Java server application in the Java Simpapp sample application, as follows:

## **Windows NT**

```
prompt>tmboot
```

## **UNIX**

```
ksh prompt>tmboot
```

Run the Java client application in the Java Simpapp sample application, as follows:

## **Windows NT**

```
prompt>java -classpath .;%TUXDIR%\udataobj\java\jdk\m3envobj.jar  
-DTOBJADDR=%TOBJADDR% SimpleClient  
String?  
Hello World  
HELLO WORLD  
hello world
```

## **UNIX**

```
ksh prompt>java -classpath .:$TUXDIR/udataobj/java/jdk\  
/m3envobj.jar -DTOBJADDR=$TOBJADDR SimpleClient  
String?  
Hello World  
HELLO WORLD  
hello world
```

**Note:** The Java Simpapp sample client application uses the client-only JAR file `m3envobj.jar`. However, you could also use the `m3.jar` file to run the client application.

# Using the C++ Client Application with the Java Simpapp Sample Application

A C++ client application is provided with the Java Simpapp sample application to demonstrate interoperability between a Java server application and a C++ client application. This section describes the process of building and running the C++ client application.

Build the C++ client application in the Java Simpapp sample application as follows:

1. Copy the files from the following directory to a work directory:

### Windows NT

```
\WLEdir\samples\CORBA\simpapp_java
```

### UNIX

```
/usr/local/WLEdir/samples/corba/simpapp_java
```

**Note:** The work directory for the Java Simpapp sample application cannot be the same as the work directory for the C++ Simpapp sample application.

2. Change the protection on the files using the following commands:

### Windows NT

```
prompt>attrib -r drive:\workdirectory\*.*
```

### UNIX

```
prompt>/bin/ksh
```

```
ksh prompt>chmod u+w /workdirectory/*.*
```

3. Make sure the UNIX `make` command or the Windows NT `nmake` command is in the path of your machine.
4. Set the `M3SIMPDIR` environment variable to your work directory.
5. Build the C++ client application, as follows:

### Windows NT

```
prompt>cd %M3SIMPDIR
```

```
prompt>nmake -f makefile.nt simple_client.exe
```

### UNIX

```
ksh prompt>cd %M3SIMPDIR
```

```
ksh prompt>make -f makefile.mk simple_client
```

Run the Java server application in the Java Simpapp sample application, as follows:

### Windows NT

```
prompt>tmboot
```

### UNIX

```
ksh prompt>tmboot
```

Run the C++ client application in the Java Simpapp sample application, as follows:

### Windows NT

```
prompt>%M3SIMPDIR%\simple_client
```

```
String? Hello
```

```
HELLO
```

```
hello
```

### UNIX

```
ksh prompt>$M3SIMPDIR/simple_client
```

```
String? Hello
```

```
HELLO
```

```
hello
```

# Stopping the Java Simpapp Sample Application

Before using another sample application, enter the following commands to stop the Java Simpapp sample application and to remove unnecessary files from the work directory:

### **Windows NT**

```
prompt>tmsshutdown -y
```

```
prompt>nmake -f makefile.nt clean
```

### **UNIX**

```
ksh prompt>tmsshutdown -y
```

```
ksh prompt>make -f makefile.mk clean
```

# 3 The JDBC Bankapp Sample Application

This topic includes the following sections:

- How the JDBC Bankapp Sample Application Works
- Development Process for the JDBC Bankapp Sample Application
- Setting Up the Database for the JDBC Bankapp Sample Application
- Building the JDBC Bankapp Sample Application
- Compiling the Client and Server Applications
- Initializing the Database
- Starting the Server Application in the JDBC Bankapp Sample Application
- Files Generated by the JDBC Bankapp Sample Application
- Starting the ATM Client Application in the JDBC Bankapp Sample Application
- Stopping the JDBC Bankapp Sample Application
- Using the ATM Client Application

Refer to the `Readme.txt` file in the `\WLEdir\samples\corba\bankapp_java\JDBC` directory for troubleshooting information and for the latest information about using the JDBC Bankapp sample application.

# How the JDBC Bankapp Sample Application Works

The JDBC Bankapp sample application implements an automatic teller machine (ATM) interface and uses Java Database Connectivity (JDBC) to access a database that stores account and customer information. This topic includes the following sections:

- Java Server Objects
- Application Workflow
- JDBC Connection Pooling

## Java Server Objects

The JDBC Bankapp sample application consists of a Java server application that contains the objects listed in Table 3-1.

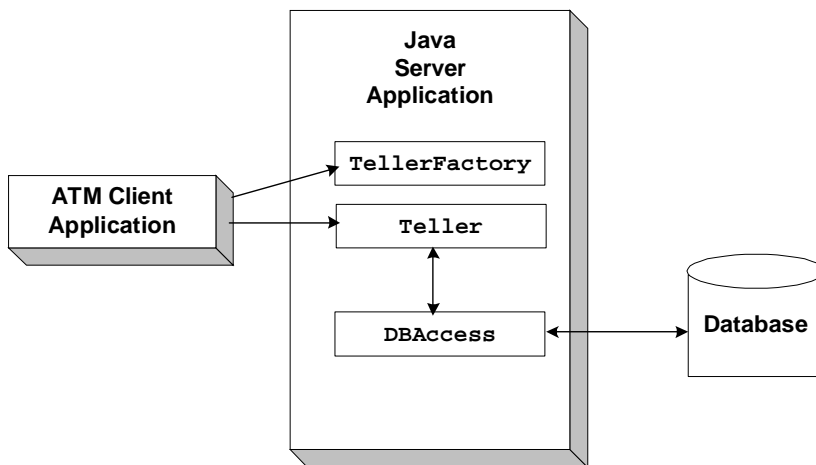

**Table 3-1   Objects in the Java Server Application of the JDBC Bankapp**

Object	Description
TellerFactory	The TellerFactory object creates the object references to the Teller object.
Teller	The Teller object receives and processes requests for banking operations from the ATM client application.
DBAccesss	The DBAccess object receives and processes requests from the Teller object to the database.

## Application Workflow

Figure 3-1 illustrates how the JDBC Bankapp sample application works.

Figure 3-1 The JDBC Bankapp Sample Application

## JDBC Connection Pooling

The JDBC Bankapp sample application demonstrates how to use JDBC database connection pooling running in a multithreaded server application. In the JDBC Bankapp sample application, the WebLogic Enterprise software creates and initializes a pool of database connections that the sample application uses. All `DBAccess` objects share this pool. For more information about JDBC connection pools, see [Using the JDBC Drivers](#).

A minimum number of database connections are established when the server applications is initialized. The number of connections is increased on demand. When a worker thread receives a request for a `DBAccess` object, the corresponding `DBAccess` method gets an available database connection from the pool. When the call to the `DBAccess` method completes, the database connection is returned to the pool. If there is no database connection available and the maximum number of database connections has been established, the worker thread waits until a database connection becomes available.

# Development Process for the JDBC Bankapp Sample Application

This topic includes the following sections:

- Object Management Group (OMG) Interface Definition Language (IDL)
- Client Application
- Server Application
- Server Description File (BankApp.xml)
- UBBCONFIG File

This topic describes the development process for the JDBC Bankapp sample application.

**Note:** The steps in this topic have been done for you and are included in the JDBC Bankapp sample application.

## Object Management Group (OMG) Interface Definition Language (IDL)

Table 3-2 lists the CORBA interfaces defined in the OMG IDL for the JDBC Bankapp sample application:

**Table 3-2 CORBA Interfaces Defined in the JDBC Bankapp OMG IDL**

Interface	Description	Methods
TellerFactory	Creates object references to the Teller object	<code>create_Teller()</code>

**Table 3-2 CORBA Interfaces Defined in the JDBC Bankapp OMG IDL (Continued)**

Teller	Performs banking operations	verify_pin_number() deposit() withdraw() inquiry() transfer() report()
DBAccess	Accesses the Oracle database on behalf of the Teller object	get_valid_accounts() read_account() update_account() transfer_funds()

## BankApp.idl File

Listing 3-1 shows the `BankApp.idl` file that defines the `TellerFactory` and `Teller` interfaces in the JDBC Bankapp sample application. A copy of this file is included in the directory for the JDBC Bankapp sample application.

### Listing 3-1 OMG IDL Code for the TellerFactory and Teller Interfaces

---

```
#pragma prefix "beasys.com"
#pragma javaPackage "com.beasys.samples"

#include "Bank.idl"

module BankApp{
    exception IOException {};
    exception TellerInsufficientFunds();

    struct BalanceAmounts{
        float fromAccount;
        float toAccount;
    };

    struct TellerActivity {
        long totalRequests;
        long totalSuccesses;
        long totalFailures;
        float currentBalance;
    };
};
```

### 3 The JDBC Bankapp Sample Application

---

```
//Process Object
interface Teller {
    void verify_pin_number(in short pinNo,
                           out Bank::CustAccounts accounts)
        raises(Bank::PinNumberNotFound, IOException);
    float deposit(in long accountNo, in float amount)
        raises(Bank::AccountRecordNotFound, IOException);
    float withdraw(in long accountNo, in float amount)
        raises(Bank::AccountRecordNotFound,
               Bank::InsufficientFunds,
               IOException, TellerInsufficientFunds);
    float inquiry(in long accountNo)
        raises(Bank::AccountRecordNotFound, IOException);
    void transfer(in long fromAccountNo,
                  in long toAccountNo, in float amount,
                  out BalanceAmounts balAmounts)
        raises(Bank::AccountRecordNotFound,
               Bank::InsufficientFunds,
               IOException);
    void report(out TellerActivity tellerData)
        raises(IOException);
};

interface TellerFactory{
    Teller createTeller(in string tellerName);
};

};
```

#### BankDB.idl File

Listing 3-2 shows the BankDB.idl file that defines the DBAccess interface in the JDBC Bankapp sample application. A copy of this file is included in the directory for the JDBC Bankapp sample application.

#### Listing 3-2 OMG IDL Code for the DBAccess Interface

---

```
#pragma prefix "beasys.com"
#pragma javaPackage "com.beasys.samples"

#include "Bank.idl"

module BankDB{
    struct AccountData{
        long accountID;
```

```
        float balance;
    };

    interface DBAccess{
        void get_valid_accounts(in short, pinNo,
                                out Bank::CustAccounts accounts)
            raises(Bank::DatabaseException,
                  Bank::PinNumberNotFound);
        void read_account(inout AccountData data)
            raises(Bank::DatabaseException,
                  Bank::AccountRecordNotFound);
        void update_account(inout AccountData data)
            raises(Bank::DatabaseException,
                  Bank::AccountRecordNotFound,
                  Bank::InsufficientFunds);
        void transfer_funds(in float_amount,
                            inout AccountData fromAcct,
                            inout AccountData toAcct,
                            raises(Bank::DatabaseException,
                                    Bank::AccountRecordNotFound,
                                    Bank::InsufficientFunds);
    };
};
```

### Bank.idl File

Listing 3-3 shows the `Bank.idl` file that defines common exceptions and structures. It is included by both `BankApp.idl` and `BankDB.idl`. A copy of this file is included in the directory for the JDBC Bankapp sample application.

#### Listing 3-3 OMG IDL Code for the Exceptions and Structures in JDBC Bankapp

---

```
#pragma prefix "beasys.com"
#pragma javaPackage "com.beasys.samples"

module Bank{

    exception DataBaseException {};
    exception PinNumberNotFound ();
    exception AccountRecordNotFound ();
    exception InsufficientFunds ();

    struct CustAccounts{
        long checkingAccountID;
```

```
        long savingsAccountID;  
    };  
};
```

## Client Application

During the development of the client application, you would write Java code that does the following:

- Initializes the ORB.
- Uses the Bootstrap environmental object to establish communication with the WebLogic Enterprise domain.
- Resolves initial references to the `FactoryFinder` environmental object.
- Uses a factory to get an object reference for the `Teller` object.
- Invokes the `verify_pin_number`, `deposit`, `withdraw`, `inquiry`, `transfer`, and `report` methods on the `Teller` object.

A Java client application, referred to as the ATM client application, is included in the JDBC Bankapp sample application. For more information about writing Java client applications that use transactions, see [Using Transactions](#).

## Server Application

During the development of the server application, you would write the following:

- The `Server` object, which initializes the server application in the JDBC Bankapp sample application and registers a factory for the `Teller` object with the WebLogic Enterprise domain. The `Server` object also obtains a reference to the JDBC connection pool from JNDI.
- The implementations for the methods of the `Teller` and `DBAccess` objects.  
The implementations for the `Teller` object include invoking operations on the `DBAccess` object.

Because the `Teller` object has durable state (for example, ATM statistics) that is stored in an external source (a flat file), the method implementations must also include the `activate_object` and `deactivate_object` methods to ensure the `Teller` object is initialized with its state.

The JDBC Bankapp server application is configured to be multithreaded. Writing a multithreaded WebLogic Enterprise Java server application is the same as writing a single-threaded Java server application; you cannot establish multiple threads programmatically in your object implementations. Instead, you establish the number of threads for a Java server application in the `UBBCONFIG` file. For information about writing Java server applications and using threads in Java server applications, see [Using Transactions](#).

## Server Description File (BankApp.xml)

During development, you create a Server Description File (`BankApp.xml`) that defines the activation and transaction policies for the `TellerFactory`, `Teller`, and `DBAccess` interfaces. Table 3-3 shows the activation and transaction policies for the JDBC Bankapp sample application.

**Table 3-3 Activation and Transaction Policies for JDBC Bankapp**

Interface	Activation Policy	Transaction Policy
<code>TellerFactory</code>	Process	Never
<code>Teller</code>	Method	Never
<code>DBAccess</code>	Method	Never

A Server Description File for the JDBC Bankapp sample application is provided. For information about creating Server Description Files and defining activation and transaction policies on objects, see [Creating Java Server Applications](#).

## UBBCONFIG File

When using the WebLogic Enterprise software, the server application is represented by a Java ARchive (JAR). The JAR must be loaded into the Java Virtual Machine (JVM) to be executed. The JVM must execute in a WebLogic Enterprise server application to be integrated in an WebLogic Enterprise application. By default, the server application that loads the JVM is called `JavaServer`. You include the options to start `JavaServer` in the `Servers` section of the application's `UBBCONFIG` file. For information about starting the `JavaServer` and defining parameters in the `UBBCONFIG` file, see "Creating the Configuration File" in the [Administration Guide](#).

## Enabling Multithreaded Support

If your Java server application is multithreaded, you can establish the number of threads by using the command-line option (`CLOPT`) `-M` in the `SERVERS` section of the `UBBCONFIG` file. In Listing 3-4, the `-M 100` option enables multithreading for the `JavaServer` and specifies 100 as the maximum number of worker threads that a particular instance of `JavaServer` can support. The largest number that you can specify is 500.

### Listing 3-4 Enabling Multithreaded Support in UBBCONFIG

---

```
JavaServer
  SRVGRP = BANK_GROUP1
  SRVID = 2
  SRVTYPE = JAVA
  CLOPT = "-A -- -M 100 Bankapp.jar TellerFactory_1 bank_pool"
  RESTART = N
```

**Notes:** The `SRVTYPE=JAVA` line is required when using JDBC connection pooling.

The information for the `CLOPT` parameter needs to be entered on one line.

You also need to set the `MAXACCESSERS` parameter in the `RESOURCES` section of the `UBBCONFIG` file to account for the number of worker threads that each server application is configured to run. The `MAXACCESSERS` parameter specifies the number of processes that can attach to a WebLogic Enterprise application.

## Setting Up the Connection Pool

For the JDBC Bankapp sample application, you need to include the name of the connection pool on the command-line option (CLOPT) in the `SERVERS` section of the `UBBCONFIG` file, as shown in Listing 3-5.

### **Listing 3-5 Specifying the Connection Pool Name (bank\_pool) in UBBCONFIG**

---

```
CLOPT = "-A -- -M 100 Bankapp.jar TellerFactory_1 bank_pool"
```

**Note:** The information for the `CLOPT` parameter needs to be entered on one line.

In addition, you need to include the following information on the `JDBCCONNPOOLS` section of the `UBBCONFIG` file:

- The server group and server ID of the server.
- The class name of JDBC driver:
  - `JdbcOracle734` for the `jdbcKona/Oracle` driver
  - `JdbcMSSQL4` for the `jdbcKona/MSSQLServer` driver
- Either the JDBC URL for the Oracle database, or the name of the machine where the Microsoft SQL Server database is installed.
- Optionally, either the user id and password for the Oracle database, or the user name and password you defined for the master instance of the Microsoft SQL Server database.
- The initial number of database connections in the pool.
- The maximum number of database connections in the pool.

Listing 3-6 provides an example of the `JDBCCONNPOOLS` section in the `UBBCONFIG`.

### **Listing 3-6 Specifying JDBCCONNPOOLS Information in UBBCONFIG**

---

```
JDBCCONNPOOLS
bank_pool
  SRVGRP          = BANK_GROUP1
  SRVID           = 2
  DRIVER          = "weblogic.jdbc20.oci815.Driver"
```

```
URL           = "jdbc:weblogic:oracle:Beq-local"
PROPS         = "user=scott;password=tiger;server=Beq-Local"
ENABLEXA      = N
INITCAPACITY  = 2
MAXCAPACITY   = 10
CAPACITYINCR  = 1
CREATEONSTARTUP = Y
```

## Setting Up the Database for the JDBC Bankapp Sample Application

The JDBC Bankapp sample application uses a database to store all the bank data. You can use either the Oracle or the Microsoft SQL Server database with the JDBC Bankapp sample application.

Before you can build and run the JDBC Bankapp sample application, you need to follow the steps in the product documentation to install the desired database.

The jdbcKona/Oracle and jdbcKona/MSSQLServer4 drivers are installed as part of the WebLogic Enterprise installation. For more information about the jdbcKona drivers, refer to the [Using the JDBC Drivers](#) and the [BEA WebLogic Enterprise Installation Guide](#).

**Note:** The jdbcKona/Oracle driver supports Oracle Version 7.3.4 and Oracle8i (for Solaris and Windows NT) and versions 8.04 and 8i (for HP-UX). By default, this sample application supports Oracle version 7.3.4 on NT/Solaris and version 8.0.4 on HP. You can use a different Oracle version by specifying command line parameters, as described in “Step 4: Run the setupJ Command” on page 3-20.

## Setting Up an Oracle Database

If you are using Oracle as the database for the JDBC Bankapp sample application, you need to install the following software:

- Visual C++ (Windows NT only)

- Sun SparcWorks Compiler
- Oracle

When using the Oracle database, you use the default database created by the Oracle installation program. You need the connection string you defined for the Oracle database and the default user id and password. Refer to the Oracle product documentation for details about obtaining this information.

## Setting Up a Microsoft SQL Server Database

If you are using the Microsoft SQL Server as the database for the JDBC Bankapp sample application, you need to install the following software:

- Visual C++ (Windows NT only)
- Sun SparcWorks Compiler (Solaris only)
- Microsoft SQL Server

When using the Microsoft SQL Server database, you use the master database instance. You need the name of the machine where the Microsoft SQL Server database is installed and the user name and password you defined for the master instance of the Microsoft SQL Server database. Refer to the Microsoft product documentation for details about obtaining this information.

# Building the JDBC Bankapp Sample Application

This topic describes the following steps, which are required to build the JDBC Bankapp sample application:

- Step 1: Copy the Files for the JDBC Bankapp Sample Application into a Work Directory

- Step 2: Change the Protection Attribute on the Files for the JDBC Bankapp Sample Application
- Step 3: Verify the Settings of the Environment Variables
- Step 4: Run the setupJ Command
- Step 5: Load the UBBCONFIG File

## Step 1: Copy the Files for the JDBC Bankapp Sample Application into a Work Directory

You need to copy the files for the JDBC Bankapp sample application into a work directory on your local machine.

### Source File Directories

The files for the JDBC Bankapp sample application are located in the following directories:

#### **Windows NT**

```
drive:\WLEdir\samples\corba\bankapp_java\JDBC  
drive:\WLEdir\samples\corba\bankapp_java\client  
drive:\WLEdir\samples\corba\bankapp_java\shared
```

#### **UNIX**

```
/usr/local/WLEdir/samples/corba/bankapp_java/JDBC  
/usr/local/WLEdir/samples/corba/bankapp_java/client  
/usr/local/WLEdir/samples/corba/bankapp_java/shared
```

Table 3-4 describes the contents of these directories.

**Table 3-4 Source File Directories for the JDBC Bankapp Sample Application**

Directory	Description
JDBC	Source files and commands needed to build and run the JDBC Bankapp sample application.
client	Files for the ATM client application. The <code>images</code> subdirectory contains <code>.gif</code> files used by the graphical user interface in the ATM client application.
shared	Common files for the JDBC Bankapp and XA Bankapp sample applications.

### Copying Source Files to the Work Directory

You need to manually copy only the files in the `\JDBC` directory. The other sample application files are automatically copied from the `\client` and `\shared` directories when you execute the `setupJ` command. For example:

#### Windows NT

```
prompt> cd c:\mysamples\bankapp_java\JDBC
prompt> copy c:\WLEdir\samples\corba\bankapp_java\JDBC\*
```

#### UNIX

```
ksh prompt> cd /usr/mysamples/bankapp_java/JDBC/*
ksh prompt> cp $TUXDIR/samples/bankapp_java/JDBC/* .
```

**Note:** You cannot run the JDBC Bankapp sample application in the same work directory as the XA Bankapp sample application, because some of the files for the JDBC Bankapp sample application have the same name as files for the XA Bankapp sample application.

### Source Files Used to Build the JDBC Bankapp Sample Application

Table 3-5 lists the files used to build and run the JDBC Bankapp sample application.

**Table 3-5 Files Included in the JDBC Bankapp Sample Application**

File	Description
<code>Bank.idl</code>	The OMG IDL code that declares common structures and extensions for the JDBC Bankapp sample application.
<code>BankApp.idl</code>	The OMG IDL code that declares the <code>TellerFactory</code> and <code>Teller</code> interfaces.
<code>BankDB.idl</code>	The OMG IDL code that declares the <code>DBAccess</code> interface.
<code>TellerFactoryImpl.java</code>	The Java source code that implements the <code>createTeller</code> method. This file is in the <code>com.beasys.samples</code> package. It is automatically moved to the <code>com/beasys/samples</code> directory by the <code>setupJ</code> command.
<code>TellerImpl.java</code>	The Java source code that implements the <code>verify</code> , <code>deposit</code> , <code>withdraw</code> , <code>inquiry</code> , <code>transfer</code> , and <code>report</code> methods. This file is in the <code>com.beasys.samples</code> package. It is automatically moved to the <code>com/beasys/samples</code> directory by the <code>setupJ</code> command.
<code>BankAppServerImpl.java</code>	The Java source code that overrides the <code>Server.initialize</code> and <code>Server.release</code> methods.
<code>DBAccessImpl.java</code>	The Java source code that implements the <code>get_valid_accounts</code> , <code>read_account</code> , <code>update_account</code> , and <code>transfer</code> methods. This file is in the <code>com.beasys.samples</code> package. It is automatically moved to the <code>com/beasys/samples</code> directory by the <code>setupJ</code> command.
<code>Atm.java</code>	The Java source code for the ATM client application.
<code>BankStats.java</code>	Contains methods to initialize, read from, and write to the flat file that contains the ATM statistics.

**Table 3-5 Files Included in the JDBC Bankapp Sample Application (Continued)**

File	Description
BankApp.xml	The Server Description File used to associate activation and transaction policy values with CORBA interfaces.
InitDB.java	A Java program that initializes the database and ensures that JDBC is working properly.
setupJ.cmd	The Windows NT batch file that builds and runs the JDBC Bankapp sample application.
setupJ.ksh	The UNIX Korn shell script that builds and runs the JDBC Bankapp sample application.
makefileJ.mk	The make file for the JDBC Bankapp sample application on the UNIX operating system. The UNIX make command needs to be in the path of your machine.
makefileJ.nt	The make file for the JDBC Bankapp sample application on the Windows NT operating system. The Windows NT nmake command needs to be in the path of your machine.
Readme.txt	The file that provides the latest information about building and running the JDBC Bankapp sample application.

## Step 2: Change the Protection Attribute on the Files for the JDBC Bankapp Sample Application

During the installation of the WebLogic Enterprise software, the files for the JDBC Bankapp sample application are marked read-only. Before you can edit or build the files in the JDBC Bankapp sample application, you need to change the protection attribute of the files you copied into your work directory, as follows:

### Windows NT

```
prompt>attrib -r drive:\workdirectory\*.*
```

**UNIX**

```
prompt>/bin/ksh
ksh prompt>chmod u+w /workdirectory/*.*
```

## Step 3: Verify the Settings of the Environment Variables

Before building and running the JDBC Bankapp sample application, you need to ensure that certain environment variables are set on your system. In most cases, these environment variables are set as part of the installation procedure. However, you need to check the environment variables to ensure they reflect correct information.

### Environment Variables

Table 3-6 lists the environment variables required to run the JDBC Bankapp sample application.

**Table 3-6 Required Environment Variables for the JDBC Bankapp Sample Application**

Environment Variable	Description
TUXDIR	The directory path where you installed the WebLogic Enterprise software. For example: <b>Windows NT</b> TUXDIR=c:\WLEdir <b>UNIX</b> TUXDIR=/usr/local/WLEdir
JAVA_HOME	The directory path where you installed the JDK software. For example: <b>Windows NT</b> JAVA_HOME=c:\JDK1.2 <b>UNIX</b> JAVA_HOME=/usr/local/JDK1.2

**Table 3-6 Required Environment Variables for the JDBC Bankapp Sample Application**

Environment Variable	Description
ORACLE_HOME	<p>The directory path where you installed the Oracle software. For example:</p> <p><b>Windows NT</b></p> <p>ORACLE_HOME=d:\orant</p> <p><b>UNIX</b></p> <p>ORACLE_HOME=/usr/local/oracle</p> <p><b>Note:</b> This environment variable applies only if you are using the Oracle database on the Solaris operating system.</p>

## Verifying Settings

To verify that the information defined during installation is correct:

### Windows NT

1. From the Start menu, select Settings.
2. From the Settings menu, select the Control Panel.  
The Control Panel appears.
3. Click the System icon.  
The System Properties window appears.
4. Click the Environment tab.  
The Environment page appears.
5. Check the settings for TUXDIR and JAVA\_HOME.

### UNIX

```
ksh prompt>printenv TUXDIR
ksh prompt>printenv JAVA_HOME
ksh prompt>printenv ORACLE_HOME
```

### Changing Settings

To change the settings:

#### Windows NT

1. On the Environment page in the System Properties window, click the environment variable you want to change, or enter the name of the environment variable in the Variable field.
2. In the Value field, enter the correct information for the environment variable.
3. Click OK to save the changes.

#### UNIX

```
ksh prompt>TUXDIR=directorypath; export TUXDIR
ksh prompt>JAVA_HOME=directorypath; export JAVA_HOME
ksh prompt>JAVA_HOME=directorypath; export ORACLE_HOME
```

**Note:** If you are running multiple WebLogic Enterprise applications concurrently on the same machine, you also need to set the `IPCKEY` and `PORT` environment variables. See the `Readme.txt` file for information about how to set these environment variables.

## Step 4: Run the setupJ Command

The `setupJ` command automates the following steps:

1. Copy the required files from the `\client` and `\shared` directories.
2. Set the `PATH`, `TOBJADDR`, `APPDIR`, `TUXCONFIG`, and `CLASSPATH` system environment variables.
3. Create the `UBBCONFIG` file (`ubb_jdbc`).
4. Create a `setenvJ.cmd` or `setenvJ.ksh` file that can be used to reset the system environment variables.

### Syntax

The syntax for the `setupJ` command is:

```
prompt>setupJ DB_DRIVER DB_SERVER DB_USER DB_PASSWORD
```

where:

Parameter	Description
<i>DB_DRIVER</i>	Name of the database driver. Valid values include: <ul style="list-style-type: none"><li>■ <code>jdbcOracle734</code></li><li>■ <code>jdbcOracle804</code></li><li>■ <code>jdbcOracle815</code></li><li>■ <code>jdbcMSSL4</code></li></ul> Default values are <code>jdbcOracle734</code> (on Solaris or NT) or <code>jdbcOracle804</code> (on Hewlett-Packard).
<i>DB_SERVER</i>	Name of the machine where the database is installed. Default values are <code>Beq-Local</code> (on NT) or <code>null</code> (on Solaris or Hewlett-Packard).
<i>DB_USER</i>	Username defined for the database. Default value is <code>scott</code> .
<i>DB_PASSWORD</i>	Password defined for the database. Default value is <code>tiger</code> .

**Note:** `SetupJ` uses default values unless you explicitly specify arguments. For example, to use Microsoft SQL Server, you must specify all command line parameters.

### Command

Follow these steps to enter the `setupJ` command:

#### Windows NT

```
prompt>cd c:\mysamples\bankapp_java\JDBC
```

```
prompt>setupJ jdbcOracle815 Beq-Local scott tiger
```

#### UNIX

```
prompt>/bin/ksh
```

```
prompt>cd /usr/mysamples/bankapp_java/JDBC
```

```
prompt>. ./setupJ.ksh jdbcOracle815 null scott tiger
```

## Step 5: Load the UBBCONFIG File

Use the following command to load the UBBCONFIG file:

```
prompt>tmloadcf -y ubb_jdbc
```

# Compiling the Client and Server Applications

The directory for the JDBC Bankapp sample application contains a make file that builds the client and server sample applications. During development, you use the `buildjavaserver` command to build the server application, and your Java product's development commands to build the client application. However, for the JDBC Bankapp sample application, these steps are included in the make file.

Use the following commands to build the client and server applications in the JDBC Bankapp sample application:

### Windows NT

```
prompt>nmake -f makefileJ.nt
```

### UNIX

```
prompt>make -f makefileJ.mk
```

## Initializing the Database

This topic includes the following sections:

- Initializing an Oracle Database

- Initializing a Microsoft SQL Server Database

## Initializing an Oracle Database

To initialize an Oracle database using the default arguments, enter the following command:

```
prompt>java InitDB
```

To initialize the Oracle database with user-defined attributes, enter the following command:

```
prompt>java InitDB driver_name connect_string username password
```

where

Parameter	Description
<i>driver_name</i>	<p>Name of the database driver. Valid values include:</p> <ul style="list-style-type: none"> <li>■ jdbcOracle734</li> <li>■ jdbcOracle804</li> <li>■ jdbcOracle815</li> <li>■ jdbcMSSQL4</li> </ul> <p>Default values are jdbcOracle734 (on Solaris or NT) or jdbcOracle804 (on Hewlett-Packard).</p>
<i>connect_string</i>	<p>Connection string for the instance of the Oracle database being used with the JDBC Bankapp sample application. Default values are Beq-Local (on NT) or null (on Solaris or Hewlett-Packard).</p>
<i>username</i>	<p>User name for the Oracle database. Default value is scott.</p>
<i>password</i>	<p>Password for the Oracle database. Default value is tiger.</p>

## Initializing a Microsoft SQL Server Database

To initialize a Microsoft SQL Server database, enter the following command:

prompt>java InitDB jdbcMSSL4 *db\_server username password*  
where:

Parameter	Description
<i>jdbcMSSL4</i>	Name of the database driver for Microsoft SQL Server. This is the only valid value.
<i>db_server</i>	Name of the machine on which the Microsoft SQL Server database is installed.
<i>username</i>	User name for the master instance of the Microsoft SQL Server database.
<i>password</i>	Password for the master instance of the Microsoft SQL Server database.

# Starting the Server Application in the JDBC Bankapp Sample Application

Start the server application in the JDBC Bankapp sample application by entering the following command:

prompt>tmboot -y

The `tmboot` command starts the application processes listed in Table 3-7.

**Table 3-7    Application Processes Started by `tmboot` Command**

Process	Description
TMSYSEVT	BEA Tuxedo system event broker.

**Table 3-7 Application Processes Started by tmboot Command**

Process	Description
TMFFNAME	Three TMFFNAME server processes are started: <ul style="list-style-type: none"><li>■ The TMFFNAME server process started with the <code>-N</code> and <code>-M</code> options is the master <code>NameManager</code> service. The <code>NameManager</code> service maintains a mapping of the application-supplied names to object references.</li><li>■ The TMFFNAME server process started with the <code>-N</code> option is the slave <code>NameManager</code> service.</li><li>■ The TMFFNAME server process started with the <code>-F</code> option contains the <code>FactoryFinder</code> object.</li></ul>
JavaServer	Server process that implements the <code>TellerFactory</code> , <code>Teller</code> , and <code>DBAccess</code> interfaces.
ISL	IIOP Listener process.

**Note:** The `JavaServer` will not start on Microsoft Windows NT if JDK bin is in the path after the network drive. Make sure the JDK bin directories (that is, `jre/bin` and `jre/bin/classic`) are set in the `PATH` before any network driver path elements via the Control Panel before booting the `JavaServer`.

## Files Generated by the JDBC Bankapp Sample Application

Table 3-8 lists the files generated by the JDBC Bankapp sample application.

**Table 3-8 Files Generated by the JDBC Bankapp Sample Application**

File	Description
<code>ubb_jdbc</code>	The <code>UBBCONFIG</code> file for the JDBC Bankapp sample application. This file is generated by the <code>setupJ</code> command.

### 3 The JDBC Bankapp Sample Application

---

**Table 3-8 Files Generated by the JDBC Bankapp Sample Application (Continued)**

File	Description
<code>setenvJ.cmd</code> and <code>setenvJ.ksh</code>	Contains the commands to set the environment variables needed to build and run the JDBC Bankapp sample application. <code>setenvJ.cmd</code> is the Windows NT version and <code>setenvJ.ksh</code> is the UNIX Korn shell version of the file.
<code>tuxconfig</code>	A binary version of the <code>UBBCONFIG</code> file. Generated by the <code>tmloadcf</code> command.
<code>ULOG.&lt;date&gt;</code>	A log file that contains messages generated by the <code>tmboot</code> command. The log file also contains messages generated by the server applications and by the <code>tmshutdown</code> command.
<code>.adm/.keybd</code>	A file that contains the security encryption key database. The subdirectory is created by the <code>tmloadcf</code> command.
<code>Atm\$1.class</code> <code>Atm.class</code> <code>AtmAppletStub.class</code> <code>AtmArrow.class</code> <code>AtmButton.class</code> <code>AtmCenterTextCanvas.class</code> <code>AtmClock.class</code> <code>AtmScreen.class</code> <code>AtmServices.class</code> <code>AtmStatus.class</code>	Used by the Java client application. Created when the <code>Atm.java</code> file is compiled.
<code>InitDB.class</code>	Initializes the database used by the JDBC Bankapp sample application. Created when <code>InitDB.java</code> is compiled.

**Table 3-8 Files Generated by the JDBC Bankapp Sample Application (Continued)**

File	Description
AccountRecordNotFound.java AccountRecordNotFoundHelper.java AccountRecordNotFoundHolder.java CustAccounts.java CustAccountsHelper.java CustAccountsHolder.java DataBaseException.java DataBaseExceptionHelper.java DataBaseExceptionHolder.java InsufficientFunds.java InsufficientFundsHelper.java InsufficientFundsHolder.java PinNumberNotFound.java PinNumberNotFoundHelper.java PinNumberNotFoundHolder.java	Generated by the m3idltojava command for the interfaces defined in the Bank.idl file. These files are created in the com/beasys/samples/Bank directory.
BalanceAmounts.java BalanceAmountsHelper.java BalanceAmountsHolder.java IOException.java IOExceptionHelper.java IOExceptionHolder.java Teller.java TellerActivity.java TellerActivityHelper.java TellerActivityHolder.java TellerFactory.java TellerFactoryHelper.java TellerFactoryHolder.java TellerInsufficientFunds.java TellerInsufficientFundsHelper.java TellerInsufficientFundsHolder.java _TellerFactoryImplBase.java _TellerFactoryStub.java _TellerImplBase.java _TellerStub.java	Generated by the m3idltojava command for the interfaces defined in the BankApp.idl file. These files are created in the com/beasys/samples/BankApp subdirectory.

**Table 3-8 Files Generated by the JDBC Bankapp Sample Application (Continued)**

File	Description
AccountData.java AccountDataHelper.java AccountDataHolder.java DBAccessHelper.java DBAccessHolder.java _DBAccessImplBase.java _DBAccessStub.java	Generated by the m3idltojava command for the interfaces defined in the BankDB.idl file. These files are created in the com/beasys/samples/BankDB subdirectory.
Bankapp.ser Bankapp.jar	The Server Descriptor File and Server Java Archive file generated by the buildjavaserver command in the make file.
stderr	Generated by the tmboot command. If the -noredirect JavaServer option is specified in the UBBCONFIG file, the System.err.println method sends the output to the stderr file instead of to the ULOG file.
stdout	Generated by the tmboot command. If the -noredirect JavaServer option is specified in the UBBCONFIG file, the System.out.println method sends the output to the stdout file instead of to the ULOG file.
tmsysevt.dat	Contains filtering and notification rules used by the TMSYSEVT (system event reporting) process. This file is generated by the tmboot command.

# Starting the ATM Client Application in the JDBC Bankapp Sample Application

Start the ATM client application by entering the following command:

**Note:** The following command sets the Java CLASSPATH to include the current directory and the client JAR file (m3envobj.jar). The full WebLogic Enterprise JAR file (m3.jar) can be specified instead of the client JAR file.

### Windows NT

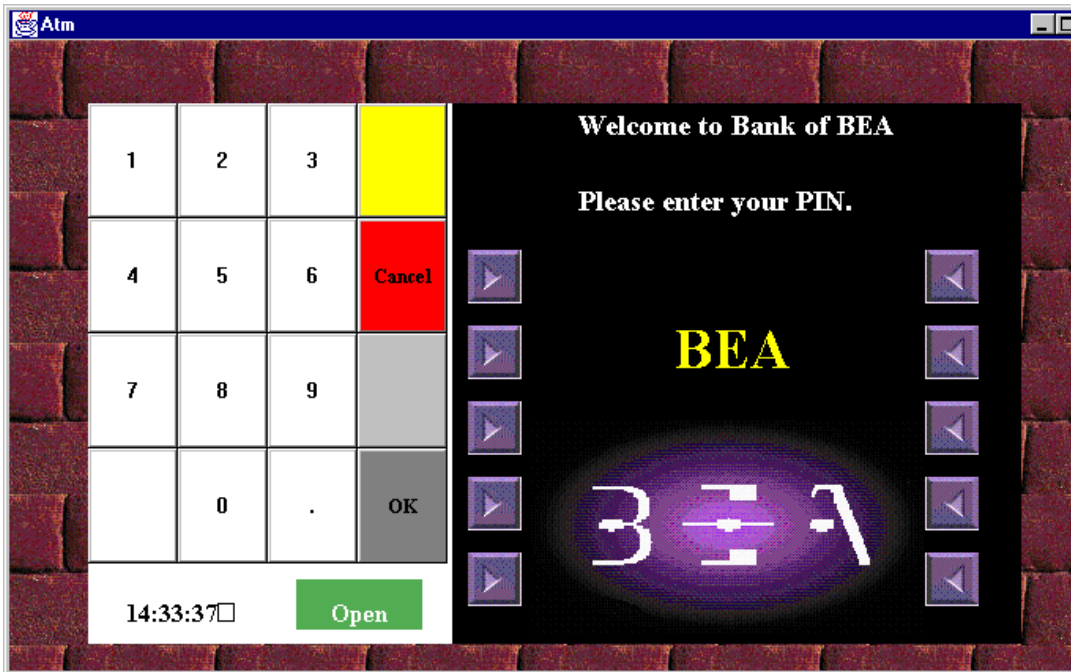

```
prompt>java -classpath .;%TUXDIR%\udataobj\java\jdk\m3envobj.jar  
-DTOBJADDR=%TOBJADDR% Atm Teller1
```

### UNIX

```
ksh prompt>java -classpath .:$TUXDIR/udataobj/java/jdk  
/m3envobj.jar -DTOBJADDR=$TOBJADDR Atm Teller1
```

The GUI for the ATM client application appears. Figure 3-2 shows the GUI for the ATM client application.

**Figure 3-2 GUI for ATM Client Application**

# Stopping the JDBC Bankapp Sample Application

Before using another sample application, enter the following commands to stop the JDBC Bankapp sample application and to remove unnecessary files from the work directory:

## **Windows NT**

```
prompt>tmshutdown -y  
prompt>nmake -f makefileJ.nt clean
```

## **UNIX**

```
ksh prompt>tmshutdown -y  
ksh prompt>make -f makefileJ.mk clean
```

# Using the ATM Client Application

This topic includes the following sections:

- Available Banking Operations
- Available Statistics
- Keypad Functions
- Steps for Using the ATM Client Application

## Available Banking Operations

In the ATM client application, a customer enters a personal identification number (PIN) and performs one of the following banking operations:

- Withdraws money from the account
- Deposits money in the account
- Inquires about the balance of the account
- Transfers money between checking and savings accounts

## Available Statistics

One special PIN number (999) allows customers to receive statistics about the ATM machine. The following statistics are available:

- Total number of requests received by the ATM machine  
For example, an inquiry is one request, and a withdrawal is one request.
- Total number of successful requests
- Total number of failed requests  
For example, when a customer attempts to withdraw more money than is in his account, the request fails.
- Total amount of cash remaining in the ATM machine  
The ATM machine starts with \$10,000 and the amount decreases with each withdrawal request.

## Keypad Functions

Use the keypad in the ATM client application to enter a PIN and amounts for deposit, transfer, and withdrawal. Table 3-9 describes the functions available on the keypad in the ATM client application.

**Table 3-9 Keypad Functions in the ATM Client Application**

Key	Function
Cancel	Use this key to cancel the current operation and exit the view.

**Table 3-9 Keypad Functions in the ATM Client Application (Continued)**

Key	Function
OK	Use this key to accept the entered data. After you enter a PIN or an amount for deposit, transfer, or withdrawal, you need to click the OK button to have the action take effect.
Numerics (0 through 9)	Use these keys to enter your PIN and an amount for deposit, transfer, and withdrawal amounts.
Period (.)	Use this key to enter decimal amounts for deposit, transfer, and withdrawal.

## Steps for Using the ATM Client Application

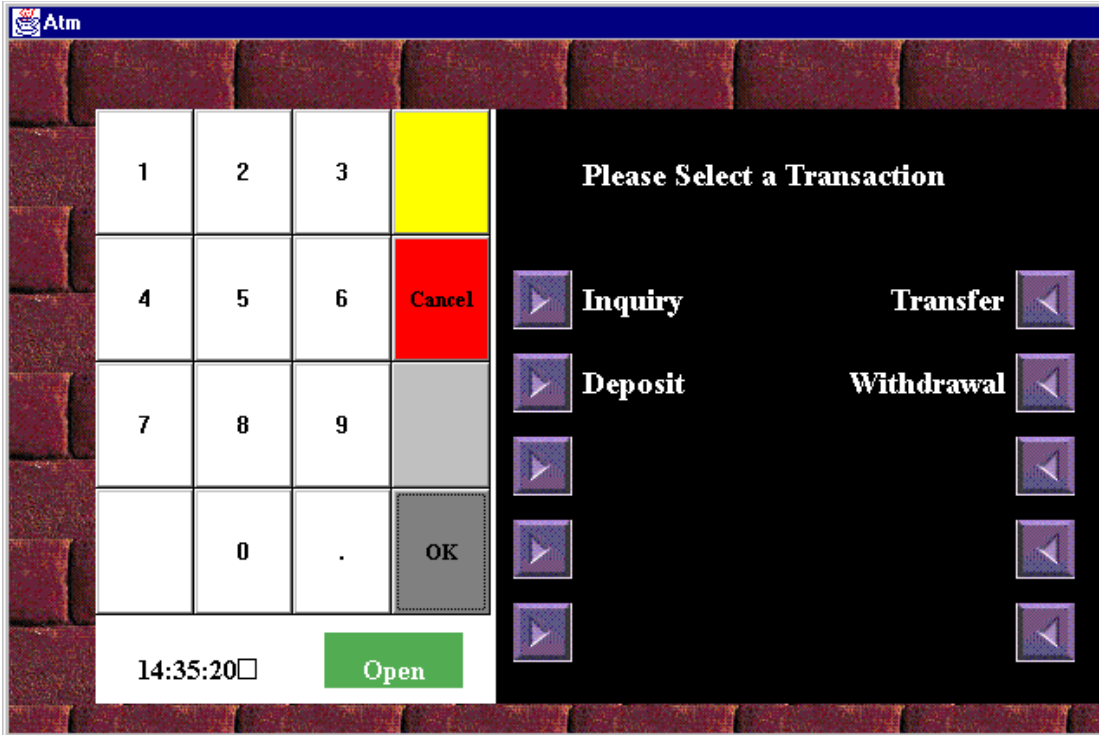

To use the ATM client application in the JDBC Bankapp sample application:

1. Enter one of the following PINs: 100, 110, 120, or 130.
2. Click OK.

The Operations view appears. Figure 3-3 shows the Operations view in the ATM client application.

Figure 3-3 Operations View in the ATM Client Application

From the Operations view, you can perform the follow banking operations:

- Inquiry
- Transfer
- Deposit
- Withdrawal

3. Click the desired banking operation.
4. Click either the Checking Acct or Savings Acct button.
5. Enter a dollar amount.
6. Click OK.

An updated account balance appears.

### 3 *The JDBC Bankapp Sample Application*

---

**Note:** After you click OK, you cannot cancel the operation. If you enter an amount and then select Cancel, the ATM client application cancels your operation and displays the previous screen.

7. Click OK.
8. Click Cancel to return to the main window of the ATM client application.

# 4 The XA Bankapp Sample Application

This topic includes the following sections:

- How the XA Bankapp Sample Application Works
- Development Process for the XA Bankapp Sample Application
- Setting Up the Database for the XA Bankapp Sample Application
- Building the XA Bankapp Sample Application
- Compiling the Client and Server Applications
- Initializing the Oracle Database
- Starting the Server Application in the XA Bankapp Sample Application
- Files Generated by the XA Bankapp Sample Application
- Starting the ATM Client Application in the XA Bankapp Sample Application
- Stopping the XA Bankapp Sample Application
- Using the ATM Client Application

For troubleshooting information and the most recent information about using the XA Bankapp sample application, see the `Readme.txt` file in the `\WLEdir\samples\corba\bankapp_java\XA` directory.

# How the XA Bankapp Sample Application Works

The XA Bankapp sample application is a CORBA application that implements the same automatic teller machine (ATM) interface as the JDBC Bankapp sample application. However, the XA Bankapp sample application uses the Oracle XA library and the WebLogic Enterprise Transaction Manager to coordinate transactions between the WebLogic Enterprise application and the Oracle database that stores account and customer information.

This topic includes the following sections:

- Server Applications
- Application Workflow

## Server Applications

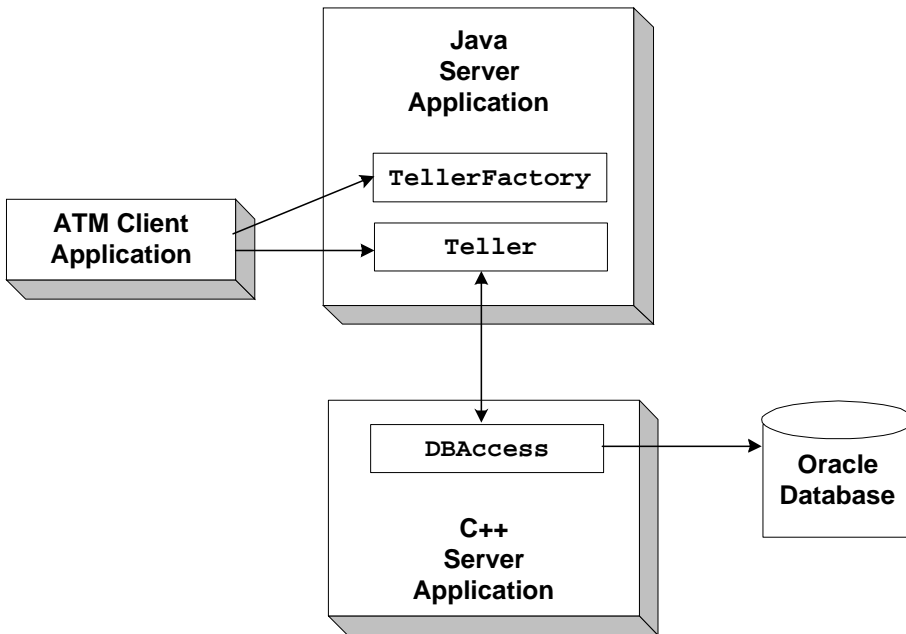

The XA Bankapp sample application consists of two server applications:

- A Java server application, which implements the `TellerFactory` and `Teller` objects.
- A C++ server application, which processes requests on objects that implement the `DBAccess` interface.

## Application Workflow

Figure 4-1 illustrates how the XA Bankapp sample application works.

Figure 4-1 The XA Bankapp Sample Application

In the XA Bankapp sample application, transactions are started and stopped in the `Teller` object using the Java Transaction Service (JTS) API. In the JDBC Bankapp sample application, transactions are started and stopped in the `DBAccess` object using the Java Database Connectivity (JDBC) API.

In the XA Bankapp sample application, the `DBAccess` object is implemented in C++ instead of Java and resides in its own server application. The object reference for the `DBAccess` object is generated in its `Server::initialize` method and is registered with the `FactoryFinder` environmental object.

## Software Prerequisites

To run the XA Bankapp sample application, you need to install the following software:

- Visual C++
- Oracle

# Development Process for the XA Bankapp Sample Application

This topic includes the following sections:

- Object Management Group (OMG) Interface Definition Language (IDL)
- Client Application
- Server Application
- Server Description File
- Implementation Configuration File
- UBBCONFIG File

These sections describe the development process for the XA Bankapp sample application.

**Note:** The steps in this section have been done for you and are included in the XA Bankapp sample application.

## Object Management Group (OMG) Interface Definition Language (IDL)

The `BankApp.idl` file used in the XA Bankapp sample application defines the `TellerFactory` and `Teller` interfaces and the `Bank.idl` file defines exceptions and structures. The `transfer_funds` interface has been removed from the `BankDB.idl` because transactions are now started and stopped by the `Teller` object.

## Client Application

The XA Bankapp sample application uses the same client application as the JDBC Bankapp sample application.

## Server Application

For the XA Bankapp sample application, you would write a Java Server object, which initializes the Java server application in the XA Bankapp sample application and registers a factory for the Teller object with the WebLogic Enterprise domain.

## Server Description File

During development, you create a Server Description File (`BankApp.xml`) that defines the activation and transaction policies for the `TellerFactory` and `Teller` objects. Table 4-1 shows the activation and transaction policies for the XA Bankapp sample application.

**Table 4-1 Activation and Transaction Policies for XA Bankapp Sample Application**

Interface	Activation Policy	Transaction Policy
<code>TellerFactory</code>	Process	Never
<code>Teller</code>	Method	Never

A Server Description File for the XA Bankapp sample application is provided. For information about creating Server Description Files and defining activation and transaction policies on objects, see [Creating Java Server Applications](#).

## Implementation Configuration File

When writing WebLogic Enterprise C++ server applications, you create an Implementation Configuration File (ICF), which is similar to the Server Description File. This file has been created for you and defines an activation policy of `transaction` and a transaction policy of `always` for the `DBAccess` interface.

For information about creating ICF files and defining activation and transaction policies on objects, see [Creating C++ Server Applications](#).

### UBBCONFIG File

During development, you need to include the following information in the UBBCONFIG file:

- The OPENINFO parameter, defined according to the XA parameter for the Oracle database. The XA parameter for the Oracle database is described the “Developing and Installing Applications that Use the XA Libraries” section of the *Oracle7 Distributed Systems* manual.
- The pathname to the transaction log (TLOG) in the TLOGDEVICE parameter.

For information about the transaction log and defining parameters in the UBBCONFIG file, see [Using Transactions](#).

## Setting Up the Database for the XA Bankapp Sample Application

The XA Bankapp sample application uses an Oracle database to store all the bank data. Before using the XA Bankapp sample application, you need to install the following Oracle components:

- Oracle Server
- Pro\*C/C++ (for more information about supported compilers, see the Oracle product documentation)

**Note:** When installing the specified Oracle components, other Oracle components are also installed. However, you will not use these additional components with the XA Bankapp sample application.

You also need to start the Oracle database daemon and enable an XA resource manager.

For information about installing the Oracle database and performing the necessary setup tasks, see the product documentation for the Oracle database.

# Building the XA Bankapp Sample Application

This topic includes the following sections:

- Step 1: Copy the Files for the XA Bankapp Sample Application into a Work Directory
- Step 2: Change the Protection Attribute on the Files for the XA Bankapp Sample Application
- Step 3: Verify the Settings of the Environment Variables
- Step 4: Run the setupX Command
- Step 5: Load the UBBCONFIG File
- Step 6: Create a Transaction Log

These sections describe how to build the XA Bankapp sample application.

## Step 1: Copy the Files for the XA Bankapp Sample Application into a Work Directory

You need to copy the files for the XA Bankapp sample application into a work directory on your local machine.

### Source File Directories

The files for the XA Bankapp sample application are located in the following directories:

#### Windows NT

`drive:\WLEdir\samples\corba\bankapp_java\XA`

`drive:\WLEdir\samples\corba\bankapp_java\client`

`drive:\WLEdir\samples\corba\bankapp_java\shared`

**UNIX**

`/usr/local/WLEdir/samples/corba/bankapp_java/XA`

`/usr/local/WLEdir/samples/corba/bankapp_java/client`

`/usr/local/WLEdir/samples/corba/bankapp_java/shared`

Table 4-2 describes the contents of these directories:

**Table 4-2 Source File Directories in the XA Bankapp Sample Application**

Directory	Description
XA	Source files and commands needed to build and run the XA Bankapp sample application.
client	Files for the ATM client application. The <code>images</code> subdirectory contains <code>.gif</code> files used by the graphical user interface in the ATM client application.
shared	Common files for the JDBC Bankapp and XA Bankapp sample applications.

## Copying Source Files to the Work Directory

You need only to copy the files manually in the XA directory. The other files are automatically copied from the `\client` and `\shared` directories when you execute the `setupX` command. For example:

**Windows NT**

`prompt> cd c:\mysamples\bankapp_xa\XA`

`prompt> copy c:\WLEdir\samples\corba\bankapp_xa\XA\*`

**UNIX**

`ksh prompt> cd /usr/mysamples/bankapp_xa/XA/`

`ksh prompt> cp $TUXDIR/samples/bankapp_xa/XA/`

**Note:** You cannot run the XA Bankapp sample application in the same work directory as the JDBC Bankapp sample application, because some of the files for the JDBC Bankapp sample application have the same name as files for the XA Bankapp sample application.

## Source Files Used to Build the XA Bankapp Sample Application

Table 4-3 lists the files used to build and run the XA Bankapp sample application.

**Table 4-3 Files Included in the XA Bankapp Sample Application**

File	Description
<code>Bank.idl</code>	The OMG IDL code that declares common structures and extensions for the XA Bankapp sample application.
<code>BankApp.idl</code>	The OMG IDL code that declares the <code>TellerFactory</code> and <code>Teller</code> interfaces.
<code>BankDB.idl</code>	The OMG IDL code that declares the <code>DBAccess</code> interface.
<code>BankDB.icf</code>	The ICF file that defines activation and transaction policies for the <code>DBAccess</code> interface.
<code>BankDBServer.cpp</code>	The C++ source code that implements the <code>Server::initialize</code> and <code>Server::release</code> methods for the C++ server application.
<code>TellerFactoryImpl.java</code>	The Java source code that implements the <code>createTeller</code> method.
<code>TellerImpl.java</code>	The Java source code that implements the <code>verify</code> , <code>deposit</code> , <code>withdraw</code> , <code>inquiry</code> , <code>transfer</code> , and <code>report</code> methods. In addition, it includes a reference to the <code>TransactionCurrent</code> environmental object and invokes operations on the <code>DBAccess</code> object within a transaction.
<code>BankAppServerImpl.java</code>	The Java source code that overrides the <code>Server.initialize</code> and <code>Server.release</code> methods.
<code>Atm.java</code>	The Java source code for the ATM client application.
<code>BankStats.java</code>	Contains methods to initialize, read from, and write to the flat file that contains the ATM statistics.

**Table 4-3 Files Included in the XA Bankapp Sample Application (Continued)**

File	Description
BankApp.xml	The Server Description File used to associate activation and transaction policy values with CORBA interfaces.
DBAccess_i.h DBAccess_i.pc	The Oracle Pro*C/C++ code that implements the DBAccess interface.
InitDB.sql	The Oracle SQL *Plus script that creates and populates the database tables.
setupX.cmd	The Windows NT batch file that builds and runs the XA Bankapp sample application.
setupX.ksh	The UNIX Korn shell script that builds and runs the XA Bankapp sample application.
makefileX.mk	The make file for the XA Bankapp sample application on the UNIX operating system. The UNIX make command needs to be in the path of your machine.
makefileX.nt	The make file for the XA Bankapp sample application on the Windows NT operating system. The Windows NT nmake command needs to be in the path of your machine.
Readme.txt	Provides the latest information about building and running the XA Bankapp sample application.

## Step 2: Change the Protection Attribute on the Files for the XA Bankapp Sample Application

During the installation of the WebLogic Enterprise software, the files for the XA Bankapp sample application are marked read-only. Before you can edit or build the files in the XA Bankapp sample application, you need to change the protection attribute of the files you copied into your work directory, as follows:

Windows NT

```
prompt>attrib -r drive:\workdirectory\*.*
```

UNIX

```
prompt>/bin/ksh
ksh prompt>chmod u+w /workdirectory/*.*
```

# Step 3: Verify the Settings of the Environment Variables

Before building and running the XA Bankapp sample application, you need to ensure that certain environment variables are set on your system. In most cases, these environment variables are set as part of the installation procedure. However, you need to check the environment variables to ensure they reflect correct information.

## Environment Variables

Table 4-4 lists the environment variables required to run the XA Bankapp sample application.

Table 4-4 Required Environment Variables for the XA Bankapp Sample Application

Environment Variable	Description
TUXDIR	The directory path where you installed the WebLogic Enterprise software. For example: <b>Windows NT</b> TUXDIR=c:\WLEdir <b>UNIX</b> TUXDIR=/usr/local/WLEdir
JAVA_HOME	The directory path where you installed the JDK software. For example: <b>Windows NT</b> JAVA_HOME=c:\JDK1.2 <b>UNIX</b> JAVA_HOME=/usr/local/JDK1.2

## 4 The XA Bankapp Sample Application

---

**Table 4-4 Required Environment Variables for the XA Bankapp Sample Application**

Environment Variable	Description
ORACLE_HOME	The directory path where you installed the Oracle software. For example: ORACLE_HOME=/usr/local/oracle You need to set this environment variable on the Solaris operating system only.

### Verifying Settings

To verify that the information defined during installation is correct:

#### Windows NT

1. From the Start menu, select Settings.  
The Control Panel appears.
2. From the Settings menu, select the Control Panel.  
The Control Panel appears.
3. Click the System icon.  
The System Properties window appears.
4. Click the Environment tab.  
The Environment page appears.
5. Check the settings for TUXDIR, ORACLE\_HOME, and JAVA\_HOME.

#### UNIX

```
ksh prompt>printenv TUXDIR  
ksh prompt>printenv JAVA_HOME  
ksh prompt>printenv ORACLE_HOME
```

### Changing Settings

To change the settings:

#### Windows NT

1. On the Environment page in the System Properties window, click the environment variable you want to change or enter the name of the environment variable in the Variable field.
2. Enter the correct information for the environment variable in the Value field.
3. Click OK to save the changes.

### UNIX

```
ksh prompt>TUXDIR=directorypath; export TUXDIR
ksh prompt>JAVA_HOME=directorypath; export JAVA_HOME
ksh prompt>JAVA_HOME=directorypath; export ORACLE_HOME
```

**Note:** If you are running multiple WebLogic Enterprise applications concurrently on the same machine, you also need to set the `IPCKEY` and `PORT` environment variables. See the `Readme.txt` file for information about how to set these environment variables.

## Step 4: Run the setupX Command

The `setupX` command automates the following steps:

1. Copy the required files from the `\client` and `\shared` directories.
2. Set the `PATH`, `TOBJADDR`, `APPDIR`, `TUXCONFIG`, and `CLASSPATH` system environment variables.
3. Create the `UBBCONFIG` file.
4. Create a `setenvX.cmd` or `setenvX.ksh` file that can be used to reset the system environment variables.

Enter the `setupX` command, as follows:

### Windows NT

```
prompt> cd c:\mysamples\bankapp_xa\XA
prompt>setupX
```

### UNIX

```
prompt>/bin/ksh
```

```
prompt> cd /usr/mysamples/bankapp_xa/XA/*
prompt>. ./setupX.ksh
```

### Step 5: Load the UBBCONFIG File

Use the following command to load the UBBCONFIG file:

```
prompt>tmloadcf -y ubb_xa
```

### Step 6: Create a Transaction Log

The transaction log records the transaction activities in a WebLogic Enterprise session. During the development process, you need to define the location of the transaction log (specified by the `TLOGDEVICE` parameter) in the `UBBCONFIG` file. For the XA Bankapp sample application, the transaction log is placed in your work directory.

To open the transaction log for the XA Bankapp sample application:

1. Enter the following command to start the Interactive Administrative Interface:

```
tmadmin
```

2. Enter the following command to create a transaction log:

```
crdl -b blocks -z directorypath TLOG
crlog -m SITE1
```

where

*blocks* specifies the number of blocks to be allocated for the transaction log and *directorypath* indicates the location of the transaction log. The *directorypath* option needs to match the location specified in the `TLOGDEVICE` parameter in the `UBBCONFIG` file. The following is an example of the command on Windows NT:

```
crdl -b 500 -z c:\mysamples\bankapp_java\XA\TLOG
```

3. Enter `quit` to exit the Interactive Administrative Interface.

# Compiling the Client and Server Applications

The directory for the XA Bankapp sample application contains a make file that builds the client and server applications. During the development process, you use the `buildjavaserver` command to build the server application, and your Java product's development commands to build the client application. However, for the XA Bankapp sample application, this step is included in the make file.

Use the following commands to build the client and server applications in the XA Bankapp sample application:

## **Windows NT**

```
prompt>nmake -f makefileX.nt
```

## **UNIX**

```
prompt>make -f makefileX.mk
```

# Initializing the Oracle Database

Use the following command to initialize the Oracle database used with the XA Bankapp sample application:

## **Windows NT**

```
prompt>nmake -f makefileX.nt InitDB
```

## **UNIX**

```
ksh prompt>make -f makefileX.mk InitDB
```

# Starting the Server Application in the XA Bankapp Sample Application

Start the server application in the XA Bankapp sample application by entering the following command:

```
prompt>tmboot -y
```

The `tmboot` command starts the application processes listed in Table 4-5.

**Table 4-5 Application Processes Started by `tmboot` Command**

Process	Description
TMSYSEVT	BEA Tuxedo system event broker.
TMFFNAME	<p>Three TMFFNAME server processes are started:</p> <ul style="list-style-type: none"> <li>■ The TMFFNAME server process with the <code>-N</code> and <code>-M</code> options is the master NameManager service. The NameManager service maintains a mapping of the application-supplied names to object references.</li> <li>■ The TMFFNAME server process started with the <code>-N</code> option only is the slave NameManager service.</li> <li>■ The TMFFNAME server process started with the <code>-F</code> option contains the FactoryFinder object.</li> </ul>
TMS_ORA	Transaction manager service.
BankDataBase	WebLogic Enterprise server process that implements the DBAccess interface.
JavaServerXA	<p>Server process that implements the <code>TellerFactory</code> and <code>Teller</code> interfaces. The JavaServer process has two options:</p> <ul style="list-style-type: none"> <li>■ <code>BankApp.jar</code>, which is the Java Archive (JAR) file that was created by the <code>buildjavaserver</code> command.</li> <li>■ <code>TellerFactory_1</code>, which is passed to the <code>Server.initialize</code> method.</li> </ul> <p>JavaServerXA is a special version of JavaServer that uses the same XA switch as the BankDataBase server process. It is created by the <code>buildXAJS</code> command.</p>

**Table 4-5 Application Processes Started by tmboot Command**

Process	Description
ISL	IIOP Listener process.

**Note:** The JavaServer will not start on Microsoft Windows NT if JDK bin is in the path after the network drive. Make sure the JDK bin directories (that is, `jre/bin` and `jre/bin/classic`) are set in the `PATH` before any network driver path elements via the Control Panel before booting the JavaServer.

## Files Generated by the XA Bankapp Sample Application

Table 4-6 lists the files generated by the XA Bankapp sample application.

**Table 4-6 Files Generated by the XA Bankapp Sample Application**

File	Description
<code>ubb_xa</code>	The <code>UBBCONFIG</code> file for the XA Bankapp sample application. This file is generated by the <code>setupX</code> command.
<code>setenvX.cmd</code> and <code>setenvX.ksh</code>	Contains the commands to set the environment variables needed to build and run the XA Bankapp sample application. <code>setenvX.cmd</code> is the Windows NT version and <code>setenvX.ksh</code> is the UNIX Korn shell version of the file.
<code>tuxconfig</code>	A binary version of the <code>UBBCONFIG</code> file. Generated by the <code>tmloadcf</code> command.
<code>TLOG</code>	The transaction log.

## 4 The XA Bankapp Sample Application

**Table 4-6 Files Generated by the XA Bankapp Sample Application (Continued)**

File	Description
ULOG.<date>	A log file that contains messages generated by the tmboot command. The log file also contains messages generated by the server applications and the tmshutdown command.
.adm/.keybd	A file that contains the security encryption key database. The subdirectory is created by the tmloadcf command.
Atm\$1.class Atm.class AtmAppletStub.class AtmArrow.class AtmButton.class AtmCenterTextCanvas.class AtmClock.class AtmScreen.class AtmServices.class AtmStatus.class	Used by the Java client application. Created when the Atm.java file is compiled.
AccountRecordNotFound.java AccountRecordNotFoundHelper.java AccountRecordNotFoundHolder.java CustAccounts.java CustAccountsHelper.java CustAccountsHolder.java DataBaseException.java DataBaseExceptionHelper.java DataBaseExceptionHolder.java InsufficientFunds.java InsufficientFundsHelper.java InsufficientFundsHolder.java PinNumberNotFound.java PinNumberNotFoundHelper.java PinNumberNotFoundHolder.java	Generated by the m3idltojava command for the interfaces defined in the Bank.idl file. These files are created in the \com\beasys\samples\Bank subdirectory.

**Table 4-6 Files Generated by the XA Bankapp Sample Application (Continued)**

File	Description
BalanceAmounts.java BalanceAmountsHelper.java BalanceAmountsHolder.java IOException.java IOExceptionHelper.java IOExceptionHolder.java Teller.java TellerActivity.java TellerActivityHelper.java TellerActivityHolder.java TellerFactory.java TellerFactoryHelper.java TellerFactoryHolder.java TellerInsufficientFunds.java TellerInsufficientFundsHelper.java TellerInsufficientFundsHolder.java _TellerFactoryImplBase.java _TellerFactoryStub.java _TellerImplBase.java _TellerStub.java	Generated by the m3idltojava command for the interfaces defined in the BankApp.idl file. These files are created in the \com\beasys\samples\BankApp subdirectory.
AccountData.java AccountDataHelper.java AccountDataHolder.java DBAccessHelper.java DBAccessHolder.java _DBAccessImplBase.java _DBAccessStub.java	Generated by the m3idltojava command for the interfaces defined in the BankDB.idl file. These files are created in the \com\beasys\samples\BankDB subdirectory.
Bankapp.ser Bankapp.jar	The Server Descriptor file and Server Java Archive file generated by the buildjavaserver command in the make file.
Bank_c.cpp Bank_c.h Bank_s.cpp Bank_s.h	Generated by the idl command for the interfaces defined in the Bank.idl file.
BankDB_c.cpp BankDB_c.h BankDB_s.cpp BankDB_s.h	Generated by the idl command for the interfaces defined in the BankDB.idl file.

**Table 4-6 Files Generated by the XA Bankapp Sample Application (Continued)**

File	Description
<code>dbaccess_i.cpp</code>	Generated from the <code>DBAccess_i.pc</code> file by the Oracle Pro*C/C++ compiler.
<code>BankDataBase.exe</code>	The WebLogic Enterprise server application that implements the <code>DBAccess</code> interface.
<code>TMS_ORA.exe</code>	The server process for the Transaction Manager service.
<code>JavaServerXA</code>	The special version of the <code>JavaServer</code> that uses the same XA switches as the <code>BankDataBase</code> server process.
<code>stderr</code>	Generated by the <code>tmboot</code> command. If the <code>-noredirect JavaServer</code> option is specified in the <code>UBBCONFIG</code> file, the <code>System.err.println</code> method sends the output to the <code>stderr</code> file instead of to the <code>ULOG</code> file.
<code>stdout</code>	Generated by the <code>tmboot</code> command. If the <code>-noredirect JavaServer</code> option is specified in the <code>UBBCONFIG</code> file, the <code>System.out.println</code> method sends the output to the <code>stdout</code> file instead of to the <code>ULOG</code> file.
<code>tmsysevt.dat</code>	Contains filtering and notification rules used by the <code>TMSYSEVT</code> (system event reporting) process. This file is generated by the <code>tmboot</code> command.

## Starting the ATM Client Application in the XA Bankapp Sample Application

Start the ATM client application by entering the following command:

**Note:** The following command sets the Java CLASSPATH to include the current directory and the client JAR file (m3envobj.jar). The full WebLogic Enterprise JAR file (m3.jar) can be specified instead of the client JAR file.

### Windows NT

```
prompt>java -classpath .;%TUXDIR%\udataobj\java\jdk\m3envobj.jar  
-DTOBJADDR=%TOBJADDR% Atm Teller2
```

### UNIX

```
ksh prompt>java -classpath .:$TUXDIR/udataobj/java/jdk  
/m3envobj.jar -DTOBJADDR=$TOBJADDR Atm Teller2
```

The GUI for the ATM client application appears.

# Stopping the XA Bankapp Sample Application

Before using another sample application, enter the following commands to stop the XA Bankapp sample application and to remove unnecessary files from the work directory:

### Windows NT

```
prompt>tmshutdown -y  
prompt>nmake -f makefileX.nt clean
```

### UNIX

```
ksh prompt>tmshutdown -y  
ksh prompt>make -f makefileX.mk clean
```

## **Using the ATM Client Application**

The ATM client application in the XA Bankapp sample application works as it does in the JDBC Bankapp sample application. For instructions, see “Using the ATM Client Application” on page 3-30.
