

# Sun N1 System Manager 1.2 Release Notes

---

Sun Microsystems, Inc.  
4150 Network Circle  
Santa Clara, CA 95054  
U.S.A.

Part No: 819-4146  
November 2005

Copyright 2005 Sun Microsystems, Inc. 4150 Network Circle, Santa Clara, CA 95054 U.S.A. All rights reserved.

Sun Microsystems, Inc. has intellectual property rights relating to technology embodied in the product that is described in this document. In particular, and without limitation, these intellectual property rights may include one or more U.S. patents or pending patent applications in the U.S. and in other countries.

U.S. Government Rights – Commercial software. Government users are subject to the Sun Microsystems, Inc. standard license agreement and applicable provisions of the FAR and its supplements.

This distribution may include materials developed by third parties.

Parts of the product may be derived from Berkeley BSD systems, licensed from the University of California. UNIX is a registered trademark in the U.S. and other countries, exclusively licensed through X/Open Company, Ltd.

Sun, Sun Microsystems, the Sun logo, the Solaris logo, the Java Coffee Cup logo, docs.sun.com, N1, Sun Fire, JDK Java, and Solaris are trademarks or registered trademarks of Sun Microsystems, Inc. in the U.S. and other countries. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. in the U.S. and other countries. Products bearing SPARC trademarks are based upon an architecture developed by Sun Microsystems, Inc. Netscape Navigator and Mozilla is a trademark or registered trademark of Netscape Communications Corporation in the United States and other countries.

The OPEN LOOK and Sun™ Graphical User Interface was developed by Sun Microsystems, Inc. for its users and licensees. Sun acknowledges the pioneering efforts of Xerox in researching and developing the concept of visual or graphical user interfaces for the computer industry. Sun holds a non-exclusive license from Xerox to the Xerox Graphical User Interface, which license also covers Sun's licensees who implement OPEN LOOK GUIs and otherwise comply with Sun's written license agreements.

Products covered by and information contained in this publication are controlled by U.S. Export Control laws and may be subject to the export or import laws in other countries. Nuclear, missile, chemical or biological weapons or nuclear maritime end uses or end users, whether direct or indirect, are strictly prohibited. Export or reexport to countries subject to U.S. embargo or to entities identified on U.S. export exclusion lists, including, but not limited to, the denied persons and specially designated nationals lists is strictly prohibited.

DOCUMENTATION IS PROVIDED "AS IS" AND ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT, ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT SUCH DISCLAIMERS ARE HELD TO BE LEGALLY INVALID.

---

Copyright 2005 Sun Microsystems, Inc. 4150 Network Circle, Santa Clara, CA 95054 U.S.A. Tous droits réservés.

Sun Microsystems, Inc. détient les droits de propriété intellectuelle relatifs à la technologie incorporée dans le produit qui est décrit dans ce document. En particulier, et ce sans limitation, ces droits de propriété intellectuelle peuvent inclure un ou plusieurs brevets américains ou des applications de brevet en attente aux Etats-Unis et dans d'autres pays.

Cette distribution peut comprendre des composants développés par des tierces personnes.

Certaines composants de ce produit peuvent être dérivées du logiciel Berkeley BSD, licenciés par l'Université de Californie. UNIX est une marque déposée aux Etats-Unis et dans d'autres pays; elle est licenciée exclusivement par X/Open Company, Ltd.

Sun, Sun Microsystems, le logo Sun, le logo Solaris, le logo Java Coffee Cup, docs.sun.com, N1, Sun Fire, JDK Java et Solaris sont des marques de fabrique ou des marques déposées de Sun Microsystems, Inc. aux Etats-Unis et dans d'autres pays. Toutes les marques SPARC sont utilisées sous licence et sont des marques de fabrique ou des marques déposées de SPARC International, Inc. aux Etats-Unis et dans d'autres pays. Les produits portant les marques SPARC sont basés sur une architecture développée par Sun Microsystems, Inc. Netscape Navigator et Mozilla sont des marques de Netscape Communications Corporation aux Etats-Unis et dans d'autres pays.

L'interface d'utilisation graphique OPEN LOOK et Sun™ a été développée par Sun Microsystems, Inc. pour ses utilisateurs et licenciés. Sun reconnaît les efforts de pionniers de Xerox pour la recherche et le développement du concept des interfaces d'utilisation visuelle ou graphique pour l'industrie de l'informatique. Sun détient une licence non exclusive de Xerox sur l'interface d'utilisation graphique Xerox, cette licence couvrant également les licenciés de Sun qui mettent en place l'interface d'utilisation graphique OPEN LOOK et qui, en outre, se conforment aux licences écrites de Sun.

Les produits qui font l'objet de cette publication et les informations qu'il contient sont régis par la législation américaine en matière de contrôle des exportations et peuvent être soumis au droit d'autres pays dans le domaine des exportations et importations. Les utilisations finales, ou utilisateurs finaux, pour des armes nucléaires, des missiles, des armes chimiques ou biologiques ou pour le nucléaire maritime, directement ou indirectement, sont strictement interdites. Les exportations ou réexportations vers des pays sous embargo des Etats-Unis, ou vers des entités figurant sur les listes d'exclusion d'exportation américaines, y compris, mais de manière non exclusive, la liste de personnes qui font objet d'un ordre de ne pas participer, d'une façon directe ou indirecte, aux exportations des produits ou des services qui sont régis par la législation américaine en matière de contrôle des exportations et la liste de ressortissants spécifiquement désignés, sont rigoureusement interdites.

LA DOCUMENTATION EST FOURNIE "EN L'ETAT" ET TOUTES AUTRES CONDITIONS, DECLARATIONS ET GARANTIES EXPRESSES OU TACITES SONT FORMELLEMENT EXCLUES, DANS LA MESURE AUTORISEE PAR LA LOI APPLICABLE, Y COMPRIS NOTAMMENT TOUTE GARANTIE IMPLICITE RELATIVE A LA QUALITE MARCHANDE, A L'APTITUDE A UNE UTILISATION PARTICULIERE OU A L'ABSENCE DE CONTREFACON.

    OS Deployment of Red Hat Linux 3.0 Update 2 Might Stop and Enter Interactive  
    Mode    17

    Unrequired Mount Point Must Be Specified for Swap Partition When Creating OS  
    Profile    17

    Setting Baud Rate for the BIOS Console Makes OS Deployment Fail on Sun Fire  
    V20z and V40z Servers (6322295)    18

    An OS Profile Name Cannot Contain a Period When Using the Browser Interface  
    (6331294)    18

The Same SUSE OS Profile Cannot Be Used on Sun Fire V20z/V40z Servers and Sun Fire X4000 Series Servers (6344382)	18
Interface Issues	19
Incorrect Server Details Are Displayed When Servers Swap Management IP Addresses (6196399)	19
Browser Interface Becomes Out of Sync if Back Button Is Used (6215298)	19
The Bottom Line of the Serial Console Message Is Not Shown in the Console Window (6308148)	19
Only SSHv1 Is Supported for Serial Console Access (6309107)	19
Serial Console Feature Requires Sun Java Plugin 1.4.2 or Later Installed (6315615)	20
Incorrect Swap Information Is Reported for Sun Fire X4100 and Sun Fire X4200 Servers with Firmware Level 6464 (6344709)	20
Firmware Update Issues	20
N1 System Manager Allows Deployment of Incompatible Firmware to Dual-Core Sun Fire V20z and Sun Fire V40z Servers (6296404)	20
Inadequate Error Message When Firmware Update Fails on ALOM-based Servers (6330195)	21
OS Update Issues	21
Installing a Linux OS Update Created From a Solaris Package Outputs Inadequate Error Messages (6230630)	21
Failed Solaris OS Update May Cause Subsequent OS Update Failures (6310032)	21
The <code>create update</code> Command Fails When Copying Solaris Packages and Patches From a URL (6324124)	22
Monitoring Issues	22
Apostrophe Cannot Be Used in Notification Description (6242713)	22
Clock Icon Representing Running Jobs Remains After Jobs Finish (6258571)	22
A Misleading Create OS Job Status After Running Out of Disk Space on Management Server (6299790)	23
Jobs That Are Queued But Not Running Are Shown in the Job Detail as “Not Started” (6318398)	23
Memory Threshold Values Are Not Updated Properly When OS Monitoring Agents are Upgraded by the <code>agentupgrade</code> Script (6330911)	23
Email Notifications Stop Being Sent After an OS Monitor Threshold Is Exceeded (6347039)	24
Unable to Change a Server’s <code>agentssh</code> Values (6347588)	25
Cannot Set the <code>fsusage.pctused</code> Threshold on a Group of Servers (6347647)	25
Resetting a Provisionable Server Makes the OS Health State Invalid Until the Server Information Is Refreshed (6351266)	25
Localization Issues	26

Non-ASCII Objects Display Random Characters if the N1 System Manager Is Running in a Non-UTF8 Locale (6231209) 26

Cannot Install ALOM Firmware With a Non-ASCII Firmware Name (6297238) 26

Internationalization Features Are Not Supported for the `n1sh` Command on Solaris Management Servers (6297808) 27

Deploying Solaris 10 With Some Installation Languages Will Time Out (6178721, 6179110) 27

Powering Off/On a Server Running a Non-English Locale Makes the Server's Hardware Health Status "Failed Critical" (6343747) 27

A Solaris SPARC Provisioning Server Running a Non-English Locale Does Not Display Package Information (6350202) 28

Adding OS Monitoring Agents to a Server Fails When Running a Non-English Locale (6351553) 28

## Preface

---

The *Sun N1 System Manager 1.2 Release Notes* contains information and problem details that were not available until immediately after the release of Sun N1 System Manager 1.2.

---

## Who Should Use This Book

This guide is intended for system administrators who are responsible for installing or upgrading the N1 System Manager software and hardware, and for personnel who use the N1 System Manager.

---

## Related Documentation

- *Sun N1 System Manager 1.2 Introduction*
- *Sun N1 System Manager 1.2 Site Preparation Guide*
- *Sun N1 System Manager 1.2 Installation and Configuration Guide*
- *Sun N1 System Manager 1.2 Administration Guide*
- *Sun N1 System Manager 1.2 Command Line Reference Manual*
- Hardware documentation:  
<http://www.sun.com/products-n-solutions/hardware/docs/>

---

## Documentation, Support, and Training

The Sun web site provides information about the following additional resources:

- Documentation (<http://www.sun.com/documentation/>)
  - Support (<http://www.sun.com/support/>)
  - Training (<http://www.sun.com/training/>)
- 

## Typographic Conventions

The following table describes the typographic conventions that are used in this book.

**TABLE P-1** Typographic Conventions

Typeface	Meaning	Example
AaBbCc123	The names of commands, files, and directories, and onscreen computer output	Edit your <code>.login</code> file.  Use <code>ls -a</code> to list all files.  <code>machine_name%</code> you have mail.
<b>AaBbCc123</b>	What you type, contrasted with onscreen computer output	<code>machine_name%</code> <b>su</b>  Password:
<i>aabbcc123</i>	Placeholder: replace with a real name or value	The command to remove a file is <i>rm filename</i> .
<i>AaBbCc123</i>	Book titles, new terms, and terms to be emphasized	Read Chapter 6 in the <i>User's Guide</i> .  A <i>cache</i> is a copy that is stored locally.  Do <i>not</i> save the file.  <b>Note:</b> Some emphasized items appear bold online.

---

## Shell Prompts in Command Examples

The following table shows the default UNIX<sup>®</sup> system prompt and superuser prompt for the C shell, Bourne shell, and Korn shell.

**TABLE P-2** Shell Prompts

Shell	Prompt
C shell	machine_name%
C shell for superuser	machine_name#
Bourne shell and Korn shell	\$
Bourne shell and Korn shell for superuser	#

## Sun N1 System Manager 1.2 Issues

---

This chapter describes the Sun N1™ System Manager 1.2 issues that are known to be problems.

---

### What's New in N1 System Manager 1.2

Here is a list of updates and changes for the N1 System Manager 1.2 release:

- New hardware support: Sun Fire X2100, Sun Fire T1000, Sun Fire T2000. Serial console and firmware update features are not available for the Sun Fire X2100 server.
- New OS support on specific provisionable servers: Red Hat Enterprise Linux 3.0 WS, Red Hat Enterprise Linux 4.0 WS, and SUSE Linux Professional 9.2/9.3.
- New server list filtering support in the browser interface and command line.
- New advanced sorting on the server list in the browser interface.
- Job details output provides the associated command run by user.

---

### Feature and Software Support Notices

This section lists the features and software that are not supported in Sun N1 System Manager 1.2 release.

- The N1 System Manager product is localized only for Japanese. The browser interface help system and command line help pages are in English only, however, Japanese versions of the entire command line help pages and important areas of the browser interface help system are available in the Sun N1 System Manager 1.2

Command Line Reference Guide (Ja, 819-4875) and the Sun N1 System Manager 1.2 Administration Guide (Ja, 819-4873), respectively.

- The serial console and firmware update features are not available for the Sun Fire X2100 server.

---

## Documentation Updates

This section describes known documentation updates, including documentation errata.

### Installation and Configuration Guide

In the “DHCP Service Conflict With N1 Grid Service Provisioning System” in *Sun N1 System Manager 1.2 Installation and Configuration Guide* (page 37), “Sun N1 Grid Service Provisioning System” should read “Sun N1 Service Provisioning System”, and “ISP” should read “OS Provisioning.”

### Command Line Help

This section provides documentation errata in the command line help pages.

### IPMI Credentials Require a User Name and Password (6344419)

Some parts of the command line tab help and the help pages show incorrect information about what to enter for IPMI credentials. All IPMI credential values in the command line require a user name and password pair value instead of just a password as documented. All IPMI values must be in the following syntax:  
*user-name/password*

---

**Note** – Sun Fire V20z and V40z servers require only a password for IPMI credentials.

---

### Hiding Passwords in the Command Line

You can enter a question mark (?) for any password attribute value if you do not want the password to display in the command line. Once you enter the command, you are prompted for the password. Examples include the `rootpassword` and `agentssh` attributes.

## Specifying the force and netboot Attributes

The `force` and `netboot` attributes are documented in the command line help pages without a corresponding value. You must specify `true` as their values to provide a valid command, such as `force=true` or `force true`.

### `set user`

The default role for the `root` user is automatically set to `Admin` after you reboot the management server or if you restart the N1 System Manager. It is still possible to set the `root` user's default role to a different role, but this is not a permanent assignment.

### `load group` and `load server`

The following attributes have been added for the `load group` command and when specifying multiple servers with the `load server` command:

- `bootnetworkdevice` *bootnetworkdevice* – The server's provisioning network interface is used to install the server. Valid Solaris values are `bge0` (default), `bge1`, `bge2`, and `bge3`. Valid Linux values are `eth0` (default), `eth1`, `eth2`, `eth3`, and `eth4`.
- `networkdevice` *networkdevice* – (Linux only) The server's provisioning network interface after the server is installed. Default is `eth0`.

---

**Note** – When installing the Red Hat 4 OS on Sun Fire X2100 servers, the `bootnetworkdevice` and `networkdevice` values must both be set to `eth1`. The default values do not work for this situation.

---

---

## N1 System Manager Installation Issues

This section describes known N1 System Manager installation issues.

### N1 System Manager Can Fail to Install on Sun Fire X4100 and X4200 Servers (6284696)

If the N1 System Manager installation process is interrupted and restarted, the N1 System Manager installation can fail in step 5, "Install OS provisioning components". If this issue occurs, a subsequent uninstall and reinstall of the N1 System Manager will fail.

The installation log file /var/tmp/installer.log.latest shows the following after initial installation failure:

```
Installing Master Server ...
Error! Missing file (looked for /opt/SUNWnlsp
/N1_Grid_Service_Provisioning_System_5.1
/server/postgres/postgresql.conf.in)!
print() on closed filehandle GEN0 at
/usr/perl5/5.8.4/lib/i86pc-solaris-64int/IO/Handle.pm line 399.
SPS install failed with exit status: 256
-----

      2k. Which port should Postgres listen on?
            (default: 5434) [1024-65535] spawn id(3) is not a tty. Not changing mode
at /usr/perl5/site_perl/5.8.4/Expect.pm line 375.
admin
admin
admin

      ** Invalid Input.  Enter a numeric value for the port number.

      2k. Which port should Postgres listen on?
            (default: 5434) [1024-65535] spawn id(3) is not a tty. Not changing mode
at /usr/perl5/site_perl/5.8.4/Expect.pm line 375.
admin
admin
admin

      ** Invalid Input.  Enter a numeric value for the port number.

      2k. Which port should Postgres listen on?
            (default: 5434) [1024-65535
```

The installation log shows the following after uninstall and reinstall of the N1 System Manager software:

```
Error! Failed to initialize the database (exit value was 1).
Exiting..
print() on closed filehandle GEN0 at /usr/lib/perl5/5.8.0
/i386-linux-thread-multi/IO/Handle.pm line 395.
SPS install failed with exit status: 256
```

Workaround: Perform the workaround procedure below that is applicable to the operating system installed on your management server. Depending on how the installation error occurred, some of the workaround steps might not complete successfully. If a workaround step does not complete successfully, go to the next step.

Solaris based Sun Fire X4100 or X4200 management server:

1. Stop the server and agent.

```
# su - nlgsps -c "/opt/SUNWnlsp/N1_Service_Provisioning_System_5.1/server/bin/cr_server stop"
# su - nlgsps -c "/opt/SUNWnlsp/N1_Service_Provisioning_System/agent/bin/cr_agent stop"
```

2. Uninstall service provisioning manually.

```
# /opt/SUNWnlsp/N1_Service_Provisioning_System_5.1/cli/bin/cr_uninstall_cli.sh
# /opt/SUNWnlsp/N1_Service_Provisioning_System_5.1/server/bin/cr_uninstall_ms.sh
```

3. Remove the following packages.

```
SUNWspsc1
SUNWspsms
SUNWspsm1

# pkgrm SUNWspsc1
# pkgrm SUNWspsms
# pkgrm SUNWspsc1
```

Type **y** in response to prompts asking “Do you want to remove this package? [y,n,?,q]”. If the message `pkgrm: ERROR: no package associated with SUNWspsc1` appears, that package has already removed by step 2. Continue removing packages.

4. Delete the service provisioning directory and files.

```
# cd /
# rm -rf /opt/SUNWnlsp/
# rm /nlgc-setup/sps/state
# rm /nlgc-setup/state/0installSPS.pl.state
```

5. Reboot the management server and then install the N1 System Manager software.

Linux based Sun Fire X4100 or X4200 management server:

1. Stop the server and agent.

```
# su - nlgsp -c "/opt/sun/N1_Service_Provisioning_System_5.1/server/bin/cr_server stop"
# su - nlgsp -c "/opt/sun/N1_Service_Provisioning_System/agent/bin/cr_agent stop"
```

2. Delete the service provisioning directory and files.

```
# cd /
# rm -rf /opt/sun/N1_Grid_Service_Provisioning_System_5.1
# rm -rf /opt/sun/N1_Grid_Service_Provisioning_System
# rm -rf /opt/sun/N1_Service_Provisioning_System
# rm -rf /opt/sun/N1_Service_Provisioning_System_5.1
# rm /nlgc-setup/sps/state
# rm /nlgc-setup/state/0installSPS.pl.state
```

3. Reboot the management server and then install the N1 System Manager software.

---

## Security Issues

This section describes known security issues.

## Browser Interface Session Never Times Out (6222506)

The event refresher frame reloads every 10 seconds, which updates the user's session timestamp. Therefore, the browser interface session will never time out.

Workaround: Explicitly log out when you are done using the browser interface.

---

## Performance Issues

This section describes known performance issues.

### Deleting Servers and Enabling/Disabling Monitoring on Servers May Take a Long Time (6344175)

The `delete server` and `set server monitored` commands may take a long time to complete. These commands do not generate a job, so you have to wait until the command finishes before you can submit another command. This is especially important to note if you try to enable/disable monitoring on a group of servers.

---

## Discovery Issues

This section describes known discovery issues.

### Hardware Model Type Information Missing From Server List After Discovering a Group of Servers (6349404)

When discovering a large group of servers (30 to 40 servers), the hardware model value does not display in the server list for some servers. For example, server 10.18.0.38 does not have the hardware information listed:

Name	Hardware	Hardware Health	Power	OS Usage	OS Resource Health
10.18.0.31	V20z	Good	On	-	-
10.18.0.32	V20z	Good	On	-	-

10.18.0.33	V20z	Good	On	-	-
10.18.0.35	V20z	Good	On	-	-
10.18.0.36	V20z	Good	On	-	-
10.18.0.37	V20z	Good	On	-	-
10.18.0.38	-	Good	On	-	-
10.18.0.39	V20z	Good	On	-	-

Workaround: Use the `refresh` attribute with the `set server` or `set group` command to update the servers in the list.

## OS Provisioning Issues

This section describes the known OS provisioning (deployment) issues.

### OS Deployment of Red Hat Linux 3.0 Update 2 Might Stop and Enter Interactive Mode

OS deployment of Red Hat Linux 3.0 Update 2 might stop and enter interactive mode due to a time out issue. This is an intermittent problem.

Workaround: Stop the OS deployment job and retry the OS deployment again. If OS deployment consistently fails, you will have to use a later version of the Red Hat OS.

### Unrequired Mount Point Must Be Specified for Swap Partition When Creating OS Profile

When specifying the swap partition for an OS profile using either the browser interface or the command line, you must specify an unrequired mount point. If you specify a mount point, a separate file system is actually created.

Workaround: Specify `swap` as the mount point for the swap partition, which serves as a placeholder and is ignored. The following is a command line example:

```
add osprofile myprofile partition swap type swap size 1024 device c0t0d0s1 sizeoption fixed
```

## Setting Baud Rate for the BIOS Console Makes OS Deployment Fail on Sun Fire V20z and V40z Servers (6322295)

The baud rate for the BIOS console must be set to 9600 (default) or OS deployment to a Sun Fire V20z or V40z server will fail. This means that you cannot change the `consolebaudrate` value in the `load server` command or the Load OS wizard in the browser interface.

---

**Note** – If the SP console baud rate is set to something other than 9600, the OS deployment will succeed but the console through the `connect server` command will display garbage characters.

---

Workaround: You must change the baud rate for the BIOS console manually after an OS deployment. To do this, reboot the target server and enter the BIOS setup screen during the boot sequence. Consult the server's user manual to see how to change its BIOS settings.

## An OS Profile Name Cannot Contain a Period When Using the Browser Interface (6331294)

If you specify a period in an OS profile name when using the browser interface wizard to create an OS profile, an "invalid profile name" error occurs. A period should be an acceptable character for an OS profile name.

Workaround: If you want to include a period in the OS profile name, use the `create osprofile` command.

## The Same SUSE OS Profile Cannot Be Used on Sun Fire V20z/V40z Servers and Sun Fire X4000 Series Servers (6344382)

Once you load a SUSE OS profile on a Sun Fire X4000 series server, that same OS profile and associated OS distribution cannot be used on Sun Fire V20z and V40z servers. Loading a SUSE OS profile on a Sun Fire X4000 series server actually modifies the associated SUSE OS distribution, which makes that OS distribution unusable by Sun Fire V20z and V40z servers.

Workaround: You must create separate SUSE OS distributions and OS profiles for Sun Fire V20z/V40z servers and Sun Fire X4000 series servers.

---

## Interface Issues

This section describes the known browser interface and command line interface issues.

### Incorrect Server Details Are Displayed When Servers Swap Management IP Addresses (6196399)

If the management IP addresses of two discovered servers are swapped, the detailed server information displayed for each of the servers with the swapped addresses will be the information for the other swapped server. For example, if server A and server B have their management IP addresses swapped, “show server A” will show server B’s information and “show server B” will show server A’s information.

Workaround: Delete both of the servers with swapped IP addresses and then rediscover them. This will result in any user supplied information about the server being lost.

### Browser Interface Becomes Out of Sync if Back Button Is Used (6215298)

The browser interface uses frames that are synchronized. If you click the browser’s Back button in one of the frames, the frames can get out of sync.

Workaround: Press F5 or refresh the page to synchronize the frames.

### The Bottom Line of the Serial Console Message Is Not Shown in the Console Window (6308148)

The last line of the serial console launched from the N1 System Manager browser interface is not displayed in the serial console window.

Workaround: Press Enter or Return to display the last line.

### Only SSHv1 Is Supported for Serial Console Access (6309107)

The applet used for serial console access from the Web Browser interface uses SSHv1 only for communication back to the N1 System Manager management server. This feature requires enabling SSHv1 for the N1 System Manager management server.

Workaround: If you do not want to enable SSHv1 and the serial console Web Browser interface, you can use the serial console feature from the `n1sh` command line interface.

## Serial Console Feature Requires Sun Java™ Plugin 1.4.2 or Later Installed (6315615)

To use the Serial Console feature from the Server Details page in the browser interface, the Sun Java Plugin 1.4.2 or later must be installed on the system where you are running the browser. Not all of the supported browsers for the N1 System Manager have this installed.

## Incorrect Swap Information Is Reported for Sun Fire X4100 and Sun Fire X4200 Servers with Firmware Level 6464 (6344709)

The browser interface server details and the `show server` command displays the wrong swap information for Sun Fire X4100 and Sun Fire X4200 Servers with Firmware Level 6464 and the Red Hat Operating System.

Workaround: Use the serial console to access the server and find out the correct swap information by using the `top` command.

---

## Firmware Update Issues

This section describes known firmware update issues.

## N1 System Manager Allows Deployment of Incompatible Firmware to Dual-Core Sun Fire V20z and Sun Fire V40z Servers (6296404)

Dual-core Sun Fire V20z and Sun Fire V40z servers require a 2.3.x and greater firmware revision. N1 System Manager does not prevent you from deploying firmware revisions below 2.3.x. Deploying firmware revisions below 2.3.x may result in issues with the server's service processor.

Workaround: Double check the firmware revision before updating.

## Inadequate Error Message When Firmware Update Fails on ALOM-based Servers (6330195)

If the ftp service is not enabled on the management server, firmware updates on ALOM-based servers fail with the following error message in the job output:

```
An exception occurred trying to update server-name. Please refer to the log file for more information.
```

Workaround: Enable the ftp service on the management server. See “Enabling FTP on the Management Server” in *Sun N1 System Manager 1.2 Site Preparation Guide* for details.

---

## OS Update Issues

### Installing a Linux OS Update Created From a Solaris Package Outputs Inadequate Error Messages (6230630)

The `create update` command allows you to create a Linux OS update from a Solaris package, even though this is not a valid procedure. If you happen to do this and then try to install the OS update on a Linux system, the Update job is accepted but it eventually fails with error messages that do not help diagnose the underlying problem.

Workaround: Make sure that the update is compatible with the installed OS. You can view a provisionable server’s OS by using the `show server` command, and you can view the OS type for an OS update by using the `show update` command.

### Failed Solaris OS Update May Cause Subsequent OS Update Failures (6310032)

If a Solaris OS update installation fails, a copy of the admin file used for the installation is not removed from the provisionable server. If the failure was due to a corrupt or invalid admin file, subsequent OS update installations will not replace the faulty admin file and it may cause continued failures.

Workaround: Delete the *package-filename*.admin file in the provisionable server's /tmp directory and retry the OS update installation. If you specified a customized admin file for the OS update, ensure that the admin file is valid.

## The create update Command Fails When Copying Solaris Packages and Patches From a URL (6324124)

The create update command does not work if you specify a valid Solaris package or patch through a URL (http://). An error similar to the following is displayed:

```
# ./n1sh create update sol file http://10.11.1.35/scs/SVR4/SCSFpoppl.pkg ostype solaris10x86
File "http://10.11.1.35/scs/SVR4/SCSFpoppl.pkg" exists but is not a valid update file.
```

Workaround: You must first download the package or patch to a location that is accessible from the management server and then specify a fully qualified path to the package or patch.

---

## Monitoring Issues

### Apostrophe Cannot Be Used in Notification Description (6242713)

The create notification command fails if an apostrophe is used for the description attribute.

Workaround: Escape the apostrophe with another apostrophe (for example, Support's Notification) or do not use an apostrophe in the description.

### Clock Icon Representing Running Jobs Remains After Jobs Finish (6258571)

Even after all jobs are finished running, the clock icon next to the servers in the View Selector section may still display, which is a problem with the refresh feature.

Workaround: Click the Refresh button or press F5 to refresh the browser interface.

## A Misleading Create OS Job Status After Running Out of Disk Space on Management Server (6299790)

If a Create OS job is running and the management server runs out of disk space, the job status shows “running”. When disk space is cleaned up, and the N1 System Manager is restarted, the job status changes to “complete” even though the Create OS job has failed.

---

**Note** – The failed job’s state will remain shown as “complete” and cannot be corrected.

---

Workaround:

1. Free up at least 3 Gbytes of disk space.
2. Stop and restart the N1 System Manager.
3. Resubmit the Create OS operation.

## Jobs That Are Queued But Not Running Are Shown in the Job Detail as “Not Started” (6318398)

When the total job load is high enough to prevent the next job in the queue from running, the Job Details screen shows the running jobs’ status as “running”, and the status for other jobs is shown as “Not Started”. The queued jobs will run after one or more of the running jobs have completed and the total job load is low enough to allow the next job in the queue to run.

See “Job Queueing” in *Sun N1 System Manager 1.2 Administration Guide* for further information.

## Memory Threshold Values Are Not Updated Properly When OS Monitoring Agents are Upgraded by the agentupgrade Script (6330911)

If you upgrade the OS monitoring agents to the 1.2 release by using the agentupgrade script, the following memory threshold values are not updated properly:

- memusage.mbmempused (Memory in use)
- msusage.mbmempfree (Memory free)
- memusage.pctmempused (Percentage of memory in use)

- `memusage.pctmemfree` (Percentage of memory free)

This issue may put the associated provisionable servers in a “Failed Critical” state.

Workaround: After you upgrade the OS monitoring agents, use the `set server` or `set group` commands to change the threshold values on the servers.

## Email Notifications Stop Being Sent After an OS Monitor Threshold Is Exceeded (6347039)

If an OS monitor threshold is exceeded, email notifications may stop being sent. This is an intermittent problem.

Workaround: Perform the following procedure on the management server.

1. Shutdown N1 System Manager.

```
# /etc/init.d/n1sminit stop
```

2. For a Red Hat management server, change directory to `/etc/opt/sun/cacao/modules`.

```
# cd /etc/opt/sun/cacao/modules
```

For a Solaris management server, change directory to `/etc/opt/SUNWcacao/modules`.

```
# cd /etc/opt/sun/SUNWcacao/modules
```

3. Backup the XML files that need to be updated.

```
# cp coreservicemodule.xml coreservicemodule.xml.save
# cp com.sun.hss.domain.xml com.sun.hss.domain.xml.save
```

4. Remove the following lines from the `coreservicemodule.xml` file.

```
<path-element>
  file:/opt/sun/n1gc/lib/activation.jar
</path-element>
<path-element>
  file:/opt/sun/n1gc/lib/mail.jar
</path-element>
```

5. Remove the following lines from the `com.sun.hss.domain.xml` file.

```
<path-element>
  file:/opt/sun/n1gc/lib/mailapi.jar
</path-element>
<path-element>
  file:/opt/sun/n1gc/lib/imap.jar
</path-element>
<path-element>
  file:/opt/sun/n1gc/lib/pop3.jar
</path-element>
<path-element>
```

```
        file:/opt/sun/nlgc/lib/smtp.jar
    </path-element>
```

6. Add the following line to the `com.sun.hss.domain.xml` file.

```
<path-element>
    file:/opt/sun/nlgc/lib/mail.jar
</path-element>
```

7. Start the N1 System Manager.

```
# /etc/init.d/nlsmgmt start
```

## Unable to Change a Server's agentssh Values (6347588)

Changing a server's agentssh value by using the `set server` command does not work.

Workaround: If you want to change a server's agentssh value, you must delete the server, discover it again, and use the `add server` command to set the agentssh value.

## Cannot Set the fsusage.pctused Threshold on a Group of Servers (6347647)

Setting the `fsusage.pctused` threshold using the `set group` command does not work. For example:

```
N1-ok> set group test-systems threshold fsusage.pctused warninghigh=70 criticalhigh=80
Invalid value "fsusage.pctused".
```

Workaround: You must set the `fsusage.pctused` threshold on a single server by using the `set server` command. You can create an `n1sh` customized script to help automate this procedure for a large number of servers. See “To Run a Script of N1 System Manager Commands” in *Sun N1 System Manager 1.2 Administration Guide* for more information.

## Resetting a Provisionable Server Makes the OS Health State Invalid Until the Server Information Is Refreshed (6351266)

After you reset (reboot) a provisionable server using the `reset` command or the Reset menu item in the browser interface, the server's OS resource health state changes to “Failed critical” until a refresh occurs after five to ten minutes. This happens even though the server's OS health state is good.

Workaround: After you reset a provisionable server, you can refresh the server using the `set server refresh` command, or wait five to ten minutes for the server's status to refresh automatically.

---

## Localization Issues

### Non-ASCII Objects Display Random Characters if the N1 System Manager Is Running in a Non-UTF8 Locale (6231209)

Non-ASCII objects created using the N1 System Manager display random characters if you start N1 System Manager in following ways:

- Running the `/etc/init.d/nlsminit` command in a non-UTF8 locale
- Rebooting the management server in a non-UTF8 locale

Workaround: Use either of the two following methods.

1. Temporary solution: set the `LANG` environment variable to the UTF8 locale on the management server and restart the N1 System Manager. For example:

```
# export LANG en_US.UTF-8
# /etc/init.d/nlsminit stop
# /etc/init.d/nlsminit start
```

2. Permanent solution:

- On a Solaris based management server:  
Edit the file `/etc/default/init` and change the `LANG` value to `en_US.UTF-8`.
- On a Linux based management server:  
Edit the file `/etc/sysconfig/i18n` and change the `LANG` value to `en_US.UTF-8`.

### Cannot Install ALOM Firmware With a Non-ASCII Firmware Name (6297238)

The `load server` command fails to install ALOM firmware if the firmware name is non-ASCII.

Workaround: Change the firmware name to ASCII using the `set firmware` command.

## Internationalization Features Are Not Supported for the `n1sh` Command on Solaris Management Servers (6297808)

The Python version (2.3) on a default Solaris management server does not provide adequate internationalization support for the `n1sh` command.

Workaround: Install Python 2.4 or later on the Solaris management server. The Python executable must be `/usr/bin/python2.4`.

## Deploying Solaris 10 With Some Installation Languages Will Time Out (6178721, 6179110)

If you deploy Solaris 10 with an OS profile that has a particular installation language set, the installation is performed in interactive mode and you must select a language when prompted. The deploy OS job will eventually time out if you do not make the language selection. The following languages create this behavior:

- `ja_JP.eucJP`
- `no_NO.ISO8859-1`
- `th_TH.TIS620`
- `ko_KR.UTF-8`
- `sh_BA.ISO8859-2`
- `zh_CN.EUC`
- `zh_CN.UTF-8`

Workaround: Because the installation is no longer automated, you must monitor the deployment through the server's serial console and make the language selection. You can choose Serial Console from the Actions menu in the browser interface or use the `connect server` command.

## Powering Off/On a Server Running a Non-English Locale Makes the Server's Hardware Health Status "Failed Critical" (6343747)

This problem occurs if an ALOM-based, Solaris provisionable server is running Non-English locale and you power on and off the server using the `stop` and `start` commands, respectively.

Workaround: Use the `reset server` command on the server.

## A Solaris SPARC Provisioning Server Running a Non-English Locale Does Not Display Package Information (6350202)

If a Solaris SPARC provisioning server is running a non-English locale, the package information does not display in the server details output.

Workaround: Edit the file `/etc/default/init` on the provisionable server, change the `LANG` value to `en_US.UTF-8`, and reboot the server.

## Adding OS Monitoring Agents to a Server Fails When Running a Non-English Locale (6351553)

When adding OS monitoring agents to a provisionable server, there are two situations that fail because the server is running a non-English locale.

- Issue 1: "Either invalid credentials were used or ssh key in known\_hosts file has changed" error message.
- Issue 2: "Driver not found for the specified device" error message for Solaris 10 HW2 provisionable servers.

Workaround:

- Issue 1: Delete the provisionable server's SSH credentials in the management server's `known_hosts` file: `/.ssh/known_hosts` file for a Solaris management server and `/root/.ssh/known_hosts` for a Red Hat management server. Then, try to add the OS monitoring agents again.
- Issue 2: There is no workaround for a non-English locale. You must run the management server in the `en_US.UTF-8` locale and reinstall Solaris 10 HW2 with the `en_US.UTF-8` locale on the provisionable server. Then, try to add the OS monitoring agents again.
