En particulier, et ce sans limitation, ces droits de propriété intellectuelle peuvent inclure un ou plus des brevets américains listés à l'adresse <http://www.sun.com/patents> et un ou les brevets supplémentaires ou les applications de brevet en attente aux Etats - Unis et dans les autres pays.

Cette distribution peut comprendre des composants développés par des tierces parties.

Des parties de ce produit pourront être dérivées des systèmes Berkeley BSD licenciés par l'Université de Californie. UNIX est une marque déposée aux Etats-Unis et dans d'autres pays et licenciée exclusivement par X/Open Company, Ltd.

Sun, Sun Microsystems, le logo Sun, Solaris, Netra et le logo Netra sont des marques de fabrique ou des marques déposées de Sun Microsystems, Inc., ou ses filiales, aux Etats-Unis et dans d'autres pays.

Ce produit est soumis à la législation américaine en matière de contrôle des exportations et peut être soumis à la réglementation en vigueur dans d'autres pays dans le domaine des exportations et importations. Les utilisations, ou utilisateurs finaux, pour des armes nucléaires, des missiles, des armes biologiques et chimiques ou du nucléaire maritime, directement ou indirectement, sont strictement interdites. Les exportations ou reexportations vers les pays sous embargo américain, ou vers des entités figurant sur les listes d'exclusion d'exportation américaines, y compris, mais de manière non exhaustive, la liste de personnes qui font objet d'un ordre de ne pas participer, d'une façon directe ou indirecte, aux exportations des produits ou des services qui sont régis par la législation américaine en matière de contrôle des exportations et la liste de ressortissants spécifiquement désignés, sont rigoureusement interdites. L'utilisation de pièces détachées ou d'unités centrales de remplacement est limitée aux réparations ou à l'échange standard d'unités centrales pour les produits exportés, conformément à la législation américaine en matière d'exportation. Sauf autorisation par les autorités des Etats-Unis, l'utilisation d'unités centrales pour procéder à des mises à jour de produits est rigoureusement interdite.

LA DOCUMENTATION EST FOURNIE "EN L'ETAT" ET TOUTES AUTRES CONDITIONS, DECLARATIONS ET GARANTIES EXPRESSES OU TACITES SONT FORMELLEMENT EXCLUES, DANS LA MESURE AUTORISEE PAR LA LOI APPLICABLE, Y COMPRIS NOTAMMENT TOUTE GARANTIE IMPLICITE RELATIVE A LA QUALITE MARCHANDE, A L'APTITUDE A UNE UTILISATION PARTICULIERE OU A L'ABSENCE DE CONTREFAÇON.

READ AND DELETE

- Print this file and have it next to you before deleting this text frame.
- Press Control and click once on the red text frame to select it, and delete it. Follow the same procedure to delete the red text frame on the next page.

If you generated a copyright notice yourself in the Legal Notices Tool, follow these instructions:

1. After generating a copyright notice for your document in the Legal Notices Tool, keep it and the browser window open on your desktop.
2. In the browser window, locate the Long English copyright notice.
3. Select and copy all paragraphs in the Long English copyright notice.
4. In the FrameMaker `copyright.xxx` template, place the cursor in the empty paragraph at the top of the template. (Select View -> Text Symbols to see the empty paragraph symbol).
5. Paste the copied text into the copyright template.
6. Press Return at end of the last English paragraph (in ALL CAPS) to insert an empty paragraph.
7. In the browser window, locate the Long French copyright notice.
8. Select and copy all paragraphs in the Long French copyright notice.
9. In the copyright template, place the cursor in the empty paragraph under the last English paragraph, and paste the French text into the template.
10. Remove all empty paragraphs from the copyright notices.

After copying and pasting all copyright notice paragraphs into the copyright template, every other paragraph is empty. You must remove these empty paragraphs.

11. Retag three paragraphs as follows:

- First paragraph in the English notice containing the "Copyright @ 2008" string:
Tag this with the "copyright" paragraph tag.
- Last paragraph in the English notice (in all caps):
Tag this paragraph with the "Paragraph_Divider" paragraph tag.
- Last paragraph in the French notice (in all caps).
Tag this paragraph with the "Paragraph_CreditsCaps" paragraph tag:

The default paragraph tag for all other text is "Paragraph_Credits." Tag the other text if necessary.

12. In the first paragraph of the English copyright notice, use the Ctrl-Q) (Shift-0) key sequence to insert a © symbol after the word "Copyright." Repeat in the first paragraph of the French copyright notice.
13. Save the copyright template as `product-name-copyright.xxx`.
14. Using standard procedures, place the `product-name-copyright.xxx` file as the second file in the book

Designing a Fault-Tolerant Network

This document provides guidelines for designing a fault-tolerant network using Netra CP3140 switches and Netra CP3240 switches.

This document contains the following topics:

- [“ATCA Network Overview” on page 2](#)
- [“Design Principles and Guidelines” on page 3](#)
- [“Related Documentation” on page 17](#)

ATCA Network Overview

ATCA is designed to be used in highly available (HA) environments. Many HA principles such as redundancy and fault tolerance are designed into ATCA specification. ATCA systems need to be connected to external networks in such a manner that the HA principles applied inside the shelf are also applied to external networks. A system is only as available as its connections to end users. This document outlines some of the techniques to maximize uptime of an ATCA system that can be applied when using Sun's Netra switch.

The following shows a simplified partial-network diagram of an ATCA network.

FIGURE 1 ATCA Network Diagram (Partial)

Design Principles and Guidelines

This section covers fault-tolerant design principles and guidelines.

Basic

Independent of the software used to increase availability, a system should be redundantly cabled, preferably at both the board level and the link level.

ATCA uses a dual-star topology for backplane connections. So, inside the ATCA shelf every node (anything that is a network endpoint) is connected to both switch blades. (For shelf managers, this statement is true only for PICMG 3.0 R2.0 ECN-002 “cross-connect” enabled shelves).

- The redundancy should be replicated outside the ATCA shelf.
- Every external element (any network-enabled equipment such as a node, a switch, or a router) should be connected to both switch blades in the ATCA shelf.
- With these redundant links, the ATCA concept of a dual-star network is extended outside of the shelf.
- While cabling to both switch blades provides fault tolerance for external link failures, running multiple cables to both hubs further increases fault tolerance.
- External cables are one of the more vulnerable parts of a HA system. A full fail-over can be avoided, or at least delayed in some cases, by having multiple links to each switch blade.

Smart End Points: Channel Bonding

The simplest and most powerful way to implement an HA network is by using channel bonding drivers. Because every ATCA node is connected to two hub blades, the node has at least two network interfaces. While these interfaces can be treated as separate interfaces logically, it makes sense to treat them as a single interface. Channel bonding drivers provide that abstraction. Higher level software uses a single virtual-network interface, and the channel bonding driver handles the complex choice of which physical-network interface to use.

Channel bonding drivers choose which port to use at what time, through various decision algorithms. Most of these algorithms put bandwidth at a higher priority than availability. However, the active-standby algorithm is specifically designed for HA, and therefore it is the best algorithm to use in ATCA networks.

The true power of a channel bonding driver is not in its decision algorithm for choosing ports, but rather its decision algorithm that defines whether a port is usable. Only two common algorithms define if a port is usable:

- The first very simply checks the link state of the network interface. This algorithm has limited use because it only monitors the immediate physical link of the port in question.
- The second monitors the availability of an IP. This one can be a very powerful method of monitoring a port, because an entire path (all links and elements between the port and the element being monitored) can be monitored. If any links between the elements fail, the channel bonding driver will failover to the other network interface. In this way, an ATCA node can monitor and act on failures both inside and outside of the ATCA shelf.

One of the great features of channel bonding drivers is that they are generally topology, layer, and protocol independent (decision algorithms are not topology independent, but the overall channel bonding driver is). They work well in complex networks, simple networks, Layer 2 switched networks, and Layer 3 routed networks.

Layer 2 Methods: VLANs and MSTP

Layer 2 switching is used often because it is simple. The simplicity of switching makes it fast and inexpensive, but it puts limits on the design of the network.

A Layer 2 network, without additional protocols, must follow a strict tree structure. No loops are allowed in the network. This limitation is in direct contrast to the key HA principle of redundancy. However, using the VLAN and MSTP protocols on top of a Layer 2 switched network resolves this limitation and allows loops.

- Use VLANs to segment the switched network into smaller networks.
- Configure switches to allow only certain VLAN tagged traffic onto certain ports. The traffic get tags from both switches and nodes as it passes through/to them (switches and nodes can remove tags as needed).

With these rules and tags, traffic can be limited and controlled so that the network loop does not exist on any single VLAN.

STP (spanning tree protocol) is a protocol that is designed specifically to deal with network loops. STP traverses a network, finds, all loops, and disables the links that created loops. It effectively makes the network graph into a tree graph (no node connect to any other node by more than one link), hence the name.

MSTP (multiple spanning tree protocol) is a protocol designed to improve STP. MSTP is better than STP in two ways. First, MSTP is VLAN aware. Regular STP ignores VLAN settings and thus, even if a network loop has been properly segmented with VLAN, STP will disable the loop link. MSTP can recognize that

while the loop exists, it has been contained by VLAN settings and does not disable the loop link. Secondly, MSTP can converge (reconfigure) more quickly than STP when the network changes. Of the two redundant links in any network loop, one will be active and the other will be inactive. When the active link fails, it is desired to switch to the inactive link as quickly as possible.

The following shows an example Layer 2 network configured with VLAN and MSTP.

FIGURE 2 Layer 2 Network Configured With VLAN and MSTP

In this network, we have three node blades that do not need to communicate with the external network (RED) and three that do (BLUE). One of the BLUE nodes needs to communicate with the RED nodes. VLANs are used to logically separate the RED and BLUE nodes. MSTP is used to prevent a blocking of the inter-switch link due to a loop in VLAN BLUE from affecting VLAN RED.

Layer 2 VLAN Configuration

The following code example shows how to configure the example network shown in [FIGURE 2](#).

CODE EXAMPLE 1 Configuring a Layer 2 VLAN Network With MSTP

```
vlan database
vlan 101
vlan 202
exit

configure

!inter-switch link needs to be in both VLANs
interface 0/2
!The port cost of MST 2 is set here are lower then normal
!to signify using this port is preferential over others
spanning-tree mst 2 cost 1800
vlan participation exclude 1
vlan participation include 101
vlan tagging 101
vlan participation include 202
vlan tagging 202
exit

!node blade A is in 202
interface 0/3
vlan participation exclude 1
vlan participation include 202
vlan pvid 202
exit

!node blade B is in 202
interface 0/4
vlan participation exclude 1
vlan participation include 202
vlan pvid 202
exit

!node blade C is in 202 and 101
```

exit
```

Layer 3 Methods: VRRP and VRRP Tracking

VRRP (virtual router redundancy protocol) lets multiple routers appear as a single virtual router. With VRRP nodes on the Layer 2 side of the hub, blades can be configured with the single virtual IP and network elements on the Layer 3 side, to see two routes to the same subnet. One of the VRRP routers becomes the master of the virtual IP and does the routing. If it fails, the backup router takes over.

Traditional VRRP defines a router failure as a series of missing checkpoint packets sent between VRRP routers. VRRP tracking adds other fail-over conditions. With VRRP tracking, multiple “tracks” can be set up to monitor the status of a link, a local route, or a remote IP. If any track fails, the router forces a fail-over immediately, without waiting for the checkpoint packets.

Layer 3 routing is more complex than Layer 2 switching but is more robust. Loops are expected in Layer 3 networks. In ATCA, hub blades are used as gateway routers. A hub blade connects a Layer 3 external network to a Layer 2 internal network. There are two gateways for the two hub blades in the ATCA shelf. The node blades could be configured to handle two separate gateways; however, the VRRP protocol provides a more elegant solution.

The following shows an example VRRP network configured with VRRP tracking.

FIGURE 3 Layer 3 Network Configured with VRRP

In this example, the two switch blades are redundant gateways between the node blades and the external network. The node blades are in the 12.55.67.x subnet, whereas the external network is in the 22.50.1.x subnet. An instance of VRRP is configured so that if either switch blade fails, the node can still reach the external network. VRRP tracks are added to provide more robust failover conditions.

Layer 3 VRRP Configuration

The following code example shows how to configure the example network shown in [FIGURE 3](#).

CODE EXAMPLE 2 Configuring a Layer 3 Network With VRRP

```
vlan database
vlan 101
vlan routing 101
exit

configure
ip routing
ip vrrp

!interswitch link needs to be in both VLANs
interface 0/2
vlan participation exclude 1
vlan participation include 101
vlan tagging 101
exit

!node blade A is in 101
interface 0/3
vlan participation exclude 1
vlan participation include 101
vlan pvid 101
exit

!node blade B is in 101
interface 0/4
vlan participation exclude 1
vlan participation include 101
vlan pvid 101
exit

!node blade C is in 101
interface 0/5
vlan participation exclude 1
vlan participation include 101
vlan pvid 101
exit

!node blade D is in 101
interface 0/6
vlan participation exclude 1
vlan participation include 101
```

CODE EXAMPLE 2 Configuring a Layer 3 Network With VRRP (*Continued*)

```
vlan pvid 101
exit

!node blade E is in 101
interface 0/7
vlan participation exclude 1
vlan participation include 101
vlan pvid 101
exit

!node blade F is in 101
interface 0/8
vlan participation exclude 1
vlan participation include 101
vlan pvid 101
exit

!external network
interface 0/20
ip address 22.50.1.5 255.255.255.0
exit

interface 4/1
!the other switch is set to 12.55.67.19
ip address 12.55.67.18 255.255.255.0
ip vrrp 102
ip vrrp 102 ip 12.55.67.20
!the other switch is set to 253
ip vrrp 102 priority 250
ip vrrp 102 mode
exit
!
!track remote server
track 1 ip route 22.50.1.15/24 reachability

!track local link state If any link goes down, failover
track 2 interface 0/3 line-protocol
track 3 interface 0/4 line-protocol

vrrp 102 track 8 decrement 40
vrrp 102 track 9 decrement 40

exit
```

Best Practices

Each of the fault-tolerant network design methods presented (channel bonding drivers, Layer 2 methods, and Layer 3 methods) are best used together to achieve maximum availability.

The following shows an example of all methods combined into a single network configuration.

FIGURE 4 Fault-Tolerant Network Combining All Design Methods

All Methods Integrated Configuration

In the following example, channel bonding, VLANs with MSTP, VRRP, and VRRP tracking are integrated.

CODE EXAMPLE 3 Configuring a Network With All Design Methods Integrated

```
vlan database
vlan 101
