Fixes included in this Service Pack.....	6

Introduction

Oracle Tax and Utilities Global Business Unit is pleased to announce the implementation of a Service Pack, designated 4.2.0.1.0, for Oracle Utilities Application Framework V4.2. The Service Pack contains all the fixes available since the original release of the framework as a single download and installation for convenience. This whitepaper outlines the contents of the Service Pack as well as implementation guidelines.

For support purposes, please quote the service pack designation, 4.2.0.1.0, for any Service Requests registered after this Service Pack has been installed. This will target the specific version and help support personnel identify the correct version of the product.

Service Packs

The Service Pack has been introduced to reduce the Total Cost Of Ownership of Oracle Utilities Application Framework based products to encourage regular update of software at sites, consistent with other Oracle products. In the past, single fixes were available on individual basis which required individual installation of the fix as well as any related prerequisite fixes. Feedback from customers and partners indicated this can become more labor intensive when the site did not keep up to date with the fixes shipped on My Oracle Support.

To address this, the concept of a Service Pack was introduced to deliver a cumulative available fixes that have been released and additional fixes allocated to this service pack. Implementing this Service Pack will reduce the time to download and install individual fixes and therefore address the issue of manual installing individual single fixes.

Individual single fixes will still be made available for critical patches only reported by individual customers. These fixes would be also included in the next scheduled Service Pack.

Note: Products using the Oracle Utilities Application Framework must be certified before using this Service Pack.

Installation of this Service Pack

In the past Group Fixes have been provided on a regular basis which contained the fixes released since the last Group Fix and targeted enhancements for the Group Fix. This has now been replaced with a cumulative Service Pack and which will implement all the fixes in a single install.

There are a number of scenarios supported by the installation of the Service Pack which will result in the same outcome in terms of fixes:

- If you are a customer who has only installed the original product from the Oracle Delivery Cloud without any fixes at all, installation of this Service Pack will ensure your installation is up to date with all the latest fixes contained in this Service Pack.
- If you are a customer who has installed selected fixes or any group fixes (or a combination of both) installation of this Service Pack will ensure your installation is up to date with all the latest fixes contained in this Service Pack. Past installed fixes will be detected and bypassed as they are already installed.

The documentation for each of the bugs included as well including past Group Fix bugs are included in this Service Pack.

Components of the Service Pack

Refer to the [README.txt](#) file for components of the install and the details of the installation process.

Contents

Service Pack 1 contains the enhancements and patches of significance outlined in the following subsections.

Note: The PFD's for each of the enhancements are included in the Service Pack installation. Refer to these documents for specific settings.

Oracle Service Bus Adapters

With the depreciation of the Multi-purpose Listener (MPL) in Oracle Utilities Application Framework 4.0, a number of real time adapters and Message Driven Beans have been released to replace the MPL functions. To complete the removal of the Multi-purpose Listener, a number of Oracle Service Bus protocol adapters have been developed to support outbound communications to be initiated from proxy services within Oracle Service Bus.

In this release the following protocol adapters are available:

- **Outbound Messages** – The adapter can be configured to process outbound messages at configurable intervals for messages in *Pending* state for a particular Outbound Message Type.
- **Notification Download Staging** (*Oracle Utilities Customer Care And Billing and Oracle Enterprise Taxation And Policy Management only*) – The adapter can be configured to process Notifications at configurable intervals for notification records in *Pending* state for a Notification Type.

These adapters surpass the existing MPL based adapters in that individual message types can be assigned different polling intervals to reflect the priority of the messages.

Customers using these adapters can install them into an installation of Oracle Service Bus as per the product Installation Guide.

Refer to the *Oracle Service Bus Integration with Oracle Utilities Application Framework* whitepaper for instructions on how to migrate existing MPL processes using

Attachment Object Support in Email Adapter

In Oracle Utilities Application Framework V4.0 a real time email adapter was added to allow implementations to compose and send emails, including file based attachments, for communication as a part of any algorithm or process. In Oracle Utilities Application Framework 4.1 the attachment object was added to the Oracle Utilities Application Framework to allow products and implementation to load and attach binary objects (such as document, sound, vision etc) within the product. In this service pack the email adapter has been extended to optionally use attachment object(s) as an email attachment(s). The adapter also allows file and attachment objects to be used as attachments in the same email, if required.

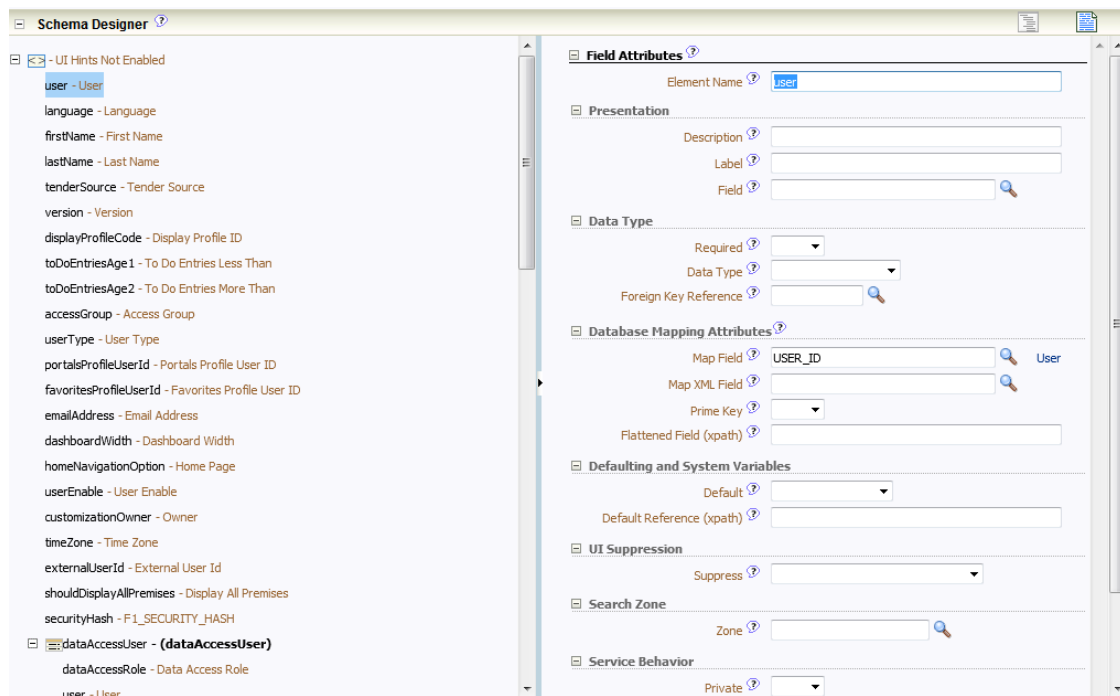

New Schema Designer

A new user friendly schema editor has been developed to improve schema editing to reduce manual effort and skill levels when developing schemas for Business Objects. This is to reduce the need to edit raw XML and continues the strategy of reducing skills required to extend our products, as with the instruction of UI hints in Oracle Utilities Application Framework V4.1 to remove the need for HTML editing.

The new Schema Designer features the following:

- **Property Sheets** – When editing each element a property sheet showing ALL the valid tag elements are show in a form style, including validation.
- **Drag and Drop Support** – Elements and groups can be dragged and dropped within the schema to reposition them.
- **Node Management** – Groups and lists can be built within the schema using the properties sheets.
- **UI Hint Management** – UI hints on elements and UI Hint section can be enabled and configured from the editor.
- **Context sensitive menus** – Right clicking an element displays a context sensitive menu to allow a developer direct access to development functions on that element.
- **Metadata driven** – Behavior and tag formats are maintained within the product metadata so that as tags are changed, added or removed, then this can be reflected in the editor without the need for coding changes.

An example of the editor is shown below:

Developers can switch between the original raw XML based editor and the new Schema Designer on the tool bar of the schema editor zone.

Default Schema and Data Explorer Currency Support

The schema language has been extended to allow for enhanced defaulting and extending the use of currency types. It is now possible to specify an installation default for currency as well as country to support multi-country objects. It is also now possible to add a currency type in data explorers to support customers with more than one currency.

EAR Setting Independence

Over the last few releases, any environmental settings have been progressively removed from the build of the J2EE application EAR file to make the EAR file environment more independent. This would allow customers to deploy software easier deployment across nodes on a cluster. This release removes the last of the identified configuration environment settings from the configuration files bundled in the EAR file. Configuration settings are dynamically determined at startup and runtime from base software locations rather than in EAR files.

This enhancement will be used by the Oracle Application Management Pack for Oracle Utilities.

Note: Product runtimes are required to be preinstalled on deployable nodes independently prior to EAR deployment for licensing reasons.

General Accessibility Enhancements

Oracle is committed to delivering products that support industry general accessibility standards. The Oracle Utilities Application Framework provides a foundation for providing accessible products. Over the last few releases, general accessibility enhancements have been implemented to automatically implement relevant standards.

Each release optimized internal rendering of screens to meet the latest assessments and standards. In this service pack the following additional accessibility features have been implemented:

- **Tab stops on query zone headers** – Products can customize the behavior of pressing tab to move across the header fields or to the records on the zone using the **ouaf.accessibility.features** configuration property.
- **Correcting tab stops** – Read only fields will be ignored for tab stops.
- **Title tags** – The title tag is now automatically generated in UI Maps.

Miscellaneous enhancements

A number of smaller enhancements have been added to this service pack:

- A new encryption/decryption convenience API has added to support in-product encryption for data fields.
- Internal program names are now included in TKPROF traces to aid in bug resolution.
- Patching has been extended to include the ability to add lookups easier. The feature needs to have Java field and value names populated for all lookups. The install of the Service Pack will automatically populate and correct these lookup attributes if necessary.
- Automatic formatting can be disabled for numeric fields using UI Hints using the new **alphaFormat** attribute.

Fixes included in this Service Pack

The following fixes are included in this Service Pack:

TABLE 1 – FIXES FROM THIS SERVICE PACK

FIX #	AREA	CONTENT
9580915	Translation	App Viewer Starts With Wrong Language (Incorrect Cookie Name)
12919398	General	Inconsistant Space Between Input Text And Custom Search Text Fields.
13000579	Security	11748 Security & Encryption For Credit Cards, Passwords, Sensitive Info
13080330	System Wide	Context Menu Not Showing Up Though Context:True Is Specified In The Display Map.
13578297	System Wide	Firefox-Mdm: Keyboard Focus Lost After Save/Cancel Of Record
