Introduction

Introduction

The Data Reference Manual (DRM) describes the data model entities of the Published Model of Oracle Product Lifecycle Analytics Multi-Dimensional Schema (MDS). The schema reference tables are documented across DRM Volume 1 and DRM Volume 2 in release 3.3.1.1.

Intended users of this document are advanced database developers who extend and customize the MDS data model to build custom solutions based on the prepackaged dashboards and reports within the Oracle Product Lifecycle Analytics application.

Note: The schema reference provided with the product may change in future releases. Any customized solution provided on the basis of this reference manual is not supported and you may need to make appropriate changes in future releases.

The measures are analyzed with not just the gate dimensions but also with project, phase, program and portfolio dimensions the gate belongs to. The source input for the table is the activity table. The phase derivation is based on the configuration and business rules. Only user-defined measures from the gate are propagated to the phase gate fact table and it is a services activity to bring in the facts into the model. This table does not contain any private templates.

Dimension Tables

The Dimensions in the MDS have multiple levels of attributes or a *Hierarchy*. This section describes the method in which the hierarchical attributes in the MDS database are stored and lists the various cascaded dimension entities.

Consider the following Hierarchy of Attributes specific to the 'Location' Dimension.

1. **Level 0** - Continent
2. **Level 1** - Region
3. **Level 2** - Country
4. **Level 3** - States
5. **Level 4** - Cities

All these attributes are stored in the database table with unique identification.

Example

Table 2–7 Dimension table example

ID	Name	Level0	Level1	Level2	Level3	Level4
3	Continent	123	-124	-125	-126	-127
23 4	Continent Region	123	234	-235	-236	-237
34 5	Continent Region Country	123	234	345	-346	-347
45 6	Continent Region Country States	123	234	345	456	-457
56 7	Continent Region Country States Cities	123	234	345	456	567

All cascaded attributes do not have the same number of levels. The non-existent levels are identified by negative-valued identifiers. The following table displays the level names corresponding to each level:

Table 2–8 Level names corresponding to each level

ID	Level0 _ Name	Level1 _ Name	Level2 _ Name	Level3 _ Name	Level4 _ Name
123	Continent	UNDEFINED	UNDEFINED	UNDEFINED	UNDEFINED
234	Continent	Region	UNDEFINED	UNDEFINED	UNDEFINED
345	Continent	Region	Country	UNDEFINED	UNDEFINED
456	Continent	Region	Country	States	UNDEFINED
567	Continent	Region	Country	States	Cities

The level name corresponding to the negative-valued identifiers is *UNDEFINED*.

Staging Tables

The staging tables are used as interface tables between the transactional database source tables and the target tables. The staging table structure is independent of source data structures.

When the ETL process runs, staging tables are truncated before they are populated with change capture data. During the initial full ETL load, these staging tables hold the entire source data set for a defined period of history, but they hold only the changes and updates to data during the subsequent refresh ETL runs.

Materialized Views

A Materialized view is a logical view of your data. In Materialized views, the result set of the query is saved in a table. These tables can be indexed, so it is easy to locate information when the tables are queried. All the joins in the Materialized views are resolved when the Materialized views are refreshed. Therefore, when you query the Materialized view, there is no delay that results from the resolution of the joins in the query.

If Query rewrite is enabled in Materialized views, Oracle allows you to optimize a query such that it sources the results from your Materialized view. If you have created your Materialized views as forms of aggregate tables or as copies of frequently executed queries, the query response time is lesser than that in a regular view. This improves the response time of the end user application.

Note: The data you receive from the materialized view is as latest as the last refresh of the Materialized view.

You can refresh the Materialized views manually or on a set schedule. You can also have the Materialized view refreshed when the database detects a change in data from the related source tables. Materialized view logs capture the change of data in the related source tables and serve as key input to the update of the Materialized views.

Data Validation Rules

Various fact tables, for example, PC_ECO_F, have a VALID_FLAG column to indicate the fact data for the row is valid or invalid. Data is valid if value is set to **1** and invalid if value is set to **0**. The value is set to **0** if the object data, for example, ECO, in Agile PLM source system is not consistent or inaccurate for deriving volume, cycle-time, aging and other related measures in the Oracle Product Lifecycle Analytics application.

Following data validation rules are used for setting the value of VALID_FLAG column to 0:

1. 1. CREATE_DATE column value for corresponding change object (for example., ECO) row in the corresponding Agile PLM source table is NULL
2. 2. WORKFLOW_ID column value for corresponding change object (for example., ECO) row in the corresponding Agile PLM source table is NULL
3. 3. SUBMIT_DATE column value for corresponding change object (for example., ECO) row in the Agile PLM source table is less than the CREATE_DATE column value.

Note: ETL uses CREATE_DATE as SUBMIT_DATE for various derived measures if the SUBMIT_DATE value is NULL.

4. 4. RELEASE_DATE column value for corresponding change object (for example., ECO) row in the Agile PLM source table is less than the SUBMIT_DATE column value.

Note: ETL uses SYSDATE as RELEASE_DATE for various derived measures if the RELEASE_DATE value is NULL.

5. 5. FINALCOMPLETE_DATE column value for corresponding change object (for example., ECO) row in the Agile PLM source table is less than RELEASE_DATE column value.

Note: ETL uses SYSDATE as FINALCOMPLETE_DATE for various derived measures if the FINALCOMPLETE value is NULL.

In addition to the above rules, all the workflow fact tables (for example., PC_ECO_WORKFLOW_DETAILS_F) use the following rule:

- NEXT_STATUS column value in Agile PLM's CHANGE_HISTORY table is NULL and EVENT_TYPE column value is either 65 (Submit) or 71 (Review).

User Defined Extensions

User Defined Columns in the Fact Tables

Table 2–12 User Defined Columns in the Fact Tables

Prefixes to the User Defined Columns

Besides the user defined columns listed above, the MDS also provides user defined columns for specific functionality. Such columns are identified by their prefixes listed in the table below. These prefixes denote the association of a user defined column to the category of PLM functionality.

For example, the column name `USRDEF_DATE0` in the dimension and fact tables denotes the User Defined Date. The same column name when prefixed with `PRJ_`, hence `PRJ_USRDEF_DATE0`, denotes the User Defined Date for belonging to a Project.

Table 2–14 *Prefixes to the user defined columns*

Prefix	PLM functionality
ACT	Activities
AI	Affected Items
DEL	Deliverables
DEV	Deviations
ECO	Engineering Change Order

User Defined Dimension Tables

You can configure the tables `USRDEF_L01_D` to `USRDEF_L119_D` as Dimensions across Subject Areas. Use these tables to bring P2/P3/Flex attributes from Agile PLM.

User Defined Bridge Tables

Each Core Fact and Item Fact table has five Bridge tables to handle many-to-many relationships.

PPM_PHASE_GATE_F

Phase gate fact table. The grain is the gate. The Phase gate table is the fact table that has the relationship between a phase and a gate. The grain of the table is gate of type DG1-DG6 and the start gates. The measures are analyzed with not just the gate dimensions but also with project, phase, program and portfolio dimensions the gate belongs to. The source input for the table is the activity table. The phase derivation is based on the configuration and business rules. Only the user-defined measures from the gate will be propagated to the phase gate fact table and it is a services activity to bring in the facts into the model. This table will not contain any private templates.
