Name list-resource-refs – lists the existing resource references

Synopsis list-resource-refs [--help] [*target*]

Description The list-resource-refs subcommand lists all resource references in a server instance. This effectively lists all the resources (for example, JDBC resources) available in the JNDI tree.

This subcommand is supported in remote mode only.

Options --help
-?
    Displays the help text for the subcommand.

Operands *target*
    The target for which you are listing the resource references. Valid targets are:

    server
        Lists the resource references for the default server instance and is the default target.

    cluster_name
        Lists the resource references for every server instance in the cluster.

    instance_name
        Lists the resource references for the named unclustered server instance.

Examples EXAMPLE 1 Using the list-resource-refs subcommand

The following command lists resource references.

```
asadmin> list-resource-refs --user admin
--passwordfile passwords.txt
jms/Topic
Command list-resource-refs executed successfully.
```

Exit Status 0   subcommand executed successfully

1   error in executing the subcommand
