

Admin GUI and Woodstock 4.1.1 Testing

Below are issues found when testing woodstock build 4.1.1:

- Tree did not display initially. Needed to add entry "com.sun.webui.jsf.faces.UIComponentELResolver" in "faces-config.xml file". Tree then was able to load and display.
- Tree does not get updated properly when creating/deleting objects. Also at times duplicate tree nodes appear. This may be an AJAX issue. [See screenshot](#).
- Breadcrumbs do not work. [See screenshot](#).
- Data and buttons were missing on a few tables. I saw this twice and have not been able to reproduce. [See screenshot](#)
- Timestamp radio button behavior not working properly. The "Specific Range" input controls are displayed initially and selecting "Most Recent" does hide the specific range inputs but selecting "Specific Range" again does not display them.
- There were exceptions being reported on the following pages. Most exceptions were coming from the ConfigurationHandlers.java file. [Click here](#) to See Exceptions.
 - Any Realm Pages: File Realm, Certificate Realm, Admin-Realm
 - Edit Module SSL Tab on HTTP-Listeners Page
 - Virtual Server Settings Details Page
 - JMS Physical Destination Details Page
