Bug 1334986 - INSERT from remote SELECT with > 256 columns can spin leaking lots of memory [ID 1334986.8]

Modified 24-SEP-2008 Type PATCH Status ARCHIVED

Bug 1334986 INSERT from remote SELECT with > 256 columns can spin leaking lots of memory

This note gives a brief overview of bug 1334986.
The content was last updated on: 08-AUG-2003
Click [here](#) for details of each of the sections below.

Affects:

Product (Component)	Oracle Server (Rdbms)
Range of versions <i>believed to be affected</i>	Versions >= 8.1.5 but < 9.0
Versions <i>confirmed as being affected</i>	<ul style="list-style-type: none">8.1.6.28.1.7.0
Platforms affected	Generic (all / most platforms affected)

Fixed:

This issue is fixed in	<ul style="list-style-type: none">8.1.6.3 (Server Patch Set)8.1.7.1 (Server Patch Set)9.0.1.0 (Base Release)
------------------------	--

Symptoms:

- Leak (Memory Leak / Growth)
- Error May Occur
- Internal Error May Occur (ORA-600)
- Hang (Process Spins)
- ORA-4030
- ORA-600 [17090]
- ORA-600 [723]

Related To:

- Database Link / Distributed

Description

This problem was introduced in 8.1.5
Insert from remote tables with more than 256 columns can
cause an infinite loop in remote buffering routines exhausting PGA
memory. This can also show up as ORA-600 [17090] / ORA-600 [723]
/ ORA-4030

RDBPROD: Introduction to Rdb "Bug Description" Articles [ID 1193733.1]

Modified 23-JUN-2011 Type REFERENCE Status PUBLISHED

This is a customer overview of the Rdb "Bug Description" documents which can be seen in My Oracle.

What are Rdb "Bug Description" Articles ?

Each article is a placeholder note for a summary description of a bug (defect) in a product in the Rdb family of products. The articles give the following summary information on an individual bug:

- [Affects](#) - Product version/s affected
- [Fixed](#) - Product version/s where the bug is fixed
- [Symptoms](#) - Key symptoms of the bug
- [Related To](#) - Key features / product areas / parameters / views etc.. which the issue is related to
- [Description](#) - A short description of the problem, sometimes including an example and/or a workaround

Many of the articles will show very little information against the description of the problem but may still be useful as they show which versions are likely to be affected and can give some idea of the impact of the bug.

IMPORTANT:

These short articles will not usually give enough information to identify that you are hitting, or may hit, a specific issue. Always check with Oracle Support if a particular issue is of interest. Also please note that some of the workarounds given may be very specific, or may have side effects. Again contact Oracle Support for information about any particular bug.

Please note that not all bugs have a bug description present. The aim is to have a description for almost all customer related bugs fixed in Oracle Rdb 7.2 or later. The version can vary with the product. We are creating these for all products in the Rdb family. Some other Oracle products have similar descriptions.

Affects

This section shows the product that the bug is reported against, the range of versions believed to be affected, the versions which are confirmed as being affected and details of the platforms affected. If the issue is believed to be a [regression](#) than that is also indicated.

Description

```
$ rmu/unload/after/cont/incl=act=(commit)/stat=1800/nolog -  
/table=(name=TABLE1,output=rdb_logminer_output_file) -  
/table=(name=TABLE2 ,output=rdb_logminer_output_file) -  
/table=(name=TABLE3,output=rdb_logminer_output_file) -  
/restart=1-28-1-161750-25853-25853 DATABASE.RDB
```

fails with:

```
%RMU-F-FILACCERR, error reading work file DISK:[DIR]HFLQASM05IY.TMP;1  
-SYSTEM-W-ENDOFFILE, end of file  
%RMU-F-FTL_RMU, Fatal error for RMU operation
```

RMU/UNLOAD/AFTER_JOURNAL command creates temporary work files. There was a problem managing the buffer pools used with these work files which could cause a SYSTEM-W-ENDOFFILE error to occur when reading a work file when multiple database tables were being unloaded in the same RMU/UNLOAD/AFTER_JOURNAL command.

Please note: The above is a summary description only. Actual symptoms can vary. Matching to any symptoms here does not confirm that you are encountering this problem. For questions about this bug please consult Oracle Support.

Oracle Rdb

This bug involves or can affect Oracle Rdb.

Optimizer

This bug involves query optimization.

Ranked Indexes

This bug involves or can affect sorted ranked indexes.

Recovery Unit Journaling

This bug is connected to the use of Recovery Unit Journaling (RUJ), possibly by database recovery (DBR) processes.

Security (Authentication / Privileges / Auditing)

This issue relates to auditing , authentication or privileges used in the database.

Description

This is a brief description of the bug itself, including any workaround if known. Sometimes this will be very short such as "A dump can occur in XXXXX" and sometimes this will include a good description with an example. Any workaround should be treated with caution.
