SG&I Division

Using Oracle Spatial for Managing Multiple Enterprise Workflows in Utilities

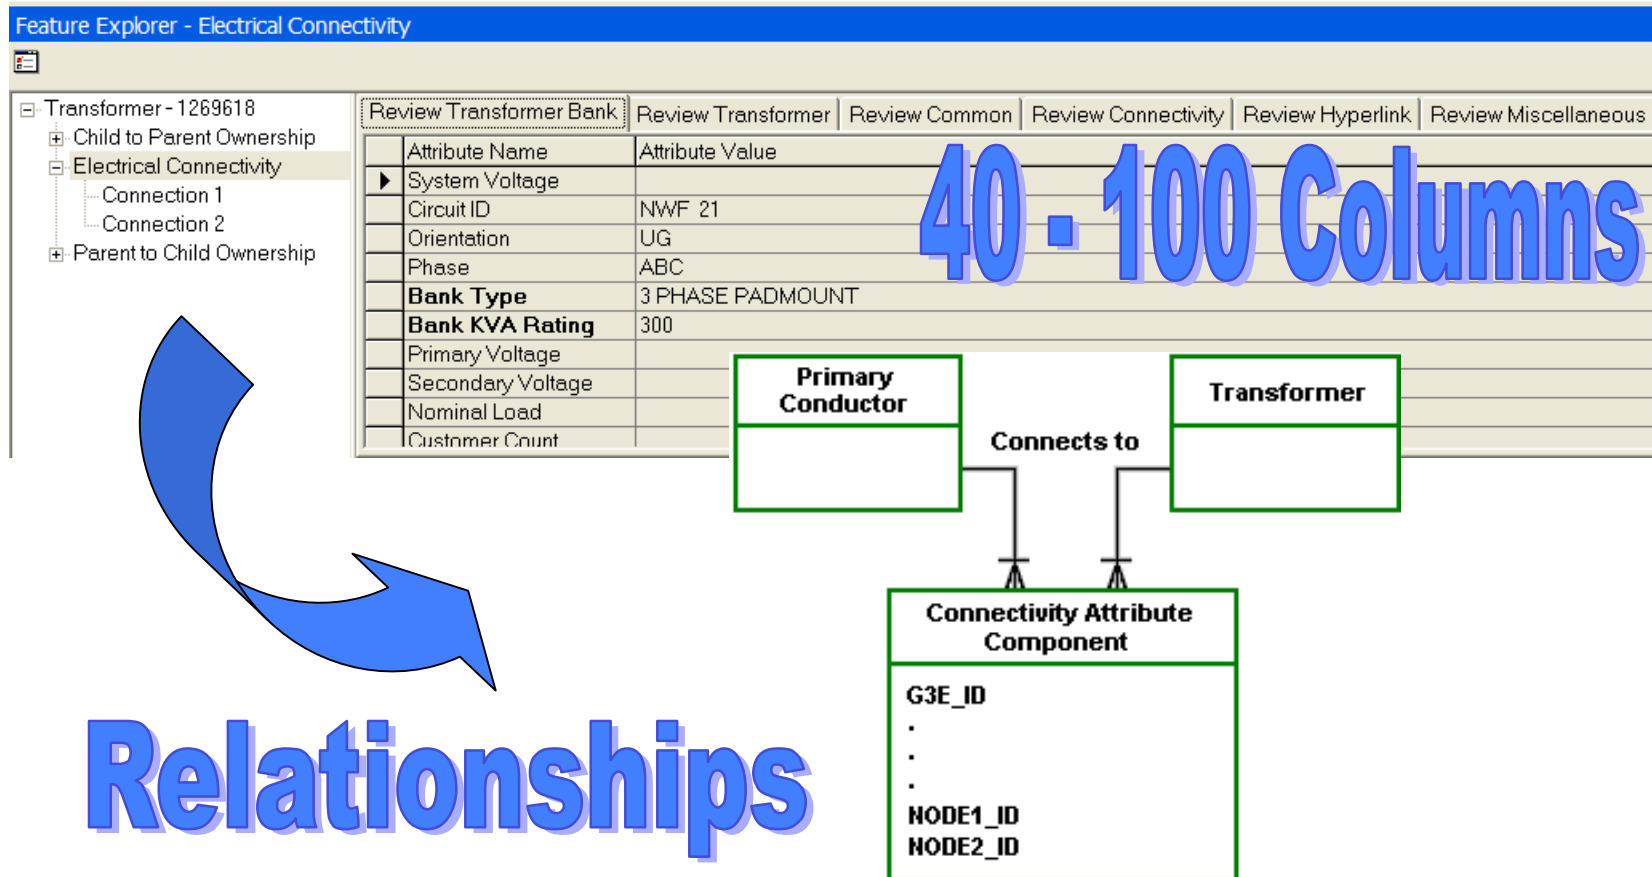

Utility Repository

- Utility companies track a multitude of equipment and assets
- Heavily attributed with:
 - Equipment characteristics
 - Relationships to other equipment
 - Work tracking history
- Location – what “spot” on the earth?
 - Just another attribute

Utility Network

Assets and Attribution

Asset Location

You are here!

Historical Corporate Repository

- Proprietary system for location storage
 - Specialized API or tools required to populate and edit
- Two-phase commit required
 - Synchronize creation and edit of location and other attributes
- Difficult interchange between agencies
 - Data translation or extraction tools required

Corporate Repository Benefits

- Open data storage
 - No specialized software required
- Standard IT practices
 - Report building to include geometries is an extension of standard report
- Availability of talent in Oracle
- Readily available IT staff
 - No specialized programming languages
 - Standard disaster recovery processes apply

Oracle Spatial!

Spatially Enabled Applications

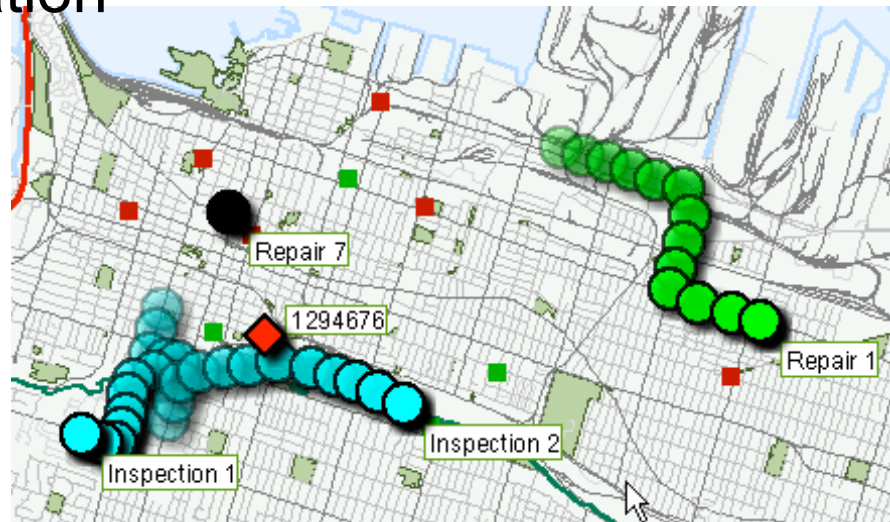

- Utility companies need to know relative position of customer to servicing equipment
 - Outage management
 - Maintenance and inspection scheduling
- Crews need to be routed to work locations efficiently
 - Field force automation
 - Mobile work force management applications

Example Applications

- Call Before You Dig
 - 1,230,000 Google matches
- Field Force Automation
 - Dispatching
 - Tracking field crews

Call Before You Dig

State law requires that before anyone begins digging or excavating, they need to first make the "One Call" for utility locates.

Expanding Necessity of Data

- Get more out of your data
 - Get it to more users
- Enable better business decisions with more accurate data
 - Oracle data warehouse for data mining by various applications

Recognizing the User

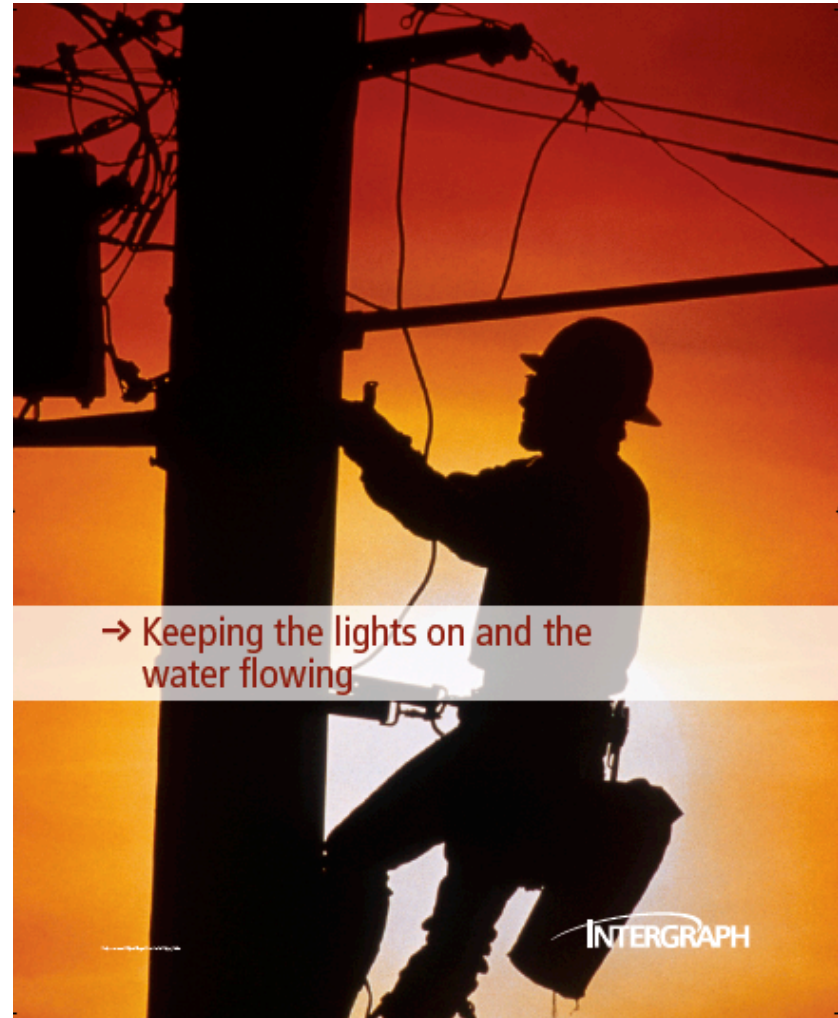

- One application or many?
 - Users have diverse skills and needs
- Software applications should help user do his job better
 - Tune presentation of data to each user
 - Restrict available functions to simplify training and support

Many Tools – One Repository

- Utilize the Oracle database as the central repository
- Many applications will access the repository directly
- External data easily integrated
 - Use Oracle tools for both import and export
- Specialized data sets can be created with common data access techniques

Anytown, USA Utility Workflows

- Engineering design
- Planning analysis
- Outage inquiry
- Spatial reporting

Engineering Design

- Traditional workhorse of GIS applications
- Builds the centrally managed data warehouse

Geometry

Work Management

Attributes

The screenshot shows a GIS application window titled 'MapWindow1' with a map displaying various symbols and labels like 'ABC 750'. Overlaid on the map is a 'Compatible Unit Query' dialog box. The dialog box has a 'Values for query' section with a table for 'Compatible Unit Code' and an 'Execute' button. Below this is a 'Query results' section with a table showing the results of the query.

Macro Indicator	Compatible Unit Code	Description
C	UC15	SEC CABLE D/B 1/C, 500 MCM, AL XLP
C	US10	SEC CABLE D/B 1/C 4/0 AL XLP
C	US11	SEC CABLE D/B 1/C 1/0AL XLP
C	US15	SEC CABLE D/B 1/C 500MCM AL XLP
C	US21	SEC CABLE D/B #2 THRU 4/0PRI #8 500
C	US24	SEC CABLE D/B 2/C SL #4 XLPECNPJ
C	US26	SEC CABLE D/B 2/C SL #6 HMP/HDP CIC
C	US28	SEC CABLE D/B 2/C SL #8 HMP/HDP

At the bottom of the screenshot, there is a table with columns: Secondary Conductor, Secondary Wire, Additional Attributes, Primary CU, Ancillary CU, Additional Cost Item, Application Dependency Attr. The table contains one row with data: Compatible Unit, Macro CU, Activity, Quantity, Account, OnEnergized System, Usage, Difficulty Factor.

Data Model Considerations

- Utility deals with many geographic elements
 - Streets, conductors, parcels, labels, annotation
- User must have control over
 - What is displayed
 - What is considered in spatial queries
- Data entity-relationship consideration
 - One-to-one mapping of graphic to SDO_GEOMETRY column
 - Multiple graphic columns per table
 - Many-to-one mapping of graphic to SDO_GEOMETRY columns

Data Model Example

OneToOneCondLabel
<ul style="list-style-type: none"> ◆ConductorLabel : SDO_GEOMETRY ◆ConstructionDate : Date

Preferred modeling

RowID	ConductorLine	Material
2	<Geometry>	Copper

ConductorData
<ul style="list-style-type: none"> ◆Line : SDO_GEOMETRY ◆Label : String ◆Material : String ◆ConstructionDate : Date

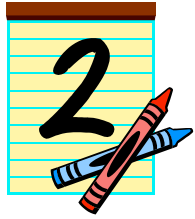

based on workflow

RowID	ConductorLine	Material	ConstructionDate
2	<Geometry>	Copper	3/4/2007

ManyToOne
<ul style="list-style-type: none"> ◆Line : SDO_GEOMETRY ◆Material : String ◆LineType : String

requirements

RowID	ConductorLine	Material	LineType
2	<Geometry>	Copper	Conduit

Planning Analysis

- What-if scenarios using data warehouse
 - How to handle population growth
 - Analyze areas with high outages for rebuilding
- Using an enterprise repository means:
 - Data immediately available after design
 - No conversion, translation or batch imports

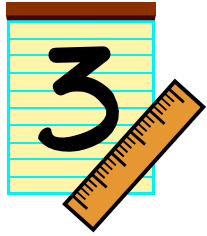

Example Analysis

- Substation reporting tool
 - Determine the amount of underground cable per substation
- Data involved
 - Primary Conductor (linear), Breaker (point), Substation (area)
 - Breaker owned by substation
 - Breaker carries name of circuits energized by this substation
- For each substation
 - Find circuit names from owned breakers
 - Find all primary conductors with associated circuit names
 - Create a collection geometry per substation
 - New derived data: PRICOND_SUB

V I D E O

Substation Reporting

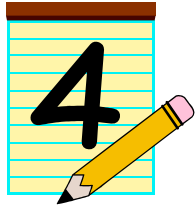

Outage Inquiry

- Simplified interface for novice users
- Ready access to same data warehouse
 - Or an easily managed public replica
- Data involved
 - Outages by type
 - Substations
 - Preconfigured thematic presentation of conductors

V I D E O

Tree Outages

Spatial Reporting

- Expand the typical use of database tools
- Tax reports created through database queries and standard IT report tools
- Census + utility data query
 - Determine number of poles per county
 - Use in tax assessment

D E M O N S T R A T I O N

Database Reporting

Other Repository Uses

- Integration with land management
 - City, county and state governments
- Ready sharing of data between agencies
 - Permit clearances
 - Share plans between different utilities
- Applicable to any industry
 - Electric, gas, water, communications
 - Unique in many workflows but same benefits

Summary

- Utilities manage large amounts of data
- Applications must address diverse end-user workflows
- Enterprise repository can greatly simplify application management
- Spatial data – managed by Oracle Spatial – adds value to the utility enterprise
 - Enables better, more cost-effective business operations
