Primary Author: Ashwin Sadanandan, Gary O'Hara

The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software – Restricted Rights (June 1987). Oracle Corporation, 500 Oracle Parkway, Redwood City, CA 94065

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

Oracle, JD Edwards, PeopleSoft, and Siebel are registered trademarks of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

Preface

The Oracle Retail Advanced Inventory Planning Implementation Guide describes post-installation tasks that need to be performed in order to bring Advance Inventory Planning online and ready for production use.

The Implementation Guide includes some or all of the following sections, depending upon the release:

- System configuration settings for the UNIX and AIP environments
- Interfaces and data mappings between AIP and other systems

Audience

The Implementation Guide is intended for the AIP integrators and implementation staff, as well as the retailer's IT personnel.

The reader should have an in-depth understand the following concepts and applications in order to perform the processes describes in this document:

- UNIX system administration, shell scripts, and job scheduling
- Oracle Retail Integration Bus (RIB)
- Oracle Retail Predictive Application Server (RPAS)
- Oracle Retail Demand Forecasting (RDF)
- Oracle databases
- Performance constraints based on the retailer's infrastructure
- Technical architecture for AIP
- Retailer's hierarchical (SKU/Store/Day) data
- AIP batch processes

Related Documents

For more information, see the following documents in the Oracle Retail Advanced Inventory Planning Release 12.0 documentation set:

- Oracle Retail Advanced Inventory Planning Installation Guide
- Oracle Retail Advanced Inventory Planning Operations Guide
- Oracle Retail Advanced Inventory Planning Administration Guide
- Oracle Retail Advanced Inventory Planning Online Help
- Oracle Retail Advanced Inventory Planning – Data Management online User Guide
- Oracle Retail Advanced Inventory Planning – Order Management User Guide
- Oracle Retail Advanced Inventory Planning – Store Replenishment Planning User Guide
- Oracle Retail Advanced Inventory Planning – Warehouse Replenishment Planning User Guide

The following documentation may also be needed when implementing AIP:

- Oracle Retail Integration Bus (RIB) 11.1 documentation
- RETL 11.3 documentation
- Oracle Retail Predictive Application Server (RPAS) documentation

Customer Support

- <https://metalink.oracle.com>

When contacting Customer Support, please provide:

- Product version and program/module name.
- Functional and technical description of the problem (include business impact).
- Detailed step-by-step instructions to recreate.
- Exact error message received.
- Screen shots of each step you take.

Conventions

Navigate: This is a navigate statement. It tells you how to get to the start of the procedure and ends with a screen shot of the starting point and the statement “the Window Name window opens.”

Note: This is a note. It is used to call out information that is important, but not necessarily part of the procedure.

This is a code sample
It is used to display examples of code

A hyperlink appears like this.

Overview

Once AIP has been installed, you need to configure the system environment variables, create integration files, and configure the system according to the retailer's specifications.

This guide provides information on

- Implementing the AIP solution.
- Customizing AIP for the retailer's environment and needs.
- Integrating AIP with merchandising, forecasting, and other external systems.

Supported Oracle Retail Products

This version of AIP is compatible with the following Oracle Retail products:

- Oracle Retail Merchandising System (RMS) 11.0, including Oracle Retail Sales Audit (ReSA)
- Oracle Retail Demand Forecasting (RDF) 12.0
- Oracle Retail Predictive Application Server (RPAS) 12.0.4
- Oracle Retail Integration Bus (RIB) 11.1
- Oracle Retail Extract Transform and Load (RETL) 11.3

Supported Oracle Databases

General requirements for a database server capable of running the AIP Online application include:

- UNIX based OS certified with Oracle 9i release 2 (v. 9.2.0.x) Enterprise Edition. Options are AIX 5.3 and Solaris 9
- Oracle 9i release 2 (v. 9.2.0.x) Enterprise Edition

Application Servers Supported by AIP 12.0

General requirements for an application server capable of running the AIP Online application include:

- UNIX based operating system certified with WebSphere 5.1.1. Available operating systems are AIX 5.3 and Solaris 9.
- IBM WebSphere Application Server version 5.1.1.

Pre-Implementation Considerations

When preparing to implement the Advanced Inventory Planning solution, you must closely explore the retailer's infrastructure, hierarchy data, and other factors that may require customizing the AIP environment through the use of configuration files and settings, custom scripts, and the RPAS Configuration Tool. Preparing your environment and analyzing your retail and data needs thoroughly before implementing AIP.

The following list provides some of the issues that the implementation team may need to address prior to implementation:

1. Hierarchy Setup

- Identify the attributes used by the Product, Location and Time hierarchies, as well as their sources and update frequency.
- Define the dimensions within each of the Hierarchies and determine the default spreading characteristics settings.
- Define any Alternate Hierarchies and identify the relationship of the required Attributes that drive those Alternates.
- Define User Defined Hierarchies to be used by planners.

The hierarchy setup mentioned above may vary depending on the extent that the Configuration Tool will be used by the application.

2. Measure Settings

The following measure settings need to be addressed during implementation, which can vary depending on the extent that the Configuration Tool will be used by the application.

- Metric/Measure definitions, usage, interaction and calculations.
- Default Label to use when building measure labels
- Default Data Type
- Default NA Value
- Default Base Intersection
- Default Aggregation Method
- Default Spread Method
- Default Base State Read / Write Status at the base level
- Default Agg State Read / Write Status at aggregated levels

3. Setting Custom Wizards

Determine if any custom wizards are required that don't exist in the base application. The use or implementation of wizards can vary depending on the extent that the Configuration Tool will be used by the application.

4. Workbook Templates, Worksheets, Tabs, Formats

Workbooks can be created or refreshed through batch processing. By doing the processing in batch at night, the end users are spared from the wait time associated with each action. The Batch Processing section should outline when each of these operations will take place.

For these default auto workbook builds, the layout, formatting, hierarchies, wizard, tabs, worksheets must be defined.

Configuring the timing of data loads, refreshes, and purges/deletions of workbooks must be set.

5. Daily and Weekly Batch Processing and scheduling

Configure the system for the following defaults:

- Batch Processes
- Week-ending Processes
- Day Ending Processes
- Data Updates
- Restructures - Adds, Renames, Deletes
- New Year Setup- 53 weeks
- Data Aging/Purging
- Administrative Processes
- Backups

6. Sizing Estimates/Hardware Requirements

A sizing estimate spreadsheet and hardware requirements should be supplied to the client. These factors are dependant on the number of domains, intersection points, number of workbooks, purge and delete strategy, planning horizon, retention of data, etc.

7. Security Access and Viewing

- User Setup/Security

To define Workbook Template Security, the system administrator will grant individual users, or user groups, access to specific workbook templates. Granting access to workbook templates provides users the ability to create, modify, save, and commit workbooks for the assigned workbook templates. Users will typically be assigned to "groups" based on their user application (or solution) role. Users in the same group can be given access to workbook templates that belong to that group alone. Users can be assigned to more than one "group" and granted workbook template access without belonging to the user group that typically uses a specific workbook template. Workbook access is either denied, read only, or full access. Read only access will allow a user to create a workbook for the template, but the user will not be able to edit any values or commit the workbook. The read only workbook can be refreshed.

When users save a workbook, they assign one of three access permissions to the workbook:

- World – Allow any user to open and edit the workbook.
- Group – Allow only those users in their same group to open and edit the workbooks.
- User – Allow no other users to open and edit the workbook.

Note: A user must have access to the workbook template in order to access the workbook, even if the workbook has world access rights.

- **Workbook Limits**

Another aspect of workbook security is the ability to set limits for the number of workbooks that a user can have saved at any given time. Limits can be set at the following levels:

- User per template
- User Group per template
- Globally per template for all users

The limits are evaluated in the above order, which means that a limit defined at user-template overrides any values defined at group-template or global-template levels. If the above limits are not defined, the default value is one billion. The limits are checked when a user begins the workbook build process. If the user's limit has been reached, an error message appears that informs the user that the workbook build process cannot be completed because the user has reached their limit. The message also informs the user what that limit is. The wizard process then terminates.

8. Data Management Automation

Creation of certain logical constructs in Data Management may be set automatically depending on the setting of certain parameters.

A Delivery Group will be created for a new supplier if the automation flag is set to "On". The "Ship To" option selected on the Supplier Attribute form in RMS drives which delivery group is created. For example, if the RMS "Ship To" attribute is set to Cross dock Only, the Delivery Group created for that supplier will contain all scheduling locations assigned warehouses with the warehouse type of Cross dock.

A Delivery Group will be created for a new supplier if the automation flag is to "On". When the appropriate information is loaded into the online system, a process is initiated that will look for new suppliers when a new demand group is created. If new suppliers are found, the system creates new order groups for them. One order group is created for each stocking point with the specified default order cycle.

A Demand Group will be created for a new supplier if the automation flag is to "On". The demand group will be automatically assigned to the delivery group for the appropriate supplier.

9. Reconciliation

The reconciliation period is set to a day if the method is Reconciliation day-on-day and is set to a review period at source if the method is Reconciliation-over-time. Therefore, it has to be determined which reconciliation method will be selected at SKU level.

You must set a flag to have a SKU reconciled in a constrained scenario.

10. Replenishment Methods

Define the replenishment methods to be used. Rule out replenishment methods that are not applicable.

11. Perishables functionality

Spoilage threshold is calculated using the Acceptable Loss parameter. Acceptable loss is a user-managed parameter in SRP, defined either at the class/store format level or the SKU/store/day level.

Users have the ability to determine when to use expected spoilage via a 'Store use inventory aging flag'. Constraints on the application of inventory aging are as follows

- a. A global limit (in number of days) on or inside which an item with product life can be considered in the expected spoilage calculation.
- b. An expected write-off's user maintained measure.

The first constraint is used as a high limit in number of days for a product life and is called 'Store Inventory Aging Limit'. Product life as entered by a user does not have a limit. The effectiveness of product life needs to be controlled by a User. Therefore a global limit respective to the product life is necessary and configurable. The second constraint refers to the fact that aging is a calculated number, not an actual number. The user may have an actual number of spoilage that is to be used. A measure (expected write-off's) can be entered by the user and if entered will override any spoilage calculation and be used as the amount to spoil on the given day.

To summarize the user input for expected spoilage:

- The product life of the inventory at the point of receipt into the final selling destination. (Sku/Str/Day)
- The 'Store use inventory aging flag' (Sku)
- The global limit for using inventory aging (Scalar)
- Expected write-off's (amount to spoil). (Sku/Str/Day)

12. Shelf capacity

If the Shelf Capacity flag is set to "True", then shelf capacity will be considered when setting boundaries.

13. Substitution and value added functionality

The linked product flag is only used for user review purposes in AIP and indicates whether there is a value added/pre-priced commodity or banded item association with that particular SKU. If there is a value added/pre-priced association, the linked product flag is only True between the promotional start and end dates. This flag will be set within RMS.

Also a Substitution Flag must be set at the SKU level within Data Management, which sets that a SKU is substitutable across Demand Group.

14. User Specified Allocations

You must set the number of days of history required for using USA Indexed.

15. Alerts

Set the days that an alert will be run.

16. Store Reconciliation Matrix configuration

The number of store priorities is configurable; therefore, the Shortage and Stockless Surplus Priority Matrices may grow or shrink. However no screens or workbooks are provided to view and maintain the configuration.

The priority of each boundary, for each store priority, will depend on the number of store priorities defined. The order in which each boundary is met is configurable however no screens or workbooks are provided to view and maintain the configuration.

17. Network Throughput settings

The WRP Network Threshold Maintenance workbook is used to maintain network alert parameters. The WRP Network Threshold Maintenance workbook is available at the global and local domain levels. All measures should reflect the value in the domain during load and refresh times, and all editable measures should be committed to the domain unless otherwise stated.

System Configuration

Setting Environment Variables

After AIP is installed, you must define the environment variables for the domain paths, integration directory paths, message logging levels, etc. These variables define the environment in which batch scripts are run. These settings do not affect the way in which the business uses AIP to replenish the supply-chain.

The scripts run as part of the nightly batch on both of the AIP platforms, RPAS and Oracle. Both platforms have defined environment variables for configuration.

Configuring AIP RPAS Environment Variables

The following aspects of the RPAS-side batch must be configured so that the `aip_batch.sh` and each batch step script can be run from the command line or from a job scheduler.

Setting RPAS Position Level Security

The position level security for RPAS needs to be modified. Position Level Security allows access control for dimensions on a position-by-position basis. Refer to the RPAS Administration for detail information this feature. To specify the security dimension for a hierarchy, use the RPAS Configurations or `hierarchyMgr` utility. Refer to the RPAS Configuration User Guide for more information.

AIP_ENV_RPAS.sh

The variables displayed in the following table need to be defined properly within `aip_env_rpas.sh`.

It is important to note that the values of the environment variables can be variables themselves depending on the business needs. Such variables may add flexibility for environment maintenance, patch testing, etc. and are used at the discretion of the business.

For example:

If `aip_env_rpas.sh` contains

```
RPAS_INTEGRATION_HOME= "${TEST_RPAS_INTEGRATION_HOME}"
```

`TEST_RPAS_INTEGRATION_HOME` is a client specific environment variable whose value is the correct path to the root integration directory. This and all other such variables must also be defined in order to run the batch.

Environment Variable	Description
AIPDOMAIN	Fully qualified path of the AIP RPAS global domain. The default value (<code>TEST_AIPDOMAIN</code>) provided at the time of installation is a variable which must also be defined apart of <code>aip_env_rpas.sh</code> if it is to be retained as the value.

Environment Variable	Description
RPAS_INTEGRATION_HOME	Fully qualified path of a readable/writeable directory that serves mainly as a base for other path definitions later in <code>aip_env_rpas.sh</code> . Commonly set equal to <code>AIPDOMAIN</code> . The default value (<code>TEST_RPAS_INTEGRATION_HOME</code>) provided at the time of installation is a variable which must also be defined apart of <code>aip_env_rpas.sh</code> if it is to be retained as the value.
BSA_TEMP_DIR	Fully qualified path of readable/writeable directory where scripts may store temporary files. Valid definition of this variable is required by the BSA common scripts. Note: THIS SHOULD NOT BE SET TO <code>/tmp</code> . Failures may occur due to insufficient temporary workspace.
BSA_LOG_LEVEL	Script logging threshold severity. Only log entries at this or higher severity level will be written to the script logs. Must be one of { <code>PROFILE</code> <code>DEBUG</code> <code>INFORMATION</code> <code>WARNING</code> <code>ERROR</code> }. Valid definition of this variable is required by the BSA common scripts.
BSA_MAX_PARALLEL	Script parallel process fan-out maximum. The number of processes that any given process (script instance) may spawn. Valid definition of this variable is required by the BSA common scripts.
BSA_LOG_HOME	Fully qualified path of readable/writeable directory where script logs will be rooted. Script logs are written into a hierarchy that parallels the script call tree, rooted in a date stamped directory located in this specified directory. Valid definition of this variable is required by the BSA common scripts.
BSA_LOG_TYPE	Integer parameter that specifies the type of script log files to be written. Must equal one of { <code>0</code> <code>1</code> <code>2</code> <code>3</code> }. These values are defined as follows: <code>0</code> = No logging <code>1</code> = Text ".log" files; <code>2</code> = XML structured ".xml" file; <code>3</code> = Text and XML log files. Valid definition of this variable is required by the BSA common scripts.
BSA_CONFIG_DIR	Fully qualified path to directory that contains the BSA configuration files <code>bsa_cred.config</code> and <code>bsa_fetch_files.config</code> . Valid definition of this variable is required by the BSA common scripts.
BSA_ARCHIVE_DIR	Fully qualified path to directory to which BSA file transfer operations will archive files. Valid definition of this variable is required by the BSA common scripts.
RPAS_LOG_LEVEL	RPAS binary logging threshold severity. Only log entries at this or higher severity level will be written to the script logs from binaries that accept a <code>-loglevel</code> argument. Must be one of { <code>PROFILE</code> <code>DEBUG</code> <code>INFORMATION</code> <code>WARNING</code> <code>ERROR</code> }.

Environment Variable	Description
ONL_OUTBOUND_DIR	Script parallel process fan-out maximum. The number of processes that any given process (script instance) may spawn.
RAW_RMS_DATA_DIR	Fully qualified path to directory that contains untransformed RMS output data.
RMS_SCHEMA_DIR	Fully qualified path to directory that contains RETL schema files corresponding to the untransformed RMS output data.
AIP_SCHEMA_DIR	Fully qualified path to directory that contains RETL schema files depicting the transformed RMS output data.
RPAS_ALI_LIMIT	The value is set to 50. This avoids excessive memory consumption and perhaps running out of memory.

RPAS_TODAY

This value defines 'TODAY' for the AIP RPAS environment. It is used to ensure that the replenishment batch can be run for a single calendar day, independent of the actual server date. During a normal production run of the batch, this value should be set by the VDATE (virtual date) value exported from AIP Online. This variable can be set for ad hoc procedures, but it should be cleared after the procedure has completed as **this may have an adverse affect on the user workbooks**.

Configuring AIP Online Environment Variables

AIP_ENV_ONLINE.sh

The `aip_env_online.sh` variables in the following table need to be configured for your environment. This information can also be found in the README file provided with the online integration files.

It is important to note that the values of the environment variables can be variables themselves depending on the clients needs. Such variables may add flexibility for environment maintenance, patch testing, etc. and are used at the discretion of the business.

Environment Variable	Description
INTEGRATION_HOME	Fully qualified path to the interface home directory.
ONL_OUTBOUND_DIR	The default is <code>\${INTEGRATION_HOME}/outbound</code> . This variable defines the directory location where <code>cron_export.sh</code> will put the files containing the data exported AIP Online.
ONL_INBOUND_DIR	The default is <code>\${INTEGRATION_HOME}/inbound</code> . This variable defines the directory location where <code>cron_import.sh</code> expects the inbound files from RPAS to be sourced from.
ARCHIVE_DIRECTORY	The default is <code>\${INTEGRATION_HOME}/archive</code> . This variable defines the directory location where <code>cron_import.sh</code> will send the input data files for archiving.

Environment Variable	Description
BSA_LOG_HOME	Fully qualified path of readable/writeable directory where script logs will be rooted. Script logs are written into a hierarchy that parallels the script call tree, rooted in a date stamped directory located in this specified directory. Valid definition of this variable is required by the BSA common scripts. This variable is initially set to <code>\${INTEGRATION_HOME}/logs</code> .
BSA_CONFIG_DIR	Fully qualified path to directory that contains the BSA configuration files <code>bsa_cred.config</code> and <code>bsa_fetch_files.config</code> . Valid definition of this variable is required by the BSA common scripts. This variable is initially set to <code>\${INTEGRATION_HOME}/config</code> .
BSA_TEMP_DIR	Fully qualified path of readable/writeable directory where scripts may store temporary files. Valid definition of this variable is required by the BSA common scripts.
BSA_LOG_LEVEL	Logging severity threshold for batch scripts. Only log entries at this or higher severity level will be written to the script logs from procedures that accept the <code>-loglevel</code> argument. Listed in increasing order of severity, one of the following levels must be selected { PROFILE DEBUG INFORMATION WARNING ERROR }.
BSA_LOG_TYPE	Integer parameter that specifies the type of script log files to be written. Must equal one of { 0 1 2 3 }. These values are defined as follows: 0 = No logging 1 = Text ".log" files 2 = XML structured ".xml" file 3 = Text and XML log files Valid definition of this variable is required by the BSA common scripts.
BSA_MAX_PARALLEL	Script parallel process fan-out maximum. The number of processes that any given process (script instance) may spawn. Valid definition of this variable is required by the BSA common scripts.
RETL_MAX_HEAP_SIZE	The default value is 500M. Raise this limit to improve performance on production systems.
RETL_CONFIG_FILE	File name containing database connection information. <code>Config.xml</code> is provided as the default file. This variable is used by <code>RETL in.sh</code> and <code>out.sh</code> extracts. The default value for this variable is set to <code>\${INTEGRATION_HOME}/config.xml</code> .
AIPDOMAIN	Fully qualified path of the AIP RPAS global domain.
HAVE_WIP	Indicates if WIP is enabled to export and import data. The default value is set to false. WIP will not be implemented for AIP 12.0.

Environment Variable	Description
ONL_SCHEMA_OWNER	This variable sets the database schema owner. It is used by the store_source extract. For example, if you are running AIP online extracts as "aipdev121user" but the schema owner is "aipdev121", then regardless of the running database user, ONL_SCHEMA_OWNER should be set to "aipdev121".
NLS_LANG	This variable defines the character encoding of the RETL import files.

RETL

Once RETL is installed, the environment variables displayed in the table below should be defined. Verify that these environment variables are properly defined.

Variable	Description
RFX_HOME	The RETL home directory.
RFX_TMP	The RETL temp directory.
ORACLE_HOME	Oracle installation directory

User Path

When invoking online shell scripts, the user's PATH must include the following directories:

- \$INTEGRATION_HOME
- \$INTEGRATION_HOME/bsa
- \$INTEGRATION_HOME/config
- \$INTEGRATION_HOME/scripts
- \$RFX_HOME
- \$RFX_TMP
- \$ORACLE_HOME

It is important to note that the values of the aip_env_online.sh environment variables can be variables themselves depending on the clients needs. The paths defined in these variables must also be in the user PATH.

For example:

If aip_env_online.sh contains

```
INTEGRATION_HOME= "${TEST_AIP_INT_HOME}"
```

TEST_AIP_INT_HOME is a client specific environment variable whose value is the correct path to the root integration directory. The path that is defined for TEST_AIP_INT_HOME must be in the user's PATH.

Configuring bsa_cred.config Server Access Credentials

The bsa_cred.config file contains single-line records that specify computer and database server access credentials and related connection information, in a generic form that is used by batch scripts that require machine and database access. This information is located in bsa_cred.config file with the intention that the file can be access-controlled so that only the process(es) which runs the RPAS and ONLINE AIP batch can read its contents.

Note: This file is used by both the RPAS and ONLINE batch scripts. If this file is not available in the ONLINE environment because it resides on a separate server than RPAS, it should be copied to the ONLINE database server. Instructions are provided in the AIP Online Configurations section below.

The following table provides a description of the bsa_cred.config fields, which are space-delimited.

Field	Description
Application	Unique key indicating the application for which the record exists. This name is used as a key by dependent batch scripts.
Server	Computer or database server name or "NA" if not applicable for the given application.
User	User name credential or "NA" if not required for the given application.
Password	Password credential or "NA" if not required for the given application. Because passwords may contain spaces, passwords must be encoded with enclosing quotes (" ").

Records for the following keys must be present in the bsa_cred.config file:

- BATCH
- AIP-ONLINE
- AIP-RPAS
- DATABASE

An example of a complete bsa_cred.config file appears below.

```
BATCH      mspdev03      NA            "NA"
AIP-ONLINE mspdev03      onlineusr    "onlinepw"
AIP-RPAS   mspdev03      rpassusr    "rpasspw"
DATABASE   devrtk11      dbuser      "dbpw"
```

Using the Scheduler to Run AIP Batch Processes

This topic provides information about using the Scheduler to run the RPAS and AIP Online batch processes.

1. Configure scripts for RPAS side of batch execution.
2. Configure scripts for AIP Online side of batch execution.
3. Configure scripts for critical path in the scheduler.
4. Configure scripts for non critical paths in the scheduler.
5. Configure the AIP Online Application.
6. Configure the AIP Online Database.

There are five transform scripts:

- aipt_item.ksh
- aipt_orghier.ksh
- aipt_sub_item.ksh
- aipt_str_prd_life.ksh
- aipt_future_delivery.ksh

These scripts are run by a master script, aip_t_master.ksh. These scripts will be located on RPAS server under <\$RPAS_HOME>/bin.

Following files must be moved using some kind of batch scheduler from RMS server to the DM online side to the location defined by <\$ONL_INBOUND_DIR> in file aip_env.sh:

- close_order.txt
- received_qty.txt
- rmse_order_purge.txt

cron_import.sh will not FTP, uncompress, and untar om.tar.Z file to the DM online server. Clients can still use om.tar.Z file, however, they are required to do tar-ing, compressing, ftp-ing, uncompressing and untar-ing using a batch scheduler.

cron_import.sh expects the three files mentioned above to be located in <\$ONL_INBOUND_DIR>.

AIP Online Configurations

AIP Online consists of three different but equally important environments: a UNIX-based platform for executing RETL scripts and batch shell scripts; an Oracle database; and an application server for hosting the web-based Java graphical user interface (GUI). Each environment requires specific values, properties, and files to be configured in order to fully implement the AIP Online portion of the solution.

AIP Online UNIX Environment

The batch scripts which execute on the data stored in the Oracle database run on a UNIX-based platform. RETL must be installed and it must be able to access the AIP Oracle database. In order to execute the batch scripts config.xml, the integration directories, and any files shared by the Online and RPAS must be setup and operational.

config.xml

The RETL interface process, run from a UNIX-based platform, is designed to be fully automated once configured. In addition to the environment variables described above config.xml is required when invoking the RETL scripts. This file should be located in the root integration directory on the UNIX server in which the AIP Online application is installed.

This configuration file contains the database connection information required by RETL for performing import and export operations. Refer to the RETL documentation for detailed descriptions of element definitions. There are two operator sections that need to be completed, one for 'oraread' and one for 'orawrite'. The 'oraread' section defines the properties required for all export operations on the database and the 'orawrite' section defines these for all import operations. Though both contain similar attributes, it's imperative that each section is defined as needed for the specific Oracle database installation. This information is also dependent on the requirement that all databases can be connected to via a properly defined tnsnames file and reachable by SQLPlus.

Below is an example config.xml file:

```
<CONFIG>
  <DEFAULTS operator="oraread">
    <PROPERTY name="arraysize" value="5000" />
    <PROPERTY name="hostname" value="mspdev38"/>
    <PROPERTY name="port" value="1524"/>
    <PROPERTY name="dbname" value="DEV029i"/>
    <PROPERTY name="connectstring" value="aiprmsint121user/retek"/>
  </DEFAULTS>
  <DEFAULTS operator="orawrite">
    <PROPERTY name="hostname" value="mspdev38"/>
    <PROPERTY name="port" value="1524"/>
    <PROPERTY name="dbname" value="DEV029i"/>
    <PROPERTY name="dbuserid" value="aiprmsint121user/retek"/>
    <PROPERTY name="method" value="conventional"/>
  </DEFAULTS>
</CONFIG>
```

Integration Directories

The following directories must be created by the system administrator. They are required and will cause errors if absent:

- \$INTEGRATION_HOME/inbound
- \$INTEGRATION_HOME/archive

Shared Files

When the AIP RPAS module is not installed on the same server as the AIP ONLINE module, the shared credential and verification files must be present in both locations.

The following table lists the files and the appropriate location on the UNIX server. Copy the files from the AIP RPAS server location to the AIP ONLINE server. Where the destination directory does not exist, one should be made. All server locations are written in reference to the `aip_env_online.sh` environment variables.

File Name	Location
<code>aip_common.sh</code>	<code>\$INTEGRATION_HOME</code>
<code>fetch_files.sh</code>	<code>\$INTEGRATION_HOME/scripts/</code>
<code>bsa_cred.config</code>	<code>\$INTEGRATION_HOME/config</code>
<code>bsa_fetch_files.config</code>	<code>\$INTEGRATION_HOME/config</code>
<code>bsa_archive.sh</code>	<code>INTEGRATION_HOME/bsa</code>
<code>bsa_common.sh</code>	<code>\$INTEGRATION_HOME/bsa</code>
<code>bsa_cred.sh</code>	<code>\$INTEGRATION_HOME/bsa</code>
<code>bsa_env.sh</code>	<code>\$INTEGRATION_HOME/bsa</code>
<code>bsa_fetch_files.sh</code>	<code>\$INTEGRATION_HOME/bsa</code>
<code>bsa_file_transfer.sh</code>	<code>\$INTEGRATION_HOME/bsa</code>
<code>bsa_logger.sh</code>	<code>\$INTEGRATION_HOME/bsa</code>
<code>bsa_para.sh</code>	<code>\$INTEGRATION_HOME/bsa</code>
<code>bsa_sql.sh</code>	<code>\$INTEGRATION_HOME/bsa</code>
<code>bsa_unit.sh</code>	<code>\$INTEGRATION_HOME/bsa</code>
<code>bsa_unit_test_script_syntax.sh</code>	<code>\$INTEGRATION_HOME/bsa</code>
<code>bsa_verify.sh</code>	<code>\$INTEGRATION_HOME/bsa</code>

Importing Configuration Files

The files imported into AIP Online are bundled (in a *.tar file) together into logical groupings based on dependencies and availability within the batch window. Each RETL import file has one, and only one, corresponding script that executes the loading of the file into the database. The execution of all RETL import scripts is controlled by a set of configuration files that list the load scripts to be run, and the order in which they will run. Each configuration file corresponds to one *.tar file.

- The configuration files can be modified to prevent execution of load scripts for files which will never be present (e.g. they are optional files for functionality that will not be used by the business). For example ‘Sister Stores’ may not be available in the merchandising system to provide to AIP, or purged order numbers may not be available for po number recycling. The line containing the path to the ‘in.sh’ load script should be deleted or commented out.
- The configuration files are a command line argument passed to the parent script, process_aiponline_data.sh. A modified configuration file or a specially constructed configuration file can be passed to the parent script to aid the initial, first day import, restart/recovery, or special ad hoc processing.
- The parent script will execute all load files listed in the configuration file passed to it. A warning message will be logged when the load script is executed but the corresponding data file is not present.

The import configuration files are listed in the following table along with any potentially optional load scripts. Optional load scripts are those which are not critical to replenishment processing. They are related to functionality outside of replenishment or provide special information that can be used as an alternative to the standard processing. Settings in both AIP RPAS import/export configuration files and AIP Online import configuration files should reflect the file requirements consistently.

Configuration File	Optional Load Scripts
import_hierarchy.config	
import_dm.config	dm/banded_commodity/in.sh dm/is_prepriced/in.sh dm/direct_store_format_pack_size/in.sh dm/direct_store_pack_size/in.sh dm/sister_store/in.sh dm/sister_wh/in.sh dm/store_format_pack_size/in.sh dm/store_pack_size/in.sh dm/value_added_commodity/in.sh dm/warehouse_promotional_dates/in.sh
import_dm_alerts.config	
import_store_source.config	
import_wip.config	
import_om.config	om/po_recycling/in.sh

Export Configuration Files

The files exported from AIP Online are bundled (.tar) together into logical groupings based on dependency. Each RETL export file has one, and only one, corresponding script that executes the extraction of the file data from the database. The execution of all RETL extract scripts is controlled by a set of configuration files that list the export scripts to be run, and the order in which they will run.

- The configuration files can be modified to prevent execution of export scripts for files which will never be present (e.g. they are optional files for functionality that will not be used by the current client). For example if 'Sister Stores' are never imported then the copy date never needs to be extracted for AIP on RPAS.

Note: Files that are optional for import may not be optional for export. Some import files are optional because the data *can* be loaded. Alternatively the data can be entered in the DM online application. Regardless of how the data gets into the Oracle database, this data is required by AIP RPAS to run replenishment batch.

- The configuration files are a command line argument passed to the parent script, `process_aiponline_data.sh`. A modified configuration file or a specially constructed configuration file can be passed to the parent script to aid restart/recovery or special ad hoc processing.

The export configuration files are listed below.

- `export_hierarchy.config`
- `export_dm.config`
- `export_wip.config`

Oracle Database

The configurations performed in the Oracle database affect how the business uses AIP. Each setting will be used when performing some action of supply-chain setup—either automatically or manually— or order execution and maintenance.

SYSTEM_PARAMETERS

The following table contains the configuration parameters contained in the SYSTEM_PARAMETERS database table, the default value assigned to the parameter, and a description about what the parameters controls. The default parameter values in the table need to be set according to your individual business needs.

Configuration Parameter	Default Value	Description
ON_SUPPLY_OFFSET	3	The corporate on supply offset value is used to calculate on-supply dates based on on-sale dates imported from the merchandising system. On-supply dates will be set to: [on-sale date] - ON_SUPPLY_OFFSET
OFF_SUPPLY_OFFSET	3	The corporate off supply offset value is used to calculate off-supply dates based on off-sale dates imported from the merchandising system. Off-supply dates will be set to: [off-sale date] - OFF_SUPPLY_OFFSET
SYSTEM_HIGH_DATE	99991231	The default end date used for default batch assignments where no end date is specified. Date format is yyyyymmdd
ON_OFF_SUPPLY_OVERWRITE_IND	N	This value indicates whether to overwrite the on supply and off supply dates with on sale and off sale dates respectively. The parameter is applied anytime a SKU/Store in the imported file matches a SKU/Store record in the on_supply_off_supply table. When set to Y, the overwrite will occur anytime a match is found. If the value is set to N, the on supply and off supply date will only be overwritten when the previous on/off supply dates are in the past and future on sale/off sale dates are found in the import file, or when the on or off supply date is equal to the SYSTEM_HIGH_DATE.
VALID_SOURCE_VALIDATION_IND	Y	This value indicates whether to execute the validation to determine if a source is valid. A valid source is one that is currently acting as a destination with a split % against it or where all the SKU pack sizes for the SKU or demand group are pending de-ranged at the source warehouse. A supplier is always considered a valid source if the supplier supplies one or more pack sizes of the SKU.
DLG_OG_VALIDATION_IND	Y	This parameter indicates whether the validation which checks if there is a delivery group and order group assigned for the given source, demand group, destination and effective date should be executed. This validation is performed when creating or changing a Time-balanced Order Source Split.

Configuration Parameter	Default Value	Description
AUTO_CREATION_OF_DELIVERY_GROUP	Y	Indicates whether to automatically create delivery groups for a new supplier.
AUTO_CREATION_OF_ORDER_GROUP	Y	Indicates whether to automatically create order groups for a new supplier.
AUTO_RANGE_DEMAND_GROUP	Y	Indicates whether to automatically range new SKU pack sizes.
COPY_SISTER_STORE	Y	Indicates whether to copy the sister store's supply chain parameters to the associated new store.
COPY_SISTER_WAREHOUSE	Y	Indicates whether to copy the sister warehouses supply chain parameters to the associated new warehouse.
AUTO_ASSIGN_ORDER_CYCLES	Y	Indicates whether to calculate a walking store lead time prior to the store opening. If no calculation is performed, the profile order cycle and any applicable exceptions will be used for producing a replenishment plan.
AUTO_CREATION_OF_PROFILE	Y	Indicates whether to automatically create Direct Profiles for new suppliers.
AUTO_ASSIGN_OF_SKUS_TO_PROFILES	Y	Indicates whether to automatically assign the SKU of new SKU/supplier combos to profiles.
SISTER_STORE_OFFSET_WEEKS	12	Indicates the maximum number of weeks before store open that a sister store copy will take place.
SISTER_WAREHOUSE_OFFSET_WEEKS	12	Indicates the maximum number of weeks before warehouse open that a sister warehouse copy will take place.
WALKING_LEAD_TIME_OFFSET	45	Indicates the number of days before a store open date to begin calculating a walking lead time for that store.
MAX_WALKING_LEAD_TIME	22	Indicates the maximum lead time to use in calculating a walking lead time.
SCHEDULE_EXCEPTION_OFFSET	9	Indicates the number of days - 1 after store open that the normal store ordering schedule will take effect. For example, if store open (SO) is a Friday and the default profile order cycle should take effect two Mondays after (10 days later), the value should be 9. This value is used when setting up the "Walking lead time" and when copying exceptions from the sister store. Sister store exceptions will be copied from SO + SCHEDULE_EXCEPTION_OFFSET + 1 onward when AUTO_ASSIGN_ORDER_CYCLES = 'Y'.

Configuration Parameter	Default Value	Description
AUTO_RANGE_BY_SHIP_TO_ONLY	N	Indicates whether to automatically range new SKU packs only to warehouses that match the supplier Ship To value. Otherwise the SKU pack size will be ranged to all valid warehouse combinations.
DEFAULT_PALLET_SETTING_USE_PALLET_HEIGHT	Y	Indicates whether to use pallet height in pallet settings for system generated delivery groups.
DEFAULT_PALLET_SETTING_USE_PALLET_WEIGHT	Y	Indicates whether to use pallet weight in pallet settings for system generated delivery groups.
DEFAULT_VEHICLE_FOOTPRINT	22	Indicates the default vehicle footprint for system generated delivery groups.
DEFAULT_VEHICLE_HEIGHT	1	Indicates the default vehicle height for system generated delivery groups.
DEFAULT_VEHICLE_WEIGHT_LIMIT	99999	Indicates the default vehicle weight limit for system generated delivery groups.
DEFAULT_VEHICLE_MINIMUM_DROP	0	Indicates the default vehicle minimum drop for system generated delivery groups.
AUTO_ASSIGN_SUP_TO_WH_ORD_MULT	Y	Indicates whether supplier to warehouse order multiples should be automatically assigned for new SKU/pack_size combinations.
AUTO_ASSIGN_WH_TO_WH_ORD_MULT	Y	Indicates whether warehouse to warehouse order multiples should be automatically assigned for new SKU/pack_size combinations. This value should be N when the AIP on RPAS dmx_somalg measure is configured to 0. This assignment will prevent the automatic creation of warehouse to warehouse order multiples, which will be subsequently overwritten in AIP on the RPAS platform before the replenishment calculations run.
AUTO_ASSIGN_PALLET_MULT	Y	Indicates whether pallet multiples should be automatically assigned for new SKU/pack size combinations.
AUTO_ASSIGN_CASE_WT	Y	Indicates whether case weights should be automatically assigned for new SKU/pack size combinations.
DEFAULT_CASE_WT	1	The default case weight used by the case weight automatic assignment process. This value must be between .1 and 9999.99, inclusive.
AUTO_ASSIGN_STACKING_FLAG	Y	Indicates whether stacking flag should be automatically assigned for new SKU/pack size combinations.

Configuration Parameter	Default Value	Description
DEFAULT_STACKING_FLAG	0	The default stacking flag used by the stacking flag automatic assignment process. Valid values are as follows: <ul style="list-style-type: none"> ▪ 0 = Yes ▪ 1 = Same ▪ 2 = No Note: Same implies that only item A can be stacked on top of item A.
AUTO_ASSIGN_STORE_FORMAT_PACK_SIZE	Y	Indicates whether to automatically assign a store format pack size for warehouse and supplier sources
DEFAULT_PLANNING_HORIZON	40	This value must be equal to or greater than the maximum AIP Batch planning horizon value. This setting is used in certain cases to limit the amount of data that is exported to AIP on the RPAS platform. The data that is sent must at least cover the planning horizon in order for the batch to produce an accurate replenishment plan.
DAYS_BEYOND_PLANNING_HORIZON	7	The order quantity planned for each receipt day (plan day) addresses need (demand) which will occur in the period between the receipt day and the next receipt day. For the last receipt day in the planning horizon the calculation period may be partially or entirely outside of the planning horizon (with the exception of the receipt day itself). In this case it is desirable to look beyond the planning horizon to find the next receipt day in order to calculate need for the last receipt day within the planning horizon. To accurately calculate the 'next' receipt day the supply chain information in AIP on the RPAS platform must complete and accurate. This parameter defines the number of additional days beyond the planning horizon (DEFAULT_PLANNING_HORIZON) for which data will be exported to AIP on the RPAS platform. <p>Note: This parameter MUST match the value set in the 'Days Beyond Planning Horizon' measure in the SRP Administration 'Implementation Parameters' worksheet.</p>
WIP_IND	N	Indicates if the WIP subsystem is being used. WIP-related extracts will only be performed if this value is Y.

Configuration Parameter	Default Value	Description
VDATE	19991231	Used to maintain the same date throughout the batch run. Functions <code>get_vdate</code> , <code>set_vdate</code> and <code>inc_vdate</code> of the <code>aip_util</code> package are used to retrieve, set and increment the value. The date format is YYYYMMDD.
DMG_ASSIGNMENT_METHOD	1	The value 1 indicates that new pack sizes associated with an existing SKU will be assigned to the existing SKUs demand group. The value 2 indicates that each new SKU/pack size will be assigned to a unique demand group. If the <code>INVENTORY_TRACKING_LEVEL</code> system parameter is equal to <code>EACHES</code> this parameter should be set to 1. Otherwise, it can be set to either 1 or 2.
DEFAULT_DMG_TYPE	0	The demand group type inserted for all automatically created demand groups. Valid values are 0 (cases), 1 (merchandising unit).
DEFAULT_DMG_SIZE	1	The demand group size inserted for all automatically created demand groups. Valid values are as follows: <ul style="list-style-type: none"> ▪ 1 (small) ▪ 2 (medium) ▪ 3 (large) ▪ 4 (x-large)
ONL_SCHEMA_OWNER	USER	The username of the AIP Online database schema owner.
INVENTORY_TRACKING_LEVEL	PACKS	The level at which inventory is tracked. Valid values are <code>PACKS</code> and <code>EACHES</code> . If the value is <code>EACHES</code> , then the <code>DMG_ASSIGNMENT_METHOD</code> parameter will be overridden and all pack sizes of a SKU will be assigned to the same demand group. Note: This setting must be kept synchronized with the <code>RPAS</code> setting. Changing this setting post implementation is not supported. An Oracle Services effort is required to change the value.
AIP_VERSION	12.0	The currently installed version of AIP Online.
BFL_RETL_LOAD.SET_WH_ORDERABLE_UNIT	1000	Bulk fetch limit for the procedure/function. This will limit the number of records retrieved at one time when performing a bulk database fetch. Once the first set of records has been processed, the next set will automatically be fetched. This setting prevents the system from hanging due to large data sets being read into memory at one time.

Configuration Parameter	Default Value	Description
BFL_RETL_LOAD.SET_WH_TO_WH_ORD_MULT	1000	Bulk fetch limit for the procedure/function. This will limit the number of records retrieved at one time when performing a bulk database fetch. Once the first set of records has been processed, the next set will automatically be fetched. This setting prevents the system from hanging due to large data sets being read into memory at one time.
BFL_RETL_LOAD.SET_SUP_TO_WH_ORD_MULT	1000	Bulk fetch limit for the procedure/function. This will limit the number of records retrieved at one time when performing a bulk database fetch. Once the first set of records has been processed, the next set will automatically be fetched. This setting prevents the system from hanging due to large data sets being read into memory at one time.

ORDER_NUMBER

The Oracle ORDER_NUMBER table defines the valid range of order numbers for purchase orders and transfers. The range of values should not overlap the range of values allocated to any other system capable of generating orders. Update the ORDER_NUMBER table to reflect the range of purchase order and transfer numbers that are appropriate for AIP.

ORDER_PURGE_PERIOD

The Oracle ORDER_PURGE_PERIOD table defines the number of day an order remains in the system after it has been set to a Closed status. Review the default purge periods inserted in the table at installation time, and update the values for purchase order purging and transfer purging when needed.

ORDER_DEFINITION

In AIP Online orders are held at order detail level (i.e. order line time level). When an order number is generated, it is generated at order header level. The Oracle ORDER_DEFINITION table holds information that specifies how order line items are grouped into to order headers.

The following options are available for defining the level of grouping:

- Source - Indicates if order sources are used in order header roundup.
- SKU - Indicates if SKUs are used in order header roundup.
- Pack Size - Indicates if pack sizes used in order header roundup.
- Destination - Indicates if the order destinations are used in order header roundup.
- Delivery Date - Indicates if delivery dates are used in order header roundup.

In the example below SKU (commodity) and pack size are not used in the order definition. This means that for each order type an order number will be assigned to each unique combination of source, destination, and delivery date. This will result in one to many SKU pack sizes being grouped under a single order number for an order type.

Destination	Order Type	USE SOURCE	USE COMMODITY	USE PACK_SIZE	USEDEST	USE DELIVERY_DATE
Warehouse	Purchase Order	Y	N	N	Y	Y
Store	Purchase Order	Y	N	N	Y	Y
Warehouse	Transfer	Y	N	N	Y	Y
Store	Transfer	Y	N	N	Y	Y

Review the ORDER_DEFINITION table and change the settings if needed.

Note: The only supported configurations for AIP 12.0 are the defaults provided in the table above and 'Y' for all columns. These two configurations can be applied per destination/order type. They do not need to be applied uniformly across destination or order type.

Order Cycles

The default order cycles created at implementation time are used by the batch processes that automatically create Profiles and Order Groups. These order cycles can be modified to match your business needs however **they must remain in sync with the same "special default order cycles" created in the RPAS platform.**

Store Order Cycles

Store order cycles are assigned to a profile when it is automatically generated by the batch processes. The following Store Order Cycles exist for these procedures

- Warehouse profiles (PRFWS)
- Direct Profiles (PRFVS).

The following store order cycles are created during installation.

Order Cycle	Sun	Mon	Tues	Wed	Thurs	Fri	Sat
PRFVS		15					
PRFWS	1	1	1	1	1	1	1

Store Order cycles are maintained in two tables, STORE_ORDER_CYCLE and STORE_ORDER_CYCLE_LEAD_TIME.

STORE_ORDER_CYCLE

STORE_ORDER_CYCLE_ID	STORE_ORDER_CYCLE_CODE	STORE_ORDER_CYCLE_NAME	STORE_ORDER_CYCLE_LENGTH
2	PRFVS	New Sup To Store Default OC	7
3	PRFWS	New Sup Warehouse to Store OC	7

STORE_ORDER_CYCLE_LEAD_TIME

STORE_ORDER_CYCLE_ID	STORE_ORDER_CYCLE_SEQ	RELEASE_LEAD_TIME	PLACEMENT_LEAD_TIME
2	1	-1	-1
2	2	15	15
2	3	-1	-1
2	4	-1	-1
2	5	-1	-1
2	6	-1	-1
2	7	-1	-1
3	1	1	1
3	2	1	1
3	3	1	1
3	4	1	1
3	5	1	1
3	6	1	1
3	7	1	1

- The STORE_ORDER_CYCLE_LENGTH is 7; therefore there is one row in the STORE_ORDER_CYCLE_LEAD_TIME table for each of the 7 days in the order cycle. Changing the length of the Store order cycle would require additional rows to be added to the STORE_ORDER_CYCLE_LEAD_TIME table such that the STORE_ORDER_CYCLE_SEQ runs from 1 to n where n is the order cycle length. The ONLY supported lengths are 7, 14, or 28. DO NOT choose a length other than those values.
- A RELEASE_LEAD_TIME or PLACEMENT_LEAD_TIME value of -1 indicates 'blank' on the screen or no lead time.
- The PLACEMENT_LEAD_TIME value MUST be equal to or greater than the RELEASE_LEAD_TIME. Therefore you cannot change one and not the other. The PLACEMENT_LEAD_TIME must NOT contain a value other than -1 when the RELEASE_LEAD_TIME is -1.

Warehouse Order Cycles

Warehouse order cycles are assigned to an Order Group when it is automatically generated by the batch procedures. The following Warehouse Order Cycles exist for these procedures:

- Warehouse sourced Order Groups (OGWW)
- Supplier sourced Order Groups (OGVW)

The following store order cycles are created during installation.

Order Cycle	Sun	Mon	Tues	Wed	Thurs	Fri	Sat
OGVW		15					
OGWW	1	1	1	1	1	1	1

Warehouse order cycles are maintained in two tables, ORDER_CYCLE and ORDER_CYCLE_LEAD_TIME.

ORDER_CYCLE

ORDER_CYCLE_ID	ORDER_CYCLE_CODE	ORDER_CYCLE_NAME	ORDER_CYCLE_LENGTH	COLLECTION_LEAD_TIME
1	OGVW	New Supplier Default Order Cycle	7	-1
2	OGWW	New Supplier Whs to Whs Order Cycle	7	-1

ORDER_CYCLE_LEAD_TIME

ORDER_CYCLE_ID	ORDER_CYCLE_SEQ	ORDER_LEAD_TIME
1	1	-1
1	2	15
1	3	-1
1	4	-1
1	5	-1
1	6	-1
1	7	-1
2	1	1
2	2	1
2	3	1
2	4	1
2	5	1
2	6	1
2	7	1

- The warehouse order cycle length (ORDER_CYCLE_LENGTH) is 7; therefore there is one row in the ORDER_CYCLE_LEAD_TIME table for each of the 7 days in the order cycle. Changing the length of the warehouse order cycle would require additional rows to be added to the ORDER_CYCLE_LEAD_TIME table such that the ORDER_CYCLE_SEQ runs from 1 to n where n is the order cycle length. The ONLY supported lengths are 7, 14, or 28. DO NOT choose a length other than those values.
- An ORDER_LEAD_TIME value of -1 indicates 'blank' on the screen or no lead time.
- The COLLECTION_LEAD_TIME must be equal to or less than the smallest ORDER_LEAD time for the order cycle. For the existing, unmodified, order cycle OGVW, the COLLECTION_LEAD_TIME can be at most 15. For the existing, unmodified, order cycle OGWW, the COLLECTION_LEAD_TIME can be at most 1.

WH_TYPE_INITIAL_PACK_TYPE

The Oracle WH_TYPE_INITIAL_PACK_TYPE table contains the warehouse type and pack type associations that are used for defaulting warehouse orderable units and order multiples. When the AIP Automated Data Maintenance batch processes run the pack type value defined for the respective process will define which pack size should be used for assignment first. If the pack size associated with the pack type is not valid for a given warehouse of the assigned warehouse type, additional logic in the batch will determine the next valid pack size to use.

The constraints on the table will need to be modified if additional warehouse types are added to the system via the STOCKING_POINT table. The warehouse type describes the destination warehouse type.

The process type identifies the process to which the warehouse type/pack type setting applies – either warehouse orderable units or order multiples.

SUPPLIER

Prior to importing any supplier data, the column constraint on the SHIP_TO column should be modified to match the SHIP_TO values that will be imported from the merchandising system. If additional values are being added, the Ship-to source and destination mappings must also be added to the SHIP_TO_WH_TYPE_SOURCE and SHIP_TO_WH_TYPE_DEST tables.

STOCKING_POINT

Prior to importing any warehouse data, the column constraint on the WH_TYPE column should be modified to match the WH_TYPE values that will be imported from the merchandising system.

SHIP_TO_WH_TYPE_SOURCE

This Oracle table contains the mappings between Supplier SHIP_TO values and the appropriate sources. These values are used when automatically generating Delivery Groups and Order Groups. When the WH_TYPE column is null, the supplier will be used as the source. A non-null WH_TYPE value indicates the warehouse the supplier ships to is an intermediate warehouse that does not ship directly to the store. When the WH_TYPE is populated, the source of the Delivery Groups and Order Groups created will be Warehouses that match the WH_TYPE.

SHIP_TO_WH_TYPE_DEST

This Oracle table contains the mappings between Supplier sources (SHIP_TO_WH_TYPE_SOURCE) and the destinations. The destinations are used to determine the valid warehouse chambers to assign to the delivery groups and order groups. One SHIP_TO value can map to many sources and destination WH_TYPES.

ALERT_DEFINITION

Every alert is assigned a priority based on the type of the alert. The priority assigned to each alert type can be set in the ALERT_DEFINITION table. The priority setting currently has no bearing on the rest of the system. It is simply a visual indicator of importance and search mechanism for the user.

Note: Updating the alert type priority in the ALERT_DEFINITION table changes the priority of any previously existing alerts corresponding to the alert type being modified

ALERT_DEFINITION_DESC

The Oracle ALERT_DEFINITION_DESC table contains the text of each alert, and the corresponding SHORT_DESC or alert type description. The SHORT_DESC value is displayed to the user as search criteria. You may modify the text of the SHORT_DESC, however, the screen is optimized to display the values provided in the installation. It is not recommended that you modify the LONG_DESC as the correct placement of the data displayed to the user depends on the structure of the LONG_DESC text.

The LONG_DESC and SHORT_DESC can be translated for another LANG and COUNTRY if desired.

ALERT_STATUS_DESC

Each alert that is imported or generated by AIP Automated Data Maintenance batch will be assigned a status. The status is displayed to the user in the DM online screen. The user can then modify the status of the alert by selecting a status option from a drop-down list. The status options displayed in the list and their descriptions are contained in the ALERT_STATUS_DESC table.

Adding a Status

The ALERT_STATUS_CODE indicates the chronological order of the statuses displayed on the screen as well as the code that is saved indicating the alert's current status.

When adding a status:

- The smallest value will be automatically assigned to every new alert.
- The largest value will be considered the final status indicating no more work needs to be completed related to the alert.
- It must be added to every set of LANG/COUNTRY combinations. Therefore, the same set of ALERT_STATUS_CODE values must exist for every LANG and COUNTRY on the table.

AIP Application Server

The following properties files are used to configure the application during implementation. All files are located in <aip app server install location>/config. Review the values in the files for completeness and accuracy. There are additional properties outlined below which must be manipulated when using the RIB with AIP.

db.properties

File Location: <aip app server install location>/config

This file contains configuration values that are related to the system's database. This file tells the DM Online and OM Online application how to connect to the database. After installation, this file should contain the correct information because it is set in the initial run of the AIP Online application. However, it is a good idea to review the values in the files for completeness and accuracy. The following table provides a description of the values contained in the db.properties file.

Configuration Value	Description
common.prop.db	This value defines the database that the system is utilizing. This value is set to Oracle.
common.prop.oracle.sid	This value is an Oracle parameter that defines the database name that the system is utilizing. SID stands for system identifier.
common.prop.oracle.host	This value is an Oracle parameter that refers to the database listener. This value defines the 'host:port' that the database listener is using.
common.prop.user	This value is an Oracle parameter that defines the 'username/password' of the database. This can be a schema owner or a standard user.
common.prop.oracle.schema	This value is an Oracle parameter that defines the schema owner username. If the username/password defined in common.prop.user is not the schema owner, then this field must also be added and defined in order for the AIP Online Administration screens to function properly.

main.properties

File Location: <aip app server install location>/config

The following table provides a description of the properties contained in the main.properties file. This file is used by the Java enabled applications: DM online, OM, and RIB publication via the OrderSenderBean.

Property	Description
base	This must match the context root of the ear or war file. This is "/" for a production system, or "/test1" for the 1st of several test systems on a single physical computer.
securemode	This is set to "1" to force connections to switch from http (non-secure) to https (secure) upon logon. This value can also be set to "0" to prevent the connection from being switched from non-secure to secure mode.
setfileattr.rcapps.properties	This defines a file to contain color attributes. The default setting is rcapps.properties.

Publishing Purchase Orders and Transfer Data to RMS

You can configure AIP Online to publish Purchase Order and Transfer Data to the Oracle Retail Merchandising System (RMS) via the Oracle Retail Integration Bus (RIB). Perform the following procedure to enable RIB publication.

1. Uncomment the following parameters in the main.properties file to activate the OrderSenderBean, which calls the RIB publication routines:

```
#aip.prop.order.period.count=1
#aip.prop.order.period.start.1=08:00:00
#aip.prop.order.period.end.1=20:00:00
#aip.prop.order.time.interval=00:01:00

#aip.prop.order.po.message.family=XOrder
#aip.prop.order.po.message.type.name=msg_type
#aip.prop.order.po.queue.table.name=PO_MFQUEUE
#aip.prop.order.po.table.id.name=order_no

#aip.prop.order.tsf.message.family=XTsf
#aip.prop.order.tsf.message.type.name=msg_type
#aip.prop.order.tsf.queue.table.name=TSF_MFQUEUE
#aip.prop.order.tsf.table.id.name=tsf_no

#aip.prop.order.max.message.bundle.size=10
#aip.prop.order.max.publishing.count=20
```

2. Save the main.properties file.
3. Have the WebSphere administrator restart the WebSphere instance where the OrderSenderBean and AIP Online application are deployed.

main.properties Publication Properties

File Location: <aip app server install location>/config

The following table provides a description of the publication properties referenced in the previous topic.

Property	Description
aip.prop.order.period.count	The number of periods in the day during which the <code>OrderSenderBean</code> will invoke RIB publication. This value must be greater than zero if RIB-based publication is to be used.
aip.prop.order.period.start.x	The start time in HH:MM:SS format of period x where x is 1 ... <code>aip.prop.order.period.count</code> .
aip.prop.order.period.end.x	The end time in HH:MM:SS format of period x where x is 1 ... <code>aip.prop.order.period.count</code> .
aip.prop.order.time.interval	The amount of time in HH:MM:SS format between calls to <code>OrderSenderBean.checkAndPublish()</code> function.
aip.prop.order.po.message.family	The purchase order message family name. This value is required by the RIB to ensure proper validation of message payloads. This value should be set to 'XOrder'.
aip.prop.order.po.message.type.name	This value can be used to indicate if the message is a header-create, header-update, detail-create, or detail-update message. Although message types are used to order the <code>OrderSenderBean</code> query, this parameter value is not currently used.
aip.prop.order.po.queue.table.name	The AIP Online table which <code>OrderSenderBean</code> queries to check for Purchase Order related messages awaiting publication. This value should be 'PO_MFQUEUE'.
aip.prop.order.po.table.id.name	This value is used to group functionally related message content. For example, all message content related to purchase order number 123 would be grouped. This value should be 'order_no'.
aip.prop.order.tsf.message.family	The transfer message family name. This value is required by the RIB to ensure proper validation of message payloads. This value should be set to 'XTsf'.
aip.prop.order.tsf.message.type.name	This value can be used to indicate if the message is a header-create, header-update, detail-create, or detail-update message. Although message types are used to order the <code>OrderSenderBean</code> query, this parameter value is not currently used.
aip.prop.order.tsf.queue.table.name	The AIP Online table which <code>OrderSenderBean</code> queries to check for Transfer related messages awaiting publication. This value should be 'TSF_MFQUEUE'.

Property	Description
aip.prop.order.tsf.table.id.name	This value is used to group functionally related message content. For example, all message content related to transfer number 456 would be grouped. This value should be 'tsf_no'.
aip.prop.order.max.message.bundle.size	The maximum number of message bundles to publish per call to <code>OrderSenderBean.checkAndPublish()</code> . The default is 10, but this number should be recalculated by the client based upon on-site performance testing.
aip.prop.order.max.publishing.count	The maximum number of messages per message bundle. For example, multiple Purchase Order header create message can be grouped in one message bundle to improve performance. The default value is 20, but this value should be recalculated by the client based upon on-site performance testing.

rcapps.properties

File Location: `<aip app server install location>/config`

These properties are applied to the main application login and navigation pages. These property settings do not apply to the pop-up applet screens.

The color properties can be set to any 6 character hexadecimal value and are preceded with the # symbol.

Hexadecimal color property examples:

#0000FF = blue

#FF0000 = red

The files defined for various properties are located off of the following base directory:

`< rfp appserver location >/installedApps/<node> /AIPOnlineApp.ear/AIPOnlineWAR.war`

Property settings that contain path assignments are appended to the base directory provided above. Use the complete path, base directory plus property path to locate specific files as needed.

For example:

`apptop.page=/fragments/apptop.jsp`

`apptop.jsp` can be found in the following path:

`< rfp appserver location >/installedApps/<node>/AIPOnlineApp.ear/AIPOnlineWAR.war/fragments`

The following table provides a description of the properties contained in the `rcapps.properties` file.

Property	Description
about.width	Width of 'about' windows. Currently, no 'about' windows are supported.
apps.width	Width of application windows.
appbanner.bg	Defines the main background color. This appears as the horizontal banner.

Property	Description
appmenu.bg	Menu banner background color. This appears as the vertical strip on the left side of the page. It is the background for any 'Applications', 'User Console', and 'Administration' menu items.
text.fg	Main text color. This is the text color for the main welcome on the login pages.
applet.codebase	Applet default codebase. The default value is appclasses. This is not expected to ever change.
apppage_top.page	Contains the code content for the upper fragment of the page including the top and left banners. The default value is /fragments/apppage_top.jsp
apptop.page	Defines the standard top banner (normal and compact versions). The default value is /fragments/apptop.jsp.
apptop_about.page	Defines the content of the 'about' page. 'About' pages typically contain version numbers and company information. 'About' pages are not supported by Oracle AIP. The default value is /fragments/apptop_about.jsp.
head.page	Contains the code content getting the configurations and saving them in variables used throughout the page. The default value is /fragments/head.jsp.
appbot.page	Defines the standard bottom banner. The default value is /fragments/appbot.jsp.
apppage_bot.page	Contains the code content for the lower page fragment. The default value is /fragments/apppage_bot.jsp.
securemode.allow	Used to enable securemode. Set to "*" to enable securemode on all clients, or set to "*, !Mac" to enable securemode on all clients except those that are using a Macintosh.
webmeter.allow	Used to display webmeter. Set to "*" to display webmeter for all clients, or "*, !Mac" to display webmeter for all clients except those that are using a Macintosh.
webmeter.page	Defines the file containing code for the WebMeter page. The default is /fragments/webmeter.jsp.

security.properties

File Location: <aip app server install location>/config

This file defines security administration settings for the application.

The following table provides a description of the properties contained in the security.properties file.

Property	Description
trackeradmin.prop.adminhosts	This is a comma delimited list of "host/mask" values that are allowed to access phantasm (the primary administration page).

strings_en.properties

This file provides the displayed text for the screens. Error text originating in the database is not provided in this file and is not accessible for customization. Customizing this file can have an affect on the visual presentation of the screen or popup message. The new text should be of equal or similar character lengths as the modified text.

The file is located in the following server path:

```
<rfp appserver location >/installedApps/<node>
/AIPOnlineApp.ear/rfp.war/appclasses/res/com/retek/applet/strings_en.properties
```

config.properties

This file contains configurable settings for Data Management and Order Management that determine how certain screens appear immediately when opened. It also contains settings which allow or prevent certain user activities on the screens.

This file is located in < rfp appserver location >/installedApps/<node>/AIPOnlineApp.ear/AIPOnlineWAR.war/appclasses/res/com/retek/applet.

Data Management Online Settings

The following table provides a description of properties found in the config.properties file that are used to define Data Management online (DMo) settings.

Property	Description
datamanagement.suppress.pre.save.message	Indicates whether or not to suppress the pre-save message saying that all applicable rows will be updated. This setting currently only applies to the On Supply/Off Supply screen when performing mass updates of SKUs and Stores. The valid values for this property are 0 to display the pre-save message and 1 for do not display the pre-save message.
datamanagement.unit.of.measure.default	Defines the unit of measure (UOM) radio button that is initially selected when displaying DM Online screens containing UOM. Valid values are 0 for cases, or 1 for eaches.

Property	Description
datamanagement.warehouse.type.available	This setting determines whether the warehouse type field is displayed in the DM online application. This should be set to 0 when warehouse types are not defined for warehouses, or set to 1 if warehouse types are assigned to warehouses.
export.launch	When the user exports the Alerts from the DM online application to a savable file, this setting will determine whether the file is opened immediately or not. If set to launch immediately, the user must have a default program for the particular file extension being saved. Two file formats are available, spreadsheet (.xls) or comma delimited (.csv). The default program associated with the file extension is specific per PC and is not an AIP controlled setting. If no program is associated to the file extension, the user may receive an error and the file will not be opened. If an error occurs, the user must manually open the file in the appropriate program. The valid values for this property are 0 for don't launch, and 1 for launch immediately.
export.type.default	When exporting the Alerts from the DM online application to a savable file, the user has the option of saving the data in spreadsheet or comma delimited file format. This property setting is applied to the initial radio button selection that defines the format. This property defines the value selected by default. The user has the option of choosing the other format by selecting the other radio button option. The valid values for this property are 0 for comma-separated file (CSV) or 1 for spreadsheet (XLS).
paginggrid.page.size	This is the default 'pagesize' setting applied to all screens with paging. Pages contain a certain number of rows and only the content for one page is displayed at a time. This property defines the number of rows that are displayed in a single page. When setting this value you should consider that the setting is system wide setting, not user specific. The resolution of each user's screen will affect how many rows are visible without scrolling. Assign a large number to this property may result in the need for some users to scroll down the page to see all of the rows. Setting this property to an arbitrarily large number also negates the benefits of paging, which is used to improve screen rendering time performance and display information in a more usable fashion. This property can be set to any value greater than 0 and less than or equal to 9999999.

Property	Description
paginggrid.<screen name>.page.size	Each screen that uses paging has its own pagesize setting. This setting, when greater than 0, will override the default 'pagesize' setting. The same considerations for the default should be applied to the individual screen settings. A value of -1 indicates that the default should be used. The valid values for this property are -1 or any number greater than 0 and less than or equal to 9999999.

Order Management Settings

The following table provides a description of properties found in the config.properties file that are used to define Order Management (OM) settings.

Property	Description
ordermanagement.order.type.default	This setting defines which order type radio button is selected by default. The available options are All, Transfers, or Purchase Orders. This setting applies to all Order Management screens which allow the user to search or select an order type. Valid values for this property are as follows: <ul style="list-style-type: none"> ▪ 0 for All ▪ 1 for Purchase Orders ▪ 2 for Transfers Note: The ordermanagement.viewable.order.type setting takes precedence over this setting. If this setting conflicts with it, the ordermanagement.viewable.order.type will be used instead.
ordermanagement.viewable.order.type	This setting defines which order types users are able to view and possibly manipulate. Users cannot perform any operations on orders types that do not match this setting, nor can they view order types that do not match this setting. This setting applies to all Order Management screens. The valid values for this property are as follows: <ul style="list-style-type: none"> ▪ 0 for All ▪ 1 for Purchase Orders ▪ 2 for Transfers Note: Users may have privileges to the Order Create screen but they will be unable to perform any operations if the ordermanagement.viewable.order.type is not set to All or Purchase Order.
ordermanagement.unit.of.measure.default	Defines the unit of measure (UOM) radio button that is initially selected when displaying OM Online screens containing UOM. Valid values are 0 for cases, or 1 for eaches.

Property	Description
ordermaintenance.order.display.format	This setting defines the display format that is selected by default in the Order Maintenance search criteria pop up. The valid options for this property are 0 for the tree format and 1 for the grid format.
ordermaintenance.expand.all.default	When the search results in the Order Maintenance screen are displayed in a tree format, this setting is used to determine whether the tree should be initially displayed in a collapsed or expanded state. When collapsed, only the header level order information appears. When expanded, all of the SKU-pack sizes and order quantities associated with the order display. Valid values for this property are 0 for collapsed or 1 for expanded.
ordermaintenance.update.quantity.default	In the Order Maintenance screen, the user has the option of viewing the quantity on the order as the total ordered quantity or as the outstanding, un-received order quantity. This setting is used to determine which radio button option will be initially selected on the screen. The valid values for this property are 0 to view the total order quantity, or 1 to view the unreceived order quantity.
ordermaintenance.supplier.tracking.default	<p>When moving the un-received purchase order quantity to a new delivery date and/or destination, the user must specify whether the supplier was the cause of the change or their business. The value that is specified affects the supplier performance tracking. This property defines which drop-down list option should be selected by default. The valid values are as follows:</p> <ul style="list-style-type: none"> ▪ 0 – Always Ask ▪ 1 – Supplier Initiated ▪ 2 – Business Initiated <p>The Always Ask option is recommended if the business will be viewing and using the supplier performance tracking information. This option forces the user to consciously select the appropriate value.</p> <p>If the business will not be using the supplier performance tracking information, then either the Supplier Initiated or Business Initiated option should be selected so that a value is always selected by default. This prevents the user from having to randomly pick one of the two options, as well as prevents the unnecessary popup which appears when the Always Ask option is selected in the drop-down list.</p>
ordermaintenance.view.default	This setting defines which view should be displayed initially in the Order Maintenance Screen – the Standard View or the Extended View. The extended view includes the Supplier Tracking value and the Release Date. The additional columns displayed in the extended view results in each column having a smaller display size. Valid values for this property are 0 for the standard view and 1 for the extended view.

Property	Description
ordermaintenance.allow.move.unreceived	This setting allows the business to prevent users from changing the destination and delivery date of a purchase order. The valid values for this property are 0 to allow changing delivery dates and destinations, or 1 to prohibit changing delivery dates and destinations.
ordermaintenance.move.unreceived.criteria	<p>This setting allows the business to define when it is acceptable to move un-received order quantities to a new delivery date and/or destination.</p> <p>The first option is anytime the order quantity is less than the received quantity. This means that the user can change the order delivery date and/or destination any time the order is released and not fully received.</p> <p>The second option is anytime the order is totally un-received. This means that the user can change the order delivery date and/or destination anytime the order has been released but not yet received against.</p> <p>The valid values for this property are 0 for not fully received or 1 for 0 received quantity.</p>
ordermaintenance.move.allow.destination.change	This setting allows the business to restrict users from changing delivery destinations of their orders. This setting is used in the Order Maintenance Move Unreceived Order Quantity popup. When users are not allowed to change order destinations, they are left with the sole option of changing the delivery date. Valid values for this property are 0 to allow destination changes, or 1 to prevent destination changes.
ordermaintenance.move.require.new.order.number	This setting determines whether or not a new order number is required when moving an order. If a new order number is not required, users are allowed to choose whether to retain the existing order number or generate a new one when moving un-received quantities. Valid values for this property are 0 - Do not require a new order number or 1 - Require a new order number.
ordermaintenance.allow.cancel.unreceived	This setting allows the business to restrict users from fully canceling a Purchase Order. The user can still modify the Purchase Order quantity but they cannot fully cancel the un-received quantity. The valid values for this property are 0 to allow the un-received order quantity to be canceled or 1 to prohibit the cancelling of all un-received order quantity.
ordermaintenance.allow.release.orders	This setting allows the business to prevent users from manually releasing purchase orders in the Order Maintenance screen. Orders that have not been released cannot be modified. Only purchase orders released on their lead time by the batch order release process would be available for modification. The valid values for this property are 0 to allow manual release of orders, or 1 to prevent manual release of orders.

Property	Description
ordermaintenance.allow.edit.quantities	The setting allows the business to prevent users from modifying purchase order quantities. The user will still have the ability to cancel the outstanding unreceived order quantity unless the ordermaintenance.allow.cancel.unreceived property is also set to disallow cancelling unreceived order quantities. Valid values for this property are 0 to allow modification of order quantities, or 1 to prevent modification of order quantities.
ordermaintenance.release.status.default	This setting determines which Release Status radio button is initially selected in the Order Maintenance search criteria popup. The valid values for this property are 0 for all statuses, 1 for Released, or 2 for unreleased.
orderreview.display.quantity.default	<p>This determines which Display Quantity value is initially selected in the Order Review search criteria popup.</p> <p>The first option is total quantity. This displays the summed order quantity in the search results.</p> <p>The second option is unreceived quantity. This will display the total order quantity that is still outstanding or yet to be received. This quantity is calculated as the total order quantity minus the total received quantity.</p> <p>The third option is received quantity. This will display the summed received quantity in the search results.</p> <p>The valid values for this property are 0 for total quantity, 1 for unreceived quantity, and 2 for received quantity.</p>
orderreview.display.zero.values.default	<p>This determines whether the Display Zero Values checkbox is initially checked or unchecked in the Order Review search criteria popup. Choosing to display zero values will result in zeros being displayed in the columns where no quantity is found. Note, however that at least one order must be found for the search criteria and date range in order to have a row displayed in the search results. When choosing to view received or unreceived quantities instead of the order quantity it will be impossible to distinguish a displayed zero that means no orders were found for the date range versus 0 quantity was received or 0 quantity is yet to be received.</p> <p>The valid values for this property are 0 to not initially select the checkbox (do not display zeros) or 1 to initially select the checkbox (display zeros).</p>

AIP RPAS Configurations

The AIP RPAS configurations listed in this section allow the business to manipulate AIP to meet their business needs. The XML files, configuration files, measures, etc. are applied to the replenishment processing to affect the plan that is produced.

shortfallPriorityMatrix.xml

The shortfall reconciliation priority matrix describes the order in which available inventory is allocated when an inventory shortfall occurs. The matrix is organized around two concepts, group and boundary. The group concept segregates stores into multiple mutually exclusive sets. For reconciliation purposes, all members of a given set are treated equally. Conversely, the inventory needs of one set may be considerably more important than those of another. For example, it may be more important to satisfy the minimum needs of one group before addressing the maximum need of another group. This is achieved by associating a group-boundary combination with a rank which allows combinations of group and boundary to be ordered. The following table illustrates the idea.

Store Priority	Boundary →			
	Group	CORT	MSS	RP
1	1	4	5	6
2	2	7	9	11
3	3	8	10	12

The number of groups is not fixed however the base product's user interface currently limits the assignment of store priority to one of three values. Moreover, the priority matrix ranking is configurable. The configuration is specified using an XML file, `shortfallPriorityMatrix.xml`, which is formatted as shown below.

```
<reconciliation-priority-matrix>
  <boundary componentName="CustomerOrderOverReviewTime">
    <group id="1" priority="1"/>
    <group id="2" priority="2"/>
    <group id="3" priority="3"/>
  </boundary>
  <boundary componentName="MinimumSalesStock">
    <group id="0" priority="13"/>
    <group id="1" priority="4"/>
    <group id="2" priority="7"/>
    <group id="3" priority="8"/>
  </boundary>
  <boundary componentName="ReceiptPoint">
    <group id="0" priority="14"/>
    <group id="1" priority="5"/>
  </boundary>
</reconciliation-priority-matrix>
```

```

    <group id="2" priority="9"/>
    <group id="3" priority="10"/>
  </boundary>
  <boundary componentName="ReceiptUptoLevel">
    <group id="0" priority="15"/>
    <group id="1" priority="6"/>
    <group id="2" priority="11"/>
    <group id="3" priority="12"/>
  </boundary>
</reconciliation-priority-matrix>

```

Within the XML file, the "id" is expected to match a store priority. Store priorities are 1-Super High, 2-High, 3-Normal, and 0-Not Defined. "componentName" is the name of a numeric DataContainer which will contain the calculated allocation boundary data.

For each group the allocation boundaries should only be prioritized in the following ascending order: CORT < MSS < RP < RUTL. Since the allocation boundaries are cumulative, undesirable results may be generated if this order is not followed.

It should also be noted that same priority numbers across multiple cells will not be supported in the current release. Each cell within the matrix should be assigned a unique priority number. Not doing so will result in erroneous results.

stocklessPriorityMatrix.xml

The stockless priority matrix describes the order in which available inventory is allocated when a Stockless inventory surplus occurs or a surplus of singles occurs for a 'Push Singles' warehouse/SKU. The matrix is organized similar to the shortfall reconciliation priority matrix. The matrix gives the priority order for allocating excess inventory to destinations associated to each store priority/allocation boundary cell.

Group	Up To Upper Boundary	Fair Share Over Upper Boundary
1	1	6
2	2	5
3	3	4

The Upper Boundary is defined as:

- RUTL, if spoilage is not a consideration for the given sku-pack
- MSQ, if spoilage is considered

The priority matrix is defined in stocklessPriorityMatrix.xml, which is shown below.

```

<reconciliation-priority-matrix>
  <boundary componentName="FairshareUpperBoundary">
    <group id="0" priority="7" method="fair-share"/>
    <group id="1" priority="6" method="fair-share"/>
    <group id="2" priority="5" method="fair-share"/>
    <group id="3" priority="4" method="fair-share"/>
  </boundary>
  <boundary componentName="ReceiptUptoLevel">
    <group id="1" priority="1"/>
    <group id="2" priority="2"/>
    <group id="3" priority="3"/>
  </boundary>
</reconciliation-priority-matrix>

```

Within the XML file the "id" is expected to match a store priority. Store priorities are 1-Super High, 2-High, 3-Normal, and 0-Not Defined. "componentName" is the name of a numeric DataContainer which will contain the calculated allocation boundary data.

For each group the allocation boundaries should only be prioritized in the following ascending order: 'Up To Upper Boundary' < 'Fair Share Over Upper Boundary'. Since the allocation boundaries are cumulative, undesirable results may be generated if this order is not followed.

Measures

Measure	Default Value	Description
dmx_plnhznmin	35	<p>The Global Minimum Planning Horizon defines the minimum number of days that will be planned at the stores and warehouses. This value can be overridden with a larger value in the DM Online application by setting a Class level default value. Additionally a SKU exception can be defined for replenishment at stores and a Demand Group exception can be defined for replenishment at warehouses. The most specific value will be used (SKU or Demand Group, or Class) unless it is less than the global minimum planning horizon, in which case the global minimum value will be used.</p> <p>The DM online application does not allow planning horizons less than 35 days or greater than 366 days. The overrides set in the DM online application will not be used if they are less than the global minimum planning horizon.</p> <p>This value should be equal to the shortest planning horizon desired. This value should not be set greater than 366 days.</p>
dmx_pstpmsflg	FALSE	The Post Promotion Substitution Flag determines whether promotional items should be substituted after their promotional date.
dmx_daywk_	7	This defines the number of days per week. This setting should never be changed.

Measure	Default Value	Description
dmx_somalg	1	<p>This flag determines whether the user will manually enter ordering parameters for the entire supply chain, or whether the supplier's value for Pallet Multiple, Order Multiple, Case Weight, and Stack-ability indicator will be spread through the supply chain.</p> <p>If the value is 1, the four parameters listed above must be defined for both supplier to warehouse and warehouse to warehouse combinations of the supply chain.</p> <p>If the value is 0, the four parameters listed above need only be defined for the top tier of the supply chain--supplier to warehouse combinations. An algorithm will run as part of DM Batch to set the values for the inner tiers of the supply chain equal to the value of the top tier. Note that any warehouse to warehouse combinations that are either system generated by DM Automated Maintenance, or user generated will be overwritten in the RPAS measure!</p>
dmx_speocy	0 = "PFOCPRFVS" 1 = "PFOCOGVW" 2 = "PFOCPRFWS" 3 = "PFOCFULLC" 4 = "PFOCOGWW"	<p>This measure contains 5 values unique Order Cycle identifiers. These order cycles are used by default when automatically generating profiles and order groups. These should not be changed unless the AIP Oracle PL/SQL is customized to use the new Order Cycle codes and the order cycle exists in the AIP Oracle database.</p> <p>The order cycle lengths and lead times are not defined in AIP RPAS at implementation time. The order cycle lengths and lead times are defined in AIP Oracle at implementation time and will be loaded into AIP RPAS before the first full run of DM Batch.</p> <ul style="list-style-type: none"> ▪ PFOCPRFVS - Used when automatically creating a new Supplier Profiles. ▪ PFOCPRFWS - Used when automatically creating new Warehouse Profiles. ▪ PFOCOGVW - Used when the system creates Automated Supplier sourced Order Groups. ▪ PFOCOGWW - Used when the system creates Automated Warehouse sourced Order Groups. ▪ PFOCFULLC - This is an empty order cycle which is used to wipe out all receipt points and lead times. It is used for new Stores which will have a walking lead time calculated prior to the store opening. It can also be assigned as a profile order cycle.

Measure	Default Value	Description
dmx_storeonly	STR	This measure contains the Supplier Ship-to code that represents 'Stores Only'. This code is used when attempting to automatically set the store source value for a new SKU. Because the Supplier Ship-to values are also sent to AIP on Oracle, the codes and table constraints in both systems must remain consistent.
dmx_cscstrfmt	SFMT1002	<p>This measure contains the store format of the stores which receive their SKUs from the warehouse when the supplier of the SKU can supply both the stores and the warehouses.</p> <p>This setting is used when the batch tries to automatically set the Store Source value for a new SKU. When the selected supplier of the SKU has a Supplier Ship-to value of equal to the value in dmx_cscdir, this indicates that the supplier can ship to either CSC warehouses or directly to stores. To determine which store source to select (the supplier or warehouse) the store format of each store that the SKU is on-supply at is compared to the store format listed in this measure. If the store's format matches, then the store's default CSC warehouse is saved as the source for the SKU/store. This means that the supplier will provide the SKU to the warehouse and the warehouse will provide the SKU to the store.</p> <p>The selected store format to be saved in this measure must have the prefix 'SFMT' added to it.</p>
dmx_cscdir	CS_ST	This is the supplier ship to value that indicates the supplier ships to both CSC warehouses and stores. Because the Supplier Ship-to values are also sent to AIP on Oracle, the codes and table constraints in both systems must remain consistent.

Measure	Default Value	Description
IpBydPlnHznG	7	<p>The Days Beyond Planning Horizon Parameter represents the number of days the replenishment batch process will look forward to find the next Available To Plan (ATP) day after the end of the planning horizon. Replenishment will use the data between the end of the planning horizon and the next ATP day to calculate the receipt plan for the last ATP day. No plan is calculated on the ATP day beyond the planning horizon. If replenishment does not find an ATP day in the period from the end of the planning horizon through the days beyond the planning horizon, the receipt plan calculations will use data through the days beyond planning horizon to plan the last receipt.</p> <p>Any positive integer, including zero, is valid. This can also be set in the SRP Administration Implementation Parameters worksheet.</p> <p>This measures value must stay in sync with the AIP on Oracle system parameter value.</p>

Modifying Measure Base Intersections Using Configuration Tools

Using the RPAS Configuration Tools, the base intersection of the following measures can be modified.

Note: The data file containing the data must match the configured measure intersection.

Measure	Description	Valid Configuration
IpFctWkPrfD	Week to Day Demand Forecast Percentage Default	All Products/Chain/Day-Of-Week Company/Chain/Day-Of-Week Division/Chain/Day-Of-Week Department/Chain/Day-Of-Week Class/Chain/Day-Of-Week Subclass/Chain/Day-Of-Week
IpFctWkPrfE	Week to Day Demand Forecast Percentage Override	Subclass/Chain/Day-of-Week
sr0_prmprsstk_*	Promotional Presentation Stock	Use Configuration Tools to show/hide this measure
sr0_prmspasc_*	Promotional Shelf Capacity	Use Configuration Tools to show/hide this measure
sr0_prmfillvl_*	Promotional Fill Level	Use Configuration Tools to show/hide this measure

Import Configuration Files

Missing data files can corrupt downstream data and cause errors which are difficult to interpret and trace to the root. Therefore, validation of the received import files must be performed prior to running any batch calculations or loading any files with dependencies. A set of configuration files are used to validate that all required files are present before proceeding to load them.

- The configuration files provide a complete list of hierarchy and measure data that can be loaded. If a client chooses to load additional data rather than have the user enter it they may add the file to the appropriate configuration file so that its presence in the AIP RPAS import directory is validated.
- The configuration files can be modified to specify whether a file is required or optional. A file can only be deemed optional if it provides data that is not required by the replenishment batch modules, is not required by AIP Online, and there are no required files that are dependant on it. Additionally, if the same data can be entered in a workbook *before* the batch run the loaded data may also be considered optional.

The configuration files for validation are listed below:

- earlyfiles.config
- latefiles.config
- forecastdata_from_external.config

After the presence of all required files has been validated a number of files are run through a stocking point prefix-adding script as well as a binary executable called interutil. These processes perform a myriad of formatting tasks including splitting files, adding S, V or W prefixes to Stores, Suppliers, and Warehouses respectively, and transforming RMS-sourced files from RMS SKU to AIP SKU or SKU-pack size. The list of files containing measure data that are reformatted by interutil is determined by a second set of configuration files.

- The configuration files can be modified to prevent interutil from being run for files that are in AIP RPAS loadable format.
- Only files containing measure data are listed in the configuration files. Hierarchy files must be provided in the predetermined format.

Note: The AIP 12.0 Operations Guide and 'RMS Integration and Mapping' information provided within this document should be carefully reviewed for file format and file output from interutil before modifying the contents of the configuration files.

The interutil configuration files are listed below:

- dm_rms_measures.config
- srp_rms_measures.config
- wrp_rms_measures.config

Moving Integration Data Source from RMS to a Non-RMS External System

AIP 12.0 is configurable to allow some files, whose default source is RMS, to be sourced instead from a Non-RMS External System. The following instructions are the procedure for adjusting the configuration files to support this change of source.

Pre-requisites for Moving the Source Application of an RMS Data Feed

1. The data feed must be one of the *inventory* data feeds that arrives *late* from *RMS*, as listed in `wrp_rms_measures.config` or `srp_rms_measures.config` file, as well as the `latefiles.config` file. These files are located in the following directory of the domain:
`$AIPDOMAIN/interface/config/external/latefiles.config`
`$AIPDOMAIN/interface/config/rms/srp_rms_measures.config`
`$AIPDOMAIN/interface/config/rms/wrp_rms_measures.config`
2. The data feed must now be formatted in RPAS-loadable format. No processing will be performed to translate RMS SKU to AIP SKU, or to add stocking-point prefixes. However, the data can still be split into multiple pieces (for Store and Warehouse Current Inventory, namely `sr0_curinv` and `wr0_curinv`).
3. The data feed is still considered to be a "late" arrival.

Setup

1. Add the data feed to the `measdata_from_external.config` configuration file. It is located in the following directory of the domain:
`$AIPDOMAIN/interface/config/measdata_from_external.config`
2. Remove the data feed from `srp_rms_measures.config` or `wrp_rms_measures.config`. Also remove the data feed from `inv_meas_ntier_prefix.config`. These configuration files are located in the following directories of the domain:
`$AIPDOMAIN/interface/config/rms/srp_rms_measures.config`
`$AIPDOMAIN/interface/config/rms/wrp_rms_measures.config`
`$AIPDOMAIN/interface/config/rms/meas/inv_meas_ntier_prefix.config`

Process

1. After the "early files" (as listed in `earlyfiles.config`) are placed into the domain, run the appropriate `aip_batch` processes, as normal, to process external data (`aip_batch.sh` steps 1, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14).

Note: `process_external_data.sh` *will not* process any file that has been moved from RMS to External source, as the feed is still considered "late."

Additionally, `load_non_rms_external.sh` *will not* load the moved feed, as it is not in the `$AIPEXTERNAL` directory yet.

2. After the "late files" (as listed in `latefiles.config`) are placed into the domain (in the `$AIPRMS` directory), run the appropriate `aip_batch` steps, as normal, to process inventory data (`aip_batch.sh` steps 2, 11).

Note: `process_inventory_data.sh` *will* consolidate the current inventory data feeds as prescribed in the script regardless of whether they are RMS-sourced or non-RMS-sourced.

However, `process_inventory_data.sh` *will not* process any moved feed by adding stocking point prefixes, or conversion from RMS SKU to AIP SKU/SKU-pack size, as the feed is no longer listed in the appropriate configuration files as in Step 2 of the setup above.

Finally, `load_rms_replenishment_measures.sh` *will not* load the moved feed, for the same reason.

3. Manually copy the moved data feed into the `$AIPEXTERNAL` directory, with the correct extension (“`rpl`”, meaning replacement load).
4. Run `load_non_rms_external.sh` a second time (step 14 of `aip_batch.sh`). Now that the data files exist in the `$AIPEXTERNAL` directory, and are listed in the `measdata_from_external.config` file, the non-RMS load script will load the files.

RMS Integration and Data Mapping

RMS to AIP Data

There are two types of data which RMS is required to provide to AIP:

- Hierarchy data
- Measure data

Hierarchy Data

Overview

AIP receives the following five hierarchy files from RMS:

	File Name	Description	Source
1	loc.txt	Location Hierarchy	RMS-partial*
2	item.txt	Item Hierarchy (Product Hierarchy)	RMS-partial*
3	splr.txt	Supplier Hierarchy	RMS
4	whse.txt	Warehouses	RMS

* These hierarchies go through a merge process with AIP Online data prior to being fully loaded into AIP RPAS.

File Format

The Retail Extraction, Transformation, and Loading (RETL) tool provides AIP with the file format displayed in the following table.

Note: Customers who do not have RETL are required to provide files with this same format.

Location Hierarchy		File Name: loc.txt		
Data Entry	Start	Width	Source	
Store	1	20	RMS	
Store Description	21	60	RMS	
Site	81	20	RMS	
Site Description	101	40	RMS	
Region	141	20	RMS	
Region Description	161	40	RMS	
Zone	201	20	RMS	
Zone Description	221	40	RMS	
Chain	261	20	RMS	
Chain Description	281	40	RMS	
Company	321	20	RMS	
Company Description	341	40	RMS	
TV Region	381	4	External	
TV Region Description	385	24	External	
Weather Region	409	4	External	
Weather Region Description	413	24	External	
Market Region	437	4	External	
Market Region Description	441	24	External	
Store Format	465	20	RMS	
Store Format Description	485	40	RMS	

Note: In the location hierarchy file, if RMS does not provide a field value, the AIP transformation script creates a '0' for the field.

Item Hierarchy (Product Hierarchy) * File Name: item.txt

Data Entry	Start	Width	Source/Comments
AIP SKU	1	20	RMS
Order Multiple	21	4	RMS
Pack Quantity	25	4	RMS
RMS SKU	29	20	RMS
RMS SKU Description	49	60	RMS
Banded Item Indicator	109	1	RMS/banded = 1 Not banded=0
Segment	110	20	RMS
Segment Description	130	60	RMS
Sub-Category	190	20	RMS
Sub-Category Description	210	60	RMS
Category	270	20	RMS
Category Description	290	60	RMS
Super-Category	350	20	RMS
Super-Category Description	370	60	RMS
Business Unit	430	20	RMS
Business Unit Description	450	60	RMS
Company	510	20	RMS
Company Description	530	60	RMS
Standard UOM	590	4	RMS
Standard UOM Description	594	20	RMS
SKU Type	614	20	RMS
SKU Type Description	634	100	RMS

The item.txt file maps as follows:

1. The RMS SKU to the AIP SKU.
2. The Pack Quantity and Order Multiple to the AIP SKU-pack size. AIP processing code creates a mapping table (measure) to tie the RMS SKU to the AIP SKU pack size, and uses this mapping method to send data back to RMS using the RMS SKU.

The following logic is applied:

- If the Pack Quantity is Null, then the AIP SKU-pack size equals the AIP SKU Order Multiple.
- If the Pack Quantity is not null, then the AIP SKU pack size equals the AIP SKU Pack Quantity.
- If the item is banded, the RMS SKU equals the AIP SKU.

Mapping Table

The following table is used for mapping the RMS SKU to the AIP SKU pack size. This information is sent in the item.txt file. (See comments above):

Mapping table: (examples)

RMS SKU	Order Multiple	Pack Quantity	AIP SKU Pack Size
300	1	(null)	300_1
302	1	12	300_12
303	6	(null)	300_6

Note: RMS truncates fractional pack sizes before sending the data to AIP as AIP cannot handle fractional pack sizes.

Banded items mapping table: (examples)

RMS SKU	Order Multiple	Pack Quantity	AIP SKU-Pack Size
300	1	(null)	300_1
302	1	12	302_12
303	6	(null)	303_6

Note: RMS handles the setting of banded items in item.txt file.

Supplier hierarchy File name: splr.txt

Data Entry	Start	Width	Source
Supplier	1	20	RMS
Supplier Description	21	40	RMS

Warehouse hierarchy File name: whse.txt

Data Entry	Start	Width	Source
Warehouse Chamber	1	20	DM-Online
Warehouse Chamber Description	21	40	DM-Online
Warehouse	61	20	RMS
Warehouse Description	81	40	RMS

Note: RMS sends warehouse chamber values equal to warehouse values.

Measure Data

Overview

AIP receives the following measure files from RMS:

	File Name	Description	Source
1	dm0_pmsstasrc.txt	Store Promotional Substitution Start Date for Warehouse	RMS
2	dm0_pmsendsrc.txt	Store Promotional Substitution End Date for Warehouse	RMS
3	dmx_dscdt_.txt	Corporate Discontinuation Date	RMS
4	dmx_vadprdasc.txt	Value Added Commodity Association	RMS
5	dmx_prdsplls.txt	Commodity-Supplier Links	RMS
6	dmx_bndprdasc.txt	Banded Item Association	RMS
7	dmx_dirspl.txt	Direct Suppliers	RMS
8	sr0_curinv.txt	Store on hand inventory (used to be historical inv)	RMS
9	sr0_it_.txt	Store In transits	RMS
10	sr0_oo_.txt	Store On Orders	RMS
11	sr0_prdlfe.txt	Store Product Life	RMS
12	wr1_curinv.txt	Current WH Inventory (on hand)	RMS
13	wr1_oo_.txt	1st Tier On Orders	RMS
14	wr1_it_.txt	1st Tier In Transits	RMS
15	wr1_ow_.txt	1st Tier Orders in the well	RMS
16	wh_type.txt	Warehouse Type	RMS
17	received_qty.txt	RMS received quantity	RMS*
18	closed_order.txt	RMS closed orders	RMS*

Note: The last files, with *, are files coming from RMS to AIP Online and NOT loaded into AIP RPAS.

File Format

The Retail Extraction, Transformation, and Loading (RETL) tool provides AIP with the file format displayed in the table below.

Note: Customers who do not have RETL are required to provide files with this same format.

Store Promotional Substitution Start Date for Warehouse Data

File Name: dm0_pmsstasrc.txt

Field Name	Type	Start	Width	Source/Comments
Warehouse	String	1	20	RMS.
RMS SKU (Promotional)	String	21	20	AIP will get the Store from store source measure.
Order Multiple	String	41	4	
Store Promotional Substitution Start Date	YYYYMMDD	45	8	

Store Promotional Substitution End Date for Warehouse Data

File Name: dm0_pmsendsrc.txt

Field Name	Type	Start	Width	Source/Comments
Warehouse	String	1	20	RMS.
RMS sku (Promotional)	String	21	20	AIP will get the store value from the store source measure.
Order Multiple	String	41	4	
Store Promotional Substitution End Date	YYYYMMDD	45	8	

Corporate Discontinuation Date Data

File Name: dmx_dscdt.txt

Field Name	Type	Start	Width	Source/Comments
RMS sku	String	1	20	RMS.
Order Multiple	String	21	4	RMS will send today's date.
Corporate Discontinuation Date	YYYYMMDD	25	8	AIP will set the ranging status at all supply locations to pending-deranged as well as initialize the stop-receiving-dates at all warehouses

Value Added Commodity Association

File Name: dmx_vadprdasc.txt

Field Name	Type	Start	Width	Source/Comments
RMS sku (child)	String	1	20	RMS.
Order Multiple	String	21	4	
RMS sku (parent)	String	25	20	
Order Multiple	String	45	4	

Commodity-Supplier Links

File Name: dmx_prdspellks.txt

Field Name	Type	Start	Width	Source/Comments
Supplier	String	1	20	RMS.
RMS sku	String	21	20	
Order Multiple	String	41	4	
Commodity Supplier Links	Boolean	45	1	

Banded Item Association

File Name: dmx_bndprdasc.txt

Field Name	Type	Start	Width	Source/Comments
RMS sku (child)	String	1	20	RMS.
Order Multiple	String	21	4	
RMS sku (parent)	String	25	20	
Order Multiple	String	45	4	

Direct Suppliers

File Name: dmx_dirspl.txt

Field Name	Type	Start	Width	Source/Comments
Supplier	String	1	20	RMS.
Direct Supplier	Boolean	21	1	

Store Current Inventory Data

File Name: sr0_curinv_*.txt

Field Name	Type	Start	Width	Source/Comments
Store	String	1	20	RMS.
RMS SKU	String	21	20	Order Multiple value is always one.
Store current inventory	Float	41	8	

Note: RMS can also send the Store Current Inventory file in a partitioning name. For example, AIP interface code can handle sr0_curinv_n.txt where n is the partition number.

Store In Transits Data

File Name: sr0_it_.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS.
Store	String	10	20	
RMS sku	String	30	20	
Order Multiple	String	50	4	
Store In Transits	Float	54	8	

Store On Orders Data

File Name: sr0_oo_.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS.
Store	String	10	20	RMS will send today's date with sum of all previous # of days values.
RMS sku	String	30	20	
Order Multiple	String	50	4	
Store On Orders	Float	54	8	

Store Product Life Data

File Name: sr0_prdlfe.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS.
RMS sku	String	10	20	
Order Multiple	String	30	4	
Store Product Life	Float	34	8	

Current Warehouse Inventory Data

File Name: wr1_curinv.txt

Field Name	Type	Start	Width	Source/Comments
Warehouse	String	1	20	RMS.
RMS sku	String	21	20	
Order Multiple	String	41	4	
Current Warehouse Inventory	Float	45	8	

On Orders Data

File Name: wr1_oo_.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS.
Supplier	String	10	20	RMS will send today's date with sum of all previous # of days values.
Warehouse	String	30	20	
RMS SKU	String	50	20	
Order Multiple	String	70	4	
On Orders	Float	74	8	

In Transit Data

File Name: wr1_it_.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS.
Supplier	String	10	20	
Warehouse	String	30	20	
RMS SKU	String	50	20	
Order Multiple	String	70	4	
In Transit	Float	74	8	

Orders in the Well Data

File Name: wr1_ow_.txt

Field Name	Type	Start	Width	Source/Comments
Day	DYYYYMMDD	1	9	RMS.
Warehouse	String	10	20	RMS will send today's date with sum of all pervious # of days values.
RMS SKU	String	30	20	
Order Multiple	String	50	4	
Orders in the Well	Float	54	8	

RMS received quantity Data

File Name: received_qty.txt

Field Name	Type	Start	Width	Source/Comments
Order Number	Integer	1	10	RMS
Order Type	String	11	1	
RMS SKU	String	12	25	
Order Multiple	Integer	37	8	
Pack Quantity	Integer	45	8	
Store	Integer	53	10	
Warehouse	Integer	63	10	
Received Date	Date	73	8	
Quantity	Integer	81	8	

RMS closed orders Data

File Name: closed_order.txt

Field Name	Type	Start	Width	Source/Comments
Order Number	Integer	1	10	RMS
Order Type	String	11	1	

File Format Including Mapping to AIP Measure Format

Store Promotional Substitution Start Date for Warehouse Data

File Name: dm0_pmsstasrc.txt

RMS Field	Start	Width	AIP Field	Start	Width
Warehouse	1	20	Store	1	20
RMS SKU	21	20	Warehouse	21	20
Order Multiple	41	4	SKU	41	20

Overview

AIP requires the following text files that need to be processed from an external system.

The list of text files that needs to be processed by the merchandising system are:

- Closed POs
- Item Sale
- Item Supplier
- Location Mapping
- Received Qty
- Store Current Inv
- Store Product Life
- Substitute Items
- Supplier
- Warehouse Current Inv
- Warehouse
- Item

In this guide we explain about how to extract the text files from RMS into AIP.

We use shell scripts, RETL scripts and merging and transformation of data from various tables in RMS to get the desired text files.

Note: Implementers can use these below mentioned mapping information steps to extract data from any other Merchandizing system with minimal customization.

RMS-AIP Closed Purchase Orders Mapping

Transformation Overview

No transformation is required for Closed Purchase Orders and Transfers feed. Extract program directly produces file closed_order.dat required by AIP.

Data Element Details

Data Type	Data Element Name	Data Description
N/A This data is not loaded into RPAS. It is loaded directly into an Oracle table.	Closed Purchase Orders	Contains Closed Purchase Orders and Transfers numbers

Extracting Program Details

Program Type	Shell script wrapper around RETL
Program Name	rmse_aip_cl_po.ksh
Schema File	rmse_aip_cl_po.shcema
Program Frequency	Daily

Data Source and Target Details

Data Source Details		Target Data Details	
Data Origin System	RMS	Target Object Type	Fixed length Text File
Source Table(s)/File(s)	ORDHEAD and TSFHEAD	Target Object Name	closed_order.dat
		Target Load Type	Full

Field Level Mapping – Source

#	Source Table	Source Table Column	Source Field Description	Source Data Type	Field Length
1	ORDHEAD	SUPPLIER	Supplier	Number	(8,0)
	TSFHEAD	FROM_LOC	Warehouse		
2	N/A	N/A	N/A	N/A	N/A

Field Level Mapping – Target

#	Target Data Field Name	Target Field Description	Target Field Data Type	Target Field Length	Condition/Format
1	ORDER_NUMBER	Order Number	int	10	N/A
2	ORDER_TYPE	Order Type	string	1	Hard coded as 'P' for the records from ORDHEAD I.e. for POs and 'T' for the records from TSFHEAD (i.e. for Transfers)

Filtering Conditions

```
(oh.CLOSE_DATE IS NOT NULL) AND (oh.ORIG_IND='6') AND (oh.CLOSE_DATE >
to_date('${LAST_EXTR_CLOSED_POT_DATE}', 'yyyymmdd'))
```

```
(tsf.CLOSE_DATE IS NOT NULL) AND (tsf.TSF_TYPE = 'AIP') AND (tsf.CLOSE_DATE >
to_date('${LAST_EXTR_CLOSED_POT_DATE}', 'yyyymmdd'))
```

Closed Orders Data Flow

Closed Order – Online Load Process

Closed Order – Online Load Process Diagram

RMS-AIP Item Mapping

Transformation Overview

A new AIP transformation program, `aipt_item.ksh`, will first join the item master and item supplier country extracts, followed by merging the result with the item retail extracts, and then join the result to merchandise hierarchy extract and then join the result to banded item extract to produce final item file `item.txt`.

Item Data Flow

RMS-AIP Item Sale Mapping

AIP cannot load the on sale/off sale files that RMS produces. The file is considered to be coming from an external system. The client can simply create a transformation on the RMS files. This custom transformation is needed before these files can be loaded into AIP.

Item Sale Data Flow

Transformation Overview

A custom transformation is required in order for AIP to load dm0_onseffdt.txt and dm0_ofseffdt.txt. The transformation should drop the Order multiple and only retain the single unique on sale date and off sale date for the SKU/Store. This script needs to place the file in the external files inbound directory.

RMS-AIP Item Supplier Mapping

Item Supplier Data Flow

A new RMS extract, `rmse_item_supp_country.ksh`, will produce a data file, `dmx_prdspllks.txt`, containing item, supplier, order multiple and commodity supplier link indicator information. The `rmse_aip_item_supp_country.dat` is also to be used as input file for AIP item transformation, `aipt_item.ksh`, to produce `item.txt` file.

Store Current Inventory Mapping

The final output files required by AIP will be created directly by these extracts with all necessary data transformations performed in the extract modules. No separate data transformation modules will be created. The reason that all transformations will be done in the extract modules directly is because some of the mathematical operations needed (such as the MOD function) do not exist in RETL and therefore these must be done during the Oracle SQL SELECT process.

Store Current Inventory Data Flow

RMS-AIP-Warehouse Current Inv Mapping

Warehouse Current Inventory Data Flow

The final output files required by AIP will be created directly by these extracts with all necessary data transformations performed in the extract modules. No separate data transformation modules will be created. The reason that all transformations will be done in the extract modules directly is because some of the mathematical operations needed (such as the MOD function) do not exist in RETL and therefore these must be done during the Oracle SQL SELECT process.

AIP to RMS Interfaces and Data Mapping

RIB Publications

The Oracle Retail Integration Bus (RIB) is a near real-time data synchronization solution used by AIP for publishing orders to RMS. Order publication begins with the order release batch adding the affected order to the appropriate message family queue staging table and marking each message with a sequence number. AIP publishes two sets of order messages to the RIB, Purchase Orders, and Transfers. RMS subscribes to the RIB messages and inserts the orders into the appropriate RMS Purchase Order and Transfer tables.

AIP Message Flow

A polling operation on the database triggers the message creation. The polling is performed by two threads:

- One for the PO_MFQUEUE staging table
- One for the TSF_MFQUEUE staging table

The polling is controlled by the configuration settings in the main.properties file.

- The order period count defines the number of time intervals that are to be used. An order period count of 0 indicates that no orders will be released. If the order period count is 0, no threads are started.
- The time interval defines the amount of time the threads sleep. A thread will not go to sleep until less than the maximum number of allowable messages is processed in a given call to the publisher (`OrderSenderBean`). Publishing less than the maximum allowable messages indicates that all orders on the staging table (at the time it was queried) have been processed. Any orders added to the staging table afterward will be processed the next time the thread wakes up and the publisher is invoked.
- For each order period count greater than zero, an order period start and order period end must be added to the properties file. When the thread wakes up and the current time falls between the start and end of any of the intervals (up to X intervals where X is the order period count), the thread will call the publication procedure. If desired, various time intervals can be created to manage the publication of orders by forcing the threads to only poll the staging tables between certain time periods.
- The publisher is an Enterprise Java Session Bean named `OrderSenderBean`. The `checkAndPublish` method will query the staging table and the base order table to get the message detail. The publisher will also ensure that messages are published to the RIB in the correct order.
- Once the message payload is built by the `OrderSenderBean`, the RIB message publisher takes the payload and wraps it with an envelope used by the RIB infrastructure.

Purchase Order Messages

The purchase order publication messages are in the XOrder message family. In AIP, this message family processes the staged orders on the PO_MFQUEUE table.

There are four purchase order message types used by AIP:

- XORDERCRE
- XORDERDTLCRE
- XORDERMOD
- XORDERDTLMOD.

All four message types use the XOrderDesc.dtd.

XORDERCRE

This message type indicates that a brand new purchase order is being sent to RMS. The orders are sent to RMS in an 'A'pproved status. This message type is inserted into PO_MFQUEUE in three different circumstances:

1. The purchase order was released by the batch, or you have chosen to release the purchase order in the OM Order Maintenance screen.
2. You have created a new purchase order in the OM Order Create screen.
3. In the OM Order Maintenance screen, you have chosen to move a purchase order delivery date and/or destination and generated a new order number.

XORDERDTLCRE

This message type indicates a new line item is being added to the purchase order after the order was externally communicated. This message type is inserted into PO_MFQUEUE when you have moved the purchase order destination and chosen to retain the existing order number, and the destination does not already exist on the order for that item.

XORDERMOD

This message type indicates that a modification was made to the overall purchase order details (header level information). This message type is inserted into PO_MFQUEUE in the following circumstances:

1. You have moved the purchase order delivery date and chosen to retain the existing order number.
2. You have canceled all ordered quantity of all items on the purchase order. The total order quantity for the entire purchase order is zero. The purchase order is sent to RMS with a 'C'anceled status.

XORDERDTLMOD

This message type indicates that a modification was made to the purchase order line items after the order was externally communicated. This message type is inserted into PO_MFQUEUE when you perform various actions in the OM Order Maintenance screen.

1. You have modified the order quantity of a purchase order that is not “Closed.”
2. You have chosen to move a purchase order line item to a new destination and retain the order number. If the “move to” destination already exists on the order, a message will be written to the staging table to increase the quantity at the “move to” location.

Note: Only one message can be inserted for the “move to” destination. This will either be an XORDERDTLCRE if the destination is new or XORDERDTLMOD if the SKU is already being delivered to the “move to” destination.

The order quantity of the “move from” destination must be decremented to equal the received quantity. A message will be staged for the “move from” destination.

Transfer Messages

The transfer publication messages are in the XTsf message family. In AIP, this message family processes the staged orders on the TSF_MFQUEUE table.

There is one transfer message type used by AIP, XTSFCRE, and it uses the XTsfDesc.dtd.

XTSFCRE

This message type indicates that a brand new transfer is being sent to RMS. The transfers are sent to RMS in an ‘A’pproved status. This message type is inserted into TSF_MFQUEUE when the transfer is released by the batch.

AIP to RMS Data

The Order Management application within AIP releases the necessary data to be sent to RMS into staging tables.

Field Level Mapping – Target

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1	order_no	The unique identifier for the order	Varchar2	10	N/A
2	supplier	The identifier of the supplier from which the order will be sourced. This cannot be modified if details exist for the PO.	Varchar2	10	A substring is used to drop the 'V' prefix that is appended to all RMS supplier numbers.
3	currency_code	The code of the order's currency.	Varchar2	3	Hardcoded as NULL
4	terms	The sales terms of the order.	Varchar2	15	Hardcoded as NULL
5	not_before_date	The first date that delivery will be accepted.	Date		Select the minimum delivery date from the order line items which are not closed. All order line items which are not closed will have the same delivery date.
6	not_after_date	The last date that delivery will be accepted.	Date		Select the maximum delivery date from the order line items which are not closed. All order line items which are not closed will have the same delivery date.
7	otb_eow_date	The end of week date of the OTB bucket used.	Date		Hardcoded as NULL
8	dept	The department in which are all the items on the order.	Number	4	Hardcoded as NULL
9	status	The code for the status of the order. Valid values are 'W' worksheet and 'A' approved for PO creation. It is also possible to modify the status to 'C' closed.	Varchar2	1	The table column has a default of 'A'
10	exchange_rate	The rate of exchange for the PO used between the order and primary currencies.	Number	20	Hardcoded as NULL
11	include_on_ord_ind	Indicates if the order should be included in on-order calculations.	Varchar2	1	Hardcoded as NULL
12	written_date	The date the order was created.	Date		Hardcoded as NULL

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
13	XORDER Detail Records				
	item	An approved, transaction level item	Varchar2	25	N/A
	location	An active store or warehouse	Number	(10,0)	A substring is used to drop the 'S' prefix that is appended to all RMS store numbers and to drop the 'W' prefix that is appended to all RMS warehouse numbers.
	unit_cost	The cost of the item from the supplier in the order's currency	Number	(20,4)	Hardcoded as NULL
	ref_item	The id of a reference item which can be used instead of using the item field	Varchar2	25	Hardcoded as NULL
	origin_country_id	The identifier of the country from which the item is being sourced	Varchar2	3	Hardcoded as NULL
	supp_pack_size	The supplier pack size for the item on the order	Number	(12,3)	The AIP SKU-pack size is mapped to the RMS Item and Order Multiple.
	qty_ordered	The quantity ordered of item	Number	(12,4)	Non-pack SKUs : store_order.case_volume x commodity_mapping.pack_size · non_contents_order.quantity x commodity_mapping.pack_size Formal Pack SKUs: store_order.case_volume · non_contents_order.quantity
	location_type	The location type of the location	Varchar2	1	S indicates the destination location is a store. W indicates the destination location is a warehouse.
	cancel_ind	Indicates if the detail record's quantity should be cancelled	Varchar2	1	Hardcoded as NULL
	reinstate_ind	Indicates if a detail record which was previously cancelled should be reinstated	Varchar2	1	Hardcoded as NULL

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
14	origin_ind	Indicates where the order originated. Valid values include: 2 - Manual, 6 - AIP generated order, 7, 8.	Varchar2	1	6 is a unique RMS identifier that indicates the PO was created in AIP and is hardcoded
15	edi_po_ind	Indicates whether or not the order will be transmitted to the supplier via an Electronic Data Exchange transaction. Valid values are: Y = Submit via EDI, N = Do not use EDI.	Varchar2	1	Hardcoded as NULL
16	pre_mark_ind	This field indicated whether or not a supplier has agreed to break an order into separate boxes so that the boxes can be sent directly to stores.	Varchar2	1	Hardcoded as NULL
17	user_id	Indicates where the order was approved. It will be the user ID of the person approving the order.	Varchar2	30	Hardcoded as NULL
18	comment_desc	Any comments pertaining to the order.	Varchar2	2000	Hardcoded as NULL

5	not_before_date	The first date that delivery will be accepted.	Date		Select the minimum delivery date from the order line items which are not closed. All order line items which are not closed will have the same delivery date.
6	not_after_date	The last date that delivery will be accepted.	Date		Select the maximum delivery date from the order line items which are not closed. All order line items which are not closed will have the same delivery date.
7	otb_eow_date	The end of week date of the OTB bucket used.	Date		Hardcoded as NULL
8	dept	The department in which are all the items on the order.	Number	4	Hardcoded as NULL
9	status	The code for the status of the order. Valid values are 'W' worksheet and 'A' approved for PO creation. It is also possible to modify the status to 'C' closed.	Varchar2	1	The table column has a default of 'A'. If all order quantities are 0 the status of 'C'ancel must be sent to RMS.
10	exchange_rate	The rate of exchange for the PO used between the order and primary currencies.	Number	20	Hardcoded as NULL
11	include_on_ord_ind	Indicates if the order should be included in on-order calculations.	Varchar2	1	Hardcoded as NULL

#	Target Data Field Name	Target Field Description	Target Field Data Type	Field Length	Condition/Format
12	written_date	The date the order was created.	Date		Hardcoded as NULL
13	origin_ind	Indicates where the order originated. Valid values include: 2 - Manual, 6 - AIP generated order, 7, 8.	Varchar2	1	6 is a unique RMS identifier that indicates the PO was created in AIP and is hardcoded
14	edi_po_ind	Indicates whether or not the order will be transmitted to the supplier via an Electronic Data Exchange transaction. Valid values are: Y = Submit via EDI, N = Do not use EDI.	Varchar2	1	Hardcoded as NULL
15	pre_mark_ind	This field indicated whether or not a supplier has agreed to break an order into separate boxes so that the boxes can be sent directly to stores.	Varchar2	1	Hardcoded as NULL
16	user_id	Indicates where the order was approved. It will be the user ID of the person approving the order.	Varchar2	30	Hardcoded as NULL
17	comment_desc	Any comments pertaining to the order.	Varchar2	2000	Hardcoded as NULL

Field Level Mapping – Target

The target table for all data is ORDHEAD.

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1	ORDER_NO	The unique identifier for the order	NUMBER	(8,0)	N/A
2	ORDER_TYPE	Order Type	VARCHAR2	3	Hardcode as 'N/B' at destination
3	DEPT		NUMBER	(4,0)	Hardcoded as NULL at Source
4	BUYER		NUMBER	(4,0)	NULL
5	SUPPLIER	The identifier of the supplier from which the order will be sourced. This cannot be modified if details exist for the PO.	NUMBER	(10,0)	A substring is used to drop the 'V' prefix that is appended to all RMS supplier numbers.
6	SUPP_ADD_SEQ_NO	Supplier Address Sequence Number	NUMBER	(4,0)	Populated with primary address sequence number for the primary supplier
7	LOC_TYPE	Location Type	VARCHAR2	1	NULL
8	LOCATION	Location Type	NUMBER	(10,0)	NULL
9	PROMOTION	Promotion Number	NUMBER	(10,0)	NULL
10	QC_IND	QC Indicator	VARCHAR2	1	Hardcoded as 'N' at destination
11	WRITTEN_DATE	The date order was created	DATE		Hardcoded as today's Vdate
12	NOT_BEFORE_DATE	The first date that delivery will be accepted.	DATE		If Source value is NULL, then Vdate Else Source Value.
13	NOT_AFTER_DATE	The last date that delivery will be accepted.	DATE		If Source value is NULL, then Vdate Else Source Value.
14	OTB_EOW_DATE	The end of week date of the OTB bucket used.	DATE		Populated with EOW date for the date NOT_AFTER_DATE at destination
15	EARLIEST_SHIP_DATE	Earliest Shipment Date	DATE		Populated as NOT_BEFORE_DATE at destination

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
16	LATEST_SHIP_DATE	Latest Shipment Date	DATE		Calculated at destination as NOT_BEFORE_DATE + LATEST_SHIP_DAYS from SYSTEM_OPTIONS table
17	CLOSE_DATE	Order Close Date	DATE		Hardcoded as NULL
18	TERMS	The sales terms of the order.	VARCHAR2	15	Populated as TERMS of primary supplier from SUPS table
19	FREIGHT_TERMS	The freight terms of the order.	VARCHAR2	30	Populated as FREIGHT_TERMS of primary supplier from SUPS table
20	ORIG_IND	Indicates where the order originated. Valid values include: 2 - Manual, 6 - AIP generated order, 7, 8.	NUMBER	(1,0)	6 is a unique RMS identifier that indicates the PO was created in AIP and is hardcoded at source
21	CUST_ORDER	Customer Order Indicator	VARCHAR2	1	Hardcoded as 'N' at destination
22	PAYMENT_METHOD	Payment Method for the Order	VARCHAR2	6	Populated as PAYMENT_METHOD of primary supplier from SUPS table
23	BACKHAUL_TYPE	Backhaul Type	VARCHAR2	6	NULL
24	BACKHAUL_ALLOWANCE	Backhaul Allowance	NUMBER	(20,4)	NULL
25	SHIP_METHOD	Shipping Method	VARCHAR2	6	Populated as SHIP_METHOD of primary supplier from SUPS table
26	PURCHASE_TYPE	Purchase Type	VARCHAR2	6	NULLLabel column
27	STATUS	The code for the status of the order.	VARCHAR2	1	Source has the status as 'A'
28	ORIG_APPROVAL_DATE	Original Approval Date of the Order	DATE		If Status is Approved, hardcoded as VDATE at destination Else NULL
29	ORIG_APPROVAL_ID	Original Approval User ID	VARCHAR2	30	User ID used to run the batch/adapter
30	SHIP_PAY_METHOD	Shipment Pay Method	VARCHAR2	2	NULL
31	FOB_TRANS_RES	Trans Reserve	VARCHAR2	2	NULL
32	FOB_TRANS_RES_DESC	Trans Reserve Description	VARCHAR2	45	NULL

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
33	FOB_TITLE_PASS	Title Pass	VARCHAR2	2	Populated as FOB_TITLE_PASS from SYSTEM_OPTIONS table

Field Level Mapping – Target Order SKU (ORDSKU) Table

The following table displays target attributes for the source data being mapped to the Order SKU table (ORDSKU).

#	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1	ORDER_NO	The unique identifier for the order	NUMBER	(8,0)	N/A
2	ITEM	An approved, transaction level item	VARCHAR2	25	
3	REF_ITEM	The id of a reference item which can be used instead of using the item field.	VARCHAR2	25	Hardcoded as NULL at Source
4	ORIGIN_COUNTRY_ID	The identifier of the country from which the item is being sourced	VARCHAR2	3	Populated as ORIGIN_COUNTRY_ID of the primary supplier & item combination from ITEM_SUPP_COUNTRY table
5	EARLISET_SHIP_DATE	Earliest Shipment Date	DATE		Populated as EARLISET_SHIP_DATE of the header row from ORDHEAD table
6	LATEST_SHIP_DATE	Latest Shipment Date	DATE		Populated as LATEST_SHIP_DATE of the header row from ORDHEAD table
7	SUPP_PACK_SIZE	The supplier pack size for the item on the order	NUMBER	(12,4)	NULL
8	NON_SCALE_IND	Non Scale Indicator	VARCHAR2	1	Hardcoded as 'Y' at destination
9	PICKUP_LOC	Pickup Location	VARCHAR2	45	NULL
10	PICKUP_NO	Pickup Number	VARCHAR2	25	NULL

Field Level Mapping – Source for Order Location (ORDLOC) Table

The following table shows source data mapped to the Order Location (ORDLOC) table.

#	Source Table	Source Table Column	Source Field Description	Data Type	Field Length
1	PO_MFQUEUE	ORDER_NUMBER	Order Number	Number	(10,0)
2	COMMODITY_MAPPING	RMS_SKU_NUMBER	RMS SKU	Varchar2	25
3	STORE STOCKING_POINT	STORE_CODE STOCKING_POINT_NUMBER	Store Code Stocking Point Number	Varchar2	20
4	N/A	N/A	N/A	N/A	N/A
5	N/A	N/A	N/A	N/A	N/A
6	STORE_ORDER NON_CONTENTS_ORDER COMMODITY_MAPPING	CASE_VOLUME QUANTITY PACK_SIZE	Case Volume Quantity Pack Size	Number	8
7	N/A	N/A	N/A	N/A	N/A
8	N/A	N/A	N/A	N/A	N/A
9	N/A	N/A	N/A	N/A	N/A
10	N/A	N/A	N/A	N/A	N/A
11	N/A	N/A	N/A	N/A	N/A
12	N/A	N/A	N/A	N/A	N/A
13	N/A	N/A	N/A	N/A	N/A
14	N/A	N/A	N/A	N/A	N/A
15	N/A	N/A	N/A	N/A	N/A
16	N/A	N/A	N/A	N/A	N/A
17	N/A	N/A	N/A	N/A	N/A
18	N/A	N/A	N/A	N/A	N/A
19	N/A	N/A	N/A	N/A	N/A
20	N/A	N/A	N/A	N/A	N/A
21	N/A	N/A	N/A	N/A	N/A

Field Level Mapping – Target Order Location (ORDLOC) Table

The following table displays source data that is mapped to Order Location table (ORDLOC).

Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1 ORDER_NO	The unique identifier for the order	NUMBER	(8,0)	N/A
2 ITEM	An approved, transaction level item	VARCHAR2	25	
3 LOCATION	An active store or warehouse. If multichannel is on, and a warehouse is being order to, a virtual warehouse is expected	NUMBER	(10,0)	A substring is used to drop the 'S' prefix that is appended to all RMS store numbers and to drop the 'W' prefix that is appended to all RMS warehouse numbers at Source
4 LOC_TYPE	The location type of the location.	VARCHAR2	1	S indicates the destination location is a store at Source W indicates the destination location is a warehouse at Source
5 UNIT_RETAIL	Unit Retail price for item & location combination	NUMBER	(20,4)	Calculated at destination as for non-sellable pack item, build the unit_retail based on component items unit_retail and for non-pack item or sellable pack item, get the unit_retail from item_zone_price
6 QTY_ORDERED	The quantity ordered of item	NUMBER	(12,4)	Non-pack SKUs : store_order.case_volume x commodity_mapping.pack_size · non_contents_order.quantity x commodity_mapping.pack_size Formal Pack SKUs: store_order.case_volume · non_contents_order.quantity
7 QTY_PRESCALED	Quantity Prescaled	NUMBER	(12,4)	Populated same as QTY_ORDERED at destination
8 QTY_RECEIVED	Received Quantity	NUMBER	(12,4)	NULL
9 LAST_RECEIVED	Last Received Quantity	NUMBER	(12,4)	NULL
10 LAST_ROUNDED_QTY	Last Rounded Quantity	NUMBER	(12,4)	NULL
11 LAST_GRP_ROUNDED_QTY	Last GRP Rounded Quantity	NUMBER	(12,4)	NULL
12 QTY_CANCELLED	Quantity Cancelled	NUMBER	(12,4)	NULL
13 CANCEL_CODE	Cancellation Code	VARCHAR2	1	NULL
14 CANCEL_DATE	Cancellation Date	DATE		NULL
15 CANCEL_ID	User ID Cancelled	VARCHAR2	30	NULL

Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
16 ORIGINAL_REPL_QTY	Original Replenishment Quantity	NUMBER	(12,4)	NULL
17 UNIT_COST	The cost of the item from the supplier in the order's currency	NUMBER	(20,4)	Populated from ITEM_SUPP_COUNTRY_LOC or ITEM_SUPP_COUNTRY for the combination item/supplier/country/loc.
18 UNIT_COST_INIT	Initial Unit Cost	NUMBER	(20,4)	NULL
19 COST_SOURCE		VARCHAR2	4	Hardcoded as 'NORM' at destination
20 NON_SCALE_IND		VARCHAR2	1	Hardcoded as 'Y' at destination
21 TSF_PO_LINK_NO		NUMBER	(10,0)	NULL

Filtering Conditions

None.

XTSF Header – RMS TSFHEAD Mapping

Data Element Details

Data Type	Data Element Name	Data Description
RMS Subscriber Mapping	Create Transfer Header	Contains Transfer header details

Extracting Program Details

Program Type	RIB Subscriber Adapter
Program Name	RMS Subscriber Adapter
Schema File	N/A
Program Frequency	Near Real Time

Data Source and Target Details

Data Source Details		Target Data Details

17	N/A	N/A	N/A	N/A	N/A
18	N/A	N/A	N/A	N/A	N/A
19	N/A	N/A	N/A	N/A	N/A

Field Level Mapping – Target

	Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1	TSF_NO	Number that uniquely identifies the transfer.	NUMBER	(10,0)	N/A
2	FROM_LOC_TYPE	The location type of the from location.	VARCHAR2	1	Hardcoded as 'W' at Source
3	FROM_LOC	The location number of the from location.	NUMBER	(10,0)	A substring is used to drop the 'W' prefix that is appended to all RMS warehouse numbers.
4	TO_LOC_TYPE	The location type of the to location.	VARCHAR2	1	Hardcoded as 'S' which indicates the destination location is a store 'W' indicates the destination location is a warehouse.
5	TO_LOC	The location number of the to location.	NUMBER	(10,0)	A substring is used to drop the 'S' prefix that is appended to all RMS store numbers and to drop the 'W' prefix that is appended to all RMS warehouse numbers.
6	DEPT	The department number associated with the transfer.	NUMBER	(4,0)	Hardcoded as NULL at Source
7	TSF_TYPE	A code indicating the type of transfer (e.g. store requisition, book transfer, etc.).	VARCHAR2	6	Hardcoded as 'AIP' at Source
8	STATUS	A code indicating the status of the transfer (e.g. approved, closed, etc.).	VARCHAR2	1	The transfer will be created in 'Approved' status so hardcoded as 'A' at Source
9	FREIGHT_CODE	A code indicating the freight status of the transfer (e.g. normal, expedite, etc.).	VARCHAR2	1	Hardcoded as 'N' at destination
10	ROUTING_CODE	If the freight status is expedite, this is a code indicating more detailed freight info.	VARCHAR2	1	Hardcoded as 'NULL'
11	CREATE_DATE	Transfer Creation Date	DATE		Hardcoded as today's Vdate
12	CREATE_ID	User who created the transfer	VARCHAR2	30	Hardcoded as current logged in User
13	APPROVAL_DATE	Transfer Approval Date	DATE		Hardcoded as today's Vdate
14	APPROVAL_ID	User who approved the transfer	VARCHAR2	30	Hardcoded as current logged in User

Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
15 DELIVERY_DATE	The earliest date the transfer can be delivered.	DATE		N/A
16 CLOSE_DATE		DATE		NULL
17 EXT_REF_NO		VARCHAR2	14	NULL
18 REPL_TSF_APPROVE_IND		VARCHAR2	1	Hardcoded as 'N' at destination
19 COMMENT_DESC	Comments associated with the transfer.	VARCHAR2	300	NULL

Filtering Conditions

None.

Field Level Mapping – Target

Target Data Field Name	Target Field Description	Field Data Type	Field Length	Condition/Format
1 TSF_NO	Number that uniquely identifies the transfer	Varchar2	(10,0)	The transfer number from header row
2 TSF_SEQ_NO	Transfer Line Item Number	Number	(8,0)	Transfer line item number under the current header row
3 ITEM	The unique identifier of the item being transferred.	Number	25	N/A
4 INV_STATUS	A code indicating the inventory status for this transfer detail; valid values are found on the inv_status_types table	Number	(2,0)	Hardcoded as NULL
5 TSF_QTY	The total quantity of the item reserved for this transfer at the from location.	Number	(12,4)	Non-pack SKUs : store_order.case_volume x commodity_mapping.pack_size · non_contents_order.quantity x commodity_mapping.pack_size Formal Pack SKUs: store_order.case_volume · non_contents_order.quantity
6 FILL_QTY	Fill Quantity	Varchar2	(12,4)	NULL
7 SHIP_QTY	Shipped Quantity	Number	(12,4)	NULL
8 RECEIVED_QTY	Received Quantity	Number	(12,4)	NULL
9 DISTRO_QTY	Distributed Quantity	Number	(12,4)	NULL
10 SELECTED_QTY	Selected Quantity	Number	(12,4)	NULL
11 CANCELLED_QTY	Cancelled Quantity	Varchar2	(12,4)	NULL
12 SUPP_PACK_SIZE	Supplier Pack Size	Number	(12,4)	The AIP SKU-pack size is mapped to the RMS Item and Order Multiple.
13 TSF_PO_LINK_NO	Transfer to PO Link number	Number	(10,0)	NULL
14 MBR_PROCESSED_IND	Member Processed Indicator	Number	1	NULL
15 PUBLISH_IND	Publishing Indicator	Number	1	Hardcoded as 'N'
