

GlassFish v3 Application Server Quick Start Guide

Sun Microsystems, Inc.
4150 Network Circle
Santa Clara, CA 95054
U.S.A.

Part No: 820-4836-01
April 2008

Copyright 2008 Sun Microsystems, Inc. 4150 Network Circle, Santa Clara, CA 95054 U.S.A. All rights reserved.

Sun Microsystems, Inc. has intellectual property rights relating to technology embodied in the product that is described in this document. In particular, and without limitation, these intellectual property rights may include one or more U.S. patents or pending patent applications in the U.S. and in other countries.

U.S. Government Rights – Commercial software. Government users are subject to the Sun Microsystems, Inc. standard license agreement and applicable provisions of the FAR and its supplements.

This distribution may include materials developed by third parties.

Parts of the product may be derived from Berkeley BSD systems, licensed from the University of California. UNIX is a registered trademark in the U.S. and other countries, exclusively licensed through X/Open Company, Ltd.

Sun, Sun Microsystems, the Sun logo, the Solaris logo, the Java Coffee Cup logo, docs.sun.com, Java, and Solaris are trademarks or registered trademarks of Sun Microsystems, Inc. in the U.S. and other countries. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. in the U.S. and other countries. Products bearing SPARC trademarks are based upon an architecture developed by Sun Microsystems, Inc.

The OPEN LOOK and Sun™ Graphical User Interface was developed by Sun Microsystems, Inc. for its users and licensees. Sun acknowledges the pioneering efforts of Xerox in researching and developing the concept of visual or graphical user interfaces for the computer industry. Sun holds a non-exclusive license from Xerox to the Xerox Graphical User Interface, which license also covers Sun's licensees who implement OPEN LOOK GUIs and otherwise comply with Sun's written license agreements.

Products covered by and information contained in this publication are controlled by U.S. Export Control laws and may be subject to the export or import laws in other countries. Nuclear, missile, chemical or biological weapons or nuclear maritime end uses or end users, whether direct or indirect, are strictly prohibited. Export or reexport to countries subject to U.S. embargo or to entities identified on U.S. export exclusion lists, including, but not limited to, the denied persons and specially designated nationals lists is strictly prohibited.

DOCUMENTATION IS PROVIDED "AS IS" AND ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT, ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT SUCH DISCLAIMERS ARE HELD TO BE LEGALLY INVALID.

Copyright 2008 Sun Microsystems, Inc. 4150 Network Circle, Santa Clara, CA 95054 U.S.A. Tous droits réservés.

Sun Microsystems, Inc. détient les droits de propriété intellectuelle relatifs à la technologie incorporée dans le produit qui est décrit dans ce document. En particulier, et ce sans limitation, ces droits de propriété intellectuelle peuvent inclure un ou plusieurs brevets américains ou des applications de brevet en attente aux États-Unis et dans d'autres pays.

Cette distribution peut comprendre des composants développés par des tierces personnes.

Certains composants de ce produit peuvent être dérivés du logiciel Berkeley BSD, licenciés par l'Université de Californie. UNIX est une marque déposée aux États-Unis et dans d'autres pays; elle est licenciée exclusivement par X/Open Company, Ltd.

Sun, Sun Microsystems, le logo Sun, le logo Solaris, le logo Java Coffee Cup, docs.sun.com, Java et Solaris sont des marques de fabrique ou des marques déposées de Sun Microsystems, Inc. aux États-Unis et dans d'autres pays. Toutes les marques SPARC sont utilisées sous licence et sont des marques de fabrique ou des marques déposées de SPARC International, Inc. aux États-Unis et dans d'autres pays. Les produits portant les marques SPARC sont basés sur une architecture développée par Sun Microsystems, Inc.

L'interface d'utilisation graphique OPEN LOOK et Sun a été développée par Sun Microsystems, Inc. pour ses utilisateurs et licenciés. Sun reconnaît les efforts de pionniers de Xerox pour la recherche et le développement du concept des interfaces d'utilisation visuelle ou graphique pour l'industrie de l'informatique. Sun détient une licence non exclusive de Xerox sur l'interface d'utilisation graphique Xerox, cette licence couvrant également les licenciés de Sun qui mettent en place l'interface d'utilisation graphique OPEN LOOK et qui, en outre, se conforment aux licences écrites de Sun.

Les produits qui font l'objet de cette publication et les informations qu'il contient sont régis par la législation américaine en matière de contrôle des exportations et peuvent être soumis au droit d'autres pays dans le domaine des exportations et importations. Les utilisations finales, ou utilisateurs finaux, pour des armes nucléaires, des missiles, des armes chimiques ou biologiques ou pour le nucléaire maritime, directement ou indirectement, sont strictement interdites. Les exportations ou réexportations vers des pays sous embargo des États-Unis, ou vers des entités figurant sur les listes d'exclusion d'exportation américaines, y compris, mais de manière non exclusive, la liste de personnes qui font objet d'un ordre de ne pas participer, d'une façon directe ou indirecte, aux exportations des produits ou des services qui sont régis par la législation américaine en matière de contrôle des exportations et la liste de ressortissants spécifiquement désignés, sont rigoureusement interdites.

LA DOCUMENTATION EST FOURNIE "EN L'ETAT" ET TOUTES AUTRES CONDITIONS, DECLARATIONS ET GARANTIES EXPRESSES OU TACITES SONT FORMELLEMENT EXCLUES, DANS LA MESURE AUTORISEE PAR LA LOI APPLICABLE, Y COMPRIS NOTAMMENT TOUTE GARANTIE IMPLICITE RELATIVE A LA QUALITE MARCHANDE, A L'APTITUDE A UNE UTILISATION PARTICULIERE OU A L'ABSENCE DE CONTREFACON.

Application Server Overview

The *GlassFish Application Server 10TP2 Quick Start Guide* provides basic instructions for quickly getting up and running with GlassFish Application Server 10TP2 software. This guide provides basic instructions for the most common Application Server tasks, including starting and configuring the Application Server, deploying applications, and getting started with using NetBeans™, JRuby, and Eclipse technologies.

This chapter provides a basic introduction to GlassFish Application Server core concepts, features, and components.

Note – This document does not provide comprehensive reference information or advanced procedures for working with GlassFish Application Server. Refer to the other documents listed in on the [Application Server Documentation Home Page](#) for more comprehensive information and instructions.

This chapter includes the following topics:

- “Installing Application Server Software” on page 6
- “Application Server Core Concepts” on page 6
- “For More Information” on page 8

For information about conventions used in this document, see the [Documentation Conventions](#) page.

Installing Application Server Software

Install the GlassFish Application Server software before continuing with this document. See the [Application Server Installation Guide](#) for complete Application Server installation instructions.

GlassFish Application Server 10TP2 software is available from [Application Server — V3 Technology Preview](#) page.

Application Server Core Concepts

The GlassFish Application Server is an open source, plugin-based, Java EE 5 application server that provides enterprise class features such as advanced administration and monitoring, clustering, high availability database (HADB) and load balancing support, and a bundled Java DB database engine.

Application Server implements the newest features of the Java EE 5 platform, including JavaServer Pages (JSP) 2.1, JavaServer Faces (JSF) 1.2, Servlet 2.5, and Java Architecture for XML Binding (JAXB) 2.1, among others.

Note – Java API for Web Services (JAX-WS) 2.1/Metro is available as a separate download from the [“Application Server Update Center”](#) on page 7.

In addition to implementing the core Java 5 EE technologies, this 10TP2 supports jRugy scripting, NetBeans plugins, downloadable extensions such as Metro, JRuby runtime, and Jersey, and Web container technologies such as Servlet 2.5, JSP 2.1, JSF 1.2, jMaki 1.x, and Comet/Cometd.

- [“Application Server Components”](#) on page 6
- [“Application Server Administration Tools”](#) on page 7
- [“Application Server Domains”](#) on page 7
- [“Application Server Update Center”](#) on page 7

Application Server Components

For the purposes of this *Quick Start Guide* and your initial interactions with the Application Server, there are five Application Server components you will work with:

Server Engine

Framework in which Web domains are hosted, and Web applications and services are deployed, monitored, and maintained

Database Engine	Back-end data store used by Web applications and services
Admin Console GUI	Browser-based tool for configuring, managing, deploying, and monitoring domains, database back end, Web applications, and Web services
Admintool (CLI)	Command—line interface for configuring, managing, deploying, and monitoring domains, database back end, Web applications, and Web services
Server Plugins	Web applications, services, and scripting components plugged into the server framework

Application Server Administration Tools

GlassFish Application Server provides three means for configuring, running, and managing the Application Server:

- A Web browser-based administration console (Admin Console GUI)
- A set of command—line tools, the centerpiece of which is `asadmin` (the Admintool CLI), incorporating all features of the browser-based administration console
- Programmatic Java Management Extensions (JMX™) APIs

For the purposes of this document, the only means of management discussed here are the two most commonly used interfaces: the browser-based administration console and the Admintool CLI.

Application Server Domains

In the context of Application Server configuration, a *domain* is a collection of configuration data, deployed applications, and machines with a designated administrator. The domain definition is encoded in a simple XML text file, and describes and can control the operation of several applications, standalone Application Server instances and clusters, potentially spread over multiple machines. (Note that cluster configuration is not covered in this document.) By default, when you install Application Server, a default domain called *domain1* is created. This default domain is referenced throughout the remainder of this document.

Application Server Update Center

The GlassFish Application Server Update Center is a convenient GUI-based tool for getting the latest versions of various Application Server plugins, extensions, and related applications. There is also a command-line interface for all Update Center functions.

The Update Center can be launched with the `updatetool` command in the Application Server `install-dir/updatecenter/bin` directory, or from the Application Server administration console GUI.

For More Information

The GlassFish Application Server is an open source community project for which numerous sources of additional information are available.

GlassFish Application Server Project Page	Starting point for Application Server downloads, documentation, wikis, and forums
Application Server Documentation Home Page	Complete Application Server documentation
Application Server Wiki	Community site that includes a wide range of topics related to Application Server
Application Server FAQ	Several FAQs covering various Application Server topics
Application Server user forums	Provide community support and tips for working with Application Server
Application Server Screencasts	Rapidly growing collection of screencasts that demonstrate numerous features and examples for working with Application Server and related projects
Java EE 5 Tutorial	Provides extensive instructions, examples, and sample code for working with all Java platform core technologies

Using Application Server Software

This chapter explains how to get started with a basic set of Application Server tasks. The following topics are included in this chapter:

- “Starting and Stopping the Default Domain” on page 9
- “Starting and Stopping the Bundled Java DB Server” on page 10
- “Using the Administration Console GUI” on page 11
- “Deploying and Undeploying Applications” on page 12

Note – The instructions in this chapter use UNIX-standard forward slashes (/) for directory path separators in commands and file names. If you are running Application Server on a Microsoft Windows system, be sure to use backslashes (\) instead; for example:

- **UNIX:** *install-dir/bin/asadmin*
 - **Windows:** *install-dir\bin\asadmin*
-

Starting and Stopping the Default Domain

By default, when you install Application Server, a default domain named `domain1` is created.

▼ To Start the Default Domain

Before You Begin Make sure that you have installed [Java JDK 6 Update 5](#) on the system on which Application Server is installed, and that the JDK `bin` directory is in your system `PATH`. See the [Application Server Installation Guide](#) for Application Server 10TP2 installation instructions.

- **Use the `asadmin start-domain` command.**

install-dir/bin/asadmin start-domain

- **Alternatively, you can enter the full command:**

```
java -jar install-dir/modules/admin-cli-10.0-SNAPSHOT.jar start-domain
```

- **As another alternative, you can run the `startserv` script.**

install-dir/bin/startserv

Note – The `startserv` script is deprecated, and may not be available in future versions of Application Server.

Any of these commands starts the default domain, `domain1`.

▼ To Stop the Default Domain

- **Use the `asadmin stop-domain` command.**

install-dir/bin/asadmin stop-domain

- **Alternatively, you can enter the full command:**

```
java -jar install-dir/modules/admin-cli-10.0-SNAPSHOT.jar stop-domain
```

- **As another alternative, you can run the `stopserv` script.**

install-dir/bin/stopserv

Note – The `stopserv` script is deprecated, and may not be available in future versions of Application Server.

Any of these commands stops the default domain, `domain1`.

Starting and Stopping the Bundled Java DB Server

Application Server is bundled by default with a Java DB server implementation, although you can use any JDBC-compliant database engine. The database is not started by default when you start Application Server, so if you have applications need a database backend, you need to start the database server manually.

▼ To Start the Java DB Server

The instructions in this procedure describe how to start the Java DB server that is bundled with Application Server, but they apply for the most part to any database you want to use.

Note – At least one Application Server domain must be started *before* starting the database server.

- **Use the `asadmin start-database` command.**

The general form for the command is:

```
install-dir/bin/asadmin start-database --dbhome directory_path
```

By default, for the Java DB bundled with Application Server, you do not need to use the `--dbhome` option:

```
install-dir/bin/asadmin start-database
```

This starts the default Java DB located in *install-dir/glassfish/javadb*.

▼ To Stop the Java DB Server

- **Use the `asadmin stop-database` command.**

```
install-dir/bin/asadmin stop-database
```

Using the Administration Console GUI

The Application Server Administration Console GUI (hereafter referred to as the *Admin Console*) provides a graphical, browser-based means for configuring, maintaining, and monitoring the Application Server and your domains.

Note – In the Application Server 10TP2 release, the Admin Console is not installed by default, but is instead installed when you invoke it for the first time after installing Application Server.

▼ To Launch the Admin Console

Before You Begin Make sure at least one Application Server domain is started, as described in [“To Start the Default Domain” on page 9](#).

1 Open the Admin Console URL in a browser window.

The default URL for the Admin Console is:

`http://localhost:4848/adminui/index.jsf`

You are prompted to install the Admin Console.

2 Enter a proxy host and proxy port, if necessary, and then click *OK* to start the Admin Console installation.

3 When the installation is complete, refresh the browser page to launch the Admin Console.

4 Enter a user name and password.

By default:

- **User Name:** admin
- **Password:** adminadmin

5 Refer to the *GlassFish v3 Application Server Administration Guide* and to the Admin Console online help for instructions on using the Admin Console.

Deploying and Undeploying Applications

The process of configuring and enabling an application to run within the Application Server framework is referred to as *deployment*. You can deploy applications in three ways:

- From the command line (Admin Console CLI) with the `asadmin deploy` command
- From the Admin Console GUI
- By placing the application in the `install-dir/domains/domain_name/autodeploy` directory

Note – In the Application Server 10TP2 release, applications can be packaged for deployment in Web Archive (WAR) format only.

The remainder of this chapter explains how to deploy, list, and undeploy applications.

The instructions in this section use the `hello.war` sample file available at <http://glassfish.dev.java.net/downloads/quickstart/hello.war>.

- “To Get the Sample Application Used in This Section” on page 13
- “To Deploy an Application From the Admin Console CLI” on page 13
- “To List Deployed Applications From the Admin Console CLI” on page 13
- “To Undeploy an Application From the Admin Console CLI” on page 14
- “To Deploy an Application From the Admin Console GUI” on page 14
- “To View Deployed Applications in the Admin Console GUI” on page 15

- “To Undeploy an Application From the Admin Console GUI” on page 15
- “To Deploy an Application Using Autodeploy” on page 15
- “To Undeploy an Autodeployed Application” on page 15

▼ To Get the Sample Application Used in This Section

- **Download the `hello.war` sample from**
<http://glassfish.dev.java.net/downloads/quickstart/hello.war> and save it in the directory of your choice.

The procedures in the remainder of this chapter use this `hello.war` sample.

▼ To Deploy an Application From the Admin Console CLI

- 1 **Use the `asadmin deploy` command.**

The general form for the command is:

```
install-dir/bin/asadmin deploy war_name
```

To deploy the `hello.war` sample, the command is:

```
install-dir/bin/asadmin deploy sample_dir/hello.war
```

- 2 **Access the `hello` application by entering the following URL in a browser window:**

```
http://localhost:8080/hello
```

The application's start page is displayed, and you are prompted to fill in your name.

```
Hi, my name is Duke. What's yours?
```

- 3 **Type your name and click *Submit*.**

The application displays a customized response, giving you a personal Hello.

▼ To List Deployed Applications From the Admin Console CLI

- **Use the `asadmin list-applications` command:**

```
install-dir/bin/asadmin list-applications
```

▼ To Undeploy an Application From the Admin Console CLI

- Use the `asadmin undeploy` command.

The general form for the command is:

```
install-dir/bin/asadmin undeploy --name war_name
```

For the `hello.war` example, the command is:

```
install-dir/bin/asadmin undeploy --name hello.war
```

▼ To Deploy an Application From the Admin Console GUI

- 1 Open the Admin Console GUI by entering the following URL in a browser window:

```
http://localhost:8080/admingui/
```

- 2 Click the *Web Applications* node in the tree on the left.

The Web Applications page is displayed.

- 3 Click *Deploy*.

The Deploy Enterprise Applications/Modules page is displayed.

- 4 Select “Packaged file to be uploaded to the server,” if it is not already selected, and then click *Browse*.

- 5 Navigate to the location in which you saved the `hello.war` sample, and then click *Open*.

Note – If running Application Server on Windows, be sure to remove the drive letter and colon (for example, C :) from the file name path.

You are returned to the Deploy Enterprise Applications/Modules page.

- 6 Enter a description in the Description field; for example, `hello`.

- 7 Accept the other default settings, and click *OK*.

You are returned to Web Applications page.

- 8 Display the sample application by entering the following URL in a browser window:

```
http://localhost:8080/hello/
```

▼ To View Deployed Applications in the Admin Console GUI

- 1 Open the Admin Console GUI by entering the following URL in a browser window:

`http://localhost:8080/admingui/`

- 2 Click the *Web Applications* node in the tree on the left.

The list of deployed Web applications is displayed in the page is displayed in the Deployed Web Applications table on the Web Applications page.

▼ To Undeploy an Application From the Admin Console GUI

- 1 Open the Admin Console GUI by entering the following URL in a browser window:

`http://localhost:8080/admingui/`

- 2 Click the *Web Applications* node in the tree on the left.

The Web Applications page is displayed.

- 3 Select the checkbox next to the application(s) you want to undeploy, and then click *Undeploy*.

Alternatively, you can keep an application deployed, but disable it by clicking *Disable*.

▼ To Deploy an Application Using Autodeploy

- 1 Create a directory named `install-dir/domains/domain_name/autodeploy`

`domain_name` is the name of the domain for which you want to configure autodeployment. For this example, use the default `domain1` domain:

`install-dir/domains/domain1/autodeploy`

- 2 Copy the application WAR file to the `install-dir/domains/domain_name/autodeploy` directory.

The application is automatically discovered and started by Application Server.

▼ To Undeploy an Autodeployed Application

- Delete the application from the domain's `autodeploy` directory.

Using Other Technologies With Application Server

In addition to Web applications packaged in WAR format, Application Server can be configured to work with JRuby/Rails, NetBeans, and Eclipse technologies. This chapter provides a brief introduction to configuring each of these technologies to work with Application Server

- “Working With JRuby-on-Rails” on page 17
- “Working With NetBeans” on page 19
- “Working With Eclipse” on page 19

Working With JRuby-on-Rails

JRuby is a Java implementation of the Ruby programming language, an interpreted language with a simple syntax that enables developers to create applications quickly and easily. *Rails* is a Web application framework that eliminates much of the repetition and configuration required in other programming environments. An application written in JRuby using the Rails framework is called a JRuby-on-Rails application. With JRuby-on-Rails, you get the simplicity and productivity offered by Ruby and Rails and the access to Java libraries offered by the Java platform.

▼ To Create and Deploy a JRuby-on-Rails Application in Application Server

This procedure illustrates how to create a simple “Hello World” application with JRuby-on-Rails in Application Server 10TP2.

These steps illustrate a directory-based deployment to Application Server. You can also package your JRuby-on-Rails application in a WAR file and deploy the WAR file to Application Server, as described earlier in this document. Alternatively, you can install a Application Server

instance in your JRuby VM and deploy your application to it. See the JRuby-on-Rails on Application Server Tutorial *******[Link TBD] for more information.

1 Download and unpack jruby1.1-bin.zip from <http://dist.codehaus.org/jruby>.

2 Change to the directory in which you unpacked JRuby, and then install Rails.

```
dirname/bin/jruby -S gem install rails --no-ri --no-rdoc
```

3 Change to the JRuby samples directory and create the hello application.

```
../bin/jruby -S rails hello
```

4 Change to the hello directory you created, and generate the controllers and views for the application:

```
../../bin/jruby script/generate controller say hello
```

5 Open the hello/app/controllers/say_controller.rb file in a text editor, and add a String variable to the hello method of the controller:

```
def hello
  @hello_string = "Welcome to JRuby on GlassFish"
end
```

6 Open the hello/app/views/say/hello.html.erb file in a text editor, and add the following to the end of the file:

```
<%= @hello_string %>
```

7 Open the hello/config/environment.rb file in a text editor, and uncomment line 21 of the file by deleting the hash mark in front of it.

Line 21 should now read:

```
config.frameworks -= [ :active_record, :active_resource, :action_mailer ]
```

8 Start Application Server.

9 Change to the parent directory of your sample hello directory and deploy the hello application:

```
install-dir/bin/asadmin deploy --path hello
```

10 Enter the following URL in your browser to run the sample:

```
http://localhost:8080/hello/say/hello
```

You should now see the following message in your browser:

```
Say#hello
Find me in app/views/say/hello.html.erb
Welcome to JRuby on GlassFish
```

Working With NetBeans

***[TBD]

Working With Eclipse
